| Command Syntax .....                | 330 |
| Default .....                       | 330 |
| Command Mode .....                  | 330 |
| Applicability .....                 | 330 |
| Example .....                       | 330 |
| set origin .....                    | 331 |
| Command Syntax .....                | 331 |
| Default .....                       | 331 |
| Command Mode .....                  | 331 |
| Applicability .....                 | 331 |
| Example .....                       | 331 |
| set originator-id .....             | 332 |
| Command Syntax .....                | 332 |
| Parameter .....                     | 332 |
| Default .....                       | 332 |
| Command Mode .....                  | 332 |
| Applicability .....                 | 332 |
| Example .....                       | 332 |
| set tag .....                       | 333 |
| Command Syntax .....                | 333 |
| Parameter .....                     | 333 |
| Default .....                       | 333 |
| Command Mode .....                  | 333 |
| Applicability .....                 | 333 |
| Example .....                       | 333 |
| set weight .....                    | 334 |
| Command Syntax .....                | 334 |
| Parameter .....                     | 334 |
| Default .....                       | 334 |
| Command Mode .....                  | 334 |
| Applicability .....                 | 334 |
| Examples .....                      | 334 |
| show route-map .....                | 335 |
| Command Syntax .....                | 335 |
| Parameters .....                    | 335 |
| Command Mode .....                  | 335 |
| Applicability .....                 | 335 |
| Example .....                       | 335 |
| show running-config route-map ..... | 336 |
| Command Syntax .....                | 336 |
| Parameters .....                    | 336 |
| Command Mode .....                  | 336 |
| Applicability .....                 | 336 |
| Example .....                       | 336 |
| Source Interface Commands .....     | 337 |

|                                                        |            |
|--------------------------------------------------------|------------|
| ip source-interface .....                              | 338        |
| Command Syntax .....                                   | 338        |
| Parameters .....                                       | 338        |
| Default .....                                          | 339        |
| Command Mode .....                                     | 339        |
| Applicability .....                                    | 339        |
| Example .....                                          | 339        |
| ipv6 source-interface .....                            | 340        |
| Command Syntax .....                                   | 340        |
| Parameters .....                                       | 340        |
| Default .....                                          | 340        |
| Command Mode .....                                     | 341        |
| Applicability .....                                    | 341        |
| Example .....                                          | 341        |
| show ip source-interface detail .....                  | 342        |
| Command Syntax .....                                   | 342        |
| Parameters .....                                       | 342        |
| Default .....                                          | 342        |
| Command Mode .....                                     | 342        |
| Applicability .....                                    | 342        |
| Example .....                                          | 342        |
| show ipv6 source-interface detail .....                | 344        |
| Command Syntax .....                                   | 344        |
| Parameters .....                                       | 344        |
| Default .....                                          | 344        |
| Command Mode .....                                     | 344        |
| Applicability .....                                    | 344        |
| Example .....                                          | 344        |
| show running-config ip source-interface .....          | 346        |
| Command Syntax .....                                   | 346        |
| Parameters .....                                       | 346        |
| Default .....                                          | 346        |
| Command Mode .....                                     | 346        |
| Applicability .....                                    | 346        |
| Example .....                                          | 346        |
| show running-config ipv6 source-interface .....        | 347        |
| Command Syntax .....                                   | 347        |
| Parameters .....                                       | 347        |
| Default .....                                          | 347        |
| Command Mode .....                                     | 347        |
| Applicability .....                                    | 347        |
| Example .....                                          | 347        |
| <b>Border Gateway Protocol Configuration .....</b>     | <b>348</b> |

|                                        |     |
|----------------------------------------|-----|
| Command Syntax .....                   | 831 |
| Parameters .....                       | 831 |
| Default .....                          | 831 |
| Command Mode .....                     | 831 |
| Applicability .....                    | 831 |
| Examples .....                         | 832 |
| neighbor ebgp-multihop .....           | 833 |
| Command Syntax .....                   | 833 |
| Parameters .....                       | 833 |
| Default .....                          | 833 |
| Command Mode .....                     | 833 |
| Applicability .....                    | 833 |
| Examples .....                         | 833 |
| neighbor enforce-multihop .....        | 835 |
| Command Syntax .....                   | 835 |
| Parameters .....                       | 835 |
| Default .....                          | 835 |
| Command Mode .....                     | 835 |
| Applicability .....                    | 835 |
| Examples .....                         | 835 |
| neighbor extended-optional-param ..... | 836 |
| Command Syntax .....                   | 836 |
| Parameters .....                       | 836 |
| Default .....                          | 836 |
| Command Mode .....                     | 836 |
| Applicability .....                    | 836 |
| Example .....                          | 836 |
| neighbor fall-over bfd .....           | 837 |
| Command Syntax .....                   | 837 |
| Parameters .....                       | 837 |
| Default .....                          | 837 |
| Command Mode .....                     | 837 |
| Applicability .....                    | 837 |
| Example .....                          | 837 |
| neighbor filter-list .....             | 838 |
| Command Syntax .....                   | 838 |
| Parameters .....                       | 838 |
| Default .....                          | 838 |
| Command Mode .....                     | 838 |
| Applicability .....                    | 838 |
| Examples .....                         | 838 |
| neighbor g-shut .....                  | 840 |
| Command Syntax .....                   | 840 |
| Parameters .....                       | 840 |
| Default .....                          | 840 |
| Command Mode .....                     | 840 |
| Applicability .....                    | 840 |

|                                    |     |
|------------------------------------|-----|
| Examples .....                     | 840 |
| neighbor g-shut-timer .....        | 841 |
| Command Syntax .....               | 841 |
| Parameters .....                   | 841 |
| Default .....                      | 841 |
| Command Mode .....                 | 841 |
| Applicability .....                | 841 |
| Examples .....                     | 841 |
| neighbor limit .....               | 842 |
| Command Syntax .....               | 842 |
| Parameters .....                   | 842 |
| Default .....                      | 842 |
| Command Mode .....                 | 842 |
| Applicability .....                | 842 |
| Example .....                      | 842 |
| neighbor local-as .....            | 843 |
| Command Syntax .....               | 843 |
| Parameters .....                   | 843 |
| Default .....                      | 843 |
| Command Mode .....                 | 843 |
| Applicability .....                | 844 |
| Example .....                      | 844 |
| neighbor maximum-prefix .....      | 845 |
| Command Syntax .....               | 845 |
| Parameters .....                   | 845 |
| Default .....                      | 845 |
| Command Mode .....                 | 845 |
| Applicability .....                | 845 |
| Examples .....                     | 846 |
| neighbor next-hop-self .....       | 847 |
| Command Syntax .....               | 847 |
| Parameters .....                   | 847 |
| Default .....                      | 847 |
| Command Mode .....                 | 847 |
| Applicability .....                | 847 |
| Examples .....                     | 847 |
| neighbor optional-as .....         | 848 |
| Command Syntax .....               | 848 |
| Parameters .....                   | 848 |
| Default .....                      | 848 |
| Command Mode .....                 | 848 |
| Applicability .....                | 848 |
| Examples .....                     | 848 |
| neighbor override-capability ..... | 849 |
| Command Syntax .....               | 849 |
| Parameters .....                   | 849 |
| Default .....                      | 849 |

|                                      |     |
|--------------------------------------|-----|
| Command Mode .....                   | 849 |
| Applicability .....                  | 849 |
| Examples .....                       | 849 |
| neighbor passive .....               | 850 |
| Command Syntax .....                 | 850 |
| Parameters .....                     | 850 |
| Default .....                        | 850 |
| Command Mode .....                   | 850 |
| Applicability .....                  | 850 |
| Examples .....                       | 850 |
| neighbor peer-group .....            | 851 |
| Command Syntax .....                 | 851 |
| Parameters .....                     | 851 |
| Default .....                        | 851 |
| Command Mode .....                   | 851 |
| Applicability .....                  | 851 |
| Example .....                        | 852 |
| neighbor WORD peer-group range ..... | 855 |
| Command Syntax .....                 | 855 |
| Parameters .....                     | 855 |
| Default .....                        | 855 |
| Command Mode .....                   | 855 |
| Applicability .....                  | 855 |
| Example .....                        | 855 |
| neighbor port .....                  | 856 |
| Command Syntax .....                 | 856 |
| Parameters .....                     | 856 |
| Default .....                        | 856 |
| Command Mode .....                   | 856 |
| Applicability .....                  | 856 |
| Examples .....                       | 856 |
| neighbor prefix-list .....           | 857 |
| Command Syntax .....                 | 857 |
| Parameters .....                     | 857 |
| Default .....                        | 857 |
| Command Mode .....                   | 857 |
| Applicability .....                  | 857 |
| Examples .....                       | 858 |
| neighbor remote-as .....             | 859 |
| Command Syntax .....                 | 859 |
| Parameters .....                     | 859 |
| Default .....                        | 859 |
| Command Mode .....                   | 859 |
| Applicability .....                  | 859 |
| Example .....                        | 860 |
| neighbor remove-private-AS .....     | 861 |
| Command Syntax .....                 | 861 |

|                                       |     |
|---------------------------------------|-----|
| Parameters .....                      | 861 |
| Default .....                         | 861 |
| Command Mode .....                    | 861 |
| Applicability .....                   | 861 |
| Example .....                         | 861 |
| neighbor restart-time .....           | 862 |
| Command Syntax .....                  | 862 |
| Parameters .....                      | 862 |
| Default .....                         | 862 |
| Command Mode .....                    | 862 |
| Applicability .....                   | 862 |
| Example .....                         | 862 |
| neighbor route-map .....              | 863 |
| Command Syntax .....                  | 863 |
| Parameters .....                      | 863 |
| Default .....                         | 863 |
| Command Mode .....                    | 863 |
| Applicability .....                   | 864 |
| Examples .....                        | 864 |
| neighbor route-reflector-client ..... | 865 |
| Command Syntax .....                  | 865 |
| Parameters .....                      | 865 |
| Default .....                         | 865 |
| Command Mode .....                    | 865 |
| Applicability .....                   | 865 |
| Examples .....                        | 865 |
| neighbor route-server-client .....    | 867 |
| Command Syntax .....                  | 867 |
| Parameters .....                      | 867 |
| Default .....                         | 867 |
| Command Mode .....                    | 867 |
| Applicability .....                   | 867 |
| Example .....                         | 867 |
| neighbor send-community .....         | 868 |
| Command Syntax .....                  | 868 |
| Parameters .....                      | 868 |
| Default .....                         | 868 |
| Command Mode .....                    | 868 |
| Applicability .....                   | 868 |
| Examples .....                        | 869 |
| neighbor send-community large .....   | 870 |
| Command Syntax .....                  | 870 |
| Parameters .....                      | 870 |
| Default .....                         | 870 |
| Command Mode .....                    | 870 |
| Applicability .....                   | 870 |
| Examples .....                        | 870 |

|                                        |     |
|----------------------------------------|-----|
| neighbor shutdown .....                | 871 |
| Command Syntax .....                   | 871 |
| Parameters .....                       | 871 |
| Default .....                          | 871 |
| Command Mode .....                     | 871 |
| Applicability .....                    | 871 |
| Examples .....                         | 871 |
| neighbor strict-capability-match ..... | 873 |
| Command Syntax .....                   | 873 |
| Parameters .....                       | 873 |
| Default .....                          | 873 |
| Command Mode .....                     | 873 |
| Applicability .....                    | 873 |
| Examples .....                         | 873 |
| neighbor timers .....                  | 874 |
| Command Syntax .....                   | 874 |
| Parameters .....                       | 874 |
| Defaults .....                         | 874 |
| Command Mode .....                     | 874 |
| Applicability .....                    | 875 |
| Examples .....                         | 875 |
| neighbor unsuppress-map .....          | 876 |
| Command Syntax .....                   | 876 |
| Parameters .....                       | 876 |
| Default .....                          | 876 |
| Command Mode .....                     | 876 |
| Applicability .....                    | 876 |
| Example .....                          | 876 |
| neighbor update-source .....           | 878 |
| Command Syntax .....                   | 878 |
| Parameters .....                       | 878 |
| Default .....                          | 878 |
| Command Mode .....                     | 878 |
| Applicability .....                    | 878 |
| Examples .....                         | 878 |
| neighbor version .....                 | 879 |
| Command Syntax .....                   | 879 |
| Parameters .....                       | 879 |
| Default .....                          | 879 |
| Command Mode .....                     | 879 |
| Applicability .....                    | 879 |
| Examples .....                         | 879 |

| Example .....                            | 1081 |
| bfd echo .....                           | 1082 |
| Command Syntax .....                     | 1082 |
| Parameters .....                         | 1082 |
| Default .....                            | 1082 |
| Command Mode .....                       | 1082 |
| Applicability .....                      | 1082 |
| Example .....                            | 1082 |
| bfd echo interval .....                  | 1083 |
| Command Syntax .....                     | 1083 |
| Parameter .....                          | 1083 |
| Default .....                            | 1083 |
| Command Mode .....                       | 1083 |
| Applicability .....                      | 1083 |
| Example .....                            | 1083 |
| bfd echo ipv4 source .....               | 1084 |
| Command Syntax .....                     | 1084 |
| Parameter .....                          | 1084 |
| Command Mode .....                       | 1084 |
| Applicability .....                      | 1084 |
| Example .....                            | 1084 |
| bfd interval .....                       | 1085 |
| Command Syntax .....                     | 1085 |
| Parameters .....                         | 1085 |
| Defaults .....                           | 1085 |
| Command Mode .....                       | 1085 |
| Applicability .....                      | 1085 |
| Example .....                            | 1085 |
| bfd multihop-peer .....                  | 1086 |
| Command Syntax .....                     | 1086 |
| Parameters .....                         | 1086 |
| Command Mode .....                       | 1086 |
| Applicability .....                      | 1087 |
| Example .....                            | 1087 |
| bfd multihop-peer A.B.C.D interval ..... | 1088 |
| Command Syntax .....                     | 1088 |
| Parameters .....                         | 1088 |
| Command Mode .....                       | 1088 |
| Default .....                            | 1088 |
| Applicability .....                      | 1088 |
| Example .....                            | 1088 |
| bfd multihop-peer interval .....         | 1089 |
| Command Syntax .....                     | 1089 |
| Parameters .....                         | 1089 |
| Command Mode .....                       | 1089 |
| Default .....                            | 1089 |
| Applicability .....                      | 1089 |

|                                           |      |
|-------------------------------------------|------|
| Example .....                             | 1089 |
| bfd multihop-peer X:X::X:X interval ..... | 1090 |
| Command Syntax .....                      | 1090 |
| Parameters .....                          | 1090 |
| Command Mode .....                        | 1090 |
| Default .....                             | 1090 |
| Applicability .....                       | 1090 |
| Example .....                             | 1090 |
| bfd notification .....                    | 1091 |
| Command Syntax .....                      | 1091 |
| Parameters .....                          | 1091 |
| Command Mode .....                        | 1091 |
| Applicability .....                       | 1091 |
| Examples .....                            | 1091 |
| bfd session .....                         | 1092 |
| Command Syntax .....                      | 1092 |
| Parameters .....                          | 1092 |
| Command Mode .....                        | 1092 |
| Applicability .....                       | 1092 |
| Examples .....                            | 1092 |
| bfd slow-timer .....                      | 1094 |
| Command Syntax .....                      | 1094 |
| Parameter .....                           | 1094 |
| Command Mode .....                        | 1094 |
| Default .....                             | 1094 |
| Applicability .....                       | 1094 |
| Example .....                             | 1094 |
| debug bfd .....                           | 1095 |
| Command Syntax .....                      | 1095 |
| Parameters .....                          | 1095 |
| Command Mode .....                        | 1095 |
| Applicability .....                       | 1095 |
| Examples .....                            | 1095 |
| key-id .....                              | 1096 |
| Command Syntax .....                      | 1096 |
| Parameters .....                          | 1096 |
| Default .....                             | 1096 |
| Command Mode .....                        | 1096 |
| Applicability .....                       | 1096 |
| Examples .....                            | 1096 |
| key chain .....                           | 1097 |
| Command Syntax .....                      | 1097 |
| Parameters .....                          | 1097 |
| Command Mode .....                        | 1097 |
| Applicability .....                       | 1097 |
| Examples .....                            | 1097 |
| key-string .....                          | 1098 |

|                                |      |
|--------------------------------|------|
| Command Syntax .....           | 1098 |
| Parameters .....               | 1098 |
| Default .....                  | 1098 |
| Command Mode .....             | 1098 |
| Applicability .....            | 1098 |
| Examples .....                 | 1098 |
| key-string encrypted .....     | 1099 |
| Command Syntax .....           | 1099 |
| Parameters .....               | 1099 |
| Default .....                  | 1099 |
| Command Mode .....             | 1099 |
| Applicability .....            | 1099 |
| Example .....                  | 1099 |
| send-lifetime .....            | 1100 |
| Command Syntax .....           | 1100 |
| Parameters .....               | 1100 |
| Command Mode .....             | 1100 |
| Applicability .....            | 1100 |
| Examples .....                 | 1101 |
| show bfd .....                 | 1102 |
| Command Syntax .....           | 1102 |
| Parameters .....               | 1102 |
| Command Mode .....             | 1102 |
| Applicability .....            | 1102 |
| Example .....                  | 1102 |
| show bfd interface .....       | 1103 |
| Command Syntax .....           | 1103 |
| Parameters .....               | 1103 |
| Command Mode .....             | 1103 |
| Applicability .....            | 1103 |
| Example .....                  | 1103 |
| show bfd session .....         | 1105 |
| Command Syntax .....           | 1105 |
| Parameters .....               | 1105 |
| Command Mode .....             | 1105 |
| Applicability .....            | 1105 |
| Example .....                  | 1105 |
| show bfd session A.B.C.D ..... | 1110 |
| Command Syntax .....           | 1110 |
| Parameters .....               | 1110 |
| Command Mode .....             | 1110 |
| Applicability .....            | 1110 |
| Example .....                  | 1110 |
| show bfd session ipv6 .....    | 1113 |
| Command Syntax .....           | 1113 |
| Parameters .....               | 1113 |
| Command Mode .....             | 1113 |

|                                 |      |
|---------------------------------|------|
| Applicability .....             | 1113 |
| Example .....                   | 1113 |
| show debugging bfd .....        | 1116 |
| Command Syntax .....            | 1116 |
| Parameters .....                | 1116 |
| Command Mode .....              | 1116 |
| Applicability .....             | 1116 |
| Example .....                   | 1116 |
| snmp restart bfd .....          | 1117 |
| Command Syntax .....            | 1117 |
| Parameters .....                | 1117 |
| Command Mode .....              | 1117 |
| Applicability .....             | 1117 |
| Example .....                   | 1117 |
| Protocol Commands for BFD ..... | 1118 |
| area virtual-link .....         | 1119 |
| Command Syntax .....            | 1119 |
| Parameters .....                | 1119 |
| Default .....                   | 1119 |
| Command Mode .....              | 1119 |
| Applicability .....             | 1119 |
| Example .....                   | 1119 |
| bfd all-interfaces .....        | 1120 |
| Command Syntax .....            | 1120 |
| Parameters .....                | 1120 |
| Default .....                   | 1120 |
| Command Mode .....              | 1120 |
| Applicability .....             | 1120 |
| Example .....                   | 1120 |
| debug bgp bfd .....             | 1121 |
| Command Syntax .....            | 1121 |
| Parameters .....                | 1121 |
| Command Mode .....              | 1121 |
| Applicability .....             | 1121 |
| Example .....                   | 1121 |
| debug isis bfd .....            | 1122 |
| Command Syntax .....            | 1122 |
| Parameters .....                | 1122 |
| Command Mode .....              | 1122 |
| Applicability .....             | 1122 |
| Example .....                   | 1122 |
| debug ospf bfd .....            | 1123 |
| Command Syntax .....            | 1123 |
| Parameters .....                | 1123 |
| Command Mode .....              | 1123 |
| Applicability .....             | 1123 |
| Example .....                   | 1123 |

|                                      |      |
|--------------------------------------|------|
| ip ospf bfd .....                    | 1124 |
| Command Syntax .....                 | 1124 |
| Parameter .....                      | 1124 |
| Default .....                        | 1124 |
| Command Mode .....                   | 1124 |

| Applicability .....                                                       | 1304        |
| Examples .....                                                            | 1304        |
| authentication key-chain .....                                            | 1305        |
| Command Syntax .....                                                      | 1305        |

|                                |      |
|--------------------------------|------|
| Parameters .....               | 1305 |
| Default .....                  | 1305 |
| Command Mode .....             | 1305 |
| Applicability .....            | 1305 |
| Example .....                  | 1305 |
| authentication mode .....      | 1306 |
| Command Syntax .....           | 1306 |
| Parameters .....               | 1306 |
| Default .....                  | 1306 |
| Command Mode .....             | 1306 |
| Applicability .....            | 1306 |
| Examples .....                 | 1306 |
| authentication send-only ..... | 1307 |
| Command Syntax .....           | 1307 |
| Parameters .....               | 1307 |
| Default .....                  | 1307 |
| Command Mode .....             | 1307 |
| Applicability .....            | 1307 |
| Examples .....                 | 1307 |
| bfd all-interfaces .....       | 1308 |
| Command Syntax .....           | 1308 |
| Parameters .....               | 1308 |
| Default .....                  | 1308 |
| Command Mode .....             | 1308 |
| Applicability .....            | 1308 |
| Examples .....                 | 1308 |
| capability cspf .....          | 1309 |
| Command Syntax .....           | 1309 |
| Parameters .....               | 1309 |
| Default .....                  | 1309 |
| Command Mode .....             | 1309 |
| Example .....                  | 1309 |
| clear clns is-neighbors .....  | 1310 |
| Command Syntax .....           | 1310 |
| Parameters .....               | 1310 |
| Command Mode .....             | 1310 |
| Applicability .....            | 1310 |
| Example .....                  | 1310 |
| clear clns neighbors .....     | 1311 |
| Command Syntax .....           | 1311 |
| Parameters .....               | 1311 |
| Command Mode .....             | 1311 |
| Applicability .....            | 1311 |
| Example .....                  | 1311 |
| clear ip isis route .....      | 1312 |
| Command Syntax .....           | 1312 |
| Parameters .....               | 1312 |

|                                     |      |
|-------------------------------------|------|
| Command Mode .....                  | 1312 |
| Applicability .....                 | 1312 |
| Example .....                       | 1312 |
| clear isis adjacency .....          | 1313 |
| Command Syntax .....                | 1313 |
| Parameters .....                    | 1313 |
| Command Mode .....                  | 1313 |
| Applicability .....                 | 1313 |
| Example .....                       | 1313 |
| clear isis counter .....            | 1314 |
| Command Syntax .....                | 1314 |
| Parameters .....                    | 1314 |
| Command Mode .....                  | 1314 |
| Applicability .....                 | 1314 |
| Example .....                       | 1314 |
| clear isis interface counter .....  | 1315 |
| Command Syntax .....                | 1315 |
| Parameters .....                    | 1315 |
| Command Mode .....                  | 1315 |
| Applicability .....                 | 1315 |
| Example .....                       | 1315 |
| clear isis process .....            | 1316 |
| Command Syntax .....                | 1316 |
| Parameters .....                    | 1316 |
| Command Mode .....                  | 1316 |
| Applicability .....                 | 1316 |
| Example .....                       | 1316 |
| debug isis .....                    | 1317 |
| Command syntax .....                | 1317 |
| Parameters .....                    | 1317 |
| Command Mode .....                  | 1318 |
| Applicability .....                 | 1318 |
| Examples .....                      | 1318 |
| default-information originate ..... | 1319 |
| Command Syntax .....                | 1319 |
| Parameters .....                    | 1319 |
| Default .....                       | 1319 |
| Command Mode .....                  | 1319 |
| Applicability .....                 | 1319 |
| Examples .....                      | 1319 |
| distance (IPv4) .....               | 1320 |
| Command Syntax .....                | 1320 |
| Parameters .....                    | 1320 |
| Default .....                       | 1320 |
| Command Mode .....                  | 1320 |
| Applicability .....                 | 1320 |
| Examples .....                      | 1320 |

|                                               |      |
|-----------------------------------------------|------|
| distance (IPv6) .....                         | 1322 |
| Command Syntax .....                          | 1322 |
| Parameters .....                              | 1322 |
| Default .....                                 | 1322 |
| Command Mode .....                            | 1322 |
| Applicability .....                           | 1322 |
| Examples .....                                | 1322 |
| domain password .....                         | 1324 |
| Command Syntax .....                          | 1324 |
| Parameters .....                              | 1324 |
| Default .....                                 | 1324 |
| Command Mode .....                            | 1324 |
| Applicability .....                           | 1324 |
| Examples .....                                | 1324 |
| dynamic-hostname .....                        | 1326 |
| Command Syntax .....                          | 1326 |
| Parameters .....                              | 1326 |
| Default .....                                 | 1326 |
| Command Mode .....                            | 1326 |
| Example .....                                 | 1326 |
| fast-reroute per-prefix .....                 | 1327 |
| Command Syntax .....                          | 1327 |
| Parameters .....                              | 1327 |
| Command Mode .....                            | 1327 |
| Applicability .....                           | 1327 |
| Examples .....                                | 1327 |
| fast-reroute terminate-hold-on interval ..... | 1328 |
| Command Syntax .....                          | 1328 |
| Parameters .....                              | 1328 |
| Default .....                                 | 1328 |
| Command Mode .....                            | 1328 |
| Applicability .....                           | 1328 |
| Examples .....                                | 1328 |
| fast-reroute tie-break .....                  | 1329 |
| Command Syntax .....                          | 1329 |
| Parameters .....                              | 1329 |
| Defaults .....                                | 1330 |
| Command Mode .....                            | 1330 |
| Applicability .....                           | 1330 |
| Examples .....                                | 1330 |
| ignore-lsp-errors .....                       | 1331 |
| Command Syntax .....                          | 1331 |
| Parameters .....                              | 1331 |
| Default .....                                 | 1331 |
| Command Mode .....                            | 1331 |
| Applicability .....                           | 1331 |
| Example .....                                 | 1331 |

|                                     |      |
|-------------------------------------|------|
| ip route high-priority tag .....    | 1332 |
| Command Syntax .....                | 1332 |
| Parameters .....                    | 1332 |
| Default .....                       | 1332 |
| Command Mode .....                  | 1332 |
| Applicability .....                 | 1332 |
| Example .....                       | 1332 |
| ip router isis .....                | 1333 |
| Command Syntax .....                | 1333 |
| Parameters .....                    | 1333 |
| Default .....                       | 1333 |
| Command Mode .....                  | 1333 |
| Applicability .....                 | 1333 |
| Example .....                       | 1333 |
| ipv6 router isis .....              | 1334 |
| Command Syntax .....                | 1334 |
| Parameters .....                    | 1334 |
| Default .....                       | 1334 |
| Command Mode .....                  | 1334 |
| Example .....                       | 1334 |
| is-type .....                       | 1335 |
| Command Syntax .....                | 1335 |
| Parameters .....                    | 1335 |
| Default .....                       | 1335 |
| Command Mode .....                  | 1335 |
| Applicability .....                 | 1335 |
| Examples .....                      | 1335 |
| isis authentication key-chain ..... | 1336 |
| Command Syntax .....                | 1336 |
| Parameters .....                    | 1336 |
| Default .....                       | 1336 |
| Command Mode .....                  | 1336 |
| Applicability .....                 | 1336 |
| Example .....                       | 1336 |
| isis authentication mode md5 .....  | 1337 |
| Command Syntax .....                | 1337 |
| Parameters .....                    | 1337 |
| Default .....                       | 1337 |
| Command Mode .....                  | 1337 |
| Applicability .....                 | 1337 |
| Example .....                       | 1337 |
| isis authentication send-only ..... | 1338 |
| Command Syntax .....                | 1338 |
| Parameters .....                    | 1338 |
| Default .....                       | 1338 |
| Command Mode .....                  | 1338 |
| Applicability .....                 | 1338 |

|                                                      |      |
|------------------------------------------------------|------|
| Example .....                                        | 1338 |
| isis bfd .....                                       | 1339 |
| Command Syntax .....                                 | 1339 |
| Parameters .....                                     | 1339 |
| Default .....                                        | 1339 |
| Command Mode .....                                   | 1339 |
| Applicability .....                                  | 1339 |
| Example .....                                        | 1339 |
| isis circuit-type .....                              | 1340 |
| Command Syntax .....                                 | 1340 |
| Parameters .....                                     | 1340 |
| Default .....                                        | 1340 |
| Command Mode .....                                   | 1340 |
| Applicability .....                                  | 1340 |
| Example .....                                        | 1340 |
| isis csnp-interval .....                             | 1341 |
| Command Syntax .....                                 | 1341 |
| Parameters .....                                     | 1341 |
| Default .....                                        | 1341 |
| Command Mode .....                                   | 1341 |
| Applicability .....                                  | 1341 |
| Example .....                                        | 1341 |
| isis fast-reroute per-prefix candidate disable ..... | 1342 |
| Command Syntax .....                                 | 1342 |
| Parameters .....                                     | 1342 |
| Command Mode .....                                   | 1342 |
| Applicability .....                                  | 1342 |
| Example .....                                        | 1342 |
| isis hello-interval .....                            | 1343 |
| Command Syntax .....                                 | 1343 |
| Parameters .....                                     | 1343 |
| Default .....                                        | 1343 |
| Command Mode .....                                   | 1343 |
| Applicability .....                                  | 1343 |
| Examples .....                                       | 1344 |
| isis hello-multiplier .....                          | 1345 |
| Command Syntax .....                                 | 1345 |
| Parameters .....                                     | 1345 |
| Default .....                                        | 1345 |
| Command Mode .....                                   | 1345 |
| Applicability .....                                  | 1345 |
| Example .....                                        | 1345 |
| isis hello padding .....                             | 1346 |
| Command Syntax .....                                 | 1346 |
| Parameters .....                                     | 1346 |
| Default .....                                        | 1346 |
| Command Mode .....                                   | 1346 |

|                                |      |
|--------------------------------|------|
| Applicability .....            | 1346 |
| Examples .....                 | 1346 |
| isis lsp-interval .....        | 1347 |
| Command Syntax .....           | 1347 |
| Parameters .....               | 1347 |
| Default .....                  | 1347 |
| Command Mode .....             | 1347 |
| Applicability .....            | 1347 |
| Examples .....                 | 1347 |
| isis mesh-group .....          | 1348 |
| Command Syntax .....           | 1348 |
| Parameters .....               | 1348 |
| Default .....                  | 1348 |
| Command Mode .....             | 1348 |
| Examples .....                 | 1348 |
| isis metric .....              | 1349 |
| Command Syntax .....           | 1349 |
| Parameters .....               | 1349 |
| Default .....                  | 1349 |
| Command Mode .....             | 1349 |
| Applicability .....            | 1349 |
| Example .....                  | 1349 |
| isis network .....             | 1350 |
| Command Syntax .....           | 1350 |
| Parameters .....               | 1350 |
| Default .....                  | 1350 |
| Command Mode .....             | 1350 |
| Applicability .....            | 1350 |
| Example .....                  | 1350 |
| isis password .....            | 1351 |
| Command Syntax .....           | 1351 |
| Parameters .....               | 1351 |
| Default .....                  | 1351 |
| Command Mode .....             | 1351 |
| Applicability .....            | 1351 |
| Example .....                  | 1351 |
| isis priority .....            | 1352 |
| Command Syntax .....           | 1352 |
| Parameters .....               | 1352 |
| Default .....                  | 1352 |
| Command Mode .....             | 1352 |
| Applicability .....            | 1352 |
| Example .....                  | 1352 |
| isis retransmit-interval ..... | 1353 |
| Command Syntax .....           | 1353 |
| Parameters .....               | 1353 |
| Default .....                  | 1353 |

|                        |      |
|------------------------|------|
| Command Mode .....     | 1353 |
| Applicability .....    | 1353 |
| Examples .....         | 1353 |
| isis tag .....         | 1354 |
| Command Syntax .....   | 1354 |
| Parameters .....       | 1354 |
| Command Mode .....     | 1354 |
| Examples .....         | 1354 |
| isis te-metric .....   | 1355 |
| Command Syntax .....   | 1355 |
| Parameters .....       | 1355 |
| Default .....          | 1355 |
| Command Mode .....     | 1355 |
| Applicability .....    | 1355 |
| Examples .....         | 1355 |
| isis wait-timer .....  | 1356 |
| Command Syntax .....   | 1356 |
| Parameters .....       | 1356 |
| Default .....          | 1356 |
| Command Mode .....     | 1356 |
| Applicability .....    | 1356 |
| Examples .....         | 1356 |
| isis wide-metric ..... | 1357 |
| Command Syntax .....   | 1357 |
| Parameters .....       | 1357 |
| Default .....          | 1357 |
| Command Mode .....     | 1357 |
| Applicability .....    | 1357 |
| Examples .....         | 1357 |
| ispf .....             | 1358 |
| Command Syntax .....   | 1358 |
| Parameters .....       | 1358 |
| Default .....          | 1358 |
| Command Mode .....     | 1358 |
| Applicability .....    | 1358 |
| Examples .....         | 1358 |
| key chain .....        | 1359 |
| Command Syntax .....   | 1359 |
| Parameters .....       | 1359 |
| Default .....          | 1359 |
| Command Mode .....     | 1359 |
| Applicability .....    | 1359 |
| Examples .....         | 1359 |
| key-id .....           | 1360 |
| Command Syntax .....   | 1360 |
| Parameters .....       | 1360 |
| Default .....          | 1360 |

|                            |      |
|----------------------------|------|
| Command Mode .....         | 1360 |
| Applicability .....        | 1360 |
| Examples .....             | 1360 |
| key-string .....           | 1361 |
| Command Syntax .....       | 1361 |
| Parameters .....           | 1361 |
| Default .....              | 1361 |
| Command Mode .....         | 1361 |
| Applicability .....        | 1361 |
| Examples .....             | 1361 |
| key-string encrypted ..... | 1362 |
| Command Syntax .....       | 1362 |
| Parameters .....           | 1362 |
| Default .....              | 1362 |
| Command Mode .....         | 1362 |
| Applicability .....        | 1362 |
| Example .....              | 1362 |
| lsp-gen-interval .....     | 1363 |
| Command Syntax .....       | 1363 |
| Parameters .....           | 1363 |
| Default .....              | 1363 |
| Command Mode .....         | 1363 |
| Applicability .....        | 1363 |
| Example .....              | 1363 |
| lsp-mtu .....              | 1364 |
| Command Syntax .....       | 1364 |
| Parameters .....           | 1364 |
| Default .....              | 1364 |
| Command Mode .....         | 1364 |
| Applicability .....        | 1364 |
| Example .....              | 1364 |
| lsp-refresh-interval ..... | 1365 |
| Command Syntax .....       | 1365 |
| Parameters .....           | 1365 |
| Default .....              | 1365 |
| Command Mode .....         | 1365 |
| Applicability .....        | 1365 |
| Examples .....             | 1365 |
| max-area-address .....     | 1366 |
| Command Syntax .....       | 1366 |
| Parameters .....           | 1366 |
| Default .....              | 1366 |
| Command Mode .....         | 1366 |
| Applicability .....        | 1366 |
| Examples .....             | 1366 |
| max-lsp-lifetime .....     | 1367 |
| Command Syntax .....       | 1367 |

|                              |      |
|------------------------------|------|
| Parameters .....             | 1367 |
| Default .....                | 1367 |
| Command Mode .....           | 1367 |
| Applicability .....          | 1367 |
| Examples .....               | 1367 |
| metric-style .....           | 1368 |
| Command Syntax .....         | 1368 |
| Parameters .....             | 1368 |
| Default .....                | 1368 |
| Command Mode .....           | 1369 |
| Examples .....               | 1369 |
| net .....                    | 1370 |
| Command Syntax .....         | 1370 |
| Parameters .....             | 1370 |
| Default .....                | 1370 |
| Command Mode .....           | 1370 |
| Applicability .....          | 1370 |
| Example .....                | 1370 |
| passive-interface .....      | 1371 |
| Command Syntax .....         | 1371 |
| Parameters .....             | 1371 |
| Command Mode .....           | 1371 |
| Examples .....               | 1371 |
| prc-interval-exp .....       | 1372 |
| Command Syntax .....         | 1372 |
| Parameters .....             | 1372 |
| Default .....                | 1372 |
| Command Mode .....           | 1372 |
| Applicability .....          | 1372 |
| Examples .....               | 1372 |
| redistribute .....           | 1373 |
| Command Syntax .....         | 1373 |
| Parameters .....             | 1373 |
| Default .....                | 1374 |
| Command Mode .....           | 1374 |
| Applicability .....          | 1374 |
| Examples .....               | 1374 |
| redistribute isis .....      | 1375 |
| Command Syntax .....         | 1375 |
| Parameters .....             | 1375 |
| Default .....                | 1375 |
| Command Mode .....           | 1375 |
| Applicability .....          | 1375 |
| Examples .....               | 1375 |
| redistribute isis WORD ..... | 1377 |
| Command Syntax .....         | 1377 |
| Parameters .....             | 1377 |

|                         |      |
|-------------------------|------|
| Default .....           | 1377 |
| Command Mode .....      | 1377 |
| Applicability .....     | 1378 |
| Examples .....          | 1378 |
| router isis .....       | 1379 |
| Command Syntax .....    | 1379 |
| Parameters .....        | 1379 |
| Default .....           | 1379 |
| Command Mode .....      | 1379 |
| Applicability .....     | 1379 |
| Example .....           | 1379 |
| send-lifetime .....     | 1380 |
| Command Syntax .....    | 1380 |
| Parameters .....        | 1380 |
| Default .....           | 1380 |
| Command Mode .....      | 1380 |
| Applicability .....     | 1381 |
| Examples .....          | 1381 |
| set-overload-bit .....  | 1382 |
| Command Syntax .....    | 1382 |
| Parameters .....        | 1382 |
| Default .....           | 1382 |
| Command Mode .....      | 1382 |
| Applicability .....     | 1382 |
| Example .....           | 1382 |
| snmp restart isis ..... | 1384 |
| Command Syntax .....    | 1384 |
| Parameters .....        | 1384 |
| Default .....           | 1384 |
| Command Mode .....      | 1384 |
| Applicability .....     | 1384 |
| Examples .....          | 1384 |
| spf-interval-exp .....  | 1385 |
| Command Syntax .....    | 1385 |
| Parameters .....        | 1385 |
| Default .....           | 1385 |
| Command Mode .....      | 1385 |
| Applicability .....     | 1385 |
| Examples .....          | 1385 |
| summary-address .....   | 1386 |
| Command Syntax .....    | 1386 |
| Parameters .....        | 1386 |
| Default .....           | 1386 |
| Command Mode .....      | 1386 |
| Applicability .....     | 1386 |
| Examples .....          | 1386 |
| summary-prefix .....    | 1387 |

|                                       |      |

| Command Syntax .....                  | 1387 |
| Parameters .....                      | 1387 |
| Default .....                         | 1387 |
| Command Mode .....                    | 1387 |
| Applicability .....                   | 1387 |
| Examples .....                        | 1387 |
| IS-IS Graceful Restart Commands ..... | 1388 |
| capability restart graceful .....     | 1389 |
| Command Syntax .....                  | 1389 |
| Parameters .....                      | 1389 |
| Default .....                         | 1389 |
| Command Mode .....                    | 1389 |
| Applicability .....                   | 1389 |
| Example .....                         | 1389 |
| isis restart grace-period .....       | 1390 |
| Command Syntax .....                  | 1390 |
| Parameters .....                      | 1390 |
| Default .....                         | 1390 |
| Command Mode .....                    | 1390 |
| Applicability .....                   | 1390 |
| Examples .....                        | 1390 |
| isis restart-hello-interval .....     | 1391 |
| Command Syntax .....                  | 1391 |
| Parameters .....                      | 1391 |
| Default .....                         | 1391 |
| Command Mode .....                    | 1391 |
| Applicability .....                   | 1391 |
| Example .....                         | 1391 |
| isis restart helper .....             | 1392 |
| Command Syntax .....                  | 1392 |
| Parameters .....                      | 1392 |
| Default .....                         | 1392 |
| Command Mode .....                    | 1392 |
| Applicability .....                   | 1392 |
| Example .....                         | 1392 |
| isis restart suppress-adjacency ..... | 1393 |
| Command Syntax .....                  | 1393 |
| Parameters .....                      | 1393 |
| Default .....                         | 1393 |
| Command Mode .....                    | 1393 |
| Applicability .....                   | 1393 |
| Example .....                         | 1393 |
| restart isis graceful .....           | 1394 |
| Command Syntax .....                  | 1394 |
| Parameters .....                      | 1394 |
| Default .....                         | 1394 |
| Command Mode .....                    | 1394 |

|                                     |      |
|-------------------------------------|------|
| Applicability .....                 | 1394 |
| Example .....                       | 1394 |
| restart-timer .....                 | 1395 |
| Command Syntax .....                | 1395 |
| Parameters .....                    | 1395 |
| Default .....                       | 1395 |
| Command Mode .....                  | 1395 |
| Applicability .....                 | 1395 |
| Example .....                       | 1395 |
| ISIS Show Commands .....            | 1396 |
| show clns is-neighbors .....        | 1397 |
| Command Syntax .....                | 1397 |
| Parameters .....                    | 1397 |
| Command Mode .....                  | 1397 |
| Applicability .....                 | 1397 |
| Example .....                       | 1397 |
| show clns neighbors .....           | 1399 |
| Command Syntax .....                | 1399 |
| Parameters .....                    | 1399 |
| Command Mode .....                  | 1399 |
| Applicability .....                 | 1399 |
| Example .....                       | 1399 |
| show debugging isis .....           | 1401 |
| Command Syntax .....                | 1401 |
| Parameters .....                    | 1401 |
| Command Mode .....                  | 1401 |
| Applicability .....                 | 1401 |
| Example .....                       | 1401 |
| show ip isis igp-shortcut-lsp ..... | 1402 |
| Command Syntax .....                | 1402 |
| Parameters .....                    | 1402 |
| Command Mode .....                  | 1402 |
| Applicability .....                 | 1402 |
| Example .....                       | 1402 |
| show ip isis lfa-config .....       | 1403 |
| Command Syntax .....                | 1403 |
| Parameters .....                    | 1403 |
| Command Mode .....                  | 1403 |
| Default .....                       | 1403 |
| Applicability .....                 | 1403 |
| Example .....                       | 1403 |
| show ip isis route .....            | 1404 |
| Command Syntax .....                | 1404 |
| Parameters .....                    | 1404 |
| Command Mode .....                  | 1404 |
| Applicability .....                 | 1404 |
| Example .....                       | 1404 |

|                                       |      |
|---------------------------------------|------|
| show ip isis route fast-reroute ..... | 1406 |
| Command Syntax .....                  | 1406 |
| Parameters .....                      | 1406 |
| Command Mode .....                    | 1406 |
| Applicability .....                   | 1406 |
| Example .....                         | 1406 |
| show ip isis route igp-shortcut ..... | 1407 |
| Command Syntax .....                  | 1407 |
| Parameters .....                      | 1407 |
| Command Mode .....                    | 1407 |
| Applicability .....                   | 1407 |
| Example .....                         | 1407 |
| show ip protocols .....               | 1409 |
| Command Syntax .....                  | 1409 |
| Parameters .....                      | 1409 |
| Command Mode .....                    | 1409 |
| Applicability .....                   | 1409 |
| Example .....                         | 1409 |
| show ip route fast-reroute .....      | 1411 |
| Command Syntax .....                  | 1411 |
| Parameters .....                      | 1411 |
| Command Mode .....                    | 1411 |
| Applicability .....                   | 1411 |
| Example .....                         | 1411 |
| show isis counter .....               | 1412 |
| Command Syntax .....                  | 1412 |
| Parameters .....                      | 1412 |
| Command Mode .....                    | 1412 |
| Applicability .....                   | 1412 |
| Example .....                         | 1412 |
| show isis database .....              | 1413 |
| Command Syntax .....                  | 1413 |
| Parameters .....                      | 1413 |
| Command Mode .....                    | 1413 |
| Applicability .....                   | 1413 |
| Example .....                         | 1413 |
| show isis interface .....             | 1416 |
| Command Syntax .....                  | 1416 |
| Parameters .....                      | 1416 |
| Command Mode .....                    | 1416 |
| Applicability .....                   | 1416 |
| Example .....                         | 1416 |
| show isis spf-logs .....              | 1419 |
| Command Syntax .....                  | 1419 |
| Parameters .....                      | 1419 |
| Command Mode .....                    | 1419 |
| Applicability .....                   | 1419 |

|                                          |      |
|------------------------------------------|------|
| Example .....                            | 1419 |
| show isis topology .....                 | 1420 |
| Command Syntax .....                     | 1420 |
| Parameters .....                         | 1420 |
| Command Mode .....                       | 1420 |
| Applicability .....                      | 1420 |
| Example .....                            | 1420 |
| show running-config interface isis ..... | 1422 |
| Command Syntax .....                     | 1422 |
| Parameters .....                         | 1422 |
| Command Mode .....                       | 1422 |
| Applicability .....                      | 1422 |
| Example .....                            | 1422 |
| show running-config router isis .....    | 1423 |
| Command Syntax .....                     | 1423 |
| Parameters .....                         | 1423 |
| Command Mode .....                       | 1423 |
| Applicability .....                      | 1423 |
| Example .....                            | 1423 |
| IS-IS Microloop-Avoidance Commands ..... | 1424 |
| microloop-avoidance .....                | 1425 |
| Command Syntax .....                     | 1425 |
| Parameters .....                         | 1425 |
| Default .....                            | 1425 |
| Command Mode .....                       | 1425 |
| Applicability .....                      | 1425 |
| Examples .....                           | 1426 |
| microloop-avoidance flex-algo .....      | 1427 |
| Command Syntax .....                     | 1427 |
| Parameters .....                         | 1427 |
| Default .....                            | 1427 |
| Command Mode .....                       | 1427 |
| Applicability .....                      | 1427 |
| Examples .....                           | 1427 |
| microloop-avoidance hold-timer .....     | 1428 |
| Command Syntax .....                     | 1428 |
| Parameters .....                         | 1428 |
| Default .....                            | 1428 |
| Command Mode .....                       | 1428 |
| Applicability .....                      | 1428 |
| Examples .....                           | 1428 |
| microloop-avoidance max-fib .....        | 1429 |
| Command Syntax .....                     | 1429 |
| Parameters .....                         | 1429 |
| Default .....                            | 1429 |
| Command Mode .....                       | 1429 |
| Applicability .....                      | 1429 |

|                                                     |             |
|-----------------------------------------------------|-------------|
| Examples .....                                      | 1429        |
| microloop-avoidance segment-routing .....           | 1430        |
| Command Syntax .....                                | 1430        |
| Parameters .....                                    | 1430        |
| Default .....                                       | 1430        |
| Command Mode .....                                  | 1430        |
| Applicability .....                                 | 1430        |
| Examples .....                                      | 1430        |
| show isis microloop-avoidance .....                 | 1431        |
| Command Syntax .....                                | 1431        |
| Parameters .....                                    | 1431        |
| Command Mode .....                                  | 1431        |
| Applicability .....                                 | 1431        |

| Examples .....                                          | 1737 |
| ip ospf disable .....                                   | 1738 |
| Command Syntax .....                                    | 1738 |
| Parameters .....                                        | 1738 |
| Default .....                                           | 1738 |
| Command Mode .....                                      | 1738 |
| Applicability .....                                     | 1738 |
| Example .....                                           | 1738 |
| ip ospf fast-reroute per-prefix candidate disable ..... | 1739 |
| Command Syntax .....                                    | 1739 |
| Parameters .....                                        | 1739 |
| Default .....                                           | 1739 |
| Command Mode .....                                      | 1739 |
| Applicability .....                                     | 1739 |
| Example .....                                           | 1739 |
| ip ospf flood-reduction .....                           | 1740 |
| Command Syntax .....                                    | 1740 |
| Parameters .....                                        | 1740 |
| Default .....                                           | 1740 |
| Command Mode .....                                      | 1740 |
| Applicability .....                                     | 1740 |
| Example .....                                           | 1740 |
| ip ospf hello-interval .....                            | 1741 |
| Command Syntax .....                                    | 1741 |
| Parameters .....                                        | 1741 |
| Default .....                                           | 1741 |
| Command Mode .....                                      | 1741 |
| Applicability .....                                     | 1741 |
| Examples .....                                          | 1741 |
| ip ospf message-digest-key .....                        | 1742 |
| Command Syntax .....                                    | 1742 |
| Parameters .....                                        | 1742 |

|                                   |      |
|-----------------------------------|------|
| Default .....                     | 1742 |
| Command Mode .....                | 1742 |
| Applicability .....               | 1742 |
| Examples .....                    | 1742 |
| ip ospf mtu .....                 | 1744 |
| Command Syntax .....              | 1744 |
| Parameters .....                  | 1744 |
| Default .....                     | 1744 |
| Command Mode .....                | 1744 |
| Applicability .....               | 1744 |
| Examples .....                    | 1744 |
| ip ospf mtu-ignore .....          | 1745 |
| Command Syntax .....              | 1745 |
| Parameters .....                  | 1745 |
| Default .....                     | 1745 |
| Command Mode .....                | 1745 |
| Applicability .....               | 1745 |
| Examples .....                    | 1745 |
| ip ospf multi-area .....          | 1746 |
| Command Syntax .....              | 1746 |
| Parameters .....                  | 1746 |
| Default .....                     | 1746 |
| Command Mode .....                | 1746 |
| Applicability .....               | 1746 |
| Examples .....                    | 1746 |
| ip ospf network .....             | 1748 |
| Command Syntax .....              | 1748 |
| Parameters .....                  | 1748 |
| Default .....                     | 1748 |
| Command Mode .....                | 1748 |
| Applicability .....               | 1748 |
| Examples .....                    | 1748 |
| ip ospf priority .....            | 1749 |
| Command Syntax .....              | 1749 |
| Parameters .....                  | 1749 |
| Default .....                     | 1749 |
| Command Mode .....                | 1749 |
| Applicability .....               | 1749 |
| Examples .....                    | 1749 |
| ip ospf resync-timeout .....      | 1750 |
| Command Syntax .....              | 1750 |
| Parameters .....                  | 1750 |
| Default .....                     | 1750 |
| Command Mode .....                | 1750 |
| Applicability .....               | 1750 |
| Examples .....                    | 1750 |
| ip ospf retransmit-interval ..... | 1751 |

|                              |      |
|------------------------------|------|
| Command Syntax .....         | 1751 |
| Parameters .....             | 1751 |
| Default .....                | 1751 |
| Command Mode .....           | 1751 |
| Applicability .....          | 1751 |
| Examples .....               | 1751 |
| ip ospf transmit-delay ..... | 1752 |
| Command Syntax .....         | 1752 |
| Parameters .....             | 1752 |
| Default .....                | 1752 |
| Command Mode .....           | 1752 |
| Applicability .....          | 1752 |
| Examples .....               | 1752 |
| log-adjacency-changes .....  | 1753 |
| Command Syntax .....         | 1753 |
| Parameters .....             | 1753 |
| Default .....                | 1753 |
| Command Mode .....           | 1753 |
| Applicability .....          | 1753 |
| Examples .....               | 1753 |
| max-concurrent-dd .....      | 1754 |
| Command Syntax .....         | 1754 |
| Parameters .....             | 1754 |
| Default .....                | 1754 |
| Command Mode .....           | 1754 |
| Applicability .....          | 1754 |
| Examples .....               | 1754 |

| Parameters .....                    | 1839 |
| Default .....                       | 1839 |
| Command Mode .....                  | 1839 |
| Applicability .....                 | 1839 |
| Examples .....                      | 1839 |
| area stub .....                     | 1840 |
| Command Syntax .....                | 1840 |
| Parameters .....                    | 1840 |
| Default .....                       | 1840 |
| Command Mode .....                  | 1840 |
| Applicability .....                 | 1840 |
| Examples .....                      | 1840 |
| area virtual-link .....             | 1841 |
| Command Syntax .....                | 1841 |
| Parameters .....                    | 1841 |
| Default .....                       | 1842 |
| Command Mode .....                  | 1842 |
| Applicability .....                 | 1842 |
| Examples .....                      | 1842 |
| auto-cost reference bandwidth ..... | 1843 |
| Command Syntax .....                | 1843 |
| Parameters .....                    | 1843 |
| Default .....                       | 1843 |
| Command Mode .....                  | 1843 |
| Applicability .....                 | 1843 |
| Examples .....                      | 1843 |
| bfd all-interfaces .....            | 1844 |
| Command Syntax .....                | 1844 |

|                               |      |
|-------------------------------|------|
| Parameters .....              | 1844 |
| Default .....                 | 1844 |
| Command Mode .....            | 1844 |
| Applicability .....           | 1844 |
| Examples .....                | 1844 |
| capability restart .....      | 1845 |
| Command Syntax .....          | 1845 |
| Parameter .....               | 1845 |
| Default .....                 | 1845 |
| Command Mode .....            | 1845 |
| Applicability .....           | 1845 |
| Examples .....                | 1845 |
| clear ipv6 ospf process ..... | 1846 |
| Command Syntax .....          | 1846 |
| Parameters .....              | 1846 |
| Command Mode .....            | 1846 |
| Applicability .....           | 1846 |
| Examples .....                | 1846 |
| debug ipv6 ospf .....         | 1847 |
| Command Syntax .....          | 1847 |
| Parameters .....              | 1847 |
| Command Mode .....            | 1847 |
| Applicability .....           | 1847 |
| Examples .....                | 1847 |
| debug ipv6 ospf bfd .....     | 1848 |
| Command Syntax .....          | 1848 |
| Parameters .....              | 1848 |
| Command Mode .....            | 1848 |
| Applicability .....           | 1848 |
| Examples .....                | 1848 |
| debug ipv6 ospf events .....  | 1849 |
| Command Syntax .....          | 1849 |
| Parameters .....              | 1849 |
| Command Mode .....            | 1849 |
| Applicability .....           | 1849 |
| Examples .....                | 1849 |
| debug ipv6 ospf ifsm .....    | 1850 |
| Command Syntax .....          | 1850 |
| Parameters .....              | 1850 |
| Command Mode .....            | 1850 |
| Applicability .....           | 1850 |
| Examples .....                | 1850 |
| debug ipv6 ospf lfa .....     | 1851 |
| Command Syntax .....          | 1851 |
| Parameters .....              | 1851 |
| Command Mode .....            | 1851 |
| Applicability .....           | 1851 |

|                                      |      |
|--------------------------------------|------|
| Examples .....                       | 1851 |
| debug ipv6 ospf lsa .....            | 1852 |
| Command Syntax .....                 | 1852 |
| Parameters .....                     | 1852 |
| Command Mode .....                   | 1852 |
| Applicability .....                  | 1852 |
| Examples .....                       | 1852 |
| debug ipv6 ospf n fsm .....          | 1853 |
| Command Syntax .....                 | 1853 |
| Parameters .....                     | 1853 |
| Command Mode .....                   | 1853 |
| Applicability .....                  | 1853 |
| Examples .....                       | 1853 |
| debug ipv6 ospf nsm .....            | 1854 |
| Command Syntax .....                 | 1854 |
| Parameters .....                     | 1854 |
| Command Mode .....                   | 1854 |
| Applicability .....                  | 1854 |
| Examples .....                       | 1854 |
| debug ipv6 ospf packet .....         | 1855 |
| Command Syntax .....                 | 1855 |
| Parameters .....                     | 1855 |
| Command Mode .....                   | 1855 |
| Applicability .....                  | 1855 |
| Examples .....                       | 1855 |
| debug ipv6 ospf retransmission ..... | 1856 |
| Command Syntax .....                 | 1856 |
| Parameters .....                     | 1856 |
| Command Mode .....                   | 1856 |
| Applicability .....                  | 1856 |
| Examples .....                       | 1856 |
| debug ipv6 ospf rib .....            | 1857 |
| Command Syntax .....                 | 1857 |
| Parameters .....                     | 1857 |
| Command Mode .....                   | 1857 |
| Applicability .....                  | 1857 |
| Examples .....                       | 1857 |
| debug ipv6 ospf route .....          | 1858 |
| Command Syntax .....                 | 1858 |
| Parameters .....                     | 1858 |
| Command Mode .....                   | 1858 |
| Applicability .....                  | 1858 |
| Examples .....                       | 1858 |
| default-information originate .....  | 1859 |
| Command Syntax .....                 | 1859 |
| Parameters .....                     | 1859 |
| Default .....                        | 1859 |

|                                   |      |
|-----------------------------------|------|
| Command Mode .....                | 1859 |
| Applicability .....               | 1860 |
| Examples .....                    | 1860 |
| default-metric .....              | 1861 |
| Command Syntax .....              | 1861 |
| Parameter .....                   | 1861 |
| Default .....                     | 1861 |
| Command Mode .....                | 1861 |
| Applicability .....               | 1861 |
| Examples .....                    | 1861 |
| distance .....                    | 1862 |
| Command Syntax .....              | 1862 |
| Parameters .....                  | 1862 |
| Command Mode .....                | 1862 |
| Defaults .....                    | 1862 |
| Applicability .....               | 1862 |
| Examples .....                    | 1862 |
| fast-reroute keep-all-paths ..... | 1863 |
| Command Syntax .....              | 1863 |
| Parameters .....                  | 1863 |
| Default .....                     | 1863 |
| Command Mode .....                | 1863 |
| Applicability .....               | 1863 |
| Examples .....                    | 1863 |
| fast-reroute tie-break .....      | 1864 |
| Command Syntax .....              | 1864 |
| Parameters .....                  | 1864 |
| Default .....                     | 1865 |
| Command Mode .....                | 1865 |
| Applicability .....               | 1865 |
| Examples .....                    | 1865 |
| distribute-list .....             | 1866 |
| Command Syntax .....              | 1866 |
| Parameters .....                  | 1866 |
| Default .....                     | 1866 |
| Command Mode .....                | 1866 |
| Applicability .....               | 1867 |
| Examples .....                    | 1867 |
| enable db-summary-opt .....       | 1868 |
| Command Syntax .....              | 1868 |
| Parameters .....                  | 1868 |
| Default .....                     | 1868 |
| Command Mode .....                | 1868 |
| Applicability .....               | 1868 |
| Examples .....                    | 1868 |
| ipv6 ospf authentication .....    | 1869 |
| Command Syntax .....              | 1869 |

|                                           |      |
|-------------------------------------------|------|
| Parameters .....                          | 1869 |
| Default .....                             | 1869 |
| Command Mode .....                        | 1869 |
| Applicability .....                       | 1869 |
| Example .....                             | 1869 |
| ipv6 ospf bfd .....                       | 1870 |
| Command Syntax .....                      | 1870 |
| Parameters .....                          | 1870 |
| Default .....                             | 1870 |
| Command Mode .....                        | 1870 |
| Applicability .....                       | 1870 |
| Example .....                             | 1870 |
| ipv6 ospf cost .....                      | 1871 |
| Command Syntax .....                      | 1871 |
| Parameters .....                          | 1871 |
| Default .....                             | 1871 |
| Command Mode .....                        | 1871 |
| Applicability .....                       | 1871 |
| Examples .....                            | 1871 |
| ipv6 ospf dead-interval .....             | 1872 |
| Command Syntax .....                      | 1872 |
| Parameters .....                          | 1872 |
| Default .....                             | 1872 |
| Command Mode .....                        | 1872 |
| Applicability .....                       | 1872 |
| Examples .....                            | 1872 |
| ipv6 ospf display route single-line ..... | 1873 |
| Command Syntax .....                      | 1873 |
| Parameters .....                          | 1873 |
| Default .....                             | 1873 |
| Command Mode .....                        | 1873 |
| Applicability .....                       | 1873 |
| Examples .....                            | 1873 |
| ipv6 ospf link-lsa-suppression .....      | 1874 |
| Command Syntax .....                      | 1874 |
| Parameters .....                          | 1874 |
| Default .....                             | 1874 |
| Command Mode .....                        | 1874 |
| Applicability .....                       | 1874 |
| Examples .....                            | 1874 |
| ipv6 ospf mtu-ignore .....                | 1875 |
| Command syntax .....                      | 1875 |
| Parameters .....                          | 1875 |
| Default .....                             | 1875 |
| Command Mode .....                        | 1875 |
| Applicability .....                       | 1875 |
| Examples .....                            | 1875 |

|                                     |      |
|-------------------------------------|------|
| ipv6 ospf neighbor .....            | 1876 |
| Command Syntax .....                | 1876 |
| Parameters .....                    | 1876 |
| Default .....                       | 1876 |
| Command Mode .....                  | 1877 |
| Applicability .....                 | 1877 |
| Examples .....                      | 1877 |
| ipv6 ospf network .....             | 1878 |
| Command Syntax .....                | 1878 |
| Parameters .....                    | 1878 |
| Default .....                       | 1878 |
| Command Mode .....                  | 1878 |
| Applicability .....                 | 1878 |
| Examples .....                      | 1878 |
| ipv6 ospf priority .....            | 1879 |
| Command Syntax .....                | 1879 |
| Parameters .....                    | 1879 |
| Default .....                       | 1879 |
| Applicability .....                 | 1879 |
| Examples .....                      | 1879 |
| ipv6 ospf retransmit-interval ..... | 1880 |
| Command Syntax .....                | 1880 |
| Parameters .....                    | 1880 |
| Default .....                       | 1880 |
| Command Mode .....                  | 1880 |
| Applicability .....                 | 1880 |
| Examples .....                      | 1880 |
| ipv6 ospf transmit-delay .....      | 1881 |
| Command Syntax .....                | 1881 |
| Parameters .....                    | 1881 |
| Default .....                       | 1881 |
| Command Mode .....                  | 1881 |
| Applicability .....                 | 1881 |
| Examples .....                      | 1881 |
| ipv6 router ospf .....              | 1882 |
| Command Syntax .....                | 1882 |
| Parameters .....                    | 1882 |
| Default .....                       | 1882 |
| Command Mode .....                  | 1882 |
| Applicability .....                 | 1883 |
| Examples .....                      | 1883 |
| ipv6 te-metric .....                | 1884 |
| Command Syntax .....                | 1884 |
| Parameters .....                    | 1884 |
| Default .....                       | 1884 |
| Command Mode .....                  | 1884 |
| Applicability .....                 | 1884 |

|                                |      |
|--------------------------------|------|
| Examples .....                 | 1884 |
| log-adjacency-changes .....    | 1885 |

| Applicability .....                   | 1970 |
| Example .....                         | 1970 |
| ip rip authentication key-chain ..... | 1971 |
| Command Syntax .....                  | 1971 |
| Parameters .....                      | 1971 |
| Default .....                         | 1971 |
| Command Mode .....                    | 1971 |
| Applicability .....                   | 1971 |
| Examples .....                        | 1971 |
| ip rip authentication mode .....      | 1972 |
| Command Syntax .....                  | 1972 |
| Parameters .....                      | 1972 |
| Default .....                         | 1972 |
| Command Mode .....                    | 1972 |
| Applicability .....                   | 1972 |
| Examples .....                        | 1972 |
| ip rip authentication string .....    | 1973 |
| Command Syntax .....                  | 1973 |
| Parameters .....                      | 1973 |
| Default .....                         | 1973 |
| Command Mode .....                    | 1973 |
| Applicability .....                   | 1973 |
| Examples .....                        | 1973 |
| ip rip receive-packet .....           | 1974 |
| Command Syntax .....                  | 1974 |
| Parameters .....                      | 1974 |

|                              |      |
|------------------------------|------|
| Default .....                | 1974 |
| Command Mode .....           | 1974 |
| Applicability .....          | 1974 |
| Example .....                | 1974 |
| ip rip receive version ..... | 1975 |
| Command Syntax .....         | 1975 |
| Parameters .....             | 1975 |
| Default .....                | 1975 |
| Command Mode .....           | 1975 |
| Applicability .....          | 1975 |
| Examples .....               | 1975 |
| ip rip send-packet .....     | 1976 |
| Command Syntax .....         | 1976 |
| Parameters .....             | 1976 |
| Default .....                | 1976 |
| Command Mode .....           | 1976 |
| Applicability .....          | 1976 |
| Example .....                | 1976 |
| ip rip send version .....    | 1977 |
| Command Syntax .....         | 1977 |
| Parameters .....             | 1977 |
| Default .....                | 1977 |
| Command Mode .....           | 1977 |
| Applicability .....          | 1977 |
| Examples .....               | 1977 |
| ip rip split-horizon .....   | 1978 |
| Command Syntax .....         | 1978 |
| Parameter .....              | 1978 |
| Default .....                | 1978 |
| Command Mode .....           | 1978 |
| Applicability .....          | 1978 |
| Examples .....               | 1978 |
| key chain .....              | 1979 |
| Command Syntax .....         | 1979 |
| Parameters .....             | 1979 |
| Default .....                | 1979 |
| Command Mode .....           | 1979 |
| Applicability .....          | 1979 |
| Examples .....               | 1979 |
| key-id .....                 | 1980 |
| Command Syntax .....         | 1980 |
| Parameters .....             | 1980 |
| Default .....                | 1980 |
| Command Mode .....           | 1980 |
| Applicability .....          | 1980 |
| Examples .....               | 1980 |
| key-string .....             | 1981 |

|                            |      |
|----------------------------|------|
| Command Syntax .....       | 1981 |
| Parameters .....           | 1981 |
| Default .....              | 1981 |
| Command Mode .....         | 1981 |
| Applicability .....        | 1981 |
| Examples .....             | 1981 |
| key-string encrypted ..... | 1982 |
| Command Syntax .....       | 1982 |
| Parameters .....           | 1982 |
| Default .....              | 1982 |
| Command Mode .....         | 1982 |
| Applicability .....        | 1982 |
| Example .....              | 1982 |
| maximum-prefix .....       | 1983 |
| Command Syntax .....       | 1983 |
| Parameters .....           | 1983 |
| Default .....              | 1983 |
| Command Mode .....         | 1983 |
| Applicability .....        | 1983 |
| Examples .....             | 1983 |
| neighbor .....             | 1984 |
| Command Syntax .....       | 1984 |
| Parameter .....            | 1984 |
| Default .....              | 1984 |
| Command Mode .....         | 1984 |
| Applicability .....        | 1984 |
| Examples .....             | 1984 |
| network .....              | 1985 |
| Command Syntax .....       | 1985 |
| Parameters .....           | 1985 |
| Default .....              | 1985 |
| Command Mode .....         | 1985 |
| Applicability .....        | 1985 |
| Examples .....             | 1985 |
| offset-list .....          | 1986 |
| Command Syntax .....       | 1986 |
| Parameters .....           | 1986 |
| Default .....              | 1986 |
| Command Mode .....         | 1986 |
| Applicability .....        | 1986 |
| Examples .....             | 1986 |
| passive-interface .....    | 1987 |
| Command Syntax .....       | 1987 |
| Parameters .....           | 1987 |
| Default .....              | 1987 |
| Command Mode .....         | 1987 |
| Applicability .....        | 1987 |

|                             |      |
|-----------------------------|------|
| Examples .....              | 1987 |
| recv-buffer-size .....      | 1988 |
| Command Syntax .....        | 1988 |
| Parameters .....            | 1988 |
| Default .....               | 1988 |
| Command Mode .....          | 1988 |
| Applicability .....         | 1988 |
| Examples .....              | 1988 |
| redistribute .....          | 1989 |
| Command Syntax .....        | 1989 |
| Parameters .....            | 1989 |
| Default .....               | 1989 |
| Command Mode .....          | 1989 |
| Examples .....              | 1990 |
| route .....                 | 1991 |
| Command Syntax .....        | 1991 |
| Parameter .....             | 1991 |
| Default .....               | 1991 |
| Command Mode .....          | 1991 |
| Applicability .....         | 1991 |
| Examples .....              | 1991 |
| router rip .....            | 1992 |
| Command Syntax .....        | 1992 |
| Parameter .....             | 1992 |
| Default .....               | 1992 |
| Command Mode .....          | 1992 |
| Applicability .....         | 1992 |
| Examples .....              | 1992 |
| send-lifetime .....         | 1993 |
| Command Syntax .....        | 1993 |
| Parameters .....            | 1993 |
| Default .....               | 1993 |
| Command Mode .....          | 1993 |
| Applicability .....         | 1994 |
| Examples .....              | 1994 |
| show debugging rip .....    | 1995 |
| Command Syntax .....        | 1995 |
| Parameters .....            | 1995 |
| Default .....               | 1995 |
| Command Mode .....          | 1995 |
| Applicability .....         | 1995 |
| Example .....               | 1995 |
| show ip protocols rip ..... | 1996 |
| Command Syntax .....        | 1996 |
| Parameters .....            | 1996 |
| Default .....               | 1996 |
| Command Mode .....          | 1996 |

|                              |      |
|------------------------------|------|
| Applicability .....          | 1996 |
| Example .....                | 1996 |
| show ip rip .....            | 1998 |
| Command Syntax .....         | 1998 |
| Parameters .....             | 1998 |
| Default .....                | 1998 |
| Command Mode .....           | 1998 |
| Applicability .....          | 1998 |
| Example .....                | 1998 |
| show ip rip interface .....  | 2000 |
| Command Syntax .....         | 2000 |
| Parameters .....             | 2000 |
| Default .....                | 2000 |
| Command Mode .....           | 2000 |
| Applicability .....          | 2000 |
| Example .....                | 2000 |
| show ip rip statistics ..... | 2002 |
| Command Syntax .....         | 2002 |
| Parameters .....             | 2002 |
| Default .....                | 2002 |
| Command Mode .....           | 2002 |
| Applicability .....          | 2002 |
| Example .....                | 2002 |
| snmp restart rip .....       | 2004 |
| Command Syntax .....         | 2004 |
| Parameters .....             | 2004 |
| Default .....                | 2004 |
| Command Mode .....           | 2004 |
| Applicability .....          | 2004 |
| Examples .....               | 2004 |
| timers basic .....           | 2005 |
| Command Syntax .....         | 2005 |
| Parameters .....             | 2005 |
| Default .....                | 2005 |
| Command Mode .....           | 2005 |
| Applicability .....          | 2005 |
| Examples .....               | 2005 |
| version .....                | 2006 |
| Command Syntax .....         | 2006 |
| Parameters .....             | 2006 |
| Default .....                | 2006 |
| Command Mode .....           | 2006 |
| Applicability .....          | 2006 |
| Examples .....               | 2006 |
| RIPng Commands .....         | 2007 |
| aggregate-address .....      | 2008 |
| Command Syntax .....         | 2008 |

|                                     |      |
|-------------------------------------|------|
| Parameter .....                     | 2008 |
| Command Mode .....                  | 2008 |
| Applicability .....                 | 2008 |
| Examples .....                      | 2008 |
| cisco-metric-behavior .....         | 2009 |
| Command Syntax .....                | 2009 |
| Parameters .....                    | 2009 |
| Default .....                       | 2009 |
| Command Mode .....                  | 2009 |
| Applicability .....                 | 2009 |
| Example .....                       | 2009 |
| clear ipv6 rip route .....          | 2010 |
| Command Syntax .....                | 2010 |
| Parameters .....                    | 2010 |
| Command Mode .....                  | 2010 |
| Applicability .....                 | 2010 |
| Example .....                       | 2010 |
| debug ipv6 rip .....                | 2011 |
| Command Syntax .....                | 2011 |
| Parameters .....                    | 2011 |
| Default .....                       | 2011 |
| Command Mode .....                  | 2011 |
| Applicability .....                 | 2011 |
| Examples .....                      | 2011 |
| default-information originate ..... | 2012 |
| Command Syntax .....                | 2012 |
| Parameters .....                    | 2012 |
| Default .....                       | 2012 |
| Command Mode .....                  | 2012 |
| Applicability .....                 | 2012 |
| Examples .....                      | 2012 |
| default-metric .....                | 2013 |
| Command Syntax .....                | 2013 |
| Parameter .....                     | 2013 |
| Default .....                       | 2013 |
| Command Mode .....                  | 2013 |
| Applicability .....                 | 2013 |
| Examples .....                      | 2013 |
| distance .....                      | 2014 |
| Command Syntax .....                | 2014 |
| Parameter .....                     | 2014 |
| Default .....                       | 2014 |
| Command Mode .....                  | 2014 |
| Applicability .....                 | 2014 |
| Example .....                       | 2014 |
| distribute-list .....               | 2015 |
| Command Syntax .....                | 2015 |

|                              |      |

| Command Mode .....           | 2015 |
| Applicability .....          | 2015 |
| Example .....                | 2015 |
| ipv6 rip metric-offset ..... | 2016 |
| Command Syntax .....         | 2016 |
| Parameter .....              | 2016 |
| Default .....                | 2016 |
| Command Mode .....           | 2016 |
| Applicability .....          | 2016 |
| Examples .....               | 2016 |
| ipv6 rip split-horizon ..... | 2017 |
| Command Syntax .....         | 2017 |
| Parameter .....              | 2017 |
| Default .....                | 2017 |
| Command Mode .....           | 2017 |
| Applicability .....          | 2017 |
| Examples .....               | 2017 |
| ipv6 router rip .....        | 2018 |
| Command Syntax .....         | 2018 |
| Parameters .....             | 2018 |
| Default .....                | 2018 |
| Command Mode .....           | 2018 |
| Applicability .....          | 2018 |
| Example .....                | 2018 |
| neighbor .....               | 2019 |
| Command Syntax .....         | 2019 |
| Parameters .....             | 2019 |
| Default .....                | 2019 |
| Command Mode .....           | 2019 |
| Applicability .....          | 2019 |
| Example .....                | 2019 |
| offset-list .....            | 2020 |
| Command Syntax .....         | 2020 |
| Parameters .....             | 2020 |
| Default .....                | 2020 |
| Command Mode .....           | 2020 |
| Applicability .....          | 2020 |
| Examples .....               | 2020 |
| passive-interface .....      | 2021 |
| Command Syntax .....         | 2021 |
| Parameters .....             | 2021 |
| Default .....                | 2021 |
| Command Mode .....           | 2021 |
| Applicability .....          | 2021 |
| Examples .....               | 2021 |

|                               |      |
|-------------------------------|------|
| recv-buffer-size .....        | 2022 |
| Command Syntax .....          | 2022 |
| Parameters .....              | 2022 |
| Default .....                 | 2022 |
| Command Mode .....            | 2022 |
| Applicability .....           | 2022 |
| Examples .....                | 2022 |
| redistribute .....            | 2023 |
| Command Syntax .....          | 2023 |
| Parameters .....              | 2023 |
| Command Mode .....            | 2023 |
| Applicability .....           | 2023 |
| Examples .....                | 2023 |
| route .....                   | 2025 |
| Command Syntax .....          | 2025 |
| Parameter .....               | 2025 |
| Command Mode .....            | 2025 |
| Applicability .....           | 2025 |
| Examples .....                | 2025 |
| route-map .....               | 2026 |
| Command Syntax .....          | 2026 |
| Parameters .....              | 2026 |
| Command Mode .....            | 2026 |
| Applicability .....           | 2026 |
| Examples .....                | 2026 |
| router ipv6 rip .....         | 2027 |
| Command Syntax .....          | 2027 |
| Parameters .....              | 2027 |
| Command Mode .....            | 2027 |
| Applicability .....           | 2027 |
| Examples .....                | 2027 |
| show debugging ipv6 rip ..... | 2028 |
| Command Syntax .....          | 2028 |
| Parameters .....              | 2028 |
| Command Mode .....            | 2028 |
| Applicability .....           | 2028 |
| Example .....                 | 2028 |
| show ipv6 protocols rip ..... | 2029 |
| Command Syntax .....          | 2029 |
| Parameters .....              | 2029 |
| Command Mode .....            | 2029 |
| Applicability .....           | 2029 |
| Example .....                 | 2029 |
| show ipv6 rip .....           | 2030 |
| Command Syntax .....          | 2030 |
| Parameters .....              | 2030 |
| Command Mode .....            | 2030 |

|                                                   |             |
|---------------------------------------------------|-------------|
| Applicability .....                               | 2030        |
| Example .....                                     | 2030        |
| show ipv6 rip interface .....                     | 2031        |
| Command Syntax .....                              | 2031        |
| Parameters .....                                  | 2031        |
| Command Mode .....                                | 2031        |
| Applicability .....                               | 2031        |
| Example .....                                     | 2031        |
| timers basic .....                                | 2032        |
| Command Syntax .....                              | 2032        |
| Parameters .....                                  | 2032        |
| Command Mode .....                                | 2032        |
| Applicability .....                               | 2032        |
| Examples .....                                    | 2032        |
| Routing Information Protocol VPN Commands .....   | 2033        |
| show ip rip interface vrf .....                   | 2034        |
| Command Syntax .....                              | 2034        |
| Parameters .....                                  | 2034        |
| Default .....                                     | 2034        |
| Command Mode .....                                | 2034        |
| Applicability .....                               | 2034        |
| Example .....                                     | 2034        |
| show ip rip vrf .....                             | 2036        |
| Command Syntax .....                              | 2036        |
| Parameters .....                                  | 2036        |
| Default .....                                     | 2036        |
| Command Mode .....                                | 2036        |
| Applicability .....                               | 2036        |
| Examples .....                                    | 2036        |
| show ip vrf .....                                 | 2038        |
| Command Syntax .....                              | 2038        |
| Parameter .....                                   | 2038        |
| Command Mode .....                                | 2038        |
| Applicability .....                               | 2038        |
| Example .....                                     | 2038        |
| Routing Information Protocol Authentication ..... | 2039        |
| Single Key Authentication .....                   | 2039        |
| Example .....                                     | 2039        |
| Multiple Keys Authentication .....                | 2039        |

# PREFACE

## About this Guide

This guide describes how to configure Layer 3 in OcNOS.

## Audience

This guide is intended for network administrators and other engineering professionals who configure OcNOS.

## Conventions

The [Table 1](#) table shows the conventions used in this guide.

**Table 1. Conventions**

| Convention                                                                                      | Description                                                        |
|-------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| Italics                                                                                         | Emphasized terms; titles of books                                  |
|  <b>Note:</b> | Special instructions, suggestions, or warnings                     |
| <code>monospaced type</code>                                                                    | Code elements such as commands, parameters, files, and directories |

## IP Infusion Product Release Version

Each integer in release numbers indicates Major, Minor, and Maintenance release versions. Build numbers that follow the release numbers are for internal tracking and verification of the software build process and are visible to customers as part of the software version number.

**Product Name:** IP Infusion Product Family

**Major Version:** New customer-facing functionality that represents a significant change to the code base; including a significant marketing change or direction in the product.

**Minor Version:** Enhancements or extensions to existing features, changes to address external needs, or internal improvements to satisfy new sales regions or marketing initiatives.

**Maintenance Version:** A collection of product bugs or issues usually scheduled every 30 or 60 days, based on the number of issues.

---

## Related Documentation

For information about installing OcNOS, see the *Installation Guide* for your platform.

---

## Feature Availability

Each OcNOS SKU contains a set of supported features. For a list of available features based on the SKU that you purchased, refer to the [Feature Matrix](#).

---

## Migration Guide

Check the *Migration Guide* for necessary configuration changes before migrating from one version of OcNOS to another.

---

## IP Maestro Support

Monitor devices running OcNOS Release 6.3.4-70 and above using IP Maestro software.

---

## Technical Support

IP Infusion maintains an online technical support site that provides a variety of technical support programs for licensed OcNOS customers at the [Technical Assistance Center](#).

Customers and partners enjoy full access to the support website. The site allows customers and partners to open technical support calls, update open calls with new information, and review the status of open or closed calls. The password-protected site includes technical documentation, Release Notes, and descriptions of service offerings.

---

## Technical Sales

Contact the IP Infusion sales representative for more information about the OcNOS solution.

---

## Technical Documentation

For core commands and configuration procedures, visit: [Product Documentation](#).

For training videos, visit: [OcNOS Free Training Videos](#).

For a list of supported platforms and SKUs of OcNOS features, refer to the [OcNOS Feature Matrix](#).

## Documentation Disclaimer

The global documentation site is evolving to provide an enhanced website user experience for select topics included in this release. Some guides are now available outside the existing documentation library and can be accessed directly from custom documentation landing pages. These guides offer robust in-built search functionality.

For the latest documentation, visit the product-specific documentation landing page and select the relevant guide.

## Comments

If you have comments, or need to report a problem with the content, contact [techpubs@ipinfusion.com](mailto:techpubs@ipinfusion.com).

# Command Line Interface

This chapter introduces the OcNOS Command Line Interface (CLI) and how to use its features.

---

## Overview

You use the CLI to configure, monitor, and maintain OcNOS devices. The CLI is text-based and each command is usually associated with a specific task.

You can give the commands described in this manual locally from the console of a device running OcNOS or remotely from a terminal emulator such as putty or xterm. You can also use the commands in scripts to automate configuration tasks.

---

## Chapter Organization

The chapters in command references are organized as described in [Command Description Format \(page 145\)](#).

The chapters in configuration guides are organized into these major sections:

- An overview that explains a configuration in words
- Topology with a diagram that shows the devices and connections used in the configuration
- Configuration steps in a table for each device where the left-hand side shows the commands you enter and the right-hand side explains the actions that the commands perform
- Validation which shows commands and their output that verify the configuration

## Command Line Interface Help

You access the CLI help by entering a full or partial command string and a question mark “?”. The CLI displays the command keywords or parameters along with a short description. For example, at the CLI command prompt, type:

```
> show ?
```

The CLI displays this keyword list with short descriptions for each keyword:

```
show ?
  application-priority      Application Priority
  arp                      Internet Protocol (IP)
  bfd                      Bidirectional Forwarding Detection (BFD)
  bgp                      Border Gateway Protocol (BGP)
  bi-lsp                   Bi-directional lsp status and configuration
  bridge                   Bridge group commands
  ce-vlan                  COS Preservation for Customer Edge VLAN
  class-map                Class map entry
  cli                     Show CLI tree of current mode
  clns                    Connectionless-Mode Network Service (CLNS)
  control-adjacency        Control Adjacency status and configuration
  control-channel          Control Channel status and configuration
  cspf                    CSPF Information
  customer                Display Customer spanning-tree
  cvlan                   Display CVLAN information
  debugging                Debugging functions
  etherchannel             LACP etherchannel
  ethernet                Layer-2
  ...
```

If you type the ? in the middle of a keyword, the CLI displays help for that keyword only.

```
> show de?
debugging  Debugging functions
```

If you type the ? in the middle of a keyword, but the incomplete keyword matches several other keywords, OcNOS displays help for all matching keywords.

```
> show i? (CLI does not display the question mark).
interface  Interface status and configuration
ip         IP information
isis       ISIS information
```

---

## Command Completion

The CLI can complete the spelling of a command or a parameter. Begin typing the command or parameter and then press the tab key. For example, at the CLI command prompt type **sh**:

```
> sh
```

Press the tab key. The CLI displays:

```
> show
```

If the spelling of a command or parameter is ambiguous, the CLI displays the choices that match the abbreviation. Type **show i** and press the tab key. The CLI displays:

```
> show i
  interface  ip          ipv6          isis
> show i
```

The CLI displays the **interface** and **ip** keywords. Type **n** to select **interface** and press the tab key. The CLI displays:

```
> show in
> show interface
```

Type **?** and the CLI displays the list of parameters for the **show interface** command.

```
> show interface
  IFNAME  Interface name
  |       Output modifiers
  >       Output redirection
  <cr>
```

The CLI displays the only parameter associated with this command, the **IFNAME** parameter.

## Command Abbreviations

The CLI accepts abbreviations that uniquely identify a keyword in commands. For example:

```
> sh int xe0
```

is an abbreviation for:

```
> show interface xe0
```

---

## Command Line Errors

Any unknown spelling causes the CLI to display the error **Unrecognized command** in response to the ?. The CLI displays the command again as last entered.

```
> show dd?
% Unrecognized command
> show dd
```

When you press the Enter key after typing an invalid command, the CLI displays:

```
(config)#router ospf here
                        ^
% Invalid input detected at '^' marker.
```

where the ^ points to the first character in error in the command.

If a command is incomplete, the CLI displays the following message:

```
> show
% Incomplete command.
```

Some commands are too long for the display line and can wrap mid-parameter or mid-keyword, as shown below. This does *not* cause an error and the command performs as expected:

```
area 10.10.0.18 virtual-link 10.10.0.19 authentication-key 57393
```

## Command Negation

Many commands have a **no** form that resets a feature to its default value or disables the feature. For example:

- The **ip address** command assigns an IPv4 address to an interface
- The **no ip address** command removes an IPv4 address from an interface

## Syntax Conventions

[Table 2](#) describes the conventions used to represent command syntax in this reference.

**Table 2. Syntax conventions**

| Convention             | Description                                                                                                                                                          | Example                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>monospaced font</b> | Command strings entered on a command line                                                                                                                            | <b>show ip ospf</b>                                        |
| <b>lowercase</b>       | Keywords that you enter exactly as shown in the command syntax.                                                                                                      | show ip ospf                                               |
| UPPERCASE              | See <a href="#">Variable Placeholders (page 144)</a>                                                                                                                 | IFNAME                                                     |
| ( )                    | Optional parameters, from which you must select one. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.     | (A.B.C.D <0-4294967295>)                                   |
| [ ]                    | Optional parameters, from which you select one or none. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.  | (A.B.C.D <0-4294967295> )                                  |
| { }                    | Optional parameter which you can specify or omit. Do not enter the parentheses or vertical bar as part of the command.                                               | (IFNAME )                                                  |
| { }                    | Optional parameters, from which you must select one or more. Vertical bars delimit the selections. Do not enter the braces or vertical bars as part of the command.  | {intra-area <1-255> inter-area <1-255> external <1-255>}   |
| [ ]                    | Optional parameters, from which you select zero or more. Vertical bars delimit the selections. Do not enter the brackets or vertical bars as part of the command.    | [<1-65535> AA:NN internet local-AS no-advertise no-export] |
| ?                      | Nonrepeatable parameter. The parameter that follows a question mark can only appear once in a command string. Do not enter the question mark as part of the command. | ?route-map WORD                                            |
| .                      | Repeatable parameter. The parameter that follows a period can be repeated more than once. Do not enter the period as part of the command.                            | set as-path prepend .<1-65535>                             |

## Variable Placeholders

[Table 3](#) shows the tokens used in command syntax use to represent variables for which you supply a value.

**Table 3. Variable placeholders**

| Token                                                  | Description                                                                                                                                |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| WORD                                                   | A contiguous text string (excluding spaces)                                                                                                |
| LINE                                                   | A text string, including spaces; no other parameters can follow this parameter                                                             |
| IFNAME                                                 | Interface name whose format varies depending on the platform; examples are: <b>eth0</b> , <b>Ethernet0</b> , <b>ethernet0</b> , <b>xe0</b> |
| A.B.C.D                                                | IPv4 address                                                                                                                               |
| A.B.C.D/M                                              | IPv4 address and mask/prefix                                                                                                               |
| X:X::X:X                                               | IPv6 address                                                                                                                               |
| X:X::X:X/M                                             | IPv6 address and mask/prefix                                                                                                               |
| HH:MM:SS                                               | Time format                                                                                                                                |
| AA:NN                                                  | BGP community value                                                                                                                        |
| XX:XX:XX:XX:XX:XX                                      | MAC address                                                                                                                                |
| <1-5><br><1-65535><br><0-2147483647><br><0-4294967295> | Numeric range                                                                                                                              |

---

## Command Description Format

The [Table 4](#) table explains the sections used to describe each command in this reference.

**Table 4. Command descriptions**

| Section        | Description                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------|
| Command Name   | The name of the command, followed by what the command does and when should it be used                |
| Command Syntax | The syntax of the command                                                                            |
| Parameters     | Parameters and options for the command                                                               |
| Default        | The state before the command is executed                                                             |
| Command Mode   | The mode in which the command runs; see <a href="#">Command Modes (page 151)</a>                     |
| Applicability  | The command introduced in a specific release version and modified or updated in subsequent versions. |
| Example        | An example of the command being executed                                                             |

## Keyboard Operations

The [Table 5](#) table lists the operations you can perform from the keyboard.

**Table 5. Keyboard operations**

| Key combination       | Operation                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Left arrow or Ctrl+b  | Moves one character to the left. When a command extends beyond a single line, you can press left arrow or Ctrl+b repeatedly to scroll toward the beginning of the line, or you can press Ctrl+a to go directly to the beginning of the line. |
| Right arrow or Ctrl-f | Moves one character to the right. When a command extends beyond a single line, you can press right arrow or Ctrl+f repeatedly to scroll toward the end of the line, or you can press Ctrl+e to go directly to the end of the line.           |
| Esc, b                | Moves back one word                                                                                                                                                                                                                          |
| Esc, f                | Moves forward one word                                                                                                                                                                                                                       |
| Ctrl+e                | Moves to end of the line                                                                                                                                                                                                                     |
| Ctrl+a                | Moves to the beginning of the line                                                                                                                                                                                                           |
| Ctrl+u                | Deletes the line                                                                                                                                                                                                                             |
| Ctrl+w                | Deletes from the cursor to the previous whitespace                                                                                                                                                                                           |
| Alt+d                 | Deletes the current word                                                                                                                                                                                                                     |
| Ctrl+k                | Deletes from the cursor to the end of line                                                                                                                                                                                                   |
| Ctrl+y                | Pastes text previously deleted with Ctrl+k, Alt+d, Ctrl+w, or Ctrl+u at the cursor                                                                                                                                                           |
| Ctrl+t                | Transposes the current character with the previous character                                                                                                                                                                                 |
| Ctrl+c                | Ignores the current line and redisplay the command prompt                                                                                                                                                                                    |
| Ctrl+z                | Ends configuration mode and returns to exec mode                                                                                                                                                                                             |
| Ctrl+l                | Clears the screen                                                                                                                                                                                                                            |
| Up Arrow or Ctrl+p    | Scroll backward through command history                                                                                                                                                                                                      |
| Down Arrow or Ctrl+n  | Scroll forward through command history                                                                                                                                                                                                       |

## Show Command Modifiers

**Note:** The show command output included in the guides is for illustration purposes only. Based on the combination of features enabled and ongoing enhancements made to the commands, the output for these commands may vary. For instance, the actual command output may differ depending on the software version, configuration, and platform. Field names, values, and formats are subject to change.

You can use two tokens to modify the output of a **show** command. Enter a question mark to display these tokens:

```
# show users ?
| Output modifiers
> Output redirection
```

You can type the | (vertical bar character) to use output modifiers. For example:

```
> show rsvp | ?
begin      Begin with the line that matches
exclude    Exclude lines that match
include    Include lines that match
last       Last few lines
redirect   Redirect output
```

### Begin Modifier

The **begin** modifier displays the output beginning with the first line that contains the input string (everything typed after the **begin** keyword). For example:

```
# show running-config | begin xe1
...skipping
interface xe1
ipv6 address fe80::204:75ff:fee6:5393/64
!
interface xe2
ipv6 address fe80::20d:56ff:fe96:725a/64
!
line con 0
login
!
end
```

You can specify a regular expression after the **begin** keyword. This example begins the output at a line with either “xe2” or “xe4”:

```
# show running-config | begin xe[2-4]

...skipping
interface xe2
 shutdown
!
interface xe4
 shutdown
!
interface svlan0.1
 no shutdown
!
route-map myroute permit 2
!
route-map mymap1 permit 10
!
```

```
route-map rmap1 permit 2
!
line con 0
  login
line vty 0 4
  login
!
end
```

## Include Modifier

The **include** modifier includes only those lines of output that contain the input string. In the output below, all lines containing the word “input” are included:

```
# show interface xe1 | include input
input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

You can specify a regular expression after the **include** keyword. This examples includes all lines with “input” or “output”:

```
#show interface xe0 | include (in|out)put
input packets 597058, bytes 338081476, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
output packets 613147, bytes 126055987, dropped 0
output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

## Exclude Modifier

The **exclude** modifier excludes all lines of output that contain the input string. In the following output example, all lines containing the word “input” are excluded:

```
# show interface xe1 | exclude input
Interface xe1
  Scope: both
  Hardware is Ethernet, address is 0004.75e6.5393
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet6 fe80::204:75ff:fee6:5393/64
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
```

You can specify a regular expression after the **exclude** keyword. This example excludes lines with “output” or “input”:

```
show interface xe0 | exclude (in|out)put
Interface xe0
  Scope: both
  Hardware is Ethernet Current HW addr: 001b.2139.6c4a
  Physical:001b.2139.6c4a Logical:(not set)
  index 2 metric 1 mtu 1500 duplex-full arp ageing timeout 3000
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Bandwidth 100m
  DHCP client is disabled.
  inet 10.1.2.173/24 broadcast 10.1.2.255
  VRRP Master of : VRRP is not configured on this interface.
  inet6 fe80::21b:21ff:fe39:6c4a/64
    collisions 0
```

## Redirect Modifier

The **redirect** modifier writes the output into a file. The output is not displayed.

```
# show cli history | redirect /var/frame.txt
```

The output redirection token (>) does the same thing:

```
# show cli history >/var/frame.txt
```

## Last Modifier

The **last** modifier displays the output of last few number of lines (As per the user input). The last number ranges from 1 to 9999.

For example:

```
#show running-config | last 10
```

---

## String Parameters

The restrictions in [Table 6](#) apply for all string parameters used in OcNOS commands, unless some other restrictions are noted for a particular command.

**Table 6. String parameter restrictions**

| Restriction                   | Description                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Input length                  | 1965 characters or less                                                                                                              |
| Restricted special characters | <p>“?”, “,”, “&gt;”, “ ”, and “=”</p> <p>The “ ” character is allowed only for the <b>description</b> command in interface mode.</p> |

---

## Command Modes

Commands are grouped into modes arranged in a hierarchy. Each mode has its own set of commands. The table below lists the command modes common to all protocols.

**Table 7. Common Command Modes**

| Name                      | Description                                                                                                                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Execution mode            | Also called <i>view</i> mode, this is the first mode to appear after you start the CLI. It is a base mode from where you can perform basic commands such as show, exit, quit, help, and enable.                                                                                  |
| Privileged execution mode | Also called <i>enable</i> mode, in this mode you can run additional basic commands such as debug, write, and show.                                                                                                                                                               |
| Configure mode            | Also called <i>configure terminal</i> mode, in this mode you can run configuration commands and go into other modes such as interface, router, route map, key chain, and address family.<br><br>Configure mode is single user. Only one user at a time can be in configure mode. |
| Interface mode            | In this mode you can configure protocol-specific settings for a particular interface. Any setting you configure in this mode overrides a setting configured in router mode.                                                                                                      |
| Router mode               | This mode is used to configure router-specific settings for a protocol such as BGP or OSPF.                                                                                                                                                                                      |

## Command Mode Tree

The diagram below shows the common command mode hierarchy.

Figure 1. Common command modes

To change modes:

1. Enter privileged executive mode by entering **enable** in Executive mode.
2. Enter configure mode by entering **configure terminal** in Privileged Executive mode.

The example below shows moving from executive mode to privileged executive mode to configure mode and finally to router mode:

```
> enable mypassword
# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
(config)# router ospf
(config-router)#
```

**Note:** Each protocol can have modes in addition to the common command modes. See the command reference for the respective protocol for details.

---

## Transaction-based Command-line Interface

The OcNOS command line interface is transaction based:

- Any changes done in configure mode are stored in a separate *candidate* configuration that you can view with the `show transaction current` command.
- When a configuration is complete, apply the candidate configuration to the running configuration with the `commit` command.
- If a `commit` fails, no configuration is applied as the entire transaction is considered failed. You can continue to change the candidate configuration and then retry the `commit`.
- Discard the candidate configuration with the `abort transaction` command.
- Check the last aborted transaction with the `show transaction last-aborted` command.
- Multiple configurations cannot be removed with a single `commit`. You must remove each configuration followed by a `commit`.

**Note:** All commands MUST be executed only in the default CML shell (`cm1sh`). If you log in as root and start `imish`, then the system configurations will go out of sync. The `imish` shell is not supported and should not be started manually.

# IPv4Static Routes

This section contains basic static routing configuration examples.

This example shows the complete configuration to enable static routing in a simple network topology. A static route is composed of a network prefix (host address) and a nexthop (gateway). Static routes are useful in small networks. They are simple solutions for making a few destinations reachable. Large networks use dynamic routing protocols.

For details about the commands used in these examples, see the Unicast Routing Information Base Command Reference.

## Topology

Router R1 is configured with these static routes:

- The remote network 10.10.12.0/24
- The loopback address (host addresses) of router R2
- The loopback address of router R3

Figure 2. Basic Static Route

In all three routes, interface `eth0` of router R2 is the gateway. Router R3 is configured with a default static route that is equivalent to configuring separate static routes with the same gateway or nexthop address. Router R2 has two routes, one for each of the remote routers' loopback address.

## Configuration

### R1

|                                                                                                                                                                                 |                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>#configure terminal</code>                                                                                                                                                | Enter configure mode.                                                                                                                                                                 |

Gateway of last resort is not set

```

# IPv6 Static Routs

This example shows complete configuration to enable IPv6 static routing in a simple network topology.

**Note:** IPv6 static route with interface alone as gateway (without gateway IPv6 address) is not supported.

## Topology

Figure 3. IPv6 static routing

## Configuration

### R1

|                                           |                                                                        |

## Static Route Discard Configuration

This section show how to configure the static route discard feature.

### Overview

If you identify some routers/attackers distributing invalid/bogus routes just to use the resources of the device or to make the device unstable, you can configure route-map rules, discard all routes, and black hole traffic corresponding to those routes.

To so this, you add “discard” route entries for a prefix in a route map with the “set interface null0” command. You then apply that route map to a BGP neighbor.

### IPv4 Route Discard

[Figure 4](#) shows the configuration required to enable static route discard for IPv4.

### Topology

Figure 4. Static route discard topology

### Configuration

#### R1

# Static Route Object Tracking using IP SLA

## Overview

Static Route Object Tracking feature tracks the state of an object's reachability using IP SLA. Client processes like Virtual Router Redundancy Protocol (VRRP) or RIB can register their interest in tracking objects and receive notifications when a state change occurs.

IP Service-Level Assurance (SLA) is a protocol used for analyzing IP service levels in applications and services. It employs active traffic-monitoring technology to continuously monitor network traffic. IP SLA utilizes Internet Control Message Protocol (ICMP) pings to detect link failures and notifies registered clients of such events.

The Object Tracking feature ensures clear separation between the objects to be tracked and the actions taken by clients when a tracked object's state changes. Multiple clients, including VRRP and RIB, can register their interest in tracking the same object, each with distinct actions upon state changes. This Tracking feature is available in OAMD.

Each tracked object is assigned a unique number in the tracking command, which client processes use to monitor specific objects. The tracking process monitors events from these tracked objects and records value changes. Any changes in tracked object values are communicated to interested client processes, either immediately or with a specified delay. The object values are reported as either `up` or `down`.

## Topology

The figure below represents a sample network topology featuring RTR1, RTR2, RTR3, and RTR4, used to demonstrate the static route object tracking feature.

**Figure 5. Static Route Object Tracking**

## Static Route Object Tracking IPv4 Configuration

The following configuration commands provide an illustrative example of setting up various network parameters on the routers (RTR1, RTR2, RTR3, and RTR4). These commands showcase the configuration of IPv4 addresses, the implementation of IP SLA for network monitoring, the establishment of static routes, and the use of time ranges.

Each command serves a specific purpose in configuring and fine-tuning the router's behavior within the network. This example demonstrates a basic network setup with key components for efficient network management and monitoring.

## RTR1

## Static Route Object Tracking IPv4 Validation

### RTR1: IP SLA Routing and Tracking Details

Below is the routing and tracking information for RTR1, which includes details about its IP SLA reachability tracking and static routes.

```
RTR1#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is UP
    4 changes, last change : 2019 Mar 14 14:53:47

RTR1#show ip route track-table
ip route 3.3.3.0 255.255.255.0 2.2.2.2 track 1 state is [up]
ip route 6.6.6.0 255.255.255.0 2.2.2.2 track 1 state is [up]

RTR1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C       1.1.1.0/24 is directly connected, xe1, 00:55:39
C       2.2.2.0/24 is directly connected, ce52, 00:55:38
S       3.3.3.0/24 [1/0] via 2.2.2.2, ce52, 00:00:03
C       4.4.4.0/24 is directly connected, xe45, 00:49:50
S       5.5.5.0/24 [1/0] via 4.4.4.2, xe45, 00:08:12
S       6.6.6.0/24 [1/0] via 2.2.2.2, ce52, 00:00:03
C       127.0.0.0/8 is directly connected, lo, 6d23h24m

Gateway of last resort is not set
```

### RTR2: Remove IPv4 Address

```
RTR2#show running-config interface ce52
!
interface ce52
  ip address 2.2.2.2/24
!
```

Now remove the IPv4 address configuration from interface `ce52` on RTR2 and commit the changes made in the configuration to the running configuration.

```
RTR2#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
RTR2(config)#interface ce52
RTR2(config-if)#no ip address
RTR2(config-if)#commit
```

### RTR1: Down State in IP SLA Routing

The following output from RTR1 routing table and tracking details indicates changes in the reachability of certain routes and related IP SLA measurements:

```
RTR1#sh ip route track-table
2019 Mar 14 14:55:14.350 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_THRESHOLD_CROSSED_2]: IP SLA 1,
response packet 15 exceeds the threshold 10000 ms
2019 Mar 14 14:55:14.351 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_TIMEOUT_2]: IP SLA 1, response packet
15 exceeds the timeout 10000 ms
2019 Mar 14 14:55:14.351 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_DISCONNECT_2]: Stopping IP SLA
measurement for sla(1) as timeout(10000) observed for packet(15)

ip route 3.3.3.0 255.255.255.0 2.2.2.2 track 1 state is [down]
ip route 6.6.6.0 255.255.255.0 2.2.2.2 track 1 state is [down]
```

The IP SLA measurement for SLA 1 experienced threshold exceedances and timeouts, resulting in changes to the reachability status of the tracked routes. The routes associated with IP SLA tracking, such as `3.3.3.0/24` and `6.6.6.0/24`, are marked as DOWN.

```
RTR1#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is DOWN
    5 changes, last change : 2019 Mar 14 14:55:14

2019 Mar 14 14:55:19.352 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_THRESHOLD_CROSSED_2]: IP SLA 1,
response packet 16 exceeds the threshold 10000 ms
2019 Mar 14 14:55:19.353 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_TIMEOUT_2]: IP SLA 1, response packet
16 exceeds the timeout 10000 ms
2019 Mar 14 14:55:19.353 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_DISCONNECT_2]: Stopping IP SLA
measurement for sla(1) as timeout(10000) observed for packet(16)

RTR1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C      1.1.1.0/24 is directly connected, xe1, 00:56:16
C      2.2.2.0/24 is directly connected, ce52, 00:56:15
C      4.4.4.0/24 is directly connected, xe45, 00:50:27
S      5.5.5.0/24 [1/0] via 4.4.4.2, xe45, 00:08:49
S      6.6.6.0/24 [10/0] via 4.4.4.2, xe45, 00:00:07
C      127.0.0.0/8 is directly connected, lo, 6d23h24m

Gateway of last resort is not set
```

When the IP SLA operation determines that 6.6.6.6 is reachable, the route appears in the routing table, allowing traffic to be routed to that destination. This mechanism provides dynamic routing based on the real-time reachability of the specified IPv4 address.

```
RTR1#ping 6.6.6.6
Press CTRL+C to exit
PING 6.6.6.6 (6.6.6.6) 56(84) bytes of data.
64 bytes from 6.6.6.6: icmp_seq=1 ttl=63 time=0.713 ms

-----
*1      icmp-echo  2.2.2.2          14000      OK          2019 Mar 14 14:56:26
```

## RTR2: Add IPv4 Address

Now configure the IPv4 address from interface `ce52` on RTR2 and commit the changes made in the configuration to the running configuration.

```
RTR2#conf t
Enter configuration commands, one per line. End with CNTL/Z.
RTR2(config)#interface ce52
RTR2(config-if)#ip address 2.2.2.2/24
RTR2(config-if)#commit
```

## RTR1: UP State in IP SLA Routing and Tracking

By configuring the IPv4 address on RTR2 interface `ce52` brings up the interface and allows RTR1 to reach RTR2 via the IPv4 address `2.2.2.2/24`, leading to the change in the IP SLA tracking state and the associated static route states to UP.

```
RTR1#show track
TRACK Id: 1
  IP SLA 1 reachability
```

```

Reachability is UP

## Static Route Object Tracking IPv6 Configuration

The following configuration commands provide an illustrative example of setting up various network parameters on the routers (RTR1, RTR2, RTR3, and RTR4). These commands showcase the configuration of IPv6 addresses, the implementation of IP SLA for network monitoring, the establishment of static routes, and the use of time ranges. Each command serves a specific purpose in configuring and fine-tuning the router's behavior within the network. This example demonstrates a basic network setup with key components for efficient network management and monitoring.

### RTR1

|                             |                       |
|-----------------------------|-----------------------|
| RTR1#configure terminal     | Enter Configure mode. |
| RTR1(config)#interface ce52 | Enter interface mode. |

|                                                                  |                                                                                   |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| RTR1(config-if)#ip address 1000::1/64                            | Configure IPv6 address.                                                           |
| RTR1(config-if)#exit                                             | Exit interface mode.                                                              |
| RTR1(config)#interface xe45                                      | Enter interface mode.                                                             |
| RTR1(config-if)#ip address 4000::2/64                            | Configure IPv6 address.                                                           |
| RTR1(config-if)#exit                                             | Exit interface mode.                                                              |
| RTR1(config)#ip sla 1                                            | Configure IP SLA with a unique number.                                            |
| RTR1(config-ip-sla)#icmp-echo ipv6 2000::1 source-interface ce52 | Configure the ICMP-echo using destination IPv6 address and source interface name. |
| RTR1(config-ip-sla-echo)#threshold 1000                          | Configure the threshold value.                                                    |
| RTR1(config-ip-sla-echo)#timeout 1000                            | Configure the timeout value.                                                      |
| RTR1(config-ip-sla-echo)#frequency 5                             | Configure the frequency value.                                                    |
| RTR1(config-ip-sla-echo)#exit                                    | Exit IP SLA echo mode.                                                            |
| RTR1(config-ip-sla)#exit                                         | Exit IP SLA mode.                                                                 |
| RTR1(config)#time-range tr1                                      | Configure a time-range.                                                           |
| RTR1(config-tr)#start-time 11:22 3 july 2021                     | Configure a start-time.                                                           |
| RTR1(config-tr)#end-time after 200                               | Configure end-time.                                                               |
| RTR1(config-tr)#exit                                             | Exit time-range mode.                                                             |
| RTR1(config)#ip sla schedule 1 time-range tr1                    | Schedule an IP SLA measurement.                                                   |
| RTR1(config)#track 1 ip sla 1 reachability                       | Configure the track ID for IP SLA.                                                |
| RTR1(config-object-track)#exit                                   | Configure object track mode.                                                      |
| RTR1(config)#ipv6 route 3000::0/64 1000::2 track 1               | Configure the static route with the nexthop address.                              |
| RTR1(config)#ipv6 route 3333::1/128 1000::2 track 1              | Configure the static route with the nexthop address and track ID.                 |
| RTR1(config)#ipv6 route 3333::1/128 1000::2 10                   | Configure the static route with the nexthop address and delay.                    |
| RTR1(config)#commit                                              | Commit the candidate configuration to the running configuration                   |
| RTR1(config)#exit                                                | Exit configure mode                                                               |

## RTR2

|                                         |                         |
|-----------------------------------------|-------------------------|
| RTR2#configure terminal                 | Enter configure mode.   |
| RTR2(config)#interface ce50             | Enter interface mode.   |
| RTR2(config-if)#ipv6 address 1000::2/64 | Configure IPv6 address. |
| RTR2(config-if)#exit                    | Exit interface mode.    |
| RTR2(config)#interface ce52             | Enter interface mode.   |
| RTR2(config-if)#ipv6 address 2000::1/64 | Configure IPv6 address. |
| RTR2(config-if)#exit                    | Exit interface mode.    |

|                                            |                                                                  |
|--------------------------------------------|------------------------------------------------------------------|
| RTR2(config)#ipv6 route 3000::0/64 2000::2 | Configure the static route with the nexthop address.             |
| RTR2(config)#commit                        | Commit the candidate configuration to the running configuration. |
| RTR2(config)#exit                          | Exit configure mode.                                             |

## RTR3

|                                            |                                                                  |
|--------------------------------------------|------------------------------------------------------------------|
| RTR3#configure terminal                    | Enter configure mode.                                            |
| RTR3(config)#interface xe7                 | Enter interface mode.                                            |
| RTR3(config-if)#ipv6 address 2000::2/64    | Configure IPv6 address.                                          |
| RTR3(config-if)#exit                       | Exit interface mode.                                             |
| RTR3(config)#interface xe14                | Enter interface mode.                                            |
| RTR3(config-if)#ipv6 address 3000::1/64    | Configure IPv6 address.                                          |
| RTR3(config-if)#commit                     | Commit the candidate configuration to the running configuration. |
| RTR3(config-if)#exit                       | Exit interface mode.                                             |
| RTR3(config)#ipv6 route 4000::0/64 3000::2 | Configure the static route with the nexthop address.             |
| RTR3(config)#ipv6 route 1000::0/64 2000::1 | Configure the static route with the nexthop address.             |
| RTR3(config)#commit                        | Commit the candidate configuration to the running configuration. |
| RTR3(config)#exit                          | Exit configure mode.                                             |

## RTR4

|                                            |                                                                  |
|--------------------------------------------|------------------------------------------------------------------|
| RTR4#configure terminal                    | Enter configure mode.                                            |
| RTR4(config)#interface ce0                 | Enter interface mode.                                            |
| RTR4(config-if)#ipv6 address 3000::2/64    | Configure IPv6 address.                                          |
| RTR4(config-if)#exit                       | Exit interface mode.                                             |
| RTR4(config)#interface xe1                 | Enter interface mode.                                            |
| RTR4(config-if)#ipv6 address 4000::1/64    | Configure IPv6 address.                                          |
| RTR4(config-if)#exit                       | Exit interface mode.                                             |
| RTR4(config)#interface xe7                 | Enter interface mode.                                            |
| RTR4(config-if)#ipv6 address 5000::2/64    | Configure IPv6 address.                                          |
| RTR4(config-if)#commit                     | Commit the candidate configuration to the running configuration. |
| RTR4(config-if)#exit                       | Exit interface mode.                                             |
| RTR4(config)#ipv6 route 1000::0/64 4000::2 | Configure the static route with the nexthop address.             |
| RTR4(config)#ipv6 route 2000::0/64 3000::1 | Configure the static route with the nexthop address.             |
| RTR4(config)#commit                        | Commit the candidate configuration to the running configuration. |

RTR4(config)#exit

Exit configure mode.

## Static Route Object Tracking IPv6 Validation

### RTR1

Below is the routing and tracking information for RTR1, which includes details about its IP SLA reachability tracking and static routes.

```
RTR1#sh track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is UP
    4 changes, last change : 2019 Mar 14 14:53:47

RTR1#sh ip route track-table
  ipv6 route 3000::0/64 1000::2 track 1 state is [up]
  ipv6 route 3333::1/128 1000::2 track 1 state is [up]

RTR1#sh ip sla summary
IP SLA Operation Summary
Codes: * active, ^ inactive
```

| ID | Type      | Destination | Stats<br>(usec) | Return<br>Code | Last<br>Run          |
|----|-----------|-------------|-----------------|----------------|----------------------|
| *1 | icmp-echo | 2000::2     | 16000           | OK             | 2019 Mar 11 16:11:40 |

```

RTR1#sh ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C      1000::/64 via ::, ce52, 00:00:15
C      4000::/64 via ::, ce0, 00:00:15
S      2000::/64 [1/0] via 1000::2, ce52, 00:00:15
S      3333::1/128 [1/0] via 1000::2, ce52, 00:00:15

Gateway of last resort is not set

```

---

# Route Monitor

## Overview

Object Tracking provides a mechanism for tracking the reachability status of objects, such as IP status, using Internet Protocol Service Level Agreement (IP SLA). This feature empowers users to monitor the state of these objects and make decisions based on their status. It permits the configuration of multiple track objects on interfaces, delivering flexibility in managing network link status.

## Feature Characteristics

Object Tracking establishes a distinct separation between the tracked objects and the actions initiated by a client when there's a change in the state of a tracked object. Users can configure object tracking types as `any` or `all` on the interface, alongside track IDs that specify which statuses to monitor. Modify the interface's link status to either `up` or `down` based on the selected track type and the statuses of the associated track IDs.

When using `Track type all`, the feature performs a Boolean `AND` operation, requiring every object configured on the interface to be in an `up` state for the interface itself to be considered `up`. If any of these objects are not in an `up` state, the interface is set to `down`.

Conversely, `Track type any` operates as a Boolean `OR` function, necessitating that at least one object configured on the interface must be in an `up` state for the interface to remain `up`. If none of the tracked objects are in an `up` state, the interface is marked as `down`.

## Benefits

Users can ensure network reliability by defining specific tracking criteria and actions, allowing them to take appropriate measures when tracked objects experience status change. This contributes to improved network management and performance.

---

## Configuration

The below topology illustrates a network configuration involving three routers, R1, R2, and R3, with a central device referred to as the Router A positioned in the middle. This topology represents a linear or sequential network structure that showcases the Route Monitor feature.

## Prerequisites

Before configuring and utilizing Object Tracking, ensure the following prerequisites:

**Track IDs:** Users must define and configure the track IDs and corresponding objects they want to track for reachability. These track IDs are essential for the feature to work effectively. Deleting all track IDs from the interface will bring the interface up if it was previously down.

**Interface Configuration:** The feature involves configuring track types on interfaces. Therefore, ensuring that the interfaces are correctly configured and operational is important. In cases where an interface has both object tracking configurations and next-hop reachability, deleting the object tracking configurations is necessary to bring the interface back up if it goes down.

**Object Tracking Criteria:** Define the specific criteria and conditions for tracking an object's reachability, such as IP status, using IP SLA.

## Topology

A series of configurations were implemented on routers R1, R2, and R3, as well as on the Router A, to showcase the functionality of the Route Monitor feature. The objective was to demonstrate the configuration of network routers to monitor the reachability status of specific IPv4 and IPv6 addresses using IP SLA and illustrate that these configurations can work in conjunction with the Route Monitor feature to enable informed decisions based on the reachability status of tracked objects.

**Figure 6. Route Monitor Topology**

## IPv4 Route Monitor Configuration

### Router A Configuration

Use the following configuration to set up an IP SLA and enable object tracking on a network device. These commands assign IPv4 addresses to interfaces, configure specific IP SLA parameters such as threshold, timeout, and frequency, create a time-range for scheduling measurements, and establish static routes with nexthop addresses. Configure object tracking to monitor the reachability of tracked objects. These configurations highlight the versatility and functionality of the network device by allowing it to monitor IPv4 addresses, make decisions based on object tracking, and optimize network operations.

|                                                                         |                                                                                                                      |
|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Router A#configure terminal                                             | Enter configure mode.                                                                                                |
| Router A(config)#interface xe50                                         | Enter interface mode xe50.                                                                                           |
| Router A(config-if)#ip address 2.2.2.1/24                               | Assign the IP address 2.2.2.1 with a subnet mask of /24 to interface xe50.                                           |
| Router A(config-if)#exit                                                | Exit interface mode xe50.                                                                                            |

## Routing and Static Routes Configuration

The following commands configure routers R1, R2, and R3 to forward network traffic to their designated destinations within the network. They assign IP addresses to the interfaces connected to the routing devices and add static routes for destination networks with a next-hop IP.

### R1

```
!
interface xe1
 ip address 1.1.1.1/24
commit
!
ip route 2.2.2.0/24 1.1.1.2
ip route 3.3.3.0/24 1.1.1.2
commit
!
```

**R2**

```

!
interface xe1
  ip address 2.2.2.2/24
commit
!
interface xe2
  ip address 3.3.3.1/24
commit
!
ip route 1.1.1.0/24 2.2.2.1
commit
!

```

**R3**

```

!
interface xe1
  ip address 3.3.3.2/24
commit
!
ip route 1.1.1.0/24 3.3.3.1
ip route 2.2.2.0/24 3.3.3.1
commit
!

```

**IPv4 Route Monitor Validation**

The following show output displays information about the IPv4 route table, IP SLA reachability tracking, and interface status on a network device running OcNOS.

**Router A**

```

Router A#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is UP
  4 changes, last change : 2019 Mar 14 14:53:47
Track interface : xe51

## IPv6 Route Monitor Configuration

### Router A Configuration

Use the following configuration to set up an IP SLA and enable object tracking on a network device. These commands assign IPv6 addresses to interfaces, configure specific IP SLA parameters such as threshold, timeout, and frequency, create a time-range for scheduling measurements, and establish static routes with nexthop addresses. Configure object tracking to monitor the reachability of tracked objects. These configurations highlight the versatility and functionality of the network device by allowing it to monitor IPv6 addresses, make decisions based on object tracking, and optimize network operations.

|                                                                         |                                                                                                                           |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|

| Router A(config-if)#object-tracking 1                   | Configure object tracking 1 on interface xe51.                                                                              |
| Router A(config-if)#object-tracking 2                   | Configure object tracking 2 on interface xe51.                                                                              |
| Router A(config-if)#exit                                | Exit interface mode.                                                                                                        |
| Router A(config)#exit                                   | Exit configure mode.                                                                                                        |

By configuring the routes below, R1, R2, and R3 effectively forward network traffic to its designated destinations within the network. These configurations actively contribute to efficient routing operations and ensure network traffic reaches its targets.

## R1 Configuration

|                                       |                                                                             |
|---------------------------------------|-----------------------------------------------------------------------------|
| R1#configure terminal                 | Enter configure mode.                                                       |
| R1(config)#interface xe1              | Enter interface mode xe1.                                                   |
| R1(config-if)#ipv6 address 1000::1/64 | Assign the IPv6 address 1000::1 with a subnet mask of /64 to interface xe1. |

|                                          |                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------|
| R1(config-if)#commit                     | Commit the candidate configuration to the running configuration.                            |
| R1(config-if)#exit                       | Exit interface mode <code>xe1</code> .                                                      |
| R1(config)#ipv6 route 2000::0/64 1000::2 | Add an IPv6 static route for the destination network 2000::0/64 with next-hop IPv6 1000::2. |
| R1(config)#ipv6 route 3000::0/64 1000::2 | Add an IPv6 static route for the destination network 3000::0/64 with next-hop IPv6 1000::2. |
| R1(config)#commit                        | Commit the candidate configuration to the running configuration.                            |
| R1(config)#exit                          | Exit configure mode.                                                                        |

## R2 Configuration

|                                          |                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------|
| R2#configure terminal                    | Enter configure mode.                                                                       |
| R2(config)#interface xe1                 | Enter interface mode <code>xe1</code> .                                                     |
| R2(config-if)#ipv6 address 2000::2/64    | Assign the IPv6 address 2000::2 with a subnet mask of /64 to interface <code>xe1</code> .   |
| R2(config-if)#exit                       | Exit interface mode <code>xe1</code> .                                                      |
| R2(config)#interface xe2                 | Enter interface mode <code>xe2</code> .                                                     |
| R2(config-if)#ipv6 address 3000::1/64    | Assign the IPv6 address 3000::1 with a subnet mask of /64 to interface <code>xe2</code> .   |
| R2(config-if)#exit                       | Exit interface mode <code>xe2</code> .                                                      |
| R2(config)#ipv6 route 1000::0/64 2000::1 | Add an IPv6 static route for the destination network 1000::0/64 with next-hop IPv6 2000::1. |
| R2(config)#commit                        | Commit the candidate configuration to the running configuration.                            |
| R2(config)#exit                          | Exit configure mode.                                                                        |

## R3 Configuration

|                                          |                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------|
| R3#configure terminal                    | Enter configure mode.                                                                       |
| R3(config)#interface xe1                 | Enter interface mode <code>xe1</code> .                                                     |
| R3(config-if)#ipv6 address 3000::2/64    | Assign the IPv6 address 3000::2 with a subnet mask of /64 to interface <code>xe1</code> .   |
| R3(config-if)#commit                     | Commit the candidate configuration to the running configuration.                            |
| R3(config-if)#exit                       | Exit interface mode <code>xe1</code> .                                                      |
| R3(config)#ipv6 route 1000::0/64 3000::1 | Add an IPv6 static route for the destination network 1000::0/64 with next-hop IPv6 3000::1. |
| R3(config)#ipv6 route 2000::0/64 3000::1 | Add an IPv6 static route for the destination network 2000::0/64 with next-hop IPv6 3000::1. |
| R3(config)#commit                        | Commit the candidate configuration to the running                                           |

|                 |                      |
|-----------------|----------------------|
|                 | configuration.       |
| R3(config)#exit | Exit configure mode. |

## IPv6 Route Monitor Validation

The following show output displays the information about IP SLA reachability tracking, IPv6 route tables, and interface status on a network device running OcNOS.

### Router A Validation

```
Router A#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is UP
    4 changes, last change : 2019 Mar 14 14:53:47
Track interface : xe51

Router A#show ip route track-table
  ipv6 route 3000::0/64 2000::2 track 1 state is [up]
  ipv6 route 3333::1/128 2000::2 track 1 state is [up]

Router A#show ip sla summary
IP SLA Operation Summary
Codes: * active, ^ inactive
```

| ID | Type      | Destination | Stats<br>(usec) | Return<br>Code | Last<br>Run          |
|----|-----------|-------------|-----------------|----------------|----------------------|
| *1 | icmp-echo | 3000::1     | 16000           | OK             | 2019 Mar 11 16:11:40 |

```
Router A#show ipv6 route
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, D- DHCP, R - RIP,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, E - EVPN N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, i - IS-IS, B - BGP,
       v - vrf leaked
Timers: Uptime

IP Route Table for VRF "default"
C      ::1/128 via ::, lo, 00:04:46
C      1000::/64 via ::, xe51, 00:02:48
C      2000::/64 via ::, xe50, 00:02:48
S      3000::/64 [1/0] via 2000::2, xe50, 00:02:48
S      3333::1/128 [1/0] via 2000::2, xe50, 00:02:48

Router A#show interface brief xe51

Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate
FR - Frame Relay, TUN -Tunnel, PBB - PBB Logical Port, VP - Virtual Port
CVP - Channelised Virtual Port, METH - Management Ethernet, UNK- Unknown
ED - ErrDisabled, PD - Protocol Down, AD - Admin Down, IA - InActive
PD(Min L/B) - Protocol Down Min-Links/Bandwidth
OTD - Object Tracking Down
DV - DDM Violation, NA - Not Applicable
NOM - No operational members, PVID - Port Vlan-id
Ctl - Control Port (Br-Breakout/Bu-Bundle)
```

| Ethernet<br>Interface | Type | PVID | Mode | Status | Reason | Speed | Port | Ch # | Ctl | Br/Bu | Loopbk |
|-----------------------|------|------|------|--------|--------|-------|------|------|-----|-------|--------|
| -----                 |      |      |      |        |        |       |      |      |     |       |        |

```
xe51      ETH      --      routed      down      OTD      10g      --      No      No
```

## Implementation Examples

Here is a practical scenario and use case for Object Tracking implementation:

**Link Redundancy:** Object Tracking can be used to monitor the reachability of primary and backup network links. If the primary link fails or becomes congested, the system can automatically switch traffic to the backup link, ensuring uninterrupted network connectivity.

**Load Balancing:** Object Tracking helps optimize load balancing by continuously assessing the health and availability of servers or paths. If a server becomes overloaded or fails, traffic can be intelligently redirected to healthy servers, improving resource utilization and user experience.

**Failover Testing and Verification:** Object Tracking provides a mechanism for simulating network failures and verifying failover mechanisms. By configuring tracked objects to mimic real-world conditions, network administrators can assess the resilience of their network configurations and ensure they perform as expected during failures.

### Route Monitor Command

The Route Monitor feature introduces the [object-tracking \(page 280\)](#) configuration command. For more information, refer to the [IP Service Level Agreements Commands \(page 266\)](#), and [Object Tracking Commands \(page 278\)](#) and [Interface Commands](#) sections in the *OcNOS System Management* document.

### object-tracking

Use this command to configure track IDs and options on the interfaces.

Use the `no` parameter with this command to remove the configurations.

These commands configure object tracking on interfaces, with specific track IDs and tracked objects set to determine what gets tracked and affects the interface's status.

The `object-tracking` command provides flexibility, enabling both `all` and `any` tracking behaviors for influencing the interface's status. A maximum of 8 track IDs can be configured per interface. It is possible to configure the same track IDs or options on multiple interfaces.

### Command Syntax

```
object-tracking <1-500>
object-tracking <all | any>
no object-tracking <1-500>
no object-tracking <all | any>
```

### Parameters

#### <1-500>

Object tracking ID

#### all

Boolean AND operation. Each object configured on the interface must be in an up state for the interface itself to be in an up state; otherwise, it will be brought down.

#### any

Boolean OR operation. At least one object configured on the interface must be in an up state; otherwise, the interface will be brought down.

## Default

None

## Command Mode

Interface mode

## Applicability

Introduced in OcNOS version 6.4.1.

## Example

Here are some example commands for configuring object tracking in the interface mode.

```
OcNOS(config)#interface xe5
OcNOS(config-if)#object-tracking 10
OcNOS(config-if)#object-tracking all
OcNOS(config-if)#commit

OcNOS(config-if)#no object-tracking 10
OcNOS(config-if)#no object-tracking all
OcNOS(config-if)#commit
OcNOS(config-if)#exit
```

## Troubleshooting

**Interface Status:** Verify the status of the interface linked with object tracking. If the configured track type is `all`, confirm that all tracked objects are in an `up` state to consider the interface as `up`. In the case of the track type being `any`, ensure that at least one tracked object is `up` to maintain the interface in an `up` state.

## Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

| Key Terms/Acronym | Description                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Acronym           | Description                                                                                                                                                                                 |
| NSM               | Network and Service Management                                                                                                                                                              |
| IP SLA            | Internet Protocol Service Level Agreement                                                                                                                                                   |
| Object Tracking   | A feature that monitors the reachability status of objects, such as IP status, using IP SLA and allows users to take actions based on their status.                                         |
| Track Object      | An object configured for tracking within the Object Tracking feature. These objects can represent specific network components or conditions, such as IP addresses or link statuses.         |
| Track ID          | A unique identifier associated with a track object that enables the system to monitor and assess the status of that object.                                                                 |
| Track Type        | The configuration specifies how the interface's link status should be determined based on the statuses of associated track objects. It can be set to <code>all</code> or <code>any</code> . |
| Track Type "All"  | A track type that uses a Boolean AND function, requiring that all tracked objects be                                                                                                        |

| Key Terms/Acronym | Description                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|                   | in an up state for the interface to be considered up.                                                                                     |
| Track Type “Any”  | A track type that uses a Boolean OR function, ensuring that at least one tracked object is in an up state for the interface to remain up. |

## Policy Based Routing Configuration

This section contains a sample Policy Based Routing (PBR) configuration.

Policy Based Routing (PBR) is an advanced packet forwarding feature which is different from conventional destination address based routing. Policy Based Routing (PBR) allows data packets forwarding based on policies defined by network administrators.

In conventional routing, when a packet is received on the router, destination address in the packet is looked upon in the routing table and if the routing entry is found, packet is routed based on routing entry. In policy based routing, routing decision could be made from source address, destination address, transport protocol id, source port, destination port, or a combination of these criteria.

PBR includes a mechanism for selectively applying policies based on an access list or other criteria. Actions taken might include (a) Forwarding a packet to a directly connected ip nexthop (b) Black hole/Drop. If traffic doesn't match the route-map's match criteria, then it will be routed as if no PBR policy exists. PBR config is interface oriented, hence when applied it affects only the traffic ingressing on that interface. It does not apply on traffic egressing on that interface or traffic ingressing on an interface without a pbr route-map.

## Topology

Figure 7. PBR Routing Topology

## Configurations - PBR IPv4

```

## PBR with Nexthop Tracking

Policy-Based Routing (PBR) with Next-Hop Tracking is a networking feature designed to increase routing resiliency and efficiency by dynamically tracking the availability of the next-hop IP address associated with a PBR policy. When a next-hop IP address becomes unreachable, the system typically waits for the ARP entry to expire before switching traffic to an alternative route, resulting in dropped traffic during this delay. This feature addresses the issue by enabling faster traffic redirection, minimizing disruptions and improving network reliability.

Policy-Based Routing (PBR) can be configured with a tracker-enabled next hop by using the optional tracking argument in the set nexthop command. When the tracker's state changes to UP, the tracker-enabled next hop is installed in hardware. If the tracker's state goes DOWN, the tracker-enabled next hop is removed—provided it is currently active—and PBR automatically reroutes traffic based on the policy's fallback configuration.

It is important to note that these dynamic state changes do not affect the output of the show running-config command, which remains static regardless of the tracker's status.

Modify the R1 configuration to enable nexthop tracking. All other configurations will remain unchanged.

## IPv4 Configurations for PBR with Nexthop Tracking

## TOS based Queue Distribution Configuration

This feature allows both type of configuration (precedence or DSCP). Before the implementation of this feature only allows DSCP profiles. The most significant three bits of the DSCP are Class Selector bits, which provides backward compatibility with ip precedence.

We will utilize these DSCP bits to set Precedence. For example when user configure Precedence 101 in CLI, we just need to convert this value to DSCPs(101000 ~ 101111), then normally set the DSCP.

Indicate the standards to be imposed or other all-embracing blanket requirements.

On the basis of already existing DSCP profiles, new precedence profiles are introducing as qos map-profile in this section.

The working on these precedence profile is similar to that of DSCP but now we can permit both the configurations according to our requirement.

There are 2 Qos-map Precedence profiles introduced:

- Precedence-to-queue
- Precedence-to-precedence

### Precedence-to-queue

This is an ingress profile similar to dscp-to-queue. This profile will map precedence value 0-7 to queue 0-7.

#### Topology

# Internet Protocol SLA Configuration

The Internet Protocol Service Level Agreement (IP SLA) is an active method for monitoring and reliably reporting network performance. The term "active" refers to IP SLA's ability to generate and actively monitor traffic across the network on a continuous basis. An IP SLA Router is capable of generating traffic and providing real-time reporting. IP SLA configuration consists of two components: the IP SLA router, which generates traffic, and the IP SLA Responder, which can be any device, not limited to just routers. While the IP SLA Responder is not mandatory for IP SLA functionality, it enhances the ability to gather more detailed information and generate more comprehensive reports.

Once IP SLA operations are configured, scheduling the operation is required to start capturing statistics and collecting error data. The operation can be scheduled to start immediately or at a specified month, day, and hour. A "pending" option is also available to schedule the operation for a later time. This "pending" state is visible through SNMP and is utilized when an operation is designed to be triggered by a certain threshold.

You can schedule a single IP SLA operation or a group of operations to start at once.

**Note:** IP SLA sessions on Edgecore AS7316-26XB switches are limited to 500 sessions. This limit may vary depending on the device's capacity and performance.

## Topology

# Traffic Mirroring using ERSPAN

## Overview

Encapsulated Remote Switched Port Analyzer (ERSPAN) is a function used for monitoring network traffic. Using ERSPAN, you can mirror traffic from one or more ports or VLANs on a network switch and send the mirrored traffic to a remote monitoring device for analysis.

ERSPAN encapsulates mirrored traffic with Generic Routing Encapsulation (GRE) and, in addition, ERSPAN headers to send over an IP network.

Traffic mirroring protocols such as Switched Port Analyzer (SPAN) and Remote Switched Port Analyzer (RSPAN) in OcNOS allow traffic analysis within the same domain. ERSPAN aims to overcome this limitation by routing the traffic to any destination on the network.

## Feature Characteristics

The main characteristics of ERSPAN are as follows:

- Transports mirrored traffic from the source to the destination over Layer 3 IP network.
- Monitors ingress, egress, or both ingress and egress traffic.
- Sends mirrored traffic to remote monitoring device for analysis without being restricted by Layer 2 boundaries.
- Supports filters on ingress traffic providing capability to filter the traffic to be mirrored.
- Supports Type 1 and Type 3 ERSPAN, with Type 1 as the default.

## Supported Hardware

- XGS platforms - Trident 3 (TR3), Trident 4 (TR4), Tomahawk (TH/TH2) and Tomahawk 4 (TH4).

## Supported scenarios

[[[Undefined variable Global-variable.Trident3 (TR3) platforms]]]

| ERSPAN type | ERSPAN over IPv4 Ingress traffic | ERSPAN over IPv4 Egress traffic | ERSPAN over IPv6 Ingress traffic | ERSPAN over IPv6 Egress traffic |
|-------------|----------------------------------|---------------------------------|----------------------------------|---------------------------------|
| Type 1      | Yes                              | Yes                             | Yes                              | No                              |
| Type 3      | Yes                              | No                              | No                               | No                              |

[[[Undefined variable Global-variable.Trident4 (TR4) platforms]]]

| ERSPAN type | ERSPAN over IPv4 Ingress traffic | ERSPAN over IPv4 Egress traffic | ERSPAN over IPv6 Ingress traffic | ERSPAN over IPv6 Egress traffic |
|-------------|----------------------------------|---------------------------------|----------------------------------|---------------------------------|
| Type 1      | Yes                              | Yes                             | Yes                              | No                              |
| Type 3      | Yes                              | No                              | No                               | No                              |

## Tomahawk2 (TH2) platforms

| ERSPAN type | ERSPAN over IPv4 Ingress traffic | ERSPAN over IPv4 Egress traffic | ERSPAN over IPv6 Ingress traffic | ERSPAN over IPv6 Egress traffic |
|-------------|----------------------------------|---------------------------------|----------------------------------|---------------------------------|
| Type 1      | Yes                              | Yes                             | No                               | No                              |
| Type 3      | Yes                              | No                              | No                               | No                              |

## Tomahawk4 (TH4) platforms

| ERSPAN type | ERSPAN over IPv4 Ingress traffic | ERSPAN over IPv4 Egress traffic | ERSPAN over IPv6 Ingress traffic | ERSPAN over IPv6 Egress traffic |
|-------------|----------------------------------|---------------------------------|----------------------------------|---------------------------------|
| Type 1      | Yes                              | Yes                             | Yes                              | Yes                             |
| Type 3      | No                               | No                              | No                               | No                              |

---

## Prerequisites

Before configuration, ensure the IP address is available for:

- Destination of the ERSPAN tunnel.
- Origin of the ERSPAN tunnel.

---

## Configuration

The following configuration enables a sender session to send packets to the destination over ERSPAN tunnels.

### Topology

The topology shown here consists of Host 1, Host 2, a Sender node R1, and a Receiver node R2.

The sender node forwards ERSPAN traffic to the receiver node. An ERSPAN tunnel is created between R1 and R2 over interface ge3.

R1 collects the traffic received or sent over one or more interfaces (such as ge1 and/or ge2), mirrors the collected traffic, encapsulates the packets inside ERSPAN and sends them to the IP address on R2.

R2 is configured to receive ERSPAN encapsulated packets.

Figure 11. ERSPAN Topology

The configuration is done in two stages:

1. [Configure ERSPAN destination \(page 218\)](#)
2. [Configure ERSPAN sender session \(page 219\)](#) using the ERSPAN destination

## Configure ERSPAN destination

1. Enter configure mode and set a name for the ERSPAN destination.  

```
R1(config-router)#monitor destination erspan erspan_dest_1
R1(config-erspan-dst)#
```
2. Configure the destination IPv4/IPv6 where the ERSPAN packets will be forwarded.  

```
R1(config-erspan-dst)#dest-ip 172.16.12.2
```
3. Set the origin IPv4/IPv6 of the ERSPAN tunnel.  

```
R1(config-erspan-dst)#origin-ip 172.16.12.1
```
4. The below parameters are optional. If not specified, the default values are used for each parameter.
  - Set the VRF where the ERSPAN tunnel will be created. If not specified, value default will be used.  

```
R1(config-erspan-dst)#vrf default
```
  - Set the TTL value to be used at the outer IP layer. If not specified, value 255 will be used.  

```
R1(config-erspan-dst)#ttl 50
```
  - Set the DSCP value to be used at the outer IP layer. If not specified, value 0 will be used.  

```
R1(config-erspan-dst)#dscp 50
```

- Enable the packet truncation when mirroring to the ERSPAN destination. When this flag is set, the original packet is truncated to 192 bytes and then encapsulated in ERSPAN. By default, truncation is not enabled.

```
R1(config-erspan-dst)#enable-truncate
```

**Note:** Packet truncation is not supported on TH and TH2 platforms.

- Set the ERSPAN tunnel to Type 1 or Type 3. If not specified, value 1 will be used.

```
R1(config-erspan-dst)#erspan-type 1
```

- Set the ERSPAN ID to be used in the ERSPAN session. This is relevant for type 3 only. If not specified, value 0 is used.

```
R1(config-erspan-dst)#erspan-id 100
```

- Set a Hardware ID value between 0 to 63. This parameter is relevant for type 3 only. If not specified, value 0 is used.

```
R1(config-erspan-dst)#hardware-id 45
```

- Set a Switch ID value between 0 to 511. This parameter is relevant for type 3 only. If not specified, value 0 is used.

```
R1(config-erspan-dst)#switch-id 110
```

- Commit the changes.

```
R1(config-erspan-dst)#commit
```

## Configure ERSPAN sender session

1. Enter configure mode and create a sender session with ID 1. Optionally, you can enter a description for the session (containing a maximum of 32 characters).

```
R1(config)#monitor session 1 type erspan-sender
```

```
R1(config-monitor)#description R1 ERSPAN sender
```

2. Configure the ERSPAN destination for the session using the name of the destination that has been created previously.

```
R1(config-monitor)#destination erspan erspan_dest_1
```

3. Optionally, add sources such as source VLAN and/or source interface to the sessions. For example, the command source interface configures the monitored source interface and the direction of the traffic to be monitored. If not specified, both ingress and egress traffic are monitored.

```
R1(config-monitor)#source interface ce51 rx
```

4. Enable the configured session on the interface.

```
no shut
```

## ERSPAN Snippet Configuration

To verify the configuration and view the overall commands, use the show running-config monitor command.

```
R1#show running-config monitor
```

```
monitor destination erspan erspan_dest_1
  dest-ip 23.1.1.2
  vrf default
  origin-ip 69.69.69.69
  ttl 211
  dscp 50
  enable-truncate
  erspan-type 1
!
monitor session 1 type erspan-sender
  description R1 ERSPAN sender
  source interface ce51 rx
  destination erspan erspan_dest_1
  no shut
```

---

## Validation

To verify the ERSPAN configuration, check the output of the show monitor session 1 command.

```
#show monitor session 1
session 1
-----
description : R1 ERSPAN sender
type : ERSPAN Sender
state : up
source intf :

Sender#
```

---

## CLI Commands

The ERSPAN feature introduces the following configuration commands.

### destination ERSPAN

Use this command to configure the ERSPAN destination for an ERSPAN sender session. The destination must be already created using the command `monitor destination erspan`.

Use the `no` form of this command to remove the ERSPAN destination from the session.

### Command Syntax

```
destination erspan NAME
no destination erspan
```

**Parameters****NAMES**

ERSPAN destination name mentioned in the command `monitor destination erspan`

**Default**

No default value is specified

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 6.6.0

**Examples**

The following sequence of commands is used to configure the ERSPAN destination.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#dest-ip 172.16.12.2
(config-erspan-dst)#origin-ip 172.16.12.1
(config-erspan-dst)#exit
(config)#monitor session 1 type erspan-sender
(config-monitor)#destination erspan erspan_dest_1
(config-monitor)#no destination erspan
```

**ERSPAN origin ip**

Use this command to set the origin IPv4/IPv6 of the ERSPAN tunnel.

Use the `no` form of this command to unset the origin IPv4/IPv6 of the ERSPAN tunnel.

**Command Syntax**

```
origin-ip A.B.C.D|X:X::X:X
no origin-ip
```

**Parameters****A.B.C.D|X:X::X:X**

Origin IPv4/IPv6 address of the ERSPAN tunnel

**Default**

Disabled

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 6.6.0

**Examples**

The following sequence of commands is used to set the origin IPv4/IPv6 of the ERSPAN tunnel.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#origin-ip 172.16.12.1
(config-erspan-dst)#commit

(config-erspan-dst)#no origin-ip
(config-erspan-dst)#commit
```

## ERSPAN destination ip

Use this command to set the destination IPv4/IPv6 of the ERSPAN tunnel.

Use the `no` form of this command to unset the destination IPv4/IPv6 of the ERSPAN tunnel.

### Command Syntax

```
dest-ip A.B.C.D|X:X::X:X
no dest-ip
```

### Parameters

#### A.B.C.D|X:X::X:X

Destination IPv4/IPv6 address of the ERSPAN tunnel

### Default

Disabled

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 6.6.0

### Examples

The following sequence of commands is used to set the destination IPv4/IPv6 of the ERSPAN tunnel.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#dest-ip 172.16.12.1
(config-erspan-dst)#commit

(config-erspan-dst)#no dest-ip
(config-erspan-dst)#commit
```

## ERSPAN vrf

Use this command to set the VRF where the ERSPAN tunnel will be created.

Use the `no` form of this command to reset the VRF to default.

### Command Syntax

```
vrf VRF_NAME
no vrf
```

**Parameters****VRF\_NAME**

VRF name where the ERSPAN tunnel will be created

**Default**

Disabled

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 6.6.0

**Examples**

The following sequence of commands is used to set the VRF where the ERSPAN tunnel will be created.

```
((config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#vrf custom_vrf_1
(config-erspan-dst)#commit

(config-erspan-dst)#no vrf
(config-erspan-dst)#commit
```

**ERSPAN ip ttl**

Use this command to set the Time To Live (TTL) value to use at the outer IP layer. This is an optional parameter that uses TTL value 255, if not specified.

Use the `no` form of this command to reset the TTL value to 255.

**Command Syntax**

```
ttl <1-255>
no ttl
```

**Parameters****<1-255>**

TTL value to be used

**Default**

value 255

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 6.6.0

**Examples**

The following sequence of commands is used to set the TTL value to use at the outer IP layer.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#ttl 25
(config-erspan-dst)#commit

(config-erspan-dst)#no ttl
(config-erspan-dst)#commit
```

## ERSPAN ip dscp

Use this command to set the Differentiated Services Code Point (DSCP) value to use at the outer IP layer. This is an optional parameter that uses DSCP value 0, if not specified.

Use the `no` form of this command to reset the DSCP value to 0.

### Command Syntax

```
dscp <0-63>
no dscp
```

### Parameters

#### <0-63>

DSCP value to be used

### Default

value 0

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 6.6.0

### Examples

The following sequence of commands is used to set the DSCP value to use at the outer IP layer.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#dscp 42
(config-erspan-dst)#commit

(config-erspan-dst)#no dscp
(config-erspan-dst)#commit
```

## ERSPAN enable truncate

Use this command to enable packet truncation when mirroring to the ERSPAN destination. When this flag is set, the original packet is truncated to 192 bytes and then encapsulated in ERSPAN.

Use the `no` form of this command to disable packet truncate.

### Command Syntax

```
enable-truncate
no enable-truncate
```

**Parameters**

None

**Default**

Disabled

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 6.6.0

**Examples**

The following sequence of commands is used to enable the packet truncation.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#enable-truncate
(config-erspan-dst)#commit

(config-erspan-dst)#no enable-truncate
(config-erspan-dst)#commit
```

**ERSPAN type**

Use this command to set the ERSPAN tunnel to Type 1 or Type 3. Note that ERSPAN Type 2 is not supported on XGS TR3 and TH/TH2 boards.

Use the `no` form of this command to reset the ERSPAN type to the default value.

**Command Syntax**

```
erspan-type (1|3)
no erspan-type
```

**Parameters**

**1**  
Use ERSPAN Type 1

**3**  
Use ERSPAN Type 1

**Default**

Type 1

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 6.6.0

## Examples

The following sequence of commands is used to set the ERSPAN tunnel.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#erspan-type 3
(config-erspan-dst)#commit

(config-erspan-dst)#no erspan-type
(config-erspan-dst)#commit
```

## ERSPAN id

Use this command to set the ERSPAN ID to be used in the ERSPAN session. This is only relevant for ERSPAN Type 3. This is an optional parameter and the ERSPAN ID 0 is used, if not specified.

Use the `no` form of this command to reset the value to 0.

### Command Syntax

```
erspan-id (1-1023)
no erspan-id
```

### Parameters

#### <1-1023>

ERSPAN ID to be used

### Default

Value 0

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 6.6.0

## Examples

The following sequence of commands is used to set the ERSPAN ID.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#erspan-id 33
(config-erspan-dst)#commit

(config-erspan-dst)#no erspan-id
(config-erspan-dst)#commit
```

## ERSPAN hardware id

Use this command to set the Hardware ID to be used. This is only relevant for ERSPAN Type 3.

Use the `no` form of this command to reset the value to 0.

### Command Syntax

```
hardware-id (0-63)
```

```
no hardware-id
```

### Parameters

#### <1-63>

Hardware ID to be used

### Default

Value 0

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 6.6.0

### Examples

The following sequence of commands is used to set the Hardware ID.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#hardware-id 12
(config-erspan-dst)#commit

(config-erspan-dst)#no hardware-id
(config-erspan-dst)#commit
```

## ERSPAN switch id

Use this command to set value for the Switch ID to be used. This is only relevant for ERSPAN Type 3.

Use the `no` form of this command to reset the value to 0.

### Command Syntax

```
switch-id (0-1023)
no switch-id
```

### Parameters

#### <1-1023>

Switch ID to be used

### Default

Value 0

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 6.6.0

## Examples

The following sequence of commands is used to set the Switch ID.

```
(config)#monitor destination erspan erspan_dest_1
(config-erspan-dst)#switch-id 112
(config-erspan-dst)#commit

(config-erspan-dst)#no switch-id
(config-erspan-dst)#commit
```

The below commands have been revised for ERSPAN. For more details, refer to the Traffic Mirroring Commands chapter.

- Command syntax in monitor session
- Example section in show monitor session

## Glossary

The following table provides definitions for key terms or abbreviations and their meanings used throughout this document:

| Key Terms/Acronym                         | Description                                                                                                |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Switched Port Analyzer (SPAN)             | A protocol that monitors the traffic on source port and sends a copy of the traffic to a destination port. |
| Remote Switched Port Analyzer (RSPAN)     | A protocol that monitors the traffic distributed over multiple switches from the source ports.             |
| Time to Live (TTL)                        | A limit on how long a piece of information can exist before it should be discarded.                        |
| Differentiated Services Code Point (DSCP) | A six-bit field in an IP header that enables allocation of resources on a per-packet basis.                |
| Virtual Routing and Forwarding (VRF)      | A technology that allows multiple data structures to co-exist within the same router at the same time.     |

## Fundamental Layer 3 Commands

This section describes the fundamental Layer 3 commands:

|                                              |     |
|----------------------------------------------|-----|
| automatic-router-id-selection enable .....   | 233 |
| clear ip route .....                         | 234 |
| clear ip route kernel .....                  | 235 |
| clear ip route vrf .....                     | 236 |
| clear router-id .....                        | 237 |
| debug rib .....                              | 238 |
| description .....                            | 240 |
| fib retain .....                             | 241 |
| ip route .....                               | 243 |
| ip urpf enable .....                         | 246 |
| ip verify unicast source reachable-via ..... | 247 |
| ip vrf .....                                 | 248 |
| ipv6 route .....                             | 249 |
| max-static-routes .....                      | 251 |
| maximum-paths .....                          | 252 |
| router-id .....                              | 253 |
| show debugging rib .....                     | 254 |
| show ip rpf .....                            | 255 |
| show ipv6 rpf .....                          | 257 |
| show rib txlist .....                        | 259 |
| show router-id .....                         | 260 |
| show running-config router .....             | 261 |
| show running-config router-id .....          | 262 |
| show running-config urpf .....               | 263 |
| show running-config vrf .....                | 264 |
| snmp restart rib .....                       | 265 |

## automatic-router-id-selection enable

Use this command to assure that OcNOS selects the loopback IP address as the router-id each time the device is rebooted.

Use the `no` form of this command to remove this constraint.

### Command Syntax

```
automatic-router-id-selection enable  
no automatic-router-id-selection enable
```

### Parameters

None

### Default

No default value is specified

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)# automatic-router-id-selection enable  
(config)#
```

## clear ip route

Use this command to clear an all IPv4 routes or any specific prefix routes.

### Command Syntax

```
clear ip route (*|A.B.C.D/M)
```

### Parameters

**\***

Clears all routes

**A.B.C.D/M**

Prefix to be cleared

### Command Mode

Execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#clear ip route *  
#clear ip route 1.1.1.0/24
```

## clear ip route kernel

Use this command to clear stale IPv4 routes from the RIB (Routing Information Base) and FIB (Forwarding Information Base).

### Command Syntax

```
clear ip route kernel  
clear ip kernel route
```

### Parameters

None

### Command Mode

Execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#clear ip route kernel
```

## clear ip route vrf

Use this command to clear all IPv4 VRF route or any specific prefix VRF route of any particular VRF name.

### Command Syntax

```
clear ip route vrf NAME (*|A.B.C.D/M)
```

### Parameters

#### NAME

VPN Routing or Forwarding instance name

\*

Clears all routes

#### A.B.C.D/M

Prefix to be cleared

### Command Mode

Execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#clear ip route vrf myVRF *
```

---

## clear router-id

Use this command to clear the current Router-Id and trigger the Router-Id calculation again. The new Router-id is sent to all protocol modules.

- To clear only the router-id for the default VRF, enter `clear router-id`.
- To clear the router-id for a particular VRF, enter `clear router-id vrf VRFNAME`.
- To clear the router-id for all VRFs, enter `clear router-id vrf`.

**Note:** Router-ID is non-preventive and changes at the routing protocol level or removal/modification of the address used for router-ID selection are not automatically reflected. The system retains the previously selected router-ID, use the `clear router-id` command to force re-selection.

## Command Syntax

```
clear router-id (vrf (VRFNAME|))
```

## Parameters

### VRFNAME

VPN routing/forwarding instance name.

## Command Mode

Execution mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#clear router-id  
#clear router-id vrf
```

---

## debug rib

Use this command to debug the `ribd` process.

Use the `no` form of this command to stop debugging.

### Command Syntax

```
debug rib (all|)
debug rib events
debug rib packet (recv|send|) (detail|)
debug rib nsm
debug rib bfd
debug rib kernel
debug rib monitor
debug ip routing (add-route|delete-route|mod-route|
no debug all
no debug rib (all|)
no debug all rib
no debug rib events
no debug rib packet (recv|send|) (detail|)
no debug rib nsm
no debug rib bfd
no debug rib kernel
no debug rib monitor
no debug ip routing (add-route|delete-route|mod-route|)
```

### Parameters

#### **all**

All debugging functions

#### **events**

Events

#### **packet**

Packet events

##### **recv**

Received packets

##### **send**

Sent packets

##### **detail**

Detailed information

#### **nsm**

NSM events

#### **kernel**

RIB kernel

#### **monitor**

Enable Monitor route netlink

#### **bfd**

bfd (Bidirectional Forwarding Detection) events

#### **ip routing**

IPv4 routing events

**add-route**

Add route events

**delete-route**

Delete route events

**mod-route**

Modify route events

**Disabled**

By default, debug command is disabled.

**Command Mode**

Privileged execution mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Example**

```
# debug rib all
```

---

## description

Use this command to assign a description to a Virtual Router instance.

Use the `no` parameter to remove a description.

### Command Syntax

```
description LINE
no description
```

### Parameters

#### LINE

Virtual Router description maximum 80 characters

### Disabled

By default, description command is disabled

### Command Mode

Virtual-router instance mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#virtual-router VR1
(config-vr)#description VR1 has been created for CLI testing
(config-vr)#exit

(config)#virtual-router VR1
(config-vr)#no description
(config-vr)#exit
```

## fib retain

Use this command to set the retention time for stale routes in the Forwarding Information Base (FIB) when `ribd` restarts. The `ribd` process reads the FIB and treats previously self-installed routes as stale.

You can display stale routes by running the `show ip route database` command. All routes preceded by the symbol `p` are stale routes. When protocol modules restart, `ribd` overrides these stale routes with routes updated by the protocol modules.

Below table show the behavior of routes when `ribd` stops.

**Table 8. FIB retention**

| Command                                      | Behavior                                                                                   |
|----------------------------------------------|--------------------------------------------------------------------------------------------|
| <code>fib retain</code>                      | Does not clear routes from the FIB and retains stale routes for 60 seconds when restarted. |
| <code>fib retain forever</code>              | Does not clear routes and retains stale routes forever.                                    |
| <code>fib retain time &lt;1-65535&gt;</code> | Does not clear routes and retains stale routes for the specified seconds.                  |
| <code>no fib retain (default)</code>         | Cleans up routes in the FIB, but retains stale routes for 60 seconds when restarted.       |

You can remove stale routes at any time with the [clear ip route kernel \(page 235\)](#) command.

Use the `no` form of this command to revert to default; that is, do not retain routes in the FIB when `ribd` stops.

## Command Syntax

```
fib retain (forever|time <1-65535>|)
no fib retain (forever|time <1-65535>|)
```

## Parameters

### **forever**

Retain FIB forever

### **time**

Retain FIB for a time after `ribd` restarts

### **<1-65535>**

Retention time in seconds; if you omit this value, the default is 60 seconds

## Default

Routes are cleared from the FIB when `ribd` stops. However, when `ribd` restarts, stale routes are retained for 60 seconds.

## Command Mode

Configure mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#fib retain time 180
```

## ip route

Use this command to create an IPv4 static route.

Use the `no` form of this command to delete a static route.

**Note:** Equal-Cost Multi-Path (ECMP) static routes with one next-hop residing in a local Virtual Routing and Forwarding (VRF) instance while the other next-hop is in an inter-VRF are not supported. Additionally, ECMP static routes within an Inter-VRF (IVRF) are not supported.

## Command Syntax

```
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME (<1-255>|) (tag <0-4294967295>|) (track <1-500>|) (description LINE|)
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D (<1-255>|) (tag <0-4294967295>|) (track <1-500>|) (recursive|) (description LINE|)
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME (<1-255>|) (tag <0-4294967295>|) (track <1-500>|) (recursive|) (description LINE|)
ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME global (track <1-500>|) (recursive|)
ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME global (track <1-500>|)
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME {<1-255>|tag <0-4294967295>|track <1-500>|description LINE}
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D {<1-255>|tag <0-4294967295>|track <1-500>|recursive|description LINE}
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME {<1-255>|tag <0-4294967295>|track <1-500>|recursive|description LINE}
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME global
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME global {track <1-500>|recursive}
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME global
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME global (track <1-500>|)
```

## Parameters

### vrf NAME

Specifies the user-defined VRF instance name.

### A.B.C.D/M

Denotes the subnet by specifying the IP address destination prefix along with a mask length.

### A.B.C.D A.B.C.D

Specifies the subnet with an IP destination address and its corresponding mask.

### A.B.C.D

Specifies the gateway's next-hop IPv4 address.

### IFNAME

Specifies the gateway's next-hop interface name.

### global

Global table lookup (to support inter-VRF static route leaking).

### <1-255>

Specifies the administrative distance value.

**track <1-500>**

Associates a tracking ID with an IPv4 static route for the tracked object.

**description LINE**

Adds a description to the static route, with a maximum character limit of 80.

**tag <0-4294967295>**

Assigns a tag value to the route, which can be used as a “match” value to control route redistribution through route maps.

**recursive**

Enables recursive lookup behavior for the next-hop in each static route. By default, it is disabled.

**Default**

None

**Command Mode**

Configure mode

**Applicability**

The command was introduced before OcNOS version 1.3 and was updated in OcNOS version 1.3.4. Introduced new parameters `track <1-500>` in OcNOS version 5.1 and `recursive` in OcNOS version 6.6.0.

**Examples**

```
#configure terminal
(config)#ip route 192.168.3.0 255.255.255.0 2.2.2.2 128
(config)#ip route 1.1.1.0/24 eth0 32
(config)#ip route vrf new 1.1.1.1/1 1.1.1.1 eth1 description new tag 1
(config)# ip route 40.1.1.0/24 eth1 track 10
(config)#commit

(config)#no ip route 40.1.1.0/24 eth1 track 10
(config)#commit
```

This example creates VRF static routes with the nexthops belonging to the default VRF. The nexthop gateway address can be the IFNAME network address or any other IP address reachable via IFNAME.

```
#show ip route vrf
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area

(config)#commit
```

---

## ip urpf enable

Use this command to enable uRPF mode on the system.

Use the `no` form of the command to disable uRPF mode on this system.

**Note:** The configuration is applied only after a reboot.

### Command Syntax

```
ip urpf enable
no ip urpf enable
```

### Parameter

None

### Default

By default, uRPF mode on the system is disabled.

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip urpf enable
% System Reboot is required for new URPF configurations to take effect

(config)#no ip urpf enable
% System Reboot is required for new URPF configurations to take effect
```

## ip verify unicast source reachable-via

Use this command to configure Unicast Reverse Path Forwarding with source-specific reachability on the interface level.

Use the `no` form of the command to disable Unicast Reverse Path Forwarding with source-specific reachability on the interface level.

### Command Syntax

```
ip verify unicast source reachable-via (any (allow-default|) | rx )
no ip verify unicast source reachable-via
```

### Parameters

#### any

Source is reachable via any interface

#### rx

Source is reachable via an interface on which packet was received

#### allow-default

Loose Default Route Unicast Reverse Path Forwarding

### Default

None

### Command Mode

Interface mode

### Applicability

This command was introduced in OcNOS version 6.0.0

### Examples

```
#configure terminal
(config)#interface xel
(config-if)#ip verify unicast source reachable-via any
(config-if)#ip verify unicast source reachable-via any allow-default
(config-if)#ip verify unicast source reachable-via rx
(config-if)#no ip verify unicast source reachable-via
```

## ip vrf

This command creates a user-defined VRF (Virtual Routing and Forwarding) RIB (Routing Information Base), assigns a VRF identifier, and switches to VRF mode.

Use the `no` parameter with command to remove a VRF RIB.

**Note:** On configuration of user-defined VRF with `ip vrf WORD CLI`, `lo.WORD` interface configuration will not be displayed in `show running-config` even though `lo.WORD` interface, default IPv4 address and default IPv6 address are present in system. To display the `interface lo.WORD`, `ip address 127.0.0.1/8` and `ipv6 address ::1/128` configurations in `show running configuration` user needs to explicitly configure the same from CLI. This is due to a restriction with scaled VRF configurations in a single commit.

## Command Syntax

```
ip vrf WORD
no ip vrf WORD
```

## Parameter

**WORD**

VRF identifier

## Default

By default, no user-defined VRFs exist, only the default VRF.

## Command Mode

Configure mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#configure terminal
(config)#ip vrf myVRF
(config-vrf)#
```

## ipv6 route

Use this command to create an IPv6 static route.

Use the no form of this command to delete a static route

**Note:** Using an interface name as the gateway next-hop for an IPv6 static route is not supported.

## Command Syntax

```
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME (<1-255>|) (track <1-500>|) (description
LINE|)
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X (<1-255>|) (track <1-500>|)
(recursive|) (description LINE|)
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME (<1-255>|) (track <1-500>|)
(recursive|) (description LINE|)
ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME global (track <1-500>|)
(recursive|)
ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME global (track <1-500>|)
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME {<1-255>|track <1-500>|description
LINE}
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X {<1-255>|track <1-
500>|recursive|description LINE}
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME {<1-255>|track <1-
500>|recursive|description LINE}
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME global
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME global {track <1-
500>|recursive}
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME global
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME global (track <1-500>|)
```

## Parameters

### vrf NAME

Specifies the user-defined VRF instance name.

### X:X::X:X/M

Denotes the subnet by specifying the IPv6 address destination prefix along with a mask length.

### X:X::X:X X:X::X:X

Specifies the subnet with an IPv6 destination address and its corresponding mask.

### X:X::X:X

Specifies the gateway's next-hop IPv6 address.

### IFNAME

Specifies the gateway's next-hop interface name.

### global

Global table lookup (to support inter-VRF static route leaking).

### <1-255>

Specifies the administrative distance value.

**track <1-500>**

Associates a tracking ID with an IPv6 static route for the tracked object.

**description LINE**

Adds a description to the static route, with a maximum character limit of 80.

**recursive**

Enables recursive lookup behavior for the next-hop in each static route. By default, it is disabled.

**Default**

None

**Command Mode**

Configure mode

**Applicability**

Introduced in OcNOS version 1.3. Added a new parameter `recursive` in OcNOS version 6.6.0.

**Example**

```
#configure terminal
(config)#ipv6 route 1234::/64 1000::1 128
(config)#ipv6 route 1235::/64 eth1 32
(config)#ipv6 route vrf vrf3 1236::/64 eth3
(config)#end

#show ipv6 route vrf all

---

## max-static-routes

Use this command to set the maximum number of static routes.

Use the `no` parameter to disable this command.

### Command Syntax

```
max-static-routes <1-4294967294>
no max-static-routes
```

### Parameters

#### <1-4294967294>

Maximum number of static routes

### Default

By default, max static routes value is 4294967294

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)# max-static-routes 123

(config)# no max-static-routes
```

---

## maximum-paths

Use this command to set the maximum number of paths to install in the FIB (Forwarding Information Base) for the ECMP (Equal-Cost MultiPath) feature.

Use the `no` parameter with this command to revert to default.

**Note:** If you change the number of paths from the default (8), you must save the running configuration and perform a reboot.

### Command Syntax

```
maximum-paths <1-64>  
no maximum-paths
```

### Parameter

**<1-64>**

Maximum number of paths to install in the FIB

### Default

By default, the maximum number of paths is 8.

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#maximum-paths 5
```

## router-id

Use this command to add a router identifier for this system.

Use the `no` form of this command to disable this function.

### Command Syntax

```
router-id A.B.C.D  
no router-id (A.B.C.D)
```

### Parameters

#### A.B.C.D

Router identifier in IP address format for this system.

### Default

None

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#router-id 123.12.3.123  
(config)#
```

## show debugging rib

Use this command to display debug settings.

### Command Syntax

```
show debugging rib
```

### Parameters

None

### Command Mode

Privileged execution mode and Execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
# show debugging rib
```

---

## show ip rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

### Command Syntax

```
show ip rpf A.B.C.D
show ip rpf (vrf NAME|) A.B.C.D
```

### Parameters

#### A.B.C.D

IP address of multicast source.

#### NAME

Virtual Routing and Forwarding name.

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show ip rpf 10.10.10.50

RPF information for 10.10.10.50
RPF interface: eth0
RPF neighbor: 10.1.2.1
RPF route: 0.0.0.0/0
RPF type: unicast (kernel)
RPF recursion count: 0
Doing distance-preferred lookups across tables
Distance: 0
Metric: 0
#
```

Here is the explanation of the "show command" output fields.

**Table 9. show ip rpf output fields**

| Field         | Description                                                    |
|---------------|----------------------------------------------------------------|
| RPF Interface | Name of the RPF interface.                                     |
| RPF neighbor  | Upstream RPF neighbor.                                         |
| RPF route     | Route table in which the logical interface address is located. |

**Table 9. show ip rpf output fields (continued)**

| Field               | Description                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| RPF type            | Different type of RPF like multicast, unicast, MBGP, DVMRP, or static mroutes.                                                     |
| RPF recursion count | Number of times that the router lookups its routing table more than once to find out the immediate next-hop and exiting interface. |
| Distance            | IP address of the remote side of the connection. Doing distance-preferred lookups across tables.                                   |
| Metric              | Metrics are informational units that can be measured and compared.                                                                 |

## show ipv6 rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

### Command Syntax

```
show ipv6 rpf X:X::X:X
show ipv6 rpf (vrf NAME|) X:X::X:X
```

### Parameters

#### X:X::X:X

IP address of multicast source.

#### NAME

Virtual Routing and Forwarding name.

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show ipv6 rpf 10:10::10:50

RPF information for 10.10.10.50
RPF interface: eth0
RPF neighbor: 10.1.2.1
RPF route: 0.0.0.0/0
RPF type: unicast (kernel)
RPF recursion count: 0
Doing distance-preferred lookups across tables
Distance: 0
Metric: 0
#
```

Here is the explanation of the "show command" output fields.

**Table 10. show ipv6 rpf output fields**

| Field         | Description                                                    |
|---------------|----------------------------------------------------------------|
| RPF Interface | Name of the RPF interface.                                     |
| RPF neighbor  | Upstream RPF neighbor.                                         |
| RPF route     | Route table in which the logical interface address is located. |

**Table 10. show ipv6 rpf output fields (continued)**

| Field               | Description                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| RPF type            | Different type of RPF like multicast, unicast, MBGP, DVMRP, or static mroutes.                                                     |
| RPF recursion count | Number of times that the router lookups its routing table more than once to find out the immediate next-hop and exiting interface. |
| Distance            | IPv6 address of the remote side of the connection. Doing distance-preferred lookups across tables.                                 |
| Metric              | Metrics are informational units that can be measured and compared.                                                                 |

---

## show rib txlist

Use this command to display internal Routing Information Base (RIB) transaction lists that are pending or currently being transmitted to the Forwarding Information Base (FIB). This command helps monitor routes awaiting installation or synchronization between the routing and forwarding planes. It is mainly used for debugging and operational verification of route processing states.

### Command Syntax

```
show rib (txlist | pending-txlist) (ipv4 | ipv6) (vrf WORD|)
```

### Parameters

#### txlist

Displays the list of routes that are currently being transmitted from RIB to FIB.

#### pending-txlist

Displays the list of routes queued for transmission to the FIB.

#### ipv4

Displays information for IPv4 routes.

#### ipv6

Displays information for IPv6 routes.

#### vrf WORD

Specifies the VRF name for which the RIB transaction information is displayed.

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

Introduced before OcNOS version 1.3.

Added the fields (req\_mpls, new\_req\_mpls, fib\_notify\_mpls, seq\_mpls) in OcNOS version 7.0.0.

### Example

```
#show rib pending-txlist ipv4 vrf VRF3
IPv4 pending:
0x02634680: 192.0.5.0/24      req(1) new_req(0) fib_notify(0) seq(0) lock(3)
0x02634830: 192.0.6.0/24      req(1) new_req(0) fib_notify(0) seq(0) lock(3)
0x026349e0: 192.0.7.0/24      req(1) new_req(0) fib_notify(0) seq(0) lock(3)
0x02634bb0: 192.0.8.0/24      req(1) new_req(0) fib_notify(0) seq(0) lock(3)
0x02652490: 192.0.9.0/24      req(1) new_req(0) fib_notify(0) seq(0) lock(3)
0x02652660: 192.0.10.0/24     req(1) new_req(0) fib_notify(0) seq(0) lock(3)
```

## show router-id

Use this command to display the Router ID of the current system.

### Command Syntax

```
show router-id
```

### Parameters

None

### Default

None

### Command Mode

Privileged execution mode and Execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show router-id  
Router ID: 10.55.0.2 (automatic)
```

---

## show running-config router

Use this command to display the running system router configuration.

### Command Syntax

```
show running-config router bgp
show running-config router isis
show running-config router ospf
show running-config router rip
show running-config router vrrp
```

### Parameters

**bgp**

Display Border Gateway Protocol (BGP) information.

**isis**

Display Intermediate System to Intermediate System (IS-IS) information.

**ospf**

Display Open Shortest Path First (OSPF) information.

**rip**

Display Routing Information Protocol (RIP) information.

**vrrp**

Display Virtual Router Redundancy Protocol (VRRP) information.

### Default

None

### Command Mode

Privileged execution mode, Configure mode, Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
>enable
#show running-config router vrrp
!
router-id 3.3.3.3
!
```

## show running-config router-id

Use this command to show the running system global router ID configuration.

### Command Syntax

```
show running-config router-id
```

### Parameters

None

### Default

None

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
>enable
#show running-config router-id
!
router-id 3.3.3.3
!
```

## show running-config urpf

Use this command to check uRPF status for this system.

### Command Syntax

```
show running-config urpf
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show running-config urpf
ip urpf enable

(config)#show running-config urpf
ip urpf enable
```

## show running-config vrf

Use this command to show the running system status and configuration details for a specified VRF instance name.

### Command Syntax

```
show running-config vrf WORD
```

### Parameters

#### WORD

Virtual Routing and Forwarding name

### Command Mode

Privileged execution mode, Configure mode, Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
>enable
#show running-config vrf xyz
!
ip vrf xyz
  description vrf
  router-id 11.11.11.11
```

---

## snmp restart rib

Use this command to restart SNMP in Routing Information Base (RIB)

### Command Syntax

```
snmp restart rib
```

### Parameters

None

### Default

By default, snmp restart command is disabled.

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#config terminal  
(config)# snmp restart rib
```

---

## IP Service Level Agreements Commands

IP Service Level Agreements (SLAs) is a diagnostic method which generates and analyses the traffic between an OcNOS device and your network. IP SLA monitors and reports network performance data which helps you to identify the actual root cause of a problem when the performance level drops.

This section describes the commands used to manage the IP SLA for ICMP echo.

|                                  |     |
|----------------------------------|-----|
| clear ip sla statistics .....    | 267 |
| frequency .....                  | 268 |
| icmp-echo .....                  | 269 |
| ip sla .....                     | 270 |
| ip sla schedule .....            | 271 |
| show ip sla statistics .....     | 272 |
| show ip sla summary .....        | 274 |
| show running-config ip sla ..... | 275 |
| threshold .....                  | 276 |
| timeout .....                    | 277 |

## clear ip sla statistics

Use this command to clear the IP SLA statistics.

### Command Syntax

```
clear ip sla statistics <1-65535>
```

### Parameters

**<1-65535>**

IP SLA identifier

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#clear ip sla statistics 1
```

---

## frequency

Use this command to configure the frequency or interval to send ICMP echo packets one by one.

Use the `no` form of this command to remove the configured ICMP echo frequency.

### Command Syntax

```
frequency <1-60>  
no frequency
```

### Parameters

**<1-60>**

Frequency in seconds

### Default

5 seconds

### Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#configure terminal  
(config)#ip sla 1  
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1  
(config-ip-sla-echo)#frequency 3
```

---

## icmp-echo

Use this command to select and configure the ICMP echo SLA operation. ICMP echo packets are constructed in the device and sent to the destination address that you specify. These packets are transferred on a specific interface by setting the `source-interface` parameter.

Use the `no` form of this command to un-configure or remove the configured ICMP echo measurement sessions.

### Command Syntax

```
icmp-echo (ipv4 A.B.C.D|ipv6 X:X::X:X|HOSTNAME) (source-interface IFNAME|)  
no icmp-echo (ipv4 A.B.C.D | ipv6 X:X::X:X | HOSTNAME)
```

### Parameters

**A.B.C.D**

IPv4 address

**X:X::X:X**

IPv6 address

**HOSTNAME**

Host name

**IFNAME**

Source interface name

### Default

None

### Command Mode

IP SLA mode (`config-ip-sla`)

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#configure terminal  
(config)#ip sla 1  
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xel  
(config-ip-sla-echo)#
```

## ip sla

Use this command to create an IP SLA instance. One instance maps to a single SLA operation. Users can create multiple SLA operations to perform multiple similar or different SLA operations.

Use the `no` form of this command to remove a configured IP SLA configurations.

### Command Syntax

```
ip sla <1-65535>  
no ip sla <1-65535>
```

### Parameters

#### <1-65535>

IP SLA identifier

### Default

None

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#configure terminal  
(config)#ip sla 1  
(config-ip-sla)#
```

---

## ip sla schedule

Use this command to schedule an IP SLA operation by associating a time-range object with the IP SLA operation. Use the `no` form of this command to stop the configured IP SLA measurement.

### Command Syntax

```
ip sla schedule <1-65535> time-range WORD (vrf (NAME) |)
```

### Parameters

**<1-65535>**

IP SLA identifier.

**time-range**

Time Range

**WORD**

Time range name that you set with the time-range command.

**vrf**

VPN Routing/Forwarding instance

**NAME**

VPN Routing/Forwarding instance name. Maximum limit 32 characters

### Default

None

### Command Mode

Configure mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#configure terminal
(config)#ip sla schedule 1 time-range t1 vrf v1
```

## show ip sla statistics

Use this command to display the statistics of IP SLA measurement.

### Command Syntax

```
show ip sla statistics <1-65535> detail
```

### Parameters

**<1-65535>**

IP SLA identifier.

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#show ip sla statistics 1 detail
=====
                IP SLA Statistics
=====
IP SLA ID           : 1
Start Time          : 2021 Aug 30 17:40:04
Elapsed time(milli sec) : 46015
Packets Sent        : 23
Packets Received    : 23
Packet Loss(%)      : 0.0000
Invalid Tests       : 0
Round Trip Delay(usec)
  Minimum           : 1000
  Maximum           : 1000
  Average           : 1000
```

Here is the explanation of the "show command" output fields.

**Table 11. show ip sla statistics fields**

| Field      | Description                 |
|------------|-----------------------------|
| IP SLA ID  | IP SLA Identifier (1-65535) |
| Start Time | Measurement start time      |

**Table 11. show ip sla statistics fields (continued)**

| <b>Field</b>            | <b>Description</b>                                                                                                            |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Elapsed time(milli sec) | Time taken to complete the measurement in milliseconds                                                                        |
| Packets Sent            | Number of packet sent                                                                                                         |
| Packets Received        | Number of packet received                                                                                                     |
| Packet Loss(%)          | Packet lost in percentage                                                                                                     |
| Invalid Tests           | Received ICMP echo reply packets after configured threshold limit will be marked as invalid tests                             |
| Round Trip Delay(usec)  | Round trip delay between ICMP echo request and ICMP echo reply: minimum, maximum and average round trip delay in microseconds |

---

## show ip sla summary

Use this command to display the summary of all IP SLA measurements.

### Command Syntax

```
show ip sla summary
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#show ip sla summary
IPSLAs Latest Operation Summary
Codes: * active, ^ inactive

ID          Type          Destination      Stats      Return      Last
            (usec)          Code            Run
-----
^1          icmp-echo      20.2.2.3        0          OK          2021 Aug 23 13:53:37
```

Here is the explanation of the "show command" output fields.

**Table 12. show ip sla summary fields**

| Field        | Description                                         |
|--------------|-----------------------------------------------------|
| ID           | IP SLA Identifier (1-65535)                         |
| Type         | Measurement type                                    |
| Destination  | Destination address                                 |
| Stats (usec) | Round trip time in microseconds for the measurement |
| Return Code  | Measurement status                                  |
| Last Run     | Measurement last run date and time                  |

## show running-config ip sla

Use this command to display the IP SLA running configuration alone.

### Command Syntax

```
show running-config ip sla
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#show running-config ip sla
ip sla 1
  icmp-echo ipv4 20.2.2.3
  frequency 2
  threshold 2000
  timeout 5000
ip sla schedule 1 time-range t1 vrf v1
```

---

## threshold

Use this command to configure the threshold for every ICMP echo packet.

Use the `no` form of this command to remove the configured ICMP echo threshold.

### Command Syntax

```
threshold <1000-60000>  
no threshold
```

### Parameters

#### <1000-60000>

Threshold in milliseconds.

### Default

10000 milliseconds

### Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#configure terminal  
(config)#ip sla 1  
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1  
(config-ip-sla-echo)#threshold 5000
```

## timeout

Use this command to configure the timeout for every ICMP echo packet. Any packet arriving beyond this interval is considered to be lost.

Use the `no` form of this command to remove the configured ICMP echo timeout.

### Command Syntax

```
timeout <1000-60000>  
no timeout
```

### Parameters

#### <1000-60000>

Timeout in milliseconds.

### Default

10000 milliseconds

### Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

### Applicability

This command was introduced in OcNOS version 5.0.

### Example

```
#configure terminal  
(config)#ip sla 1  
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1  
(config-ip-sla-echo)#timeout 5000
```

---

## Object Tracking Commands

This section describes the Object Tracking commands:

|                                 |     |
|---------------------------------|-----|
| delay up down .....             | 279 |
| object-tracking .....           | 280 |
| show running-config track ..... | 282 |
| show track .....                | 283 |
| show track <1-500> .....        | 284 |
| show track summary .....        | 285 |
| track ip sla reachability ..... | 286 |

---

## delay up down

Use this command is used to delay the state change notification of Object tracking.

Use the `no` form of this command to remove delay the state change notification of Object

### Command Syntax

```
delay (up <1-9999>|) (down <1-9999>|)  
no delay (|up|down)
```

### Parameters

#### <1-999>

Delay in Notification in seconds.

### Default

None

### Command Mode

Object tracking Mode

### Applicability

This command is introduced in OcNOS version 5.1.

### Example

```
OcNOS(config-object-track)#delay up 10 down 20  
OcNOS(config-object-track)#no delay  
OcNOS(config-object-track)#commit  
OcNOS(config-object-track)#  
OcNOS(config-object-track)#delay down 10  
OcNOS(config-object-track)#commit  
OcNOS(config-object-track)#no delay down  
OcNOS(config-object-track)#commit  
OcNOS(config-object-track)#  
OcNOS(config-object-track)#delay up 10  
OcNOS(config-object-track)#commit  
OcNOS(config-object-track)#no delay up  
OcNOS(config-object-track)#commit  
OcNOS(config-object-track)#
```

---

## object-tracking

Use this command to configure track IDs and options on the interfaces.

Use the `no` parameter with this command to remove the configurations.

These commands configure object tracking on interfaces, with specific track IDs and tracked objects set to determine what gets tracked and affects the interface's status.

The `object-tracking` command provides flexibility, enabling both `all` and `any` tracking behaviors for influencing the interface's status. A maximum of 8 track IDs can be configured per interface. It is possible to configure the same track IDs or options on multiple interfaces.

### Command Syntax

```
object-tracking <1-500>
object-tracking <all | any>
no object-tracking <1-500>
no object-tracking <all | any>
```

### Parameters

#### <1-500>

Object tracking ID

#### all

Boolean AND operation. Each object configured on the interface must be in an up state for the interface itself to be in an up state; otherwise, it will be brought down.

#### any

Boolean OR operation. At least one object configured on the interface must be in an up state; otherwise, the interface will be brought down.

### Default

None

### Command Mode

Interface mode

### Applicability

Introduced in OcNOS version 6.4.1.

### Example

Here are some example commands for configuring object tracking in the interface mode.

```
OcNOS(config)#interface xe5
OcNOS(config-if)#object-tracking 10
OcNOS(config-if)#object-tracking all
OcNOS(config-if)#commit

OcNOS(config-if)#no object-tracking 10
OcNOS(config-if)#no object-tracking all
```

```
OcNOS(config-if)#commit  
OcNOS(config-if)#exit
```

## show running-config track

Use this command to display object tracking running configuration alone.

### Command Syntax

```
show running-config track
```

### Parameters

None

### Default

None

### Command Mode

Privileged execution mode and Execution mode

### Applicability

This command is introduced in OcNOS version 5.1.

### Example

```
OcNOS#sh running-config track
track 1 ip sla 1 reachability
  delay up 20
!
track 2 ip sla 2 reachability
!
OcNOS#
```

---

## show track

Use this command to display Sham link information.

### Command Syntax

```
show track
```

### Parameters

None

### Default

None

### Command Mode

Execution mode

### Applicability

This command is introduced in OcNOS version 5.1.

### Example

```
OcNOS#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is DOWN
    0 changes, last change : 2021 Dec 11 05:20:23
OcNOS#
```

---

## show track <1-500>

Use this command to display Sham link information.

### Command Syntax

```
show track <1-500>
```

### Parameters

**<1-500>**

Object identifier

### Default

None

### Command Mode

Privileged execution mode and Execution mode

### Applicability

This command is introduced in OcNOS version 5.1.

### Example

```
OcNOS#show track 2
TRACK Id: 2
  IP SLA 2 reachability
  Reachability is DOWN
    0 changes, last change : 2021 Dec 11 05:29:49
OcNOS#
```

---

## show track summary

Use this command to display the summary of all object tracking.

### Command Syntax

```
show track summary
```

### Parameters

None

### Default

None

### Command Mode

Privileged execution mode and Execution mode

### Applicability

This command is introduced in OcNOS version 5.1.

### Example

```
OcNOS#show track summary
Object Tracking Summary
ID      Type      Type-Identifier  State
-----
1       ip-sla      1                DOWN
2       ip-sla      2                DOWN
OcNOS#
```

---

## track ip sla reachability

Use this command to configure an Object for tracking using IP SLA.

Use the `no` form of this command to delete to object tracking

### Command Syntax

```
track <1-500> ip sla <1-65535> reachability
no track <1-500> ip sla <1-65535> reachability
```

### Parameters

#### **object-number <1-500>**

Identifier for the tracked object

#### **ip-sla-number <1-65535>**

Identifier for IP SLA association with tracking object

### Command Mode

Configure mode

### Applicability

This command is introduced in OcNOS version 5.1.

### Example

```
#configure terminal
OcNOS(config)#track 1 ip sla 1 reachability
OcNOS(config-object-track)#commit

OcNOS(config)#no track 1
OcNOS(config)#commit
```

---

## Route-Map Commands

This section describes the Route-Map commands:

|                                       |     |
|---------------------------------------|-----|
| continue .....                        | 289 |
| match as-path .....                   | 291 |
| match community .....                 | 292 |
| match extcommunity .....              | 293 |

## continue

The `continue` clause provides the capability to execute additional entries in a route map after an entry is executed with a successful `match` and `set` clauses (i.e), the `continue` command allows multiple entries to be evaluated within a single `route-map`. `Continue` commands can be assigned optional `sequence numbers` that indicate the order in which clauses are to be evaluated.

Use the `no` form of the command (specifying a particular `sequence number` if desired), to remove individual or all `continue` clauses from a `route-map`.

### Notes:

- Configuration update from `continue` to `continue <sequence number>` or vice versa is not supported. To switch between these command formats, users must first remove the existing configuration and then apply the new one.
- If the target sequence in the `continue` statement does not exist, the route-map behaves as if there was no `continue` statement at all and processing stops after the current sequence.

## Continue clause with match Clauses

When a `match` clause exists in a route map with `continue` clause, then the `continue` clause is executed only when a successful `match` occurs. If a `match` clause does not exist in the route-map and if a `continue` clause does exist, the `continue` clause will be evaluated and then go to the specified route-map entry. When a successful `match` occurs and we have a `continue` clause, the route-map executes the `set` clauses and then goes to the specified route-map entry. If `continue` clause does not exist in the next route map, then the route-map will behave normally. If a `continue` clause exists in the next route-map but a `match` is not successful, the route-map will not continue and will *fall through* to the next sequence number if one exists.

## Continue clause with set Clauses

`Set` clauses are executed after the route-map evaluation is done. The `set` clauses are evaluated and executed in the order in which they were configured. `Set` clauses are only executed after a successful `match` occurs. The `continue` statement proceeds to the specified route-map entry only after configured `set` actions are performed. If a `set` action is configured in the first route-map and then the same `set` action occurs again, but with a different value in a subsequent route-map entry, then the last `set` action will override the previous `set` actions, which were configured with the same `set` command.

## Command Syntax

```
continue <2-65535>|)
no continue <2-65535>|)
```

## Parameter

### <2-65535>

Continue sequence number.

## Default

No default value is specified

## Command Mode

Route map mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
(config)#route-map Rmap1
(config-route-map)#continue ?
<2-65535> Route-map entry sequence number
<cr>
(config-route-map)#continue 10
(config-route-map)#continue 30
```

## match as-path

Use this command to match an autonomous system path access list. This command specifies the autonomous system path to be matched. If there is a match for the specified AS path, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are `not` met then the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

**Note:** This command is valid only for BGP.

Use the `no` parameter with this command to remove a path list entry.

### Command Syntax

```
match as-path WORD
no match as-path (WORD|)
```

### Parameter

#### WORD

Autonomous system path access list name.

#### Default

Enabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match as-path myaccesslist
```

## match community

Use this command to specify the community to be matched.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by the `match community` command overrides the global values. The route that does not match at least one match clause is ignored.

**Note:** Only one `match community` command is permitted per route-map sequence. Configuring a new one replaces the existing entry. This command applies only to BGP routes.

Use the `no` parameter with this command to remove the community list entry.

### Command Syntax

```
match community (<1-99>|<100-199>|WORD) (exact-match|)  
no match community (<1-99>|<100-199>|WORD|) (exact-match|)
```

### Parameters

#### <1-99>

Specifies standard community list number.

#### <100-199>

Specifies expanded community list number.

#### WORD

Specifies named community list (standard or expanded).

#### exact-match

(Optional) Requires the route's communities to exactly match those in the list.

### Default

None

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#route-map myroute permit 3  
(config-route-map)#match community mylist
```

## match extcommunity

Use this command to match BGP external community list

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by this command overrides the global values. The route that does not match at least one match clause is ignored.

**Note:** Only one `match extcommunity` command is permitted per route-map sequence. Configuring a new one replaces the existing entry. This command applies only to BGP routes.

Use the `no` parameter with this command to remove the community list entry.

### Command Syntax

```
match extcommunity (<1-99>|<100-199>|WORD) (exact-match|)  
no match extcommunity (<1-99>|<100-199>|WORD|) (exact-match|)
```

### Parameters

#### <1-99>

Specifies standard community list number.

#### <100-199>

Specifies expanded community list number.

#### WORD

Specifies named community list (standard or expanded).

#### exact-match

(Optional) Requires the route's communities to exactly match those in the list.

### Default

None

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#route-map myroute permit 3  
(config-route-map)#match extcommunity mylist
```

---

## match interface

Use this command to define the interface match criterion. This command specifies the next-hop interface name of a route to be matched.

Use the `no` parameter with this command to remove the specified match criterion.

### Command Syntax

```
match interface IFNAME  
no match interface (IFNAME|)
```

### Parameter

#### **IFNAME**

Interface name.

### Default

By default, match interface is disabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#route-map mymap1 permit 10  
(config-route-map)#match interface eth0
```

---

## match ip address

Use this command to specify the match address of route. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified then the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

### Command Syntax

```
match ip address (<1-199>|<1300-2699>|WORD)
no match ip address (<1-199>|<1300-2699>|WORD|)
```

### Parameters

#### WORD

IP access-list name.

#### <1-199>

IP access-list number (standard range).

#### <1300-2699>

IP access-list number (expanded range).

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match ip address List1
```

## match ip address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to disable this function.

**Note:** The route-map with `match ip address prefix-list WORD` only applies to IPv4 prefixes. When users apply it to IPv6 prefixes, it does not perform a match. Instead, the route-map is treated as RMAP\_PERMIT.

### Command Syntax

```
match ip address prefix-list WORD
no match ip address prefix-list (WORD|)
```

### Parameter

**WORD**

IP prefix list name.

### Default

None

### Command Mode

Route map mode

### Applicability

Introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip address prefix-list mylist
```

---

## match ip next-hop

Use this command to specify a next-hop address to be matched in a route-map. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
match ip next-hop (<1-199>|<1300-2699>|WORD)
no match ip next-hop (<1-199>|<1300-2699>|WORD|)
```

### Parameters

#### WORD

Specify the IP access-list name.

#### <1-199>

Specify the IP access-list number (standard range).

#### <1300-2699>

Specify the IP access-list number (expanded range).

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip next-hop mylist
```

## match ip next-hop prefix-list

Use this command to specify the next-hop IP address match criterion using the prefix-list. This command matches the next-hop IP address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

### Command Syntax

```
match ip next-hop prefix-list WORD
no match ip next-hop prefix-list (WORD|)
```

### Parameter

#### WORD

Prefix-list name.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip next-hop prefix-list list1
```

---

## match ip peer

Use this command to specify the match peer IPv4 address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

### Command Syntax

```
match ip peer (<1-199>|<1300-2699>|WORD)
no match ip peer (<1-199>|<1300-2699>|WORD|)
```

### Parameter

#### WORD

IP access-list name.

#### <1-199>

IP access-list number (standard range).

#### <1300-2699>

IP access-list number (expanded range).

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip peer 123

(config-route-map)#no match ip peer 123
```

---

## match ipv6 address

Use this command to specify the match address of route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

**Note:** This command is valid for BGP, OSPFv3, and RIPng only.

### Command Syntax

```
match ipv6 address WORD
no match ipv6 address (WORD|)
```

### Parameter

**WORD**

IPv6 access list name.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map myRM deny 1
(config-route-map)#match ipv6 address myRM
```

## match ipv6 address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might differ from what is indicated by the routing protocols. Setting policies allows packets to follow different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding rules specified in routing tables.

Use the `no` parameter with this command to disable this function

### Notes:

- This command is valid for BGP, OSPFv3, and RIPng only.
- The route-map with `match ipv6 address prefix-list WORD` only applies to IPv6 prefixes. When users apply it to IPv4 prefixes, it does not perform a match. Instead, the route-map is treated as `RMAP_PERMIT`.

## Command Syntax

```
match ipv6 address prefix-list WORD
no match ipv6 address prefix-list (WORD|)
```

## Parameter

### WORD

IPv6 access list name.

## Default

None

## Command Mode

Route map mode

## Applicability

Introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 address prefix-list mylist
```

---

## match ipv6 next-hop

Use this command to specify the next-hop address to be matched. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

**Note:** This command is valid for BGP and IS-IS only.

Use the `no` parameter with this command to disable this function

### Command Syntax

```
match ipv6 next-hop (X:X::X:X|WORD)
no match ipv6 next-hop (X:X::X:X|WORD|)
```

### Parameters

#### **X:X::X:X**

IPv6 address of the next-hop.

#### **WORD**

IPv6 access list name.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop 3ffe::1
```

---

## match ipv6 next-hop prefix-list

Use this command to match the IPv6 next-hop against entries in a prefix-list. The route defined by policies may differ from the route chosen by routing protocols. Policies allow packets to follow different paths based on their length or content. Packet forwarding determined by configured policies overrides the forwarding decisions made by routing tables. This command applies to BGP and IS-IS.

Use the `no` parameter with this command to delete the entries in the prefix-list that match the IPv6 next-hop.

### Command Syntax

```
match ipv6 next-hop prefix-list WORD
no match ipv6 next-hop prefix-list WORD
```

### Parameters

**prefix-list WORD**

Specifies the name of the IPv6 prefix-list used for matching next-hops.

### Default

None

### Command Mode

Route map mode

### Applicability

Introduced before OcNOS version 1.3.

### Examples

This example creates a route-map named `rmap1` with sequence number 3 and attaches a condition to match IPv6 next-hops against the prefix-list `nh_prefixes`. Only routes with next-hops allowed by `nh_prefixes` will match this route-map entry.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop prefix-list nh_prefixes
```

---

## match ipv6 peer

Use this command to specify the match peer IPv6 address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

### Command Syntax

```
match ipv6 peer (<1-199>|<1300-2699>|WORD)
no match ipv6 peer (<1-199>|<1300-2699>|WORD|)
```

### Parameter

#### WORD

IP access-list name.

#### <1-199>

IP access-list number (standard range).

#### <1300-2699>

IP access-list number (expanded range).

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ipv6 peer 123

(config-route-map)#no match ipv6 peer 123
```

---

## match metric

Use this command to match a metric of a route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

**Note:** This command is valid for BGP, OSPF, RIP, and IS-IS only.

Use the `no` parameter with this command to disable this function

### Command Syntax

```
match metric <0-4294967295>
no match metric (<0-4294967295>|)
```

### Parameters

**<0-4261412864>**

Metric value.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match metric 888999
```

## match origin

Use this command to match origin code. The origin attribute defines the origin of the path information. The `egp` parameter is indicated as an `e` in the routing table, and it indicates that the origin of the information is learned via EGP (Exterior Gateway Protocol). The `igp` parameter is indicated as an `i` in the routing table, and it indicates the origin of the path information is interior to the originating AS. The `incomplete` parameter is indicated as a `?` in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

This command specifies the origin to be matched. If there is a match for the specified origin, and `permit` is specified when you created the route-map, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

**Note:** This command is valid only for BGP.

Use the `no` parameter with this command to disable this matching.

## Command Syntax

```
match origin (egp|igp|incomplete)
no match origin (egp|igp|incomplete|)
```

## Parameters

### **egp**

Remote exterior gateway protocol.

### **igp**

Local internal gateway protocol.

### **incomplete**

Unknown heritage.

## Default

No default value is specified

## Command Mode

Route-map mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match origin egp
```

## match route-map

Use this command to nest a route-map as a match criteria. The nested route-map entries are executed in the order of sequence ID. The match criteria of the nested route-map entry are evaluated, then if a match occurs and a permit action is specified in the entry, its set actions are executed and a “match” result is returned to the parent route-map, which then continues its evaluations. If a match occurs and a deny action is specified in the entry, the set actions are skipped, and a no-match result is returned to the parent route-map. If the match criteria are not satisfied in any of the nested route-map entries, a no-match is returned to the parent route-map.

Use the `no` parameter with this command to remove a nested route-map.

Notes: This command applies only to BGP.

A maximum of 8 route-maps can be nested within a route-map instance at the same time and more than 4 levels of nesting are not allowed.

A route-map needs to exist to be nested.

## Command Syntax

```
match route-map WORD
no match route-map WORD
```

## Parameters

### WORD

Name for the route-map (Max size 64).

### Default

By default, match route-map is disabled

## Command Mode

Route map mode

## Applicability

This command was introduced in OcNOS version 7.0.0.

## Examples

```
#configure terminal
```

```
(config)#route-map CHILD permit 10
(config-route-map)#exit
(config)#route-map PARENT permit 10
(config-route-map)#match route-map CHILD
```

---

## match route-type

Use this command to match an external route type. AS-external LSA is either Type-1 or Type-2. External type-1 matches only Type 1 external routes and external type-2 matches only Type 2 external routes.

Use the `no` parameter with this command to turn off the matching.

### Command Syntax

```
match route-type external (type-1|type-2)
no match route-type external (type-1|type-2|)
```

### Parameters

#### type-1

Match OSPF External Type 1 metric.

#### type-2

Match OSPF External Type 2 metric.

### Default

By default, match route type external is disabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match route-type external type-1
```

## match tag

Use this command to match the specified tag value.

Use the `no` parameter with this command to turn off the declaration.

### Command Syntax

```
match tag <0-4294967295>  
no match tag (<0-4294967295>|)
```

### Parameters

#### <0-4294967295>

Tag value.

### Default

By default, match tag is disabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#route-map mymap1 permit 10  
(config-route-map)#match tag 100
```

---

## route-map

Use this command to enter route-map mode and to permit or deny match/set operations.

This command controls and modifies routing information to allow redistribution of routes. It has a list of `match` and `set` commands associated with it. The `match` commands specify the conditions under which redistribution is allowed, and the `set` commands specify the particular redistribution actions to be performed if the criteria enforced by match commands are met. Route maps are used for detailed control over route distribution between routing processes.

Route maps also allow policy routing, and might route packets to a different route than the obvious shortest path.

Use the `no` parameter with this command to turn off the declaration.

### Command Syntax

```
route-map WORD (deny|permit) <1-65535>  
no route-map WORD ((deny|permit) <1-65535>|)
```

### Parameters

#### WORD

Route-map name (maximum size 63 characters).

#### deny

Route map deny set operations. If this parameter is specified, and the match criteria are met, the route is not redistributed, and any other route maps with the same map tag are not examined.

#### permit

Route map permit set operations. If this parameter is specified, and the match criteria are met, the route is redistributed as specified by the set actions. If the `match` criteria are not met, the next route map with the same tag is tested.

#### <1-65535>

Sequence to insert into or delete from an existing route-map.

### Default

No default value is specified

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#route-map routel permit 1  
(config-route-map)#
```

## set aggregator

Use this command to set the AS number for the route map and router ID. An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the `set aggregator` command to assign an AS number for the aggregator.

To use the `set aggregator` command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

### Command Syntax

```
set aggregator as <1-65535> A.B.C.D
no set aggregator as (<1-65535> A.B.C.D|)
```

### Parameters

#### <1-65535>

AS number of aggregator.

#### A.B.C.D

IP address of aggregator.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set aggregator as 43 10.10.0.3
```

## set as-path

Use this command to modify an autonomous system path for a route. By specifying the length of the AS-Path, the router influences the best path selection by a neighbor. Use this command to prepend an AS path string to routes increasing the AS path length.

To use this command, users must first give the `match` and `set` commands configure the conditions for redistributing routes from one routing protocol to another:

- The `match` command specifies the match criteria under which redistribution is allowed for the current route-map.
- The `set` command specifies the set redistribution actions to be performed if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

## Command Syntax

```
set as-path prepend .<1-4294967295>  
no set as-path prepend (.<1-4294967295>|)
```

## Parameters

<1-4294967295>

OcNOS prepends the 32 bit number to the AS path.

## Default

No default value is specified

## Command Mode

Route map mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal  
(config)#route-map myroute permit 3  
(config-route-map)#set as-path prepend 8 24
```

## set atomic-aggregate

Use this command to set an atomic aggregate attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

### Command Syntax

```
set atomic-aggregate
no set atomic-aggregate
```

### Parameters

No default value is specified

### Default

None

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set atomic-aggregate
```

## set comm-list

Use this command to delete the matched communities from the community attribute of an inbound or outbound update when applying route-map.

Use the `no` parameter with this command to disable this feature.

### Command Syntax

```
set comm-list (<1-99>|<100-199>|WORD) delete
no set comm-list (<1-99>|<100-199>|WORD) delete
```

### Parameters

**<1-99>**

Standard community-list number.

**<100-199>**

Expanded community-list number.

**WORD**

Name of the community-list.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map myRM permit 3
(config-route-map)#set comm-list 34 delete
```

---

## set community

Use this command to set the communities attribute, and group destinations in a certain community, as well as apply routing decisions according to those communities.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to delete the entry.

### Command Syntax

```
set community [<65536-4294901759>|AA:NN|internet|local-AS|no-advertise|no-export|none] (additive|)
no set community [AA:NN|internet|local-AS|no-advertise|no-export|none] (additive|)
```

### Parameters

#### <65536-4294901759>

Community number

#### AA:NN

The community number in aa:nn format.

#### internet

Internet.

#### local-AS

Do not send outside the local AS (well-known community).

#### no-advertise

Do not advertise this route to eBGP peers

#### no-export

Do not advertise this route to any peer.

#### none

Remove the community attribute from the prefixes that pass the route-map.

#### additive

Add to the existing community.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

The following examples show the use of the `set community` command with different parameters.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-export no-advertise

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-advertise

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community 10:01 23:34 12:14 no-export
```

## set dampening

Use this command to enable route-flap dampening and set parameters. Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

Use the `no` parameter with this command to delete the entry.

### Command Syntax

```
set dampening <1-45> <1-20000> <1-20000> <1-255> (<1-45>|)  
no set dampening <1-45> <1-20000> <1-20000> <1-255> (<1-45>|)
```

### Parameters

#### <1-45>

Reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value.

#### <1-20000>

Reuse-limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.

#### <1-20000>

Suppress-limit value. When the penalty for a route exceeds the suppress value, the route is suppressed.

#### <1-255>

Max-suppress-time. Maximum time that a dampened route is suppressed.

#### <1-45>

Unreachability half-life time for penalty, in minutes.

### Default

Default reachability half-life time: 15 minutes

Default reuse limit value: 750

Default suppress limit value: 2000

Default max-suppress value is 4 times the half-life time (60 minutes)

Default unreachability half-life time value: 15 minutes

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#route-map R1 permit 24  
(config-route-map)#set dampening 20 333 534 30
```

## set extcommunity

Use this command to set an extended community attribute.

To use this command you must first have a match clause. The `match` and `set` commands define the conditions for redistributing routes from one routing protocol to another:

- The `match` command defines the match criteria under which redistribution is allowed for the current route-map.
- The `set` command defines the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
set extcommunity rt .AA:NN (additive|)
set extcommunity soo .AA:NN
set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>
no set extcommunity rt (.AA:NN|) (additive|)
no set extcommunity soo (.AA:NN|)
no set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>
```

### Parameters

**rt**

Route target extended community.

**.AA:NN**

VPN extended community

**additive**

Add to the exsisting community.

**soo**

Site-of-origin extended community.

**cost**

Extended cost community.

**igp**

Compare following IGP cost comparison.

**pre-bestpath**

Compare following IGP cost comparison.

**<0-255>**

Community ID.

**<0-4294967295>**

Cost.

### Default

None

### Command Mode

Route map mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 06:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 0.0.0.6:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 06:01

#configure terminal
(config-route-map)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 0.0.0.6:01
```

---

## set interface null0

Use this command to discard routes based on policy/rules configured for a route map.

Route maps can be applied to BGP neighbors. When this command is given for a route map and that route map is applied to a BGP neighbor, the discard route entries are added by BGP for the prefix permitted by the route map.

Use the `no` form of this command to not discard routes based on policy/rules configured for a route map.

### Command Syntax

```
set interface null0
no set interface null0
```

### Parameters

None

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

To discard 1.1.1.1/24 from BGP neighbor 30.1.1.1:

```
#configure terminal
(config)#ip prefix-list myPrefixList seq 5 permit 1.1.1.1/24 eq 24
(config)#route-map myRM permit 1
(config-route-map)#match ip address prefix-list myPrefixList
(config-route-map)#set interface null0
(config-route-map)#exit
(config)#router bgp 200
(config-router)#neighbor 30.1.1.1 remote-as 200
(config-router)#neighbor 30.1.1.1 route-map myRM in
```

## set ip next-hop

Use this command to set the specified next-hop value.

Use the `no` parameter with this command to turn off the setting.

**Note:** This command is valid for BGP, OSPF, and RIP only.

### Command Syntax

```
set ip next-hop A.B.C.D | peer-address |self
no set ip next-hop (A.B.C.D|)
no set ip next-hop peer-address
no set ip next-hop self
```

### Parameter

#### A.B.C.D

IP address of the next-hop.

#### peer-address

Use peer address (for Outbound BGP only)

#### self

Self (for BGP LU only)

**Note:** The `set ip next-hop` options are mutually exclusive. Only one option can be configured in a route-map at any given time. Configuring more than one option is not permitted.

### Default

Disabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3

### Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#set ip next-hop 10.10.0.67
```

---

## set ipv6 next-hop

Use this command to set a next hop-address and configure IPv6 nexthop as tracked object to verify its availability.

Use the `no` parameter with this command to delete an entry

**Note:** This command is valid for BGP and OSPFv3 only.

### Command Syntax

```
set ipv6 next-hop X:X::X:X
set ipv6 next-hop local X:X::X:X
no set ipv6 next-hop (X:X::X:X|)
no set ipv6 next-hop local (X:X::X:X|)
```

### Parameters

**X:X::X:X**

Global IPv6 address of the nexthop.

**local**

Local IPv6 address of the nexthop.

### Default

Disabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3

### Examples

The following example is for configuring a route-map to set the next-hop IP address, without availability trackings:

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set ipv6 next-hop local fe80::203:47ff:fe97:66dc
```

---

## set ip next-hop self

Use this command to set next hop self for IPV4 BGP-LU neighbors.

Use “no” form of this command to not set next hop self.

### Command Syntax

```
set ip next-hop self
no set ip next-hop self
```

## Parameters

None

## Command Mode

Route map mode mode

## Applicability

This command is introduced in OcNOS version 7.0.0

## Examples

```
ip prefix-list BCOM-IP
  seq 5 permit 25.4.4.0/24 eq 24

route-map BCOM-RM permit 2
  match ip address prefix-list BCOM-IP
  set ip next-hop self

router bgp 26
..
  address-family ipv4 labeled-unicast
  neighbor 27.27.27.27 route-map BCOM-RM out
..
```

---

## set large-community

Use this command to set the large community values in routing policies.

### Command Syntax

```
set large-community (.AAaa:NNnn:ZZzz) (additive|)
no set large-community (.AAaa:NNnn:ZZzz) (additive|)
```

### Parameters

#### .AAaa:NNnn:ZZzz

Specifies the large community value with a maximum length of 255 characters.

#### additive

(Optional) Appends the specified large-community values to the existing large-community values in the route.

### Default

The send-community large is enabled by default for peers.

### Command Mode

Route map mode

### Applicability

This command was introduced in OcNOS version 6.1.0. Introduced a new parameter, `additive`, and updated the maximum character length for large community values to 255 in OcNOS version 6.6.1.

### Examples

#### Setting Multiple Large Communities

```
OcNOS(config)#route-map R1 permit 10
OcNOS(config-route-map)#set large-community 2:2:2 9:9:9 3:3:3
OcNOS(config-route-map)#commit
```

The below configuration adds two large community attributes `132:1:132` and `132:1:132`, to the matching routes. The `additive` option ensures these communities are added without replacing any existing ones.

```
OcNOS(config-route-map)#set large-community 132:1:132 132:1:132 additive
OcNOS(config-route-map)#commit
```

#### Setting a Single Large Community

```
OcNOS(config-route-map)#set large-community 1:2:3
OcNOS(config-route-map)#commit
```

- Verify the configured lists using the `show` command.

```
OcNOS#show running-config route-map
!
route-map rmap permit 10
  match large-community EXPTEST
  set large-comm-list 100 delete
!
```

```
route-map rmap1 permit 10
  match large-community 1
  set large-community 1:2:3
!
route-map rmap2 permit 10
  match large-community 100
  set large-comm-list 104 delete
!
route-map rmap3 permit 10
  match large-community STDTEST exact-match
!

OcNOS#show route
route-map router-id
OcNOS#show route-map
route-map rmap, permit, sequence 10
  Match clauses:
    large-community: EXPTEST
  Set clauses:
    large-comm-list 100 delete
route-map rmap1, permit, sequence 10
  Match clauses:
    large-community: 1
  Set clauses:
    large-community 1:2:3
route-map rmap2, permit, sequence 10
  Match clauses:
    large-community: 100
  Set clauses:
    large-comm-list 104 delete
route-map rmap3, permit, sequence 10
  Match clauses:
    large-community: STDTEST exact-match
  Set clauses:
```

---

## set level

Use this command to set the IS-IS level to export a route.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
set level (level-1|level-2|level-1-2)
no set level (level-1|level-2|level-1-2|)
```

### Parameters

#### level-1

Export into a level-1 area.

#### level-2

Export into a level-2 sub-domain.

#### level-1-2

Export into level-1 and level-2.

### Default

By default, set level is disabled

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set level level-1
```

## set local-preference

Use this command to set the BGP local preference path attribute.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
set local-preference <0-4294967295>  
no set local-preference (<0-4294967295>|)
```

### Parameters

**<0-4294967295>**

Tag value for destination routing protocol.

### Default

By default, set local preference is disabled

### Command Mode

Route-map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#route-map rmap1 permit 3  
(config-route-map)#set local-preference 12
```

---

## set metric

Use this command to set a metric value for a route and influence external neighbors about the preferred path into an Autonomous System (AS). The preferred path is the one with a lower metric value. A router compares metrics for paths from neighbors in the same ASs. To compare metrics from neighbors coming from different ASs, use the `bgp always-compare-med` command.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
set metric WORD
no set metric (WORD|)
```

### Parameters

#### WORD

Metric value [+/-] <1-4294967295>

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric 600
```

## set metric-type

Use this command to set the metric type for the destination routing protocol. Select a type to be either Type-1 or Type-2 in the AS-external-LSA when the route-map matches the condition.

**Note:** This command is for OSPF, OSPFv3, or IS-IS only.

Use the `no` parameter with this command to return to the default.

### Command Syntax

```
set metric-type (internal|external)
set metric-type (type-1|type-2)
no set metric-type (internal|external|)
no set metric-type (type-1|type-2|)
```

#### Parameters

##### external

IS-IS external metric type.

##### internal

IS-IS internal metric type.

##### type-1

OSPF external type 1 metric.

##### type-2

OSPF external type 2 metric

#### Default

No default value is specified

#### Command Mode

Route map mode

#### Applicability

This command was introduced before OcNOS version 1.3.

#### Example

In this example the metric type of the destination protocol is set to OSPF external Type 1.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric-type type-1
```

---

## set origin

Use this command to set the BGP origin code. The origin attribute defines the origin of the path information.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to delete an entry.

### Command Syntax

```
set origin (egp|igp|incomplete)
no set origin (egp|igp|incomplete|)
```

### Parameters

#### egp

Learned through an Exterior Gateway Protocol.

#### igp

Interior to the originating AS. This happens when an Internal Gateway Protocol is redistributed into BGP.

#### incomplete

Unknown or learned through some other means. This happens when a static route is redistributed in BGP and the origin of the route is incomplete.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set origin egp
```

---

## set originator-id

Use this command to set the originator ID attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

### Command Syntax

```
set originator-id A.B.C.D
no set originator-id (A.B.C.D|)
```

### Parameter

#### A.B.C.D

IP address of originator.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set originator-id 1.1.1.1
```

---

## set tag

Use this command to set a tag value. The parameter is the route tag that is labeled by another routing protocol (BGP or other IGP when redistributing), because AS-external-LSA has a route-tag field in its LSAs. In addition, when using route-map, OcNOS can tag the LSAs with the appropriate tag value. Sometimes the tag matches with using route-map, and sometimes, the value may be used by another application.

Use the `no` parameter with this command to unset a tag value.

### Command Syntax

```
set tag <0-4294967295>
no set tag (<0-4294967295>|)
```

### Parameter

**<0-4294967295>**

Tag value for destination routing protocol.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

In the following example the tag value of the destination routing protocol is set to 6:

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set tag 6
```

---

## set weight

Use this command to set weights for the routing table.

The weight value is used to assist in best path selection. It is assigned locally to a router. When there are several routes with a common destination, the routes with a higher weight value are preferred.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

**Note:** This command is valid only for BGP.

Use the `no` parameter with this command to delete an entry.

### Command Syntax

```
set weight <0-4294967295>
no set weight (<0-4294967295>|)
```

### Parameter

**<0-4294967295>**

Weight value.

### Default

No default value is specified

### Command Mode

Route map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

In the following configuration, all routes that apply to access-list 10 will have the weight set at 400. If the packets do not match any of the defined criteria, they are routed through the normal routing process.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match as-path 10
(config-route-map)#set weight 400
```

## show route-map

Use this command to display route-map information.

### Command Syntax

```
show route-map (|WORD)
```

### Parameters

#### WORD

Route-map name (maximum size 63 characters)

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

The following is a sample output of the `show route-map` command.

```
#show route-map
route-map myRM, permit, sequence 1
Match clauses:
metric 200
Set clauses:
metric 60
#
```

Here is the explanation of the "show command" output fields.

**Table 13. show route-map details**

| Field         | Description                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|
| route-map     | Name of a route map.                                                                                                                   |
| permit        | Routes that match the match clauses are redistributed according to the conditions defined by the set clauses.                          |
| sequence      | Position of this route map in sequence of route-maps with the same name.                                                               |
| Match clauses | Routes that match the conditions defined by the match clause are redistributed according to the conditions defined by the set clauses. |
| Set clauses   | Routes that pass the match clause are redistributed according to the conditions defined by the set clauses.                            |

## show running-config route-map

Use this command to display the running system status and configuration details for route-maps.

### Command Syntax

```
show running-config route-map
```

### Parameters

None

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
>enable
#show running-config route-map
!
route-map abc deny 2
match community 2
!
route-map abc permit 3
match route-type external type-2
set metric-type type-1
!
```

---

## Source Interface Commands

This section is a reference for source interface commands. The source Interface feature routes management traffic to a dedicated interface using `iptables` NAT rules.

The source interface feature is supported for the protocols shown in the table below:

**Table 14. Source interface protocols and port numbers**

| Protocol | Default port number |
|----------|---------------------|
| Tacacs+  | 49                  |
| Radius   | 1812 and 1813       |
| Snmp     | 161 and 162         |
| Ntp      | 123                 |
| Syslog   | 514                 |

This section contains these commands:

|                                                 |     |
|-------------------------------------------------|-----|
| ip source-interface .....                       | 338 |
| ipv6 source-interface .....                     | 340 |
| show ip source-interface detail .....           | 342 |
| show ipv6 source-interface detail .....         | 344 |
| show running-config ip source-interface .....   | 346 |
| show running-config ipv6 source-interface ..... | 347 |

## ip source-interface

Use this command to configure the IPv4 source interface for a protocol.

Use the `no` form of this command to remove the IPv4 source interface for a protocol.

### Notes:

- It is possible that the router may establish an outgoing TCP connection using an interface that does not have a valid or routable IP address. In such case, the user must specify the address of a different interface to use as the source IP address for the outgoing connection. For this scenario, the command [ip source-interface \(page 338\)](#) or [ipv6 source-interface \(page 340\)](#) is used.
- NTP is supported only on default port.
- OcNOS supports configuring multiple ports for the same protocol in the `ip source-interface` command.

## Command Syntax

```
ip source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (123|162|1812|49|514|<1025-65535>)) (vrf (NAME|management))
no ip source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (49|123|162|514|1812|<1025-65535>)) (vrf (NAME|management))
```

## Parameters

### IFNAME

Interface name (lo or physical interface)

### tacacs+

Terminal Access Controller Access Control System

### tacacs+ 49

Default source interface protocol port number for TACACS+

### ntp

Network Time Protocol

### ntp 123

Default source interface protocol port number for NTP

### snmp

Simple Network Management Protocol

### snmp 162

Default source interface protocol port number for SNMP

### syslog

syslog

### syslog 514

Default source interface protocol port number for Rsyslog

### radius

Remote Authentication Dial-In User Service

**radius 1812**

Default source interface protocol port number for RADIUS

**<1025-65535>**

Port number. Default value is as per the protocol.

**vrf management**

Defines the management VRF instance.

**vrf NAME**

Specify the user-defined VRF instance name.

**Default**

None

**Command Mode**

Configure mode

**Applicability**

This command was introduced in OcNOS version 4.0. Added VRF NAME parameter in OcNOS version 6.6.0

**Example**

```
#configure terminal
(config)#ip source-interface xe12 ntp vrf vrf1
(config)#ip source-interface xe2 radius port 1025
(config)#ip source-interface xe3 syslog port 65535 vrf management
```

The following example shows how to configure multiple source interface protocol port number:

```
OcNOS#configure terminal
OcNOS(config)#ip source-interface lo syslog port 6666
OcNOS(config)#ip source-interface lo syslog port 7777
OcNOS(config)#ip source-interface lo syslog port 8888
OcNOS(config)#ip source-interface lo syslog port 9999
OcNOS(config)#commit
```

---

## ipv6 source-interface

Use this command to configure the IPv6 source interface for a protocol.

Use the `no` form of this command to remove the IPv6 source interface for a protocol.

### Command Syntax

```
ipv6 source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (123|162|1812|49|514|<1025-65535>)|) (vrf (NAME|management)|)
no ipv6 source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (49|123|162|514|1812|<1025-65535>)|) (vrf (NAME|management)|)
```

### Parameters

#### IFNAME

Interface name (lo or physical interface)

#### tacacs+

Terminal Access Controller Access Control System

#### tacacs+ 49

Default source interface protocol port number for TACACS+

#### ntp

Network Time Protocol

#### ntp 123

Default source interface protocol port number for NTP

#### snmp

Simple Network Management Protocol

#### snmp 162

Default source interface protocol port number for SNMP

#### syslog

syslog

#### syslog 514

Default source interface protocol port number for Rsyslog

#### radius

Remote Authentication Dial-In User Service

#### radius 1812

Default source interface protocol port number for RADIUS

#### <1025-65535>

Port number. Default value is as per the protocol.

#### vrf management

Defines the management VRF instance.

#### vrf NAME

Specify the user-defined VRF instance name.

### Default

None

## Command Mode

Configure mode

## Applicability

This command was introduced in OcNOS version 4.0.

## Example

```
OcNOS#configure terminal
OcNOS(config)#ipv6 source-interface xe12 ntp vrf vrf1
OcNOS(config)#ipv6 source-interface xe2 radius port 1025
OcNOS(config)#ipv6 source-interface xe3 syslog port 65535 vrf management
```

The following example shows how to configure multiple source interface protocol port number:

```
OcNOS#configure terminal
OcNOS(config)#ipv6 source-interface lo tacacs+ port 1111
OcNOS(config)#ipv6 source-interface lo tacacs+ port 2222
OcNOS(config)#ipv6 source-interface lo tacacs+ port 3333
OcNOS(config)#ipv6 source-interface lo tacacs+ port 4444
OcNOS(config)#commit
OcNOS(config)#
```

---

## show ip source-interface detail

Use this command to display the IPv4 source interface status in detail.

### Command Syntax

```
show ip source-interface detail
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 4.0.

### Example

The following example shows the output using different protocols with multiple port numbers:

```
#show ip source-interface detail
Source-Interface Detailed Information
=====
Protocol : tacacs+
Interface : lo
Port : 6666
Address : 1.1.1.1
Status : Active
VRF Name : Default

Protocol : radius
Interface : lo
Port : 7777
Address : 1.1.1.1
Status : Active
VRF Name : Default

Protocol : ntp
Interface : xe12
Port : 8888
Address : 1.1.1.1
Status : Active
VRF Name : Management

Protocol : syslog
Interface : lo
Port : 9999
Address : 0.0.0.0
Status : Active
VRF Name : default
```

```

Protocol : ntp
Interface : xe12
Port : 123
Address : 1.1.1.1
Status : Active
VRF Name : vrfl

```

The following example shows the output using the same protocol with multiple port numbers:

```

OcNOS#show ip source-interface detail
Source-Interface Detailed Information
=====
Protocol : syslog
Interface : lo
Port : 6666
Address : 0.0.0.0
Status : Active
VRF Name : default

Protocol : syslog
Interface : lo
Port : 7777
Address : 0.0.0.0
Status : Active
VRF Name : default

Protocol : syslog
Interface : lo
Port : 8888
Address : 0.0.0.0
Status : Active
VRF Name : default

Protocol : syslog
Interface : lo
Port : 9999
Address : 0.0.0.0
Status : Active
VRF Name : default

```

Here is the explanation of the "show command" output fields.

**Table 15. Output fields**

| Field     | Description                               |
|-----------|-------------------------------------------|
| Protocol  | tacacs+, ntp, snmp, syslog, or radius     |
| Interface | Interface name (lo or physical interface) |
| Port      | Source interface protocol port number     |
| Address   | IP address                                |
| Status    | Whether active or inactive                |
| VRF Name  | Virtual Routing and Forwarding name       |

---

## show ipv6 source-interface detail

Use this command to display the IPv6 source interface status in detail.

### Command Syntax

```
show ipv6 source-interface detail
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 4.0.

### Example

The following example shows the output using different protocols with multiple port numbers:

```
#show ipv6 source-interface detail
Source-Interface Detailed Information
=====
Protocol : tacacs+
Interface : lo
Port : 6666
Address : ::1
Status : Active
VRF Name : Default

Protocol : radius
Interface : lo
Port : 7777
Address : ::1
Status : Active
VRF Name : Default

Protocol : ntp
Interface : xe12
Port : 7777
Address : 2001::1
Status : Active
VRF Name : vrfl
```

The following example shows the output using the same protocol with multiple port numbers:

```
OcNOS#show ipv6 source-interface detail
Source-Interface Detailed Information
=====
```

```
Protocol : tacacs+
Interface : lo
Port : 1111
Address : ::
Status : Active
VRF Name : default

Protocol : tacacs+
Interface : lo
Port : 2222
Address : ::
Status : Active
VRF Name : default

Protocol : tacacs+
Interface : lo
Port : 3333
Address : ::
Status : Active
VRF Name : default

Protocol : tacacs+
Interface : lo
Port : 4444
Address : ::
Status : Active
VRF Name : default
```

Here is the explanation of the "show command" output fields.

**Table 16. Output fields**

| Field     | Description                               |
|-----------|-------------------------------------------|
| Protocol  | tacacs+, ntp, snmp, syslog, or radius     |
| Interface | Interface name (lo or physical interface) |
| Port      | Source interface protocol port number     |
| Address   | IP address                                |
| Status    | Whether active or inactive                |
| VRF Name  | Virtual Routing and Forwarding name       |

## show running-config ip source-interface

Use this command to display the IPv4 source interface running configuration.

### Command Syntax

```
show running-config ip source-interface
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 4.0

### Example

```
#show running-config ip source-interface
ip source-interface lo tacacs+ port 1025
ip source-interface lo radius
ip source-interface lo.management ntp vrf management
ip source-interface lo.management syslog port 1026 vrf management
ip source-interface ge3 snmp
ip source-interface lo syslog port 6666
ip source-interface lo syslog port 7777
ip source-interface lo syslog port 8888
ip source-interface lo syslog port 9999
```

## show running-config ipv6 source-interface

Use this command to display the IPv6 source interface running configuration.

### Command Syntax

```
show running-config ipv6 source-interface
```

### Parameters

None

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

This command was introduced in OcNOS version 4.0.

### Example

```
#show running-config ipv6 source-interface
ipv6 source-interface lo tacacs+ port 1025
ipv6 source-interface lo radius
ipv6 source-interface lo.management ntp vrf management
ipv6 source-interface lo.management syslog port 1026 vrf management
ipv6 source-interface ge3 snmp
ip source-interface lo syslog port 6666
ip source-interface lo syslog port 7777
ip source-interface lo syslog port 8888
ip source-interface lo syslog port 9999
```

# BORDER GATEWAY PROTOCOL CONFIGURATION

|                                                                 |     |
|-----------------------------------------------------------------|-----|

# BGP

This section contains basic Border Gateway Protocol configuration examples.

## Enable BGP Routers in the Same Autonomous System

Figure 12 shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network 10.10.10.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

Figure 12. Routers in the Same Autonomous System

### R1

|                                                    |                                                                                                                                             |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| #configure terminal                                | Enter configure mode.                                                                                                                       |
| (config)#router bgp 200                            | Define the routing process. The number 200 specifies the AS number of R1.                                                                   |
| (config-router)#neighbor 10.10.10.11 remote-as 200 | Define BGP neighbors, and establish a TCP session. 10.10.10.11 is the IP address of the neighbor (R2), and 200 is the neighbor's AS number. |
| (config-router)# address-family ipv4 unicast       | Enter address-family ipv4 unicast mode                                                                                                      |
| (config-router-af)# neighbor 10.10.10.11 activate  | Activate the neighbor in the Ipv4 address family.                                                                                           |
| (config-router-af)# exit-address-family            | Exit address-family mode.                                                                                                                   |
| (config-router)#commit                             | Commit the candidate configuration to the running configuration.                                                                            |

### R2

|                         |                                                                           |
|-------------------------|---------------------------------------------------------------------------|
| #configure terminal     | Enter configure mode.                                                     |
| (config)#router bgp 200 | Define the routing process. The number 200 specifies the AS number of R2. |

|                                                    |                                                                                                                                             |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| (config-router)#neighbor 10.10.10.10 remote-as 200 | Define BGP neighbors, and establish a TCP session. 10.10.10.10 is the IP address of the neighbor (R1), and 200 is the neighbor's AS number. |
| (config-router)# address-family ipv4 unicast       | Enter address-family ipv4 unicast mode                                                                                                      |
| (config-router-af)# neighbor 10.10.10.10 activate  | Activate the neighbor in the Ipv4 address family.                                                                                           |
| (config-router-af)# exit-address-family            | Exit address-family mode.                                                                                                                   |
| (config-router)#commit                             | Commit the candidate configuration to the running configuration.                                                                            |

## Route-Map

Use route maps to filter incoming updates from a BGP peer. In this example, the prefix-list ABC on R1 is configured to deny entry of any routes with the IP address 1.1.1.0/M (M = 26, 27, 28). To test the filter, R2 is configured to generate network addresses 1.1.1.0/27 and 1.1.2.0/24. To verify, use the show ip bgp command on R1; it displays R1 receiving updates from only 1.1.2.0/24.

**Note:** Route maps enable filtering and modification of BGP routes using 'match' and 'set' clauses. They can be applied to a BGP peer or peer-group in either the inbound or outbound direction to influence received or advertised routes. However, for route-map updates to take effect, a manual command such as `clear ip bgp A.B.C.D<neighbor> soft` must be executed for each BGP peer or peer-group address-family. This manual step is required in all software releases except for release 6.6.x and later, provided that the 'bgp auto-policy-soft-reset enable' feature is configured.

## Topology

## Route-map Continue

The continue clauses allow you to configure and organize more modular policy definitions to reduce the number of policy configurations that are repeated within the same route map.

Continue clause under a route-map provides the capability to execute additional entries in a route map after an entry is executed with a successful match and set clauses. The continue command allows multiple entries to be evaluated within a single route-map. Continue commands can be assigned optional sequence numbers that indicates the order in which clauses are to be evaluated.

## Using Continue with Match Clauses

When a `match` clause exists in a route-map with `continue` clause then `continue` clause is executed only when a successful match occurs. If a `match` clause does not exist in the route-map and if a `continue` clause exists, the `continue` clause will be evaluated and will go to the specified route-map entry. When a successful match occurs and we have a `continue` clause, the route-map executes the `set` clauses and then goes to the specified route-map entry. If a `continue` clause does not exist in the next route map, then the route-map will behave normally. If a `continue` clause exists in the next route-map but a match is not successful, the route-map will not continue and will “fall through” to the next sequence number if one exists

## Using Continue with Set Actions

`Set` clauses are executed after the route-map evaluation is done. The `set` clauses are evaluated and executed in the order in which they were configured. `Set` clauses are only executed after a successful match occurs. The `continue` statement proceeds to the specified route-map entry only after configured `set` actions are performed. If a `set` action is configured in the first route-map and then the same `set` action occurs again but with a different value, in a subsequent route-map entry, then the last `set` action will override the previous `set` actions which were configured with the same `set` command.

## Topology

Figure 15. Route-map continue

## Configure Route-map continue on R1

In the below example we will apply route-map `continue` on R1 under BGP 100, with redistributed connected routes from R2 on R1. Here, 10.1.0.0/16 is a superset, while 10.1.1.0/24, 10.1.2.0/24, 10.1.3.0/24, 10.1.4.0/24, and 10.1.5.0/24 are subsets and will filter PF1, which is a superset and sets several prefixes.

### R1

## Validation

### R1

The following provides the R1 validation:

```
R1#show ip bgp summary
BGP router identifier 1.1.1.1, local AS number 100
BGP table version is 5
2 BGP AS-PATH entries
0 BGP community entries

Neighbor          V    AS  MsgRcv  MsgSen  TblVer   InQ   OutQ   Up/Down   State/PfxRcd
20.1.1.2          4    100   145     177      5      0      0   00:40:05      5

Total number of neighbors 1

Total number of Established sessions 1

Note: Check the prefixes learnt here are 5.

R1#

R1#show ip bgp
BGP table version is 5, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
```

Origin codes: i - IGP, e - EGP, ? - incomplete

|     | Network     | Next Hop | Metric | LocPrf | Weight  | Path  |
|-----|-------------|----------|--------|--------|---------|-------|
| *>i | 10.1.1.0/24 | 20.1.1.2 | 20     | 100    | 3465789 | i     |
| *>i | 10.1.2.0/24 | 20.1.1.2 | 30     | 100    | 3465789 | 600 ? |
| *>i | 10.1.3.0/24 | 20.1.1.2 | 10     | 400    | 400     | ?     |
| *>i | 10.1.4.0/24 | 20.1.1.2 | 10     | 100    | 3465789 | ?     |
| *>i | 10.1.5.0/24 | 20.1.1.2 | 10     | 100    | 3465789 | ?     |

Total number of prefixes 5  
R1#

**Note:** In the above example, 10.1.4.0/24 and 10.1.5.0/24 prefixes will match only on PF1 which is a super set prefix and metric is set as 10, while the 10.1.1.0/24, 10.1.2.0/24 and 10.1.3.0/24 prefixes will match in P1, P2 and P3 prefix-lists and execute the set clauses respectively.

R1#show ip route

## Route-map Nesting

Route-maps can be used to filter incoming updates from a BGP peer. The `match route-map` command within a route-map allows another route-map to be called as a subroutine. The nested route-map is evaluated, and if it returns permit, it is treated as a match; if it returns deny, it is treated as a no-match. A route-map must exist to be nested.

## Topology

In the below example, router R2 sets the metric to 300 for all the routes except those with the prefix 20.1.2.0/23. Router R1 then filters incoming route advertisements by matching metric 300 and matching the nested route-map

CHILD.

In the CHILD route-map, the sequence 10 denies prefix 10.1.1.0/24, while sequence 20 denies prefix 1.1.1.0/24 and permits all other routes. Since 20.1.2.0/23 is the only route from R2 with a metric different from 300, it is denied.

**Figure 16. Route-map Nesting**

**Note:** The nested route-map is referred to only by the name, so the first route-map in the sequence with the same name will be evaluated, and if no match is found, the next in the sequence will be evaluated. This continues until a match is found or the sequence ends. A maximum of 8 route-maps can be nested within a route-map instance at the same time. Note that more than 4 levels of nesting are not allowed.

## Configure Route-map

|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>R1#configure terminal</code>                                       | Enter configure mode.                                                                                                                                                                                |
| <code>R1(config)#ip prefix-list ABC</code>                               | Create an entry in the prefix-list. The <code>ABC</code> parameter is the name of the prefix-list.                                                                                                   |
| <code>R1(config-ip-prefix-list)#seq 5 deny 1.1.1.0/24 ge 26 le 28</code> | The sequence number of the prefix entry is specified as 5. <code>deny</code> specifies that the packets must be rejected.<br><br>The minimum and maximum prefix lengths to be matched are 26 and 28. |
| <code>R1(config-ip-prefix-list)#seq 10 permit any</code>                 | The sequence number of the prefix-list entry is specified as 10. The permit parameter <code>any</code> denotes accepting all packets of any length.                                                  |
| <code>R1(config-ip-prefix-list)#exit</code>                              | Exit prefix-list mode.                                                                                                                                                                               |
| <code>R1(config)#ip prefix-list ABC2</code>                              | Create an entry in the prefix-list. The <code>ABC2</code> parameter is the name of the prefix-list.                                                                                                  |
| <code>R1(config-ip-prefix-list)#seq 5 permit 10.1.1.0/24</code>          | The sequence number of the prefix entry is specified as 5. The parameter <code>permit</code> specifies that the packets with the prefix 10.1.1.0/24 will be accepted.                                |
| <code>R1(config-ip-prefix-list)#exit</code>                              | Exit prefix-list mode                                                                                                                                                                                |
| <code>R1(config)#route-map PARENT permit 10</code>                       | Create the PARENT route-map.                                                                                                                                                                         |
| <code>R1(config-route-map)#match route-map CHILD</code>                  | Match route-map CHILD as a subroutine. If a match is returned, this match condition is satisfied.                                                                                                    |

|                                                                 |                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| R1(config-route-map)#match metric 300                           | Match only the routes with the metric 300.                                                                                                                                                                                                                                                  |
| R1(config-route-map)#exit                                       | Exit Route-map mode and return to Configure mode.                                                                                                                                                                                                                                           |
| R1(config)#route-map CHILD deny 10                              | Create an entry with the sequence number 10 and a deny action for the route-map that is being nested.                                                                                                                                                                                       |
| R1(config-route-map)#match ip address prefix-list ABC2          | Set the match criteria based on the prefix-list ABC2. As the prefix 10.1.1.0/24 will be a match, and the action of the route-map is “deny”, the routes with the prefix 10.1.1.0/24 will be denied. If an entry does not have a match, the next route-map in the sequence will be evaluated. |
| R1(config-route-map)#exit                                       | Exit Route-map mode and return to Configure mode.                                                                                                                                                                                                                                           |
| R1(config)#route-map CHILD permit 20                            | Create an entry with the sequence number 20 and a permit action for the route-map that is being nested.                                                                                                                                                                                     |
| R1(config-route-map)#match ip address prefix-list ABC           | Set the match criteria based on the prefix-list ABC. Every prefix that is matched by the prefix-list will be accepted.                                                                                                                                                                      |
| R1(config-route-map)#exit                                       | Exit Route-map mode and return to Configure mode.                                                                                                                                                                                                                                           |
| R1(config)#router bgp 10                                        | Define the routing process, and establish a TCP session. The number 10 specifies the AS number of R1.                                                                                                                                                                                       |
| R1(config-router)#neighbor 192.168.10.11 remote-as 11           | Define BGP neighbors, and establish a TCP session. 192.168.10.11 is the IP address of the neighbor (R2), and 11 is the neighbor's AS number.                                                                                                                                                |
| R1(config-router)#address-family ipv4 unicast                   | Enter address-family ipv4 unicast mode.                                                                                                                                                                                                                                                     |
| R1(config-router-af)#neighbor 192.168.10.11 activate            | Activate the neighbor in the IPv4 address family.                                                                                                                                                                                                                                           |

```

## Route Reflector

The configurations in this section apply to BGP Route Reflectors (RR).

### Reduce the iBGP Mesh Inside an Autonomous System

Use Route Reflectors to reduce the iBGP mesh inside an Autonomous System (AS).

#### Notes:

- When utilizing BGP redundant route reflectors with BFD, setting the multi-hop timer to 999ms and the multiplier to 3 results in a BGP convergence time of approximately 6 seconds in the event of an aggregator node reload.

## Topology

In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with the RR only, but not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to R2. This reduces the iBGP peer connections in AS1.

Figure 17. BGP Route Reflector

**RR (R5)**

|                                                                |                                                                                                                                                      |

  Nexthop local: ::
  BGP connection: non shared network
```

---

## Multiple Route Reflectors

The basic rule of BGP is that a BGP speaker cannot advertise a route to an iBGP neighbor if that route was learned from another iBGP neighbor. Configuring a route reflector provides a means to circumvent this rule. The entire route reflector process is transparent to the clients, and no configuration is necessary on these clients.

Whenever an iBGP-speaking router receives a route update, it forwards the route to the neighbor without changing the nexthop IP address, thus making it an unreachable route, unless verified by an iGP (for example, neighbor x.x.x.x route-reflector-client).

- A route learned from a non-RR client is advertised to RR clients but not to non-RR clients.
- A route learned from a RR client is advertised to both RR clients and non-RR clients. Even the RR client that advertised the route will receive a copy and discards it because it sees itself as the originator.
- A route learned from an EBGp neighbor is advertised to both RR clients and non-RR clients.

## Topology

Figure 18. eBGP and iBGP Route Reflector Topology

### R1

|                                                     |                                                                  |
|-----------------------------------------------------|------------------------------------------------------------------|
| #configure terminal                                 | Enter configure mode.                                            |
| (config)#interface eth1                             | Enter interface mode                                             |
| (config-if)#ip addr 1.1.1.1/24                      | Specify IP address for the interface.                            |
| (config-if)#exit                                    | Exit interface mode                                              |
| (config)#interface lo                               | Enter loopback interface mode.                                   |
| (config-if)#ip address 100.100.100.100/32 secondary | Specify IP address for the interface.                            |
| (config-if)#exit                                    | Exit loopback interface mode.                                    |
| (config)#router bgp 100                             | Define the routing process with AS number 100.                   |
| (config-router)#neighbor 1.1.1.2 remote-as 200      | Define the eBGP neighbor (R2).                                   |
| (config-router)# address-family ipv4 unicast        | Enter address-family ipv4 unicast mode                           |
| (config-router-af)# neighbor 1.1.1.2 activate       | Activate the neighbor under address family mode                  |
| (config-router-af)#network 100.100.100.100/32       | Advertise a route via eBGP connection to R2.                     |
| (config-router-af)#exit-address-family              | Exit router mode.                                                |
| (config-router)#commit                              | Commit the candidate configuration to the running configuration. |

### R2

|                                   |                                       |
|-----------------------------------|---------------------------------------|
| #configure terminal               | Enter configure mode.                 |
| (config)#interface eth1           | Enter interface mode                  |
| (config-if)#ip address 1.1.1.2/24 | Specify IP address for the interface. |
| (config-if)#exit                  | Exit interface mode                   |

|                                                            |                                                                    |
|------------------------------------------------------------|--------------------------------------------------------------------|
| (config)#interface eth2                                    | Enter interface mode                                               |
| (config-if)#ip address 3.3.3.2/24                          | Specify IP address for the interface.                              |
| (config-if)#exit                                           | Exit interface mode                                                |

## BGP Confederations

In BGP, nodes running iBGP protocols must be interconnected forming a full mesh. Confederation solves the iBGP full-mesh network complexity and inefficiency by splitting a large autonomous system domain into smaller autonomous system domains, called member autonomous systems. Member autonomous systems can form eBGP connections among themselves, to prevent full-mesh connections among each iBGP-running node.

The `bgp confederation identifier` command tells the router that it is a member of a confederation and the confederation ID. The `bgp confederation peers` command lists the member AS to which the router is connected.

In the following example, R1, R2, and R3 are members of the same confederation with different AS numbers.

### Topology

Figure 19. BGP Confederation

### R1

|                     |                       |
|---------------------|-----------------------|
| #configure terminal | Enter configure mode. |
|---------------------|-----------------------|

|                                                                 |                                                                                                                                     |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <code>(config)#router bgp 400</code>                            | Assign the ASN value ( 400) to the router.                                                                                          |
| <code>(config-router)#bgp confederation identifier 1000</code>  | Specify the BGP confederation ID, the externally visible autonomous system number that identifies the BGP confederation as a whole. |
| <code>(config-router)#bgp confederation peers 7000</code>       | Specify the neighbor ASN value for confederation membership.                                                                        |
| <code>(config-router)#neighbor 10.20.30.2 remote-as 7000</code> | Specify the neighbor's IP address ( 10.20.30.2) and the ASN value of the neighbor ( 7000).                                          |
| <code>(config-router)# address-family ipv4 unicast</code>       | Enter address-family ipv4 unicast mode                                                                                              |
| <code>(config-router-af)# neighbor 10.20.30.2 activate</code>   | Activate the neighbor under address family mode                                                                                     |
| <code>(config-router-af)#exit-address-family</code>             | Exit address-family mode.                                                                                                           |
| <code>(config-router)#commit</code>                             | Commit the candidate configuration to the running configuration.                                                                    |

**R2**

|                                                                |                                                                                           |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| <code>#configure terminal</code>                               | Enter configure mode.                                                                     |
| <code>(config)#router bgp 7000</code>                          | Assign the ASN value ( 7000) to the router.                                               |
| <code>(config-router)#bgp confederation identifier 1000</code> | Specify the BGP confederation ID.                                                         |
| <code>(config-router)#bgp confederation peers 400 90</code>    | Specify the neighbor ASN values for confederation membership.                             |
| <code>(config-router)#neighbor 10.20.30.1 remote-as 400</code> | Specify the neighbor's IP address ( 10.20.30.1) and the ASN value of the neighbor ( 400). |
| <code>(config-router)#neighbor 11.20.30.30 remote-as 90</code> | Specify the neighbor's IP address ( 11.20.30.30) and the ASN value of the neighbor ( 90). |
| <code>(config-router)# address-family ipv4 unicast</code>      | Enter address-family ipv4 unicast mode                                                    |
| <code>(config-router-af)# neighbor 10.20.30.1 activate</code>  | Activate the neighbor under address family mode                                           |
| <code>(config-router-af)# neighbor 11.20.30.30 activate</code> | Activate the neighbor under address family mode                                           |
| <code>(config-router-af)#exit-address-family</code>            | Exit address-family mode.                                                                 |
| <code>(config-router)#commit</code>                            | Commit the candidate configuration to the running configuration.                          |

**R3**

|                                                                  |                                                                                             |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <code>#configure terminal</code>                                 | Enter configure mode.                                                                       |
| <code>(config-router)#router bgp 90</code>                       | Assign the ASN value ( 90) to the router.                                                   |
| <code>(config-router)#bgp confederation identifier 1000</code>   | Specify the BGP confederation ID.                                                           |

## Dynamic BGP Peering

BGP Dynamic Neighbors is a quick way of setting up BGP on device like a Hub router where user is expecting numerous BGP neighbors. Before dynamic neighbors, user had to provide a large amount of configuration to work with all these neighbors. This new feature dramatically reduces the amount and complexity of CLI configuration on the router and save CPU and memory usage.

BGP dynamic neighbor support allows BGP peering to a group of remote neighbors that are defined by a range of IP addresses. Each range can be configured as a subnet IP address. BGP dynamic neighbors are configured using a range of IP addresses and BGP peer groups.

After a subnet range is configured for a BGP peer group and a TCP session is initiated by another router for an IP address in the subnet range, a new BGP neighbor is dynamically created as a member of that group. After the initial configuration of subnet ranges and activation of the peer group, dynamic BGP neighbor creation does not require any further CLI configuration on the initial router. Other routers can establish a BGP session with the initial router,

but the initial router need not establish a BGP session to other routers if the IP address of the remote peer used for the BGP session is not within the configured range.

A dynamic BGP neighbor will inherit any configuration for the peer group. In larger BGP networks, implementing BGP dynamic neighbors can reduce the amount and complexity of CLI configuration and save CPU and memory usage. Both IPv4 and IPV6 peering is supported.

## IPv4 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

**Figure 22. IPv4 IBGP Peering**

### R1

## IPv4 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with vrf enabled on the device and interface being part of vrf. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

**Figure 23. IPv4 VRF IBGP Peering**

**R1**

|                                                                          |                                                                                |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------|

Nexthop global: ::
Nexthop local: ::
BGP connection: non shared network
```

## IPv4 EBGp Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

**Figure 24. IPv4 EBGp Peering**

### R1

|                                                   |                                                                  |
|---------------------------------------------------|------------------------------------------------------------------|
| #configure terminal                               | Enter configure mode.                                            |
| (config)#interface lo                             | Enter interface mode for loopback.                               |
| (config-if)#ip address 33.33.33.33/32 secondary   | Assign a secondary IP address.                                   |
| (config-if)#exit                                  | Exit interface mode.                                             |
| (config)#interface xe1                            | Enter interface mode for xe1.                                    |
| (config-if)#ip address 11.11.11.1/24              | Assign IP address to the interface.                              |
| (config-if)#exit                                  | Exit interface mode.                                             |
| (config)#router bgp 100                           | Enter Router BGP mode.                                           |
| (config-router)#bgp router-id 1.1.1.1             | Assign a BGP router ID.                                          |
| (config-router)#neighbor 11.11.11.2 remote-as 200 | Create a static neighbor 11.11.11.2 with remote AS 200.          |
| (config-router)# address-family ipv4 unicast      | Enter address-family ipv4 unicast mode.                          |
| (config-router-af)# neighbor 11.11.11.2 activate  | Activate the neighbor under address family mode                  |
| (config-router-af)#exit-address-family            | Exit address-family mode.                                        |
| (config-router)#commit                            | Commit the candidate configuration to the running configuration. |

### R2

|                                                 |                                     |
|-------------------------------------------------|-------------------------------------|
| #configure terminal                             | Enter configure mode.               |
| (config)#interface lo                           | Enter interface mode for loopback.  |
| (config-if)#ip address 22.22.22.22/32 secondary | Assign a secondary IP address.      |
| (config-if)#exit                                | Exit interface mode.                |
| (config)#interface xe1                          | Enter interface mode for xe1.       |
| (config-if)#ip address 11.11.11.2/24            | Assign IP address to the interface. |
| (config-if)#exit                                | Exit interface mode.                |

|                                                                       |                                                                  |
|-----------------------------------------------------------------------|------------------------------------------------------------------|
| (config)#interface xe2                                                | Enter interface mode for xe2.                                    |
| (config-if)#ip add 11.11.12.2/24                                      | Assign IP address to the interface.                              |
| (config-if)#exit                                                      | Exit interface mode.                                             |
| (config)#router bgp 200                                               | Enter Router BGP mode.                                           |
| (config-router)#bgp router-id 2.2.2.2                                 | Assign a BGP router ID.                                          |
| (config-router)#neighbor IPV4_EBGW_PEER peer-group range 11.11.0.0/16 | Create a dynamic peer-group, IPV4_EBGW_PEER.                     |
| (config-router)#neighbor IPV4_EBGW_PEER remote-as 100                 | Assign remote AS with the peer-group IPV4_EBGW_PEER.             |
| (config-router)#neighbor IPV4_EBGW_PEER optional-as 300               | Assign optional AS with the peer-group IPV4_EBGW_PEER            |
| (config-router)#address-family ipv4 unicast                           | Enter address-family ipv4 unicast mode                           |
| (config-router-af)# neighbor IPV4_EBGW_PEER activate                  | Activate the peer-group in address family                        |
| (config-router-af)#network 22.22.22.22/32                             | Advertise the loopback network into BGP.                         |
| (config-router-af)#exit-address-family                                | Exit address-family mode.                                        |
| (config-router)#commit                                                | Commit the candidate configuration to the running configuration. |

**R3**

|                                                   |                                                                  |
|---------------------------------------------------|------------------------------------------------------------------|
| #configure terminal                               | Enter configure mode.                                            |
| (config)#interface lo                             | Enter interface mode for loopback.                               |
| (config-if)#ip address 44.44.44.44/32 secondary   | Assign a secondary IP address.                                   |
| (config-if)#exit                                  | Exit interface mode.                                             |
| (config)#interface xe2                            | Enter interface mode for xe2.                                    |
| (config-if)#ip add 11.11.12.3/24                  | Assign IP address to the interface.                              |
| (config-if)#exit                                  | Exit interface mode.                                             |
| (config)#router bgp 300                           | Enter Router BGP mode.                                           |
| (config-router)#bgp router-id 3.3.3.3             | Assign a BGP router ID.                                          |
| (config-router)#neighbor 11.11.12.2 remote-as 200 | Create a static BGP neighbor 11.11.12.2 with remote AS 200.      |
| (config-router)#address-family ipv4 unicast       | Enter address-family ipv4 unicast mode                           |
| (config-router-af)# neighbor 11.11.12.2 activate  | Activate the neighbor under address family mode                  |
| (config-router-af)#network 44.44.44.44/32         | Advertise the loopback network into BGP.                         |
| (config-router-af)#exit-address-family            | Exit address-family mode.                                        |
| (config-router)#commit                            | Commit the candidate configuration to the running configuration. |

## Validation

### R2

The following provides the R1 validation:

```

## IPv6 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1/64 and 11:11:12::1/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

**Figure 25. IPv6 IBGP Peering**

### R1

|                                    |                                    |
|------------------------------------|------------------------------------|
| #configure terminal                | Enter configure mode.              |
| (config)#interface lo              | Enter interface mode for loopback. |
| (config-if)#ipv6 address 33::1/128 | Assign an IPv6 address.            |
| (config-if)#exit                   | Exit interface mode.               |
| (config)#interface xe1             | Enter interface mode for xe1.      |

|                                                                     |                                                                             |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------|
| (config-if)#ipv6 address 11:11:11::1/64                             | Assign an IPv6 address to the interface.                                    |
| (config-if)#exit                                                    | Exit interface mode.                                                        |
| (config)#interface xe2                                              | Enter interface mode for xe2.                                               |
| (config-if)#ipv6 address 11:11:12::1/64                             | Assign an IPv6 address to the interface.                                    |
| (config-if)#exit                                                    | Exit interface mode.                                                        |
| (config)#router bgp 100                                             | Enter Router BGP mode.                                                      |
| (config-router)#bgp router-id 1.1.1.1                               | Assign a BGP router ID.                                                     |
| (config-router)#neighbor IPV6_IBGP_PEER peer-group range 11:11::/16 | Create a dynamic peer-group, IPV6_IBGP_PEER with a dynamic range 11:11::/16 |
| (config-router)#neighbor IPV6_IBGP_PEER remote-as 100               | Configure a remote AS with the peer group, IPV6_IBGP_PEER.                  |
| (config-router)#neighbor IPV6_IBGP_PEER limit 1                     | Set peer group neighbors limit to 1. Only one BGP session will be up.       |
| (config-router)#address-family ipv6 unicast                         | Enter the IPv6 Unicast Address Family.                                      |
| (config-router-af)#neighbor IPV6_IBGP_PEER activate                 | Activate the peer group, IPV6_IBGP_PEER in the IPv6 address family.         |
| (config-router-af)#network 33::1/128                                | Advertise the loopback network into the BGP IPv6 address family.            |

```

## IPv6 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with VRF enabled on the device and interface being part of VRF. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1 and 11:11:12::1. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

Figure 26. IPv6 VRF IBGP peering

## IPv6 EBGp Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11:11:11::/64 and 11:11:12::/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

### Topology

Figure 27. IPv6 EBGp peering

**R1**

## VPNv4 Configuration

Below mentioned topology displays bgp vpnv4 configuration on PE nodes, R1 and R3. IBGP peering will be formed on the loopback interface of R1 and R3; also IGP is running between all the routers.

### Topology

**Figure 28. IPv4 IBGP VPNv4 Configuration**

### R1

|                                        |                                               |
|----------------------------------------|-----------------------------------------------|
| #configure terminal                    | Enter Configuration mode.                     |
| (config)#ip vrf vrf1                   | Create a VRF, vrf1.                           |
| (config-vrf)#rd 100:1                  | Configure a route distinguisher value.        |
| (config-vrf)#route-target export 100:1 | Configure a route target export value to VRF. |
| (config-vrf)#route-target import 200:1 | Configure a route target import value to VRF. |
| (config-vrf)#exit                      | Exit from VRF configuration mode.             |
| (config)#router ldp                    | Enter Router LDP mode.                        |
| (config-router)#router-id 3.3.3.3      | Configure an LDP router ID.                   |
| (config-router)#exit                   | Exit from Router LDP mode.                    |
| (config)#interface xe5                 | Enter Interface configuration mode.           |

|                                                                               |                                                                        |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------|
| <code>(config-if)#ip vrf forwarding vrf1</code>                               | Configure the interface to a VRF.                                      |
| <code>(config-if)#ip address 1.1.1.1/24</code>                                | Assign an IP address to the interface.                                 |
| <code>(config-if)#exit</code>                                                 | Exit from Interface configuration mode.                                |
| <code>(config-if)#interface xe1</code>                                        | Enter another interface.                                               |
| <code>(config-if)#ip address 11.11.11.1/24</code>                             | Assign an IP address to the interface.                                 |
| <code>(config-if)#label-switching</code>                                      | Enable label switching on interface.                                   |
| <code>(config-if)#enable-ldp ipv4</code>                                      | Enable IPv4 LDP configuration on interface.                            |
| <code>(config-if)#exit</code>                                                 | Exit from Interface configuration mode.                                |
| <code>(config-if)#interface lo</code>                                         | Enter the loopback interface.                                          |
| <code>(config-if)#ip address 20.20.20.20/32 secondary</code>                  | Assign a secondary IP address to the interface.                        |
| <code>(config-router)#commit</code>                                           | Commit the candidate configuration to the running configuration.       |
| <code>(config-if)#exit</code>                                                 | Exit from Interface Configuration mode.                                |
| <code>(config)#router ospf 100</code>                                         | Enter Router OSPF mode.                                                |
| <code>(config-router)#network 11.11.11.0/24 area 0</code>                     | Configure the interface on which OSPF runs, and associate the area ID. |
| <code>(config-router)#network 20.20.20.20/32 area 0</code>                    | Configure the interface on which OSPF runs, and associate the area ID. |
| <code>(config-router)#exit</code>                                             | Exit from Router OSPF mode.                                            |
| <code>(config)#router ospf 200 vrf1</code>                                    | Create an OSPF process on VRF.                                         |
| <code>(config-router)#network 1.1.1.1/24 area 0</code>                        | Configure the interface on which OSPF runs, and associate the area ID. |
| <code>(config-router)#redistribute bgp</code>                                 | Redistribute BGP into OSPF.                                            |
| <code>(config-router)#exit</code>                                             | Exit from Router OSPF mode.                                            |
| <code>(config)#router bgp 100</code>                                          | Create a BGP process.                                                  |
| <code>(config-router)#neighbor lo_peer peer-group range 30.30.30.30/32</code> | Configure a dynamic peer group with the range command.                 |
| <code>(config-router)#neighbor lo_peer remote-as 100</code>                   | Configure remote AS to the peer group.                                 |
| <code>(config-router)#neighbor lo_peer update-source lo</code>                | Configure BGP neighbors to update the source routes.                   |
| <code>(config-router)#address-family vpnv4 unicast</code>                     | Enter the VPNv4 Address Family.                                        |
| <code>(config-router-af)#neighbor lo_peer activate</code>                     | Activate the peer group in VPNv4 address family.                       |
| <code>(config-router-af)#exit-address-family</code>                           | Exit from VPNv4 address family.                                        |
| <code>(config-router)#address-family ipv4 vrf vrf1</code>                     | Enter IPv4 VRF address family.                                         |
| <code>(config-router-af)#redistribute ospf 200</code>                         | Redistribute OSPF into the IPv4 VRF address family.                    |
| <code>(config-router-af)#exit-address-family</code>                           | Exit address-family mode.                                              |
| <code>(config-router)#commit</code>                                           | Commit the candidate configuration to the running configuration.       |

| (config-if)#enable-ldp ipv4                        | Enable IPv4 LDP configuration on the interface.                     |
| (config-if)#exit                                   | Exit from Interface configuration mode.                             |
| (config-if)#interface lo                           | Enter loopback interface.                                           |
| (config-if)#ip address 30.30.30.30/32 se           | Assign a secondary IP address to the interface.                     |
| (config-if)#exit                                   | Exit from Interface mode.                                           |
| (config)#commit                                    | Commit the candidate configuration to the running configuration.    |
| (config)#router ospf 100                           | Enter Router OSPF mode.                                             |
| (config-router)#network 12.12.12.0/24 area 0       | Define the interface on which OSPF runs, and associate the area ID  |
| (config-router)#network 30.30.30.30/32 area 0      | Define the interface on which OSPF runs, and associate the area ID  |
| (config-router)#exit                               | Exit from Router OSPF mode.                                         |
| (config)#router ospf 200 vrf2                      | Create an OSPF process on VRF.                                      |
| (config-router)#network 2.2.2.3/24 area 0          | Define the interface on which OSPF runs, and associate the area ID. |
| (config-router)#redistribute bgp                   | Redistribute BGP into OSPF.                                         |
| (config-router)#exit                               | Exit from Router OSPF mode.                                         |
| (config)#commit                                    | Commit the candidate configuration to the running configuration.    |
| (config)#router bgp 100                            | Create a BGP process.                                               |
| (config-router)#neighbor 20.20.20.20 remote-as 100 | Configure BGP neighbor by specifying a neighbor IP address.         |
| (config-router)#neighbor 20.20.20.20 update-s lo   | Define the BGP neighbors to update the source routes.               |
| (config-router)#address-family vpnv4 unicast       | Enter VPNv4 Address Family.                                         |
| (config-router-af)#neighbor 20.20.20.20 activate   | Activate the neighbor in VPNv4 address family.                      |
| (config-router-af)#exit-address-family             | Exit from VPNv4 address family.                                     |
| (config-router)#address-family ipv4 vrf vrf2       | Enter IPv4 VRF address family.                                      |
| (config-router-af)#redistribute ospf 200           | Redistribute OSPF into the IPv4 address family.                     |
| (config-router-af)#exit-address-family             | Exit address-family mode.                                           |
| (config-router)#commit                             | Commit the candidate configuration to the running configuration.    |

## Validation

### R1

The following provides the R1 validation:

```
#show running-config router bgp

Enable eBGP Multihop

This example shows the minimum configuration required for enabling eBGP multihop on peers speaking BGP. eBGP multihop is used for routers that are not directly connected to each other. Typically, eBGP peers are directly connected, but if there is a requirement that necessitates this scenario, this configuration can be used.

**Note:** The IP addresses used in the configuration should be accessible through an IGP or static routing.

Topology

Figure 29. eBGP Multihop Connection

R1

|                                                         |                                                                                                                                             |

## Enable Peer Groups

A BGP speaker might have the same update policies for a set of its peers. This is very useful if you have to change the update policies for all of the peers: Changing individual routers for separate policies can be very time-consuming, thus, peer groups play an important role in creating and assigning policies to a group of routers.

**Note:** A maximum of 32 peers can be bound in a peer group.

The peer group can be created dynamically or statically.

For dynamic peer groups all configuration can be done at group level only.

The static peer group configuration falls into two categories:

- Attributes that can be configured only at group level. Attempt to configure at member peer level will return error.

- Attributes that allow member peer level configuration. The member peer configuration has precedence.

## Category A: Neighbor configuration allowed only at peer-group level

The outbound update impacting configurations of peer group will replace peer member configurations of same attributes when a peer becomes member of peer group. Outbound attribute modifications to group members are not allowed.

Following are the commands which are allowed at peer-group level.

- neighbor WORD activate - [neighbor activate \(page 810\)](#)
- neighbor WORD as-origination-interval <1-65535> - [neighbor as-origination-interval \(page 814\)](#)
- neighbor WORD attribute-unchanged ({as-path|next-hop|med}}) - [neighbor attribute-unchanged \(page 815\)](#)
- neighbor WORD fall-over bfd - [neighbor extended-optional-param \(page 836\)](#)
- neighbor WORD fall-over bfd multihop - [neighbor extended-optional-param \(page 836\)](#)
- neighbor WORD next-hop-self - [neighbor next-hop-self \(page 847\)](#)
- neighbor WORD remove-private-AS - [neighbor remove-private-AS \(page 861\)](#)
- neighbor WORD route-reflector-client - [neighbor route-reflector-client \(page 865\)](#)
- neighbor WORD route-server-client - [neighbor route-server-client \(page 867\)](#)
- neighbor WORD send-community - [neighbor send-community \(page 868\)](#)
- neighbor WORD distribute-list WORD out - [neighbor distribute-list \(page 831\)](#)
- neighbor WORD capability orf prefix-list (both|receive|send) - [neighbor capability orf prefix-list \(page 820\)](#)
- neighbor WORD filter-list WORD out - [neighbor filter-list \(page 838\)](#)
- neighbor WORD prefix-list WORD out - [neighbor prefix-list \(page 857\)](#)
- neighbor WORD route-map WORD out - [neighbor route-map \(page 863\)](#)
- neighbor WORD advertisement-interval <1-65535> - [neighbor advertisement-interval \(page 811\)](#)
- neighbor WORD disallow-infinite-holdtime - [neighbor disallow-infinite-holdtime \(page 830\)](#)
- neighbor WORD local-as <1-4294967295> - [neighbor local-as \(page 843\)](#)

## Category B: Neighbor configuration allowed at peer-group member level; precedence based

For the below configuration, member level configurations will take precedence over peer group configuration.

Following are the commands which are allowed at member level also.

- neighbor WORD authentication-key WORD - [neighbor authentication-key \(page 817\)](#)
- neighbor WORD remote-as <1-4294967295> - [neighbor remote-as \(page 859\)](#)
- neighbor WORD allowas-in <1-10> - [neighbor allowas-in \(page 812\)](#)
- neighbor WORD description WORD - [neighbor description \(page 828\)](#)
- neighbor WORD distribute-list WORD In - [neighbor distribute-list \(page 831\)](#)
- neighbor WORD ebgp-multihop - [neighbor ebgp-multihop \(page 833\)](#)
- neighbor WORD ebgp-multihop <1-255> - [neighbor ebgp-multihop \(page 833\)](#)
- neighbor WORD maximum-prefix <1-4294967295> - [neighbor maximum-prefix \(page 845\)](#)
- neighbor WORD update-source WORD - [neighbor update-source \(page 878\)](#)

- neighbor WORD weight <0-65535> - [neighbor weight \(page 881\)](#)
- neighbor WORD shutdown - [neighbor shutdown \(page 871\)](#)
- neighbor WORD strict-capability-match - [neighbor strict-capability-match \(page 873\)](#)

- neighbor WORD enforce-multihop - [neighbor enforce-multihop \(page 835\)](#)
- neighbor WORD collide-established - [neighbor collide-established \(page 822\)](#)

BGP Peer Groups for Address-Family IPv4 Unicast

In the following scenario, R1, R2, and R3 belong to the same peer group ABC. R1, R2 and R3 are in AS 200 and R1 is the route reflector. R4 and R1 are eBGP peers. R4 is in AS 100.

Topology

Figure 30. BGP Peer Groups with IPv4 Unicast Members

R1

## Validation

### R1

The following provides the R1 validation:

```
R1#show bgp neighbors 2.2.2.2
BGP neighbor is 2.2.2.2, remote AS 200, local AS 200, internal link
Member of peer-group ABC for session parameters
  BGP version 4, local router ID 10.12.65.126, remote router ID 10.12.65.123
  BGP state = Established, up for 00:07:01
  Last read 00:00:15, hold time is 90, keepalive interval is 30 seconds
Neighbor capabilities:
  Route refresh: advertised and received (old and new)
  Address family IPv4 Unicast: advertised and received
Received 20 messages, 0 notifications, 0 in queue
Sent 28 messages, 1 notifications, 0 in queue
Route refresh request: received 0, sent 0
Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  ABC peer-group member
  Route-Reflector Client
  Community attribute sent to this neighbor (both)
  Outbound path policy configured
  Route map for outgoing advertisements is *permit-only-1
  0 accepted prefixes
  1 announced prefixes

Connections established 2; dropped 1
Local host: 2.2.2.1, Local port: 179
Foreign host: 2.2.2.2, Foreign port: 42657
Nexthop: 2.2.2.1
Nexthop global: ::
Nexthop local: ::
BGP connection: non shared network
Last Reset: 00:08:39, due to Hold Timer Expired (Notification sent)

## Route Redistribution in BGP

If there are routers that run both OSPF and BGP, certain OSPF routes might have to be sent to other eBGP peers. This can be achieved using the redistribution feature. Consider the following topology, in which R1 and R2 are eBGP peers, and R2 and R3 are OSPF peers. R2 is redistributing OSPF routes into BGP. The OSPF routes are sent to the R1 BGP routing table. This configuration assumes that all OSPF and eBGP sessions are up and running, and that only the redistribution must be configured.

## Topology

**Figure 31. Redistribute with OSPF**

### R2

|                                              |                                                                                 |
|----------------------------------------------|---------------------------------------------------------------------------------|

```

## Add Multiple Instances of the Same Autonomous System

BGP supports adding the same AS number multiple times to influence the route selection process. This can be done using route maps, as described below.

Under normal circumstances, any route advertised by R1 is sent to R4 via two different routes, and then R4 selects the path from R2. This decision can be influenced by adding multiple instances of AS number 200 at R2.

## Topology

**Figure 32. Multiple Instances of Same AS**

### R1

|                                                                 |                                                                                    |

## Removing Sent and Received MED values

The following describes how to remove the received and sent MED values, respectively.

**R2 - Remove Received MED Value**

|                                                                |                                                                                |
|----------------------------------------------------------------|--------------------------------------------------------------------------------|
| <code>#configure terminal</code>                               | Enter configure mode.                                                          |
| <code>(config)#router bgp 200</code>                           | Define the routing process with AS number 200.                                 |
| <code>(config-router)#neighbor 1.1.1.1 remote-as 100</code>    | Define neighbor R1. 1.1.1.1 is the IP address of R1, and 100 is the AS number. |
| <code>(config-router)#neighbor 2.2.2.2 remote-as 200</code>    | Define neighbor R3. 2.2.2.2 is the IP address of R3, and 200 is the AS number. |
| <code>(config-router)#bgp bestpath med remove-recv- med</code> | Enable the remove received MED value option.                                   |
| <code>(config-router)# address-family ipv4 unicast</code>      | Enter address-family ipv4 unicast mode                                         |
| <code>(config-router-af)# neighbor 1.1.1.1 activate</code>     | Activate neighbor under address family mode                                    |
| <code>(config-router-af)# neighbor 2.2.2.2 activate</code>     | Activate neighbor under address family mode                                    |
| <code>(config-router-af)# exit-address-family</code>           | Exit address family mode                                                       |
| <code>(config-router)#commit</code>                            | Commit the candidate configuration to the running configuration.               |

**R1 - Add Static Route**

|                                        |                                                                  |
|----------------------------------------|------------------------------------------------------------------|
| (config)#router bgp 100                | Enter to router bgp mode                                         |
| (config)#address-family ipv4 unicast   | Config redistribute under address-family                         |
| (config-router-af)#redistribute static | Redistribute the static routes                                   |
| (config-router)#commit                 | Commit the candidate configuration to the running configuration. |

**R2 - Remove Send MED Value**

|                                                   |                                                                                |
|---------------------------------------------------|--------------------------------------------------------------------------------|
| #configure terminal                               | Enter configure mode.                                                          |
| (config)#router bgp 200                           | Define the routing process with AS number 200.                                 |
| (config-router)#neighbor 1.1.1.1 remote-as 100    | Define neighbor R1. 1.1.1.1 is the IP address of R1, and 100 is the AS number. |
| (config-router)#neighbor 2.2.2.2 remote-as 200    | Define neighbor R3. 2.2.2.2 is the IP address of R3, and 200 is the AS number. |
| (config-router)#bgp bestpath med remove-send- med | Enable the remove sent MED value option.                                       |
| (config-router)# address-family ipv4 unicast      | Enter address-family ipv4 unicast mode                                         |
| (config-router-af)# neighbor 1.1.1.1 activate     | Activate neighbor under address family mode                                    |
| (config-router-af)# neighbor 2.2.2.2 activate     | Activate neighbor under address family mode                                    |
| (config-router-af)# exit-address-family           | Exit address family mode                                                       |
| (config-router)#commit                            | Commit the candidate configuration to the running configuration.               |

## BGP Four-Byte Autonomous System

Extended AS numbers can be mapped to 2-byte AS numbers if the value is less than, or equal to, 65535. If the AS number is higher than 65535, it cannot be mapped to a 2-byte AS number. Therefore, if a BGP speaker is configured with a non-mappable AS number, it must enable the BGP extended ASN capability in OcNOS.

### Notes:

- Autonomous System number 23456 is a reserved IANA number for AS transition; thus, it is recommended that no system be configured with 23456 as its AS number.
- OcNOS does not support 4-byte BGP Autonomous System Numbers (ASNs) in as-dot notation format

The extended ASN capability is disabled by default. However, when it is enabled, it is able to interoperate with a 2-byte AS-numbered speaker, in compliance with RFC 4893.

If a 4-byte AS number is configured in the provider's network using BGP MPLS VPN or standard IPv4/IPv6 BGP, it is recommended that the PE routers be 4-byte AS-enabled before connecting to 4-byte AS-enabled customer networks. For implications related to AS number transition issues, refer to RFC 4893.

You can also set up 4-byte AS-specific extended communities and route distinguishers (RDs) with limited capabilities. However, it is recommended that 2-byte AS-specific RDs and extended communities be used for regular deployment.

BGP encodes an ASN into four octets, so that more autonomous systems can be supported. Extended ASN capability is advertised in the Open message capabilities when the 4-octet ASN capability is enabled. When the 4-octet ASN capability is enabled, the valid ASN value range is <1-4294967295>, with the exception discussed in the first Note, above.

### Notes:

- Four-octet capability is disabled by default.
- OcNOS only supports 4-byte BGP ASNs in asplain format; as-dot notation is not supported.

## 4-Octet ASN Capability Enabled on R1 and R2

In this example, 4-Octet ASN capability is enabled on BGP speakers R1 and R2.

### Topology

Figure 34. 4-Octet ASN on Both Routers

## BGP Extended Community Attribute

The Extended Community Attribute provides a mechanism for labeling information carried in BGP.

### Extended Community with a 2-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 are 2-byte-ASN capable, and do not support 4-byte-ASN capability.

#### Topology

#### CE1

|                                                    |                                                                                          |
|----------------------------------------------------|------------------------------------------------------------------------------------------|
| #configure terminal                                | Enter configure mode.                                                                    |
| (config)#interface eth1                            | Enter interface mode.                                                                    |

Extended Community with a 4-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 support 4-byte ASN capability.

**Note:** PE1 and PE2 should both either be 4-byte-ASN capable or 2-byte-ASN capable. Support for the combination of one 4-byte-ASN capable PE with one 2-byte-ASN-capable PE is currently unavailable.

Topology

Figure 38. Extended Communities — 4-Byte ASN

## Nexthop Tracking

Nexthop tracking is used to notify the BGP process asynchronously whenever there is any change in the IGP routes. It reduces the convergence time of BGP routes when IGP routes are changed.

### Topology

**Figure 39. BGP Nexthop Tracking**

#### R1

|                                                           |                                                                                              |

**Nexthop Tracking Delay Timer**

The delay interval between routing table walks can be configured for nexthop delay tracking. This time determines how long BGP waits before it starts walking the full BGP routing table after receiving notification from NSM about a

next-hop change.

## Topology

**Figure 40. Topology for Nexthop Tracking Delay Timer**

## BGP Weight per Peer

A different weight can be assigned per address family of a peer. For example, a system can be configured to prefer VPN4 routes from peer A and IPv4 routes from peer B.

If the neighbor weight command is given under a specific address-family mode, the peer weight is set for that specific address family. If the address family is not specifically set, the weight is updated for the default address-family.

## Topology

Figure 42. BGP Weight Per Peer

### R1

## OSPF as PE-CE Protocol for VPNs

In an MPLS VPN environment, customer networks are connected to an MPLS VPN-enabled provider backbone. As shown in [Figure 43](#), Customer A areas, Areas 0 and 1, are connected to an MPLS VPN-enabled provider network. Area 0 and Area 1 have routers CE1 and CE2 running OSPF. MP-iBGP is used between PE1 and PE2 to propagate routes between Site 1 (Area 0) and Site 2 (Area 1). Traditional OSPF-BGP redistribution is performed at PE routers, PE1 and PE2. In this case, routes distributed by CE1 into the MP-iBGP cloud are sent to CE2 as external routes, even though both CE1 and CE2 belong to the same customer.

This behavior can be changed with the additional domain ID configuration. Each VRF should be configured a domain ID on the PE routers. If a PE router gets a route through the MP-iBGP cloud and has to send to any customer site, it checks the domain ID value against the list of stored domain ID values. If the incoming domain ID matches any of the stored IDs, that route is inserted into the customer site with the same type, as it was inserted into the MP-BGP cloud; otherwise, it is inserted as external route.

### Topology

## BGP Multipath for IPv4

BGP supports multipath for IPv4 prefixes. BGP Multipath allows load-balancing traffic among multiple BGP routes. It supports both iBGP and eBGP routes. In case of eBGP, the routes should arrive from same AS number.

## Topology

**Figure 44. Multipath iBGP for IPv4**

## Configuration

### Rtr1

|                                                   |                                                                  |

## Multipath eiBGP

Use this command to set the number of equal-cost multi-path (ECMP) routes for both eBGP and iBGP. This feature allows to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol.

When enabled, this feature can perform load balancing on eBGP and/or iBGP paths. With multiple eBGP and iBGP paths, selection is per all paths sorted according to BGP rules and hence either of all eBGP or iBGP or both will be marked as candidates for multipath programming i.e., it is possible either all eBGP paths or all iBGP paths or both eBGP and iBGP are programmed as multipaths.

Exceptions during path selections when eiBGP is enabled:

- AS Path length check is ignored.
- Origin Check is ignored.
- Peer type check is ignored.
- IGP Metric check is ignored.

### Topology

## BGP AS-PATH Multipath-relax

BGP will not load balance across multiple paths by default. We can configure it to do so with the `max-paths ebgp <no-of-multipaths>` command. The criterion of this command is that all attributes must match (Weight, Local preference, AS Path, etc). This is acceptable if we are multi-homed to a single AS, but what if we are multi-homed to different AS.

BGP AS PATH multipath relax effectively allows for ECMP to be done across different neighboring ASN's.

### Topology

**Figure 47. BGP AS-PATH Multipath-relax Topology**

Below topology explains about BGP AS PATH multipath relax functionality.

## Configuration

### R1

|                                                 |                                                                  |

## BGP FIB Install (Selective Route Download)

The BGP—Selective Route Download feature allows a network administrator to selectively download some or none of the BGP routes into the Routing Information Base (RIB). The primary application for this feature is to suppress the unnecessary downloading of certain BGP routes to the RIB or Forwarding Information Base (FIB) on a dedicated route reflector, which propagates BGP updates without carrying transit traffic. The feature thereby helps to maximize resources available and to improve routing scalability and convergence on the dedicated route reflector.

With RFC 4456, the concept of route reflection was defined; this would allow configuring designated one or more BGP routers in iBGP network as route reflectors. BGP relaxes the re-advertising restriction on these route reflectors, allowing them to accept and propagate IBGP routes to their clients.

The role of a dedicated route reflector (RR) is to propagate BGP updates without participating in the actual forwarding of transit traffic. That means the RR does not need to have all BGP routes downloaded into its RIB or FIB. It is beneficial for the RR to preserve its resources by not processing and storing those routes.

By default, BGP routes are downloaded to the RIB. To save resources on a dedicated route reflector, such downloading can be reduced or prevented by configuring a table map. A table map is so named because it controls what is put into the BGP routing table.

By reducing the route installation in the dedicated route reflectors, we can maximize availability of resources and improve routing scalability and convergence.

A new command 'table map' is being introduced to achieve this. A table map controls what is put into the BGP routing table. When configured it would reduce or prevent downloading routes to RIB.

Table map command references 'route map' rules available in BGP to control the routes going into the BGP routing table.

Table-map command can be used in two ways:

- When a simple table-map command is given (without filter option), the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option 'filter' is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

## Topology

Below topology explains about BGP FIB Install functionality.

**Figure 48. BFP FIB Install Topology**

## Configuration

### R1

### Table-map With Filter Option

Now verify after applying table-map with filter option, only one route will be installed in FIB table according to route-map and access-list configured, BGP table remains same, table-map effect will be seen only for FIB table.

After applying table-map, clear BGP with "clear ip bgp table-map."

```
(config)#router bgp 100
(config-router)#address-family ipv4-unicast
(config-router-af)#table-map test filter
(config-router-af)#end
#clear ip bgp table-map

#show ip bgp

```

**Note:** Same can be tried with IPV6 VRF–v4 and VRF–v6 address-families and this feature is not supported for VPNV4 address-family

## Route Target Constraint

BGP/MPLS IP VPNs use PE routers to Route Target (RT) extended communities and control the distribution of routes into the VRFs. Within a given iBGP mesh, PE routers hold routes marked with RouteTargets pertaining to VRFs that have local CE attachments.

BGP RT Constrained Route Distribution is a feature that can be used by service providers in Multiprotocol Label Switching (MPLS) Layer 3 VPNs to reduce the number of unnecessary routing updates that route reflectors (RRs) send to Provider Edge (PE) routers. The reduction in “routing updates” saves resources by allowing RRs, Autonomous System Boundary Routers (ASBRs), and PEs to carry fewer routes. Route targets are used to constrain routing updates.

With (MPLS)VPNs, the (iBGP) peers or Route Reflectors send all VPN4 and/or VPN6 prefixes to the PE routers. The PE routers drop the VPN4/6 prefixes for which there is no importing VPN route forwarding (VRF).

## Topology

The topology below shows Route-target filtering in an L3VPN—with Route Target Constraint (RTC), the RR sends only wanted VPN4/6 prefixes to the PE; “wanted” means that the PEs have the VRFs importing the specific prefixes.

**Figure 49. Route-target Filter Topology**

## Configuration

## Validation

Through RTfilter, address-family RT values will be exchanged between RR and PEs. Neighbors are activated under this address-family and configured clients as well. RR will learn routes from PEs and send them to other PEs if it has any peer requesting those routes based on their RT import values.

The outputs below show the routes sent and learned in PEs, installed in VRFs, and display the RT filter values exchanged between them. For more details on show command output fields, refer to [show ip bgp \(page 965\)](#), [show ip bgp vpnv4 \(page 978\)](#), and [show ip bgp rtfilter all \(page 972\)](#)

### CE1

The following provides the CE1 validation:

```
CE1#show ip bgp
BGP table version is 6, local router ID is 192.160.50.5
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network        Next Hop         Metric      LocPrf     Weight Path
*>  1.1.1.0/24      0.0.0.0             0          100       32768  ?
*>  3.3.3.0/24      0.0.0.0             0          100       32768  ?
*>  4.4.4.0/24      0.0.0.0             0          100       32768  ?

Total number of prefixes 3
```

## PE1

The following provides the PE1 validation:

```
PE1#show ip bgp vpnv4 all
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, l - labeled
              S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Example: The format 100:1:400/96 is interpreted as ORIGIN_AS:Route-Target/Prefix-length
Breakdown of 100:1:400/96:
    The first part (100) is the Global Administrator ASN represents Origin AS.
    1:400 -> Represents the Route Target (RT) Extended Community.
    /96 -> The prefix length, which in the case of RTC is always 96 bits.
```

## BGP Best Path Selection Process

BGP assigns the first valid path as the current best path. BGP then compares the best path with the next path in the list, until BGP reaches the end of the list of valid paths. Below steps provides the rules that are used to determine the best path:

1. Prefer the path with the highest WEIGHT.
2. Prefer the path with the highest LOCAL\_PREF.
3. Prefer the path that was locally originated via a network or aggregate BGP subcommand or through redistribution from an IGP.
4. Prefer the path with the shortest AS\_PATH.

**Notes:** Beware of these items:

- This step is skipped if user has configured the `bgp bestpath as-path ignore` command.
- If `bgp bestpath compare-confed-aspath` is configured then Prefer the path with the shortest AS\_CONFED path.

5. Prefer the path with the lowest ORIGIN type.

**Notes:** Beware of these items:

- IGP is lower than Exterior Gateway Protocol (EGP), and EGP is lower than INCOMPLETE.

6. Prefer the path with the lowest multi-exit discriminator (MED).

**Notes:** Beware of these items:

- MEDs are compared only if the first AS in the AS\_SEQUENCE is the same for multiple paths.
- If both the paths are internal as routes.
- If paths have confederation as-path then MEDs are compared only if the first AS in the BGP\_AS\_CONFED\_SEQUENCE is the same for multiple paths.
- To override all above checks, user can configure `bgp always-compare-med` command

7. Prefer eBGP over iBGP paths.

**Notes:** Beware of these items:

- EBGp is preferred over IGBP or EBGp is preferred over CONFED.

8. Path learned from LU Address-family is preferred over IPv4 Unicast Address-family.

**Notes:** Beware of these items:

- This is Exception Rule for IPv4 Labeled-Unicast Address-family.
- This rule applicable only for IPv4 Labeled-Unicast/Unicast routes over default VRF.

9. Prefer the path with the lowest IGP metric to the BGP next hop.

10 Determine if multiple paths require installation in the routing table for BGP Multipath and mark the ECMP candidate.

11 When both paths are external, prefer the path that was received first (the oldest one). This step minimizes route-flap, since a newer path won't displace an older one, even if it was the preferred route based on the additional decision criteria below. This has to be enabled by BGP command `bestpath tie-break-on-age`

**Notes:** Beware of these items:

- Skip this step if any of these items are true:
  - If `bgp bestpath compare-routerid` is configured in addition to `bestpath tie-break-on-age`, then this step will be skipped.
  - If the router ID is same for multiple paths, because the routes were received from the same router, then this step will be skipped.

12 Router ID and Originator Id:

- If `bgp bestpath compare-routerid` is configured, then prefer the route that comes from the BGP router with the lowest Router ID.
- If `bgp bestpath dont-compare-originator-id` is not configured, prefer the route that comes from the BGP router with the lowest Router ID.

**Notes:** Beware of these items:

- If a path contains Route Reflector (RR) attributes, the Originator ID is substituted for the Router ID in the path selection process.
- If `bgp bestpath dont-compare-originator-id` is configured, prefer the route that comes from the BGP router with the lowest router ID. In this case, Originator ID is not compared even if the RR attribute is present.

13 If the originator or Router ID is the same for multiple paths, prefer the path with the minimum cluster list length. Prefer the path that comes from the lowest neighbor address.

## BGP Dampening

BGP supports route dampening for IPv4 and IPv6 prefixes. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the

suppress limit, the advertisement of the route is suppressed. This penalty is decayed according to the configured half time value. Once the penalty is lower than the reuse limit, the route advertisement is unsuppressed. The dampening information is purged from the router once the penalty becomes less than half of the reuse limit.

## Topology

In this example, a successful TCP connection is being established between the routers.

**Figure 50. BGP dampening**

## IPv4 Configuration

## Validation

### R2

The following provides the R2 validation:

Verify the BGP dampening parameters.

```
#show ip bgp dampening parameters

dampening 15 750 2000 60 15 Dampening Control Block(s):
Reachability Half-Life time : 15 min Reuse penalty    : 750
Suppress penalty      : 2000
Max suppress time     : 60 min Un-reachability Half-Life time : 15 min Max penalty (ceil)   :
11999
Min penalty (floor)   : 375
```

Verify BGP dampened paths for flapping networks.

```
#show ip bgp dampening dampened-paths
BGP table version is 21, local router ID is 4.4.4.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, l - labeled, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

## Validation

### R2

The following provides the R2 validation:

Verify the IPv6 BGP dampening parameters.

```
#sh bgp dampening parameters

dampening 15 750 2000 60 15
Dampening Control Block(s):
  Reachability Half-Life time      : 15 min
  Reuse penalty                    : 750
  Suppress penalty                 : 2000
  Max suppress time                : 60 min
  Un-reachability Half-Life time   : 15 min
  Max penalty (ceil)               : 11999
  Min penalty (floor)              : 375
```

Verify IPv6 BGP dampened paths for flapping networks.

```
#sh bgp dampening dampened-paths
BGP table version is 7, local router ID is 4.4.4.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

## BGP Authentication

BGP authentication allows users to receive selected routing information, enhancing security of their network traffic. When BGP authentication is enabled on a router, the router verifies routing packets it receives by exchanging a password that is configured on both the sending and receiving routers.

In this example, both R1 and R2 have ABC as the password. Configure the same password on all routers that are to communicate using BGP in a network.

## Topology

**Figure 51. BGP Authentication**

## Configuration

### R1

|                                                               |                                                                  |

## BGP Unnumbered

This section contains configurations for BGP unnumbered interface which provides BGP peering with minimal configuration.

### Overview

BGP protocol is used to exchange IP prefixes between AS. For BGP neighbor ship to be established, IPv4 address configuration on peer is pre-requisite. In a large network, this can consume a lot of your address space, requiring a separate IP address for each peer-facing interface apart from administrator effort in configuration. When a BGP peer advertises an IPv4 prefix, it must include an IPv4 next hop address, which is usually the address of the advertising router; for this each BGP peer should have an IPv4 address. This feature is to enable BGP peering with minimal configuration, less IPv4 address-space.

For DC use-case, where hundreds of switches can be connected in CLOS topology, configuring each neighbor is both time consuming and (IPv4) address hungry.

To minimize this, BGP unnumbered can, avoid the need for an IP address on each BGP interface and by removing the need to configure the IP address and ASN of each neighbor. This feature uses link local ipv6 address of interface as per RFC-5549.

**Notes:**

- If BGP unnumbered is configured with only if /30 or /31 on the IPv4 address interface, then the BGP session is established through the IPv4 address. To establish the BGP session through link-local, configure `no ipv6 nd suppress-ra` and `ipv6 nd ra-interval <value>` commands on the interface without any IP address.
- To enable router solicitation or advertisement on an interface for un-numbered support, the `no ipv6 nd suppress-ra` command must be configured on both sides of the interface. Currently, suppression is disabled by default. This facilitates learning a neighbor's IPv6 Link-Local Address (LLA), which is necessary for sending OPEN messages to establish BGP neighborhood.
- As per RFC 5549, extended next-hop is not supported when IPv6 prefixes are advertised to a next-hop device running IPv4. Both devices must have either IPv6 or IPv4 addresses. AFI 1, SAFI 1, and IPv6 next-hop (Link-Local Address) are the only supported combinations with this feature. Global Unicast Address (GUA) for IPv6 next-hop is not supported.
- The hardware supports only data path packet forwarding (for IPv4 prefixes received through BGP neighborhood with the unnumbered interface over IPv6 LLA). Ping and traceroute do not work since entries are not installed in the kernel.

BGP Blackhole Community Attribute

A blackhole route is used to forward unwanted or undesirable traffic into a black hole. In other words, a special logical interface called a null interface, is used to create the black hole. Static routes are created for destinations that are not desirable, and the static route configuration points to the null interface. Any traffic that has a destination address that has a best match of the black hole static route automatically will be dropped.

Notes:

- 65535:666 is reserved for Blackhole community.
- BGP blackhole community is supported only for unicast address-family.

Topology

C       127.0.0.0/8 is directly connected, lo, 00:37:28

Gateway of last resort is not set

```

---

## Accumulated Interior Gateway Protocol

### Overview

This section includes step-by-step configuration of AIGP Metric Attribute for BGP. It also contains an overview of the concepts of AIGP. AIGP is a non-transitive attribute that includes the accumulated IGP metric. BGP routers advertise this AIGP metric to neighbors in other ASes. This allows BGP routers to select the best path based on the end-to-end IGP metric.

### Topology

The diagram depicts the topology for the configuration examples that follow.

**Figure 54. Accumulated Interior Gateway Protocol****Base Configurations****R1****Loopback Interface:**

|                                             |                                                      |
|---------------------------------------------|------------------------------------------------------|
| #configure terminal                         | Enter configuration mode.                            |
| (config)#interface lo                       | Enter the Interface mode for the loopback interface. |
| (config-if)#ip address 1.1.1.1/32 secondary | Configure IP address on loopback interface.          |
| (config-if)#commit                          | Commit the transaction                               |

**Interface Configuration:**

|                                       |                                        |
|---------------------------------------|----------------------------------------|
| (config)#interface xe15               | Enter the Interface mode for xe15.     |
| (config-if)# ip address 10.10.10.1/24 | Configure IP address on the interface. |
| (config-if)#exit                      | Exit interface mode                    |
| (config)#interface xe13               | Enter the Interface mode for xe13.     |
| (config-if)# ip address 11.11.11.1/24 | Configure IP address on the interface. |
| (config)#interface xe12               | Enter the Interface mode for xe12.     |
| (config-if)# ip address 50.50.50.2/24 | Configure IP address on the interface. |
| (config-if)#commit                    | Commit the transaction.                |

**OSPF Configuration:**

|                                              |                                     |
|----------------------------------------------|-------------------------------------|
| (config)#router ospf 100                     | Enter the Router OSPF mode.         |
| (config-router)#ospf router-id 1.1.1.1       | Router-id configurations            |
| (config-router)# network 1.1.1.1/32 area 0   | Advertise loopback address in OSPF. |
| (config-router)#network 10.10.10.0/24 area 0 | Advertise network address in OSPF.  |
| (config-router)#network 11.11.11.0/24 area 0 | Advertise network address in OSPF.  |
| (config-router)#commit                       | Commit the transaction              |

**R2****Loopback Interface:**

|                                             |                                                      |
|---------------------------------------------|------------------------------------------------------|
| #configure terminal                         | Enter configuration mode.                            |
| (config)#interface lo                       | Enter the Interface mode for the loopback interface. |
| (config-if)#ip address 2.2.2.2/32 secondary | Configure IP address on loopback interface.          |
| (config-if)#commit                          | Commit the transaction                               |

**Interface Configuration:**

|                                       |                                        |
|---------------------------------------|----------------------------------------|
| (config)#interface ce4/4              | Enter the Interface mode for ce4/4.    |
| (config-if)# ip address 10.10.10.2/24 | Configure IP address on the interface. |
| (config-if)#interface ce4/1           | Enter the Interface mode for ce4/1.    |
| (config-if)# ip address 12.12.12.1/24 | Configure IP address on the interface. |
| (config-if)#interface ce3/2           | Enter the Interface mode for ce3/2.    |
| (config-if)# ip address 13.13.13.1/24 | Configure IP address on the interface. |
| (config-if)#commit                    | Commit the transaction.                |

**OSPF Configuration:**

|                                              |                                     |
|----------------------------------------------|-------------------------------------|
| (config)#router ospf 100                     | Enter the Router OSPF mode.         |
| (config-router)#ospf router-id 2.2.2.2       | Router-id configurations            |
| (config-router)# network 2.2.2.2/32 area 0   | Advertise loopback address in OSPF. |

# BGP Graceful Restart Configuration

During a BGP restart, all BGP peers detect that a session had gone down and come back up. OcNOS invalidates the associated portion of the IP forwarding cache, does a BGP route re-computation, and generates BGP routing updates. The forwarding tables become corrupted and unstable.

Graceful restart helps minimize these negative effects on routing caused by a BGP restart by allowing the restarting BGP router to temporarily retain routing information and continue forwarding packets while BGP restarts. In this way, even while a router rebuilds routing and forwarding tables, the router continues to operate across the TCP connection.

Graceful restart allows a restarting router, and its neighbors, to continue forwarding packets, without disrupting network performance. Because neighboring routers assist in the restart, the restarting router can quickly resume full operation.

The graceful restart capability extends to the case when a configuration change forces a peer reset.

*Graceful reset* is a refinement of graceful restart to help ensure smooth restarts when a configuration change forces BGP peer reset.

**Note:** For seamless recovery and optimal functionality, configure VPNv4 GR only for a peer along with VPN AF in BGP. No other BGP capabilities must be configured.

## Topology

Figure 55. Device topology for BGP in VR/VRF

# BGP Labeled Unicast Next Hop Self in Route-Map

## Overview

The BGP-LU next-hop-self in route map feature provides the ability set the local BGP peer as the next-hop for select BGP-LU routes. When such a route map is applied to a BGP-LU neighbor in the outbound direction, the matched routes will be updated as below:

- The next-hop address is replaced with the local BGP peer address. Based on the BGP configuration, this is either the local interface address or the local loopback address
- The label is replaced with the local label allocated for the prefix

---

## Feature Characteristics

BGP-LU routes permitted by the route-map and configured with `set ip next-hop self` are advertised with the local BGP peer address as the next-hop and the locally assigned label. BGP-LU routes permitted by the route-map without `set next-hop self` are advertised with their original next-hop and the label remains unchanged. The BGP-LU routes denied by the route-map are not advertised.

---

## Limitations

The existing route-map CLIs to set next-hop, such as, `set ip next-hop a.b.c.d` or `set ip next-hop peer-address` are not recommended to be used for this feature and they can impact adversely.

---

## Prerequisites

While deploying BGP labelled unicast, ensure that the `allocate-label` command is enabled under `router bgp` mode. This command is required for allocating labels to IPv4 prefixes.

---

## Configuration

### Topology

This topology contains Route Reflectors (RR) and PE nodes with BGP-LU as the transport between them.

Domain 1 contains LDP as transport with OSPF as IGP on all nodes. Domain 2 contains RSVP as transport with IS-IS as IGP on all nodes.

**Figure 56. BGP LU Next-hop in Route-map**

To configure BGP LU Next-hop, follow the steps mentioned below:

**1. Configure BGP LU as transport**

```
#configure terminal
(config)#interface lo
(config-if)#ip address 11.11.11.55/32 secondary
(config-if)#exit
(config)#interface xe16
(config-if)#ip address 172.4.5.55/24
(config-if)#label-switching
(config-if)#exit
(config)#commit
```

**2. Configure the routing process OSPF with process ID 1.**

```
(config)#router ospf 1
```

**3. Define the interface (172.4.5.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).**

```
(config-router)#network 172.4.5.0/24 area 0
```

**4. Define the interface (11.11.11.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).**

```
(config-router)#network 11.11.11.55/32 area 0
(config-router)#exit
(config)#commit
(config)#router bgp 100
```

**5. Create a Prefix-list to match the advertised prefixes**

```
(config-router)# ip prefix-list BGP-LU-FILTER permit 10.10.10.0/24
```

**6. Create Route-map for LU using the prefix-list**

```
(config-router)#route-map RM-BGPLU-OUT permit 10
(config-router)#match ip address prefix-list BGP-LU-FILTER
```

Optionally, apply strict filtering using deny

```
(config-router)#route-map RM-BGPLU-OUT deny 20
```

## 7. Apply Route-map on BGP-LU Neighbor

```
(config-router)# allocate-label all route-map RM-BGPLU-OUT
```

## Commands

The BGP LU Next-hop self in Route-map feature has the following configuration commands:

### set ip next-hop self

Use this command to set next hop self for IPV4 BGP-LU neighbors.

Use “no” form of this command to not set next hop self.

#### Command Syntax

```
set ip next-hop self
no set ip next-hop self
```

#### Parameters

None

#### Command Mode

Route map mode mode

#### Applicability

This command is introduced in OcNOS version 7.0.0

#### Examples

```
ip prefix-list BCOM-IP
  seq 5 permit 25.4.4.0/24 eq 24

route-map BCOM-RM permit 2
  match ip address prefix-list BCOM-IP
  set ip next-hop self

router bgp 26
..
  address-family ipv4 labeled-unicast
  neighbor 27.27.27.27 route-map BCOM-RM out
..
```

---

# BGP Additional Paths Configuration

## Overview

The Border Gateway Protocol (BGP) ADDPATH allows the advertisement of multiple paths through the same peer session for a given prefix without the new paths implicitly replacing any previous paths. This behavior promotes path diversity and reduces the severity of a network failure, thereby improving the control plane convergence in case of network failures.

## Feature Characteristics

The advertisement of multiple paths in BGP is made possible by sending a BGP OPEN message to the neighbor with a BGP capability code of 69, which identifies the BGP ADD-PATH Capability.

| Feature                                    | Characteristics |
|--------------------------------------------|-----------------|
| Address Family Identifier(AFI)             | 2 octets        |
| Subsequent Address Family Identifier(SAFI) | 1 octet         |
| Send/Receive                               | 1 octet         |

For a given <AFI, SAFI>, the send/receive field in the BGP TLV indicates, the sender is able to:

- Receive multiple paths from its peer (value 1)
- Send multiple paths to its peer (value 2), or
- Receive and send multiple paths to its peer (value 3)
- Each alternate path is identified by a Path Identifier in addition to the address prefix

| Feature         | Characteristics |
|-----------------|-----------------|
| Path Identifier | 4 octets        |
| Length          | 1 octet         |
| Prefix          | variable        |

## Benefits

This feature enables BGP add-path in the vrf address-family. In the event of a next-hop failure, BGP Add-Path improves the BGP control plane convergence time.

---

## Prerequisites

- The supported OcNOS router running a compatible release.
- Provide access to the management interface of the router.
- Understand BGP well enough to enable it BGP on an interface.

**Note:** BGP does not advertise additional paths (non-best paths) to a neighbor when the neighbor is an eBGP peer with implicit next-hop-self or when next-hop-self is explicitly configured using the neighbor A.B.C.D next-hop-self command.

## Topology

**Figure 57. BGP Additional Path Topology**

## Configuration

The following sessions displays the detailed information about bgp additional paths topology, configurations, and validations.

### R1

|                                                  |                                                   |

| R1(config-if)#ipv6 address 1090::1/64            | Configure IPv6 address for Loopback interface lo. |
| R1(config-if)#exit                               | Exit the Interface mode.                          |
| R1(config)#router bgp 200                        | Enter the Router BGP mode .                       |
| R1(config-router)#neighbor 1001::2 remote-as 100 | Specify a neighbor router with a peer address and |

|                                                  |                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------|
|                                                  | remote-as for BGP peering.                                                   |
| R1(config-router)#neighbor 1002::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R1(config-router)#neighbor 1003::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R1(config-router)#neighbor 1004::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R1(config-router)#address-family ipv6 unicast    | Enter address-family mode for the neighbor router session to activate.       |
| R1(config-router-af)#neighbor 1001::2 activate   | Activate the neighbor router with a peer address.                            |
| R1(config-router-af)#neighbor 1002::2 activate   | Activate the neighbor router with a peer address.                            |
| R1(config-router-af)#neighbor 1003::2 activate   | Activate the neighbor router with a peer address.                            |
| R1(config-router-af)#neighbor 1004::2 activate   | Activate the neighbor router with a peer address.                            |
| R1(config-router-af)#neighbor 1090::/64          | Activate the neighbor router with a peer address.                            |
| R1(config-router-af)#exit-address-family         | Exit the Address Family mode and return to Router mode.                      |
| R1(config-router)#exit                           | Exit the Router BGP mode and enter the Configure mode.                       |
| R1(config)#commit                                | Apply commit.                                                                |
| R1(config)#exit                                  | Exit the Configure mode.                                                     |

## R2

Here is the detailed configuration of router R2.

|                                       |                                                                  |
|---------------------------------------|------------------------------------------------------------------|
| #configure terminal                   | Enter configure mode                                             |
| R2(config)#interface eth1             | Enter Interface mode for eth1.                                   |
| R2(config-if)#ipv6 address 3001::1/64 | Configure an IPv6 address for Interface eth1.                    |
| R2(config-if)#ipv6 router ospf area 0 | Enable OSPFv3 routing on an interface, and assign the Area ID 0. |
| R2(config-if)#exit                    | Exit interface mode.                                             |
| R2(config)#interface eth2             | Enter Interface mode for eth2.                                   |
| R2(config-if)#ipv6 address 1001::2/64 | Configure an IPv6 address for Interface eth2.                    |
| R2(config-if)#exit                    | Exit interface mode.                                             |
| R2(config)#interface eth3             | Enter Interface mode for eth3.                                   |
| R2(config-if)#ipv6 address 1002::2/64 | Configure an IPv6 address for Interface eth3.                    |
| R2(config-if)#exit                    | Exit interface mode.                                             |
| R2(config)#interface eth4             | Enter Interface mode for eth4.                                   |
| R2(config-if)#ipv6 address 1003::2/64 | Configure an IPv6 address for Interface eth4.                    |
| R2(config-if)#exit                    | Exit interface mode.                                             |

|                                                  |                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------|
| R2(config)#interface eth5                        | Enter Interface mode for eth5.                                               |
| R2(config-if)#ipv6 address 1004::1/64            | Configure an IPv6 address for Interface eth5.                                |
| R2(config-if)#exit                               | Exit interface mode.                                                         |
| R2(config)#router bgp 100                        | Enter the router bgp mode                                                    |
| R2(config-router)#neighbor 3001::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R2(config-router)#neighbor 1001::1 remote-as 200 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R2(config-router)#neighbor 1002::1 remote-as 200 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R2(config-router)#neighbor 1003::1 remote-as 200 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R2(config-router)#neighbor 1004::1 remote-as 200 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R2(config-router)#address-family ipv6 unicast    | Enter address-family mode for the neighbor router session to activate.       |
| R2(config-router-af)#neighbor 1001::1 activate   | Activate the neighbor router with a peer address.                            |
| R2(config-router-af)#neighbor 1002::1 activate   | Activate the neighbor router with a peer address.                            |
| R2(config-router-af)#neighbor 1003::1 activate   | Activate the neighbor router with a peer address.                            |
| R2(config-router-af)#neighbor 1004::1 activate   | Activate the neighbor router with a peer address.                            |
| R2(config-router-af)#neighbor 3001::2 activate   | Activate the neighbor router with a peer address.                            |
| R2(config-router-af)#exit-address-family         | Exit the Address Family mode and return to Router mode.                      |
| R2(config-router)#exit                           | Exit the Router BGP mode and enter the Configure mode.                       |
| R2(config)#router ipv6 ospf                      | Enter Router OSPFv3 mode.                                                    |
| R2(config-router)#redistribute connected         | Configure Redistribution of Connected networks into OSPF.                    |
| R2(config-router)#exit                           | Exit the router OSPF mode and enter the configure mode.                      |
| R2(config)#commit                                | Apply commit.                                                                |
| R2(config)#exit                                  | Exit the Configure mode.                                                     |

## R3

Here is the detailed configuration of router R3.

|                                       |                                                   |
|---------------------------------------|---------------------------------------------------|
| #configure terminal                   | Enter configure mode                              |
| R3(config)#interface eth1             | Enter Interface mode for eth1.                    |
| R3(config-if)#ipv6 address 3001::2/64 | Configure an IPv6 address for Interface eth1.     |
| R3(config-if)#ipv6 router ospf area 0 | Enable OSPFv3 routing on an interface, and assign |

|                                                  |                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------|
|                                                  | the Area ID 0.                                                               |
| R3(config-if)#exit                               | Exit interface mode.                                                         |
| R3(config)#interface eth2                        | Enter Interface mode for eth2.                                               |
| R3(config-if)#ipv6 address 2001::2/64            | Configure an IPv6 address for Interface eth2.                                |
| R3(config-if)#exit                               | Exit interface mode.                                                         |
| R3(config)#interface eth3                        | Enter Interface mode for eth3.                                               |
| R3(config-if)#ipv6 address 2002::2/64            | Configure an IPv6 address for Interface eth3.                                |
| R3(config-if)#exit                               | Exit interface mode.                                                         |
| R3(config)#interface eth4                        | Enter Interface mode for eth4.                                               |
| R3(config-if)#ipv6 address 2003::2/64            | Configure an IPv6 address for Interface eth4.                                |
| R3(config-if)#exit                               | Exit interface mode.                                                         |
| R3(config)#interface eth5                        | Enter Interface mode for eth5.                                               |
| R3(config-if)#ipv6 address 2004::2/64            | Configure an IPv6 address for Interface eth5.                                |
| R3(config-if)#exit                               | Exit interface mode.                                                         |
| R3(config)#router bgp 100                        | Enter the router bgp mode                                                    |
| R3(config-router)#neighbor 3001::1 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R3(config-router)#neighbor 2001::1 remote-as 300 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R3(config-router)#neighbor 2002::1 remote-as 300 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R3(config-router)#neighbor 2003::1 remote-as 300 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R3(config-router)#neighbor 2004::1 remote-as 300 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R3(config-router)#address-family ipv6 unicast    | Enter address-family mode for the neighbor router session to activate.       |
| R3(config-router-af)#neighbor 2001::1 activate   | Activate the neighbor router with a peer address.                            |
| R3(config-router-af)#neighbor 2002::1 activate   | Activate the neighbor router with a peer address.                            |
| R3(config-router-af)#neighbor 2003::1 activate   | Activate the neighbor router with a peer address.                            |
| R3(config-router-af)#neighbor 2004::1 activate   | Activate the neighbor router with a peer address.                            |
| R3(config-router-af)#neighbor 3001::1 activate   | Activate the neighbor router with a peer address.                            |
| R3(config-router-af)#exit-address-family         | Exit the Address Family mode and return to Router mode.                      |
| R3(config-router)#exit                           | Exit the Router BGP mode and enter the Configure mode.                       |
| R3(config)#router ipv6 ospf                      | Enter Router OSPFv3 mode.                                                    |
| R3(config-router)#redistribute connected         | Configure Redistribution of Connected networks into OSPF.                    |

|                        |                                                         |
|------------------------|---------------------------------------------------------|
| R3(config-router)#exit | Exit the router OSPF mode and enter the configure mode. |
| R3(config)#commit      | Apply commit.                                           |
| R3(config)#exit        | Exit the Configure mode.                                |

## R4

Here is the detailed configuration of router R4.

|                                                  |                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------|
| #configure terminal                              | Enter configure mode                                                         |
| R4(config)#interface eth2                        | Enter Interface mode for eth2.                                               |
| R4(config-if)#ipv6 address 2001::1/64            | Configure an IPv6 address for Interface eth1.                                |

| R4(config-if)#ipv6 address 2003::1/64            | Configure an IPv6 address for Interface eth3.                                |
| R4(config-if)#exit                               | Exit interface mode.                                                         |
| R4(config)#interface eth5                        | Enter Interface mode for eth5.                                               |
| R4(config-if)#ipv6 address 2004::1/64            | Configure an IPv6 address for Interface eth4.                                |
| R4(config-if)#exit                               | Exit interface mode.                                                         |
| R4(config)#interface lo                          | Enter the interface mode for loopback lo.                                    |
| R4(config-if)#neighbor 9999::1/64 remote-as 100  | Configure IPv6 address for Loopback Interface lo.                            |
| R4(config-if)#exit                               | Exit the Interface mode.                                                     |
| R4(config)#router bgp 300                        | Exit the router BGP mode.                                                    |
| R4(config-router)#neighbor 2001::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R4(config-router)#neighbor 2002::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R4(config-router)#neighbor 2003::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R4(config-router)#neighbor 2004::2 remote-as 100 | Specify a neighbor router with a peer address and remote-as for BGP peering. |
| R4(config-router)#address-family ipv6 unicast    | Enter address-family mode for the neighbor router session to activate.       |
| R4(config-router-af)#neighbor 2001::2 activate   | Activate the neighbor router with a peer address.                            |
| R4(config-router-af)#neighbor 2002::2 activate   | Activate the neighbor router with a peer address.                            |
| R4(config-router-af)#neighbor 2003::2 activate   | Activate the neighbor router with a peer address.                            |

|                                                  |                                                         |
|--------------------------------------------------|---------------------------------------------------------|
| R4(config-router-af)#neighbor 2004::2 activate   | Activate the neighbor router with a peer address.       |
| R4(config-router-af)#neighbor 9999::/64 activate | Activate the neighbor router with a peer address.       |
| R4(config-router-af)#exit-address-family         | Exit the Address Family mode and return to Router mode. |
| R4(config-router)#exit                           | Exit the Router BGP mode and enter the Configure mode.  |
| R4(config)#commit                                | Apply commit.                                           |
| R4(config)#exit                                  | Exit the Configure mode.                                |

## Additional Paths at the Global Level

In the following sessions additional paths at the global level is illustrated.

### R2

|                                                      |                                                                           |
|------------------------------------------------------|---------------------------------------------------------------------------|
| R2#configure terminal                                | Enter the Configure mode.                                                 |
| R2(config)#router bgp 100                            | Enter BGP router mode                                                     |
| R2(config-router)#address-family ipv6 unicast        | Enter address-family mode for neighbor router session to activate.        |
| R2(config-router-af)#bgp additional-paths send       | Configure R2 to send additional paths to all iBGP neighbors.              |
| R2(config-router-af)#bgp additional-paths select all | Configure R2 to select all available paths to send to all iBGP neighbors. |
| R2(config-router-af)#exit-address-family             | Exit Address Family mode and return to Router mode.                       |
| R2(config-router)#exit                               | Exit the router BGP mode and return to the configure mode                 |
| R2(config)#commit                                    | Apply commit                                                              |
| R2(config)#exit                                      | Exit the configure mode                                                   |

### R3

Here is the detailed configuration of router R3.

|                                                   |                                                                    |
|---------------------------------------------------|--------------------------------------------------------------------|
| R3#configure terminal                             | Enter the Configure mode.                                          |
| R3(config)#router bgp 100                         | Enter BGP router mode                                              |
| R3(config-router)#address-family ipv6 unicast     | Enter address-family mode for neighbor router session to activate. |
| R3(config-router-af)#bgp additional-paths receive | Configure R3 to receive additional paths to all iBGP neighbors.    |
| R3(config-router-af)#exit-address-family          | Exit Address Family mode and return to Router mode.                |

|                        |                                                           |
|------------------------|-----------------------------------------------------------|
| R3(config-router)#exit | Exit the router BGP mode and return to the configure mode |
| R3(config)#commit      | Apply commit                                              |
| R3(config)#exit        | Exit the configure mode                                   |

## Validation

The following is the validations for routers R2 and R3.

### R2

The following is the validation for router.

```
#show bgp ipv6 neighbors 3001::2
BGP neighbor is 3001::2, remote AS 100, local AS 100, internal link
  BGP version 4, remote router ID 10.12.5.92
  BGP state = Established, up for 00:14:55
  Last read 00:14:55, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 536 messages, 50 notifications, 0 in queue
  Sent 611 messages, 3 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 5, Offset 0, Mask 0x20
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

For address family: IPv6 Unicast
  BGP table version 38, neighbor version 38
  Index 5, Offset 0, Mask 0x20
  AF-dependant capabilities:
    Add-Path Send Capability : advertised
    Add-Path Receive Capability : received
  Community attribute sent to this neighbor (both)
  1 accepted prefixes
  4 announced prefixes

Connections established 3; dropped 2
Local host: 3001::1, Local port: 38451
Foreign host: 3001::2, Foreign port: 179
Nexthop: 10.12.5.93
Nexthop global: 3001::1
Nexthop local: fe80::5054:ff:fe19:1758
BGP connection: shared network
Last Reset: 00:15:00, due to BGP Notification received
Notification Error Message: (Cease/Other Configuration Change.)

#show bgp ipv6 summary
BGP router identifier 10.12.5.93, local AS number 100
BGP table version is 38
2 BGP AS-PATH entries
0 BGP community entries
```

| Neighbor | V | AS  | MsgRcv | MsgSen | TblVer | InQ | OutQ | Up/Down  | State/PfxRcd |

## Additional Paths Send and Receive at Address-family level

The following session displays the additional paths Send and Receive at Address-family level.

### R2

Here is the detailed configuration of router R2.

|                                               |                                                                    |
|-----------------------------------------------|--------------------------------------------------------------------|
| R2#configure terminal                         | Enter the Configure mode.                                          |
| R2(config)#router bgp 100                     | Enter BGP router mode.                                             |
| R2(config-router)#address-family ipv6 unicast | Enter address-family mode for neighbor router session to activate. |

|                                                        |                                                                                                |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------|
| R2(config-router-af)#bgp additional-paths send-receive | Configure R2 to send additional paths to and receive additional paths from all iBGP neighbors. |
| R2(config-router-af)#bgp additional-paths select all   | Configure R2 to select all available paths to send to all iBGP neighbors.                      |
| R2(config-router-af)#exit-address-family               | Exit Address Family mode and return to Router mode.                                            |
| R2(config-router)#exit                                 | Exit the router BGP mode and return to the configure mode.                                     |
| R2(config)#commit                                      | Apply commit .                                                                                 |
| R2(config)#exit                                        | Exit the configure mode.                                                                       |

## R3

Here is the detailed configuration of router R3.

|                                                        |                                                                                                |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------|
| R3#configure terminal                                  | Enter the Configure mode.                                                                      |
| R3(config)#router bgp 100                              | Enter BGP router mode                                                                          |
| R3(config-router)#address-family ipv6 unicast          | Enter address-family mode for neighbor router session to activate.                             |
| R3(config-router-af)#bgp additional-paths send-receive | Configure R3 to send additional paths to and receive additional paths from all iBGP neighbors. |
| R3(config-router-af)#exit-address-family               | Exit Address Family mode and return to Router mode.                                            |
| R3(config-router)#exit                                 | Exit the router BGP mode and return to the configure mode                                      |
| R3(config)#commit                                      | Apply commit                                                                                   |
| R3(config)#exit                                        | Exit the configure mode                                                                        |

## Additional Paths at the Neighbor Level

The following session displays the additional paths at the neighbor level.

## R2

Here is the detailed configuration of router R2.

|                                                                      |                                                                    |
|----------------------------------------------------------------------|--------------------------------------------------------------------|
| R2#configure terminal                                                | Enter the Configure mode.                                          |
| R2(config)#router bgp 100                                            | Enter BGP router mode                                              |
| R2(config-router)#address-family ipv6 unicast                        | Enter address-family mode for neighbor router session to activate. |
| R2(config-router-af)#neighbor 3001::2 additional-paths send-receive  | Configure R2 to receive additional paths from the iBGP neighbor R3 |
| R2(config-router-af)#neighbor 3001::2 advertise additional-paths all | Configure R2 to advertise all available paths to the               |

|                                          |                                                           |
|------------------------------------------|-----------------------------------------------------------|
|                                          | iBGP neighbor R3                                          |
| R2(config-router-af)#exit-address-family | Exit Address Family mode and return to Router mode.       |
| R2(config-router)#exit                   | Exit the router BGP mode and return to the configure mode |
| R2(config)#commit                        | Apply commit                                              |
| R2(config)#exit                          | Exit the configure mode                                   |

## R3

Here is the detailed configuration of router R3.

|                                                                      |                                                                       |
|----------------------------------------------------------------------|-----------------------------------------------------------------------|
| R3#configure terminal                                                | Enter the Configure mode.                                             |
| R3(config)#router bgp 100                                            | Enter BGP router mode                                                 |
| R3(config-router)#address-family ipv6 unicast                        | Enter address-family mode for neighbor router session to activate.    |
| R3(config-router-af)#neighbor 3001::1 additional-paths send-receive  | Configure R3 to receive additional paths from the iBGP neighbor R2    |
| R3(config-router-af)#neighbor 3001::1 advertise additional-paths all | Configure R2 to advertise all available paths to the iBGP neighbor R3 |
| R3(config-router-af)#exit-address-family                             | Exit Address Family mode and return to Router mode.                   |
| R3(config-router)#exit                                               | Exit the router BGP mode and return to the configure mode             |
| R3(config)#commit                                                    | Apply commit                                                          |
| R3(config)#exit                                                      | Exit the configure mode                                               |

## Validation

The following validation for router R2 and R3 is shown below.

### R2

The following validation is for router R2.

```
#show bgp ipv6 neighbors 3001::2
BGP neighbor is 3001::2, remote AS 100, local AS 100, internal link
  BGP version 4, remote router ID 10.12.5.92
  BGP state = Established, up for 00:00:29
  Last read 00:00:29, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 588 messages, 51 notifications, 0 in queue
  Sent 664 messages, 4 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 5, Offset 0, Mask 0x20
```

```

Community attribute sent to this neighbor (both)
0 accepted prefixes
0 announced prefixes

For address family: IPv6 Unicast
BGP table version 64, neighbor version 64
Index 5, Offset 0, Mask 0x20
AF-dependant capabilities:
  Add-Path Send Capability : advertised and received
  Add-Path Receive Capability : advertised and received
Community attribute sent to this neighbor (both)
4 accepted prefixes
4 announced prefixes

Connections established 5; dropped 4
Local host: 3001::1, Local port: 179
Foreign host: 3001::2, Foreign port: 39326
Nexthop: 10.12.5.93
Nexthop global: 3001::1
Nexthop local: fe80::5054:ff:fe19:1758
BGP connection: shared network
Last Reset: 00:00:29, due to BGP Notification sent
Notification Error Message: (Cease/Other Configuration Change.)

## Selection of all Additional Paths Configuration and Validation

### Selection of all Additional Paths at the Address-family Level

The following are the configurations and validations for additional paths at the address-family level.

#### R2 Configuration

Here is the detailed configuration of router R2.

|                                                      |                                                                                                |
|------------------------------------------------------|------------------------------------------------------------------------------------------------|
| #configure terminal                                  | Enter the Configure mode.                                                                      |
| (config)#router bgp 100                              | Enter BGP router mode.                                                                         |
| (config-router)#address-family ipv6 unicast          | Enter address-family mode for neighbor router session to activate.                             |
| (config-router-af)#bgp additional-paths send-receive | Configure R2 to send additional paths to and receive additional paths from all iBGP neighbors. |
| (config-router-af)#bgp additional-paths select all   | Configure R2 to select all available paths to send to all iBGP neighbors.                      |
| (config-router-af)#exit-address-family               | Exit Address Family mode and return to Router mode.                                            |
| (config-router)#exit                                 | Exit the router BGP mode and enter the configure mode.                                         |
| (config)#commit                                      | Apply commit .                                                                                 |
| (config)#exit                                        | Exit the configure mode.                                                                       |

### Selection of all Additional Paths at the Neighbor Level

The following are the configurations and validations for additional paths at the neighbor level.

## R2 Configuration

Here is the detailed configuration of router R2.

|                                                                      |                                                                                                |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| R2#configure terminal                                                | Enter the Configure mode.                                                                      |
| R2(config)#router bgp 100                                            | Enter BGP router mode                                                                          |
| R2(config-router)#address-family ipv6 unicast                        | Enter address-family mode for neighbor router session to activate.                             |
| R2(config-router-af)#neighbor 3001::2 additional-paths send          | Configure R2 to send additional paths to and receive additional paths from all iBGP neighbors. |
| R2(config-router-af)#neighbor 3001::2 advertise additional-paths all | Exit Address Family mode and return to Router mode.                                            |
| R2(config-router-af)#exit-address-family                             | Configure R2 to select all available paths to send to all iBGP neighbors.                      |
| R2(config-router)#exit                                               | Exit the router BGP mode and return to the configure mode                                      |
| R2(config)#commit                                                    | Apply commit                                                                                   |
| R2(config)#exit                                                      | Exit the configure mode                                                                        |

## Validation

The following is the validations for routers R2 and R3.

### R2

The following is the validation for router R2.

```
#show bgp ipv6 1090::/64
BGP routing table entry for 1090::/64
Paths: (4 available, best #1, table Default-IP-Routing-Table)

## Selection of Best 2 Additional Paths Configuration and Validation

### Selection of Best 2 Additional Paths at AF Level

The following are the configurations and validations for best 2 additional paths at AF level.

#### R2 Configuration

Here is the detailed configuration of router R2.

|                                                         |                                                                                 |
|---------------------------------------------------------|---------------------------------------------------------------------------------|
| R2#configure terminal                                   | Enter the Configure mode.                                                       |
| R2(config)#router bgp 100                               | Enter BGP router mode.                                                          |
| R2(config-router)#address-family ipv6 unicast           | Enter address-family mode for neighbor router session to activate.              |
| R2(config-router-af)#bgp additional-paths send          | Configure R2 to send additional paths to the iBGP neighbors.                    |
| R2(config-router-af)#bgp additional-paths select best 2 | Configure R2 to select best 2 out of all available paths to all iBGP neighbors. |
| R2(config-router-af)#exit-address-family                | Exit Address Family mode and return to Router mode.                             |
| R2(config-router)#exit                                  | Exit the router BGP mode and enter the configure mode.                          |
| R2(config)#commit                                       | Apply commit.                                                                   |
| R2(config)#exit                                         | Exit the configure mode.                                                        |

## Selection of Best 2 Additional Paths at the Neighbor Level

The following are the configurations and validations for best 2 additional paths at neighbor level.

### R2 Configuration

Here is the detailed configuration of router R2.

|                                                                         |                                                                                                |
|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| R2#configure terminal                                                   | Enter the Configure mode.                                                                      |
| R2(config)#router bgp 100                                               | Enter BGP router mode                                                                          |
| R2(config-router)#address-family ipv6 unicast                           | Enter address-family mode for neighbor router session to activate.                             |
| R2(config-router-af)#neighbor 3001::2 additional-paths send             | Configure R2 to send additional paths to and receive additional paths from all iBGP neighbors. |
| R2(config-router-af)#neighbor 3001::2 advertise additional-paths best 2 | Configure R2 to advertise best 2 out of all available paths to R3.                             |
| R2(config-router-af)#exit-address-family                                | Exit Address Family mode and return to Router mode.                                            |
| R2(config-router)#exit                                                  | Exit the router BGP mode and return to the configure mode                                      |
| R2(config)#commit                                                       | Apply commit                                                                                   |
| R2(config)#exit                                                         | Exit the configure mode                                                                        |

### Validation

The following is the validations for routers R2 and R3.

#### R2

The following is the validation for router R2.

```
#show bgp ipv6 1090::/64
BGP routing table entry for 1090::/64
Paths: (4 available, best #1, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
    1002::1 1003::1 1004::1
  200
    1001::1(fe80::5054:ff:fe9c:b7e6) from 1001::1 (10.12.5.144)
    (fe80::5054:ff:fe9c:b7e6)
      Origin IGP, metric 0, localpref 100, valid, external, best
      rx path_id: -1      tx path_id: 0
      Advertised to non peer-group peers:
        3001::2
      Last update: Wed Jan 11 06:34:49 2017

  200
    1002::1(fe80::5054:ff:fe0d:f5e) from 1002::1 (10.12.5.144)
    (fe80::5054:ff:fe0d:f5e)
      Origin IGP, metric 0, localpref 100, valid, external
      rx path_id: -1      tx path_id: 1
      Advertised to non peer-group peers:
        3001::2
      Last update: Wed Jan 11 06:34:49 2017

  200
    1003::1(fe80::5054:ff:fec7:1940) from 1003::1 (10.12.5.144)
    (fe80::5054:ff:fec7:1940)
      Origin IGP, metric 0, localpref 100, valid, external
      rx path_id: -1      tx path_id: -1
      Not advertised to any peer
      Last update: Wed Jan 11 06:34:49 2017

  200
    1004::1(fe80::5054:ff:fe62:70d8) from 1004::1 (10.12.5.144)
    (fe80::5054:ff:fe62:70d8)
      Origin IGP, metric 0, localpref 100, valid, external
      rx path_id: -1      tx path_id: -1
      Not advertised to any peer
      Last update: Wed Jan 11 06:34:49 2017
```

### R3

The following is the validation for router R3.

```
#show bgp ipv6 1090::
BGP routing table entry for 1090::/64
Paths: (2 available, best #1, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
    2001::1 2002::1 2003::1 2004::1
  200
    1001::1 (metric 20) from 3001::1 (10.12.5.93)
    Origin IGP, metric 0, localpref 100, valid, internal, best
    rx path_id: 0      tx path_id: 0
    Not advertised to any peer
    Last update: Wed Jan 11 06:34:49 2017

  200
    1002::1 (metric 20) from 3001::1 (10.12.5.93)
    Origin IGP, metric 0, localpref 100, valid, internal
    rx path_id: 1      tx path_id: -1
    Not advertised to any peer
    Last update: Wed Jan 11 06:34:49 2017
#show bgp ipv6
BGP table version is 407, local router ID is 10.12.5.92
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, l - labeled
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

| Network                    | Next Hop                          | Metric | LocPrf | Weight | Path  |

## Selection of Best 3 Additional Paths Configuration and Validation

### Selection of Best 3 Additional Paths at AF Level

The following are the configurations and validations for best 3 additional paths at AF level.

#### R2 Configuration

Here is the detailed configuration of router R2.

|                                                         |                                                                                 |
|---------------------------------------------------------|---------------------------------------------------------------------------------|
| R2#configure terminal                                   | Enter the Configure mode.                                                       |
| R2(config)#router bgp 100                               | Enter BGP router mode.                                                          |
| R2(config-router)#address-family ipv6 unicast           | Enter address-family mode for neighbor router session to activate.              |
| R2(config-router-af)#bgp additional-paths send          | Configure R2 to send additional paths to the iBGP neighbors.                    |
| R2(config-router-af)#bgp additional-paths select best 3 | Configure R2 to select best 3 out of all available paths to all iBGP neighbors. |
| R2(config-router-af)#exit-address-family                | Exit Address Family mode and return to Router mode.                             |
| R2(config-router)#exit                                  | Exit the router BGP mode and enter the configure mode.                          |
| R2(config)#commit                                       | Apply commit.                                                                   |
| R2(config)#exit                                         | Exit the configure mode.                                                        |

### Selection of Best 3 Additional Paths at the Neighbor Level

The following are the configurations and validations for best 2 additional paths at neighbor level.

#### R2 Configuration

Here is the detailed configuration of router R2.

|                           |                           |
|---------------------------|---------------------------|
| R2#configure terminal     | Enter the Configure mode. |
| R2(config)#router bgp 100 | Enter BGP router mode     |

|                                                                         |                                                                                                |
|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| R2(config-router)#address-family ipv6 unicast                           | Enter address-family mode for neighbor router session to activate.                             |
| R2(config-router-af)#neighbor 3001::2 additional-paths send             | Configure R2 to send additional paths to and receive additional paths from all iBGP neighbors. |
| R2(config-router-af)#neighbor 3001::2 advertise additional-paths best 2 | Configure R2 to advertise best 3 out of all available paths to R3.                             |
| R2(config-router-af)#exit-address-family                                | Exit Address Family mode and return to Router mode.                                            |
| R2(config-router)#exit                                                  | Exit the router BGP mode and return to the configure mode                                      |
| R2(config)#commit                                                       | Apply commit                                                                                   |
| R2(config)#exit                                                         | Exit the configure mode                                                                        |

## Validation

The following is the validations for routers R2 and R3.

### R2

The following is the validation for router R2.

```
#show bgp ipv6 1090::/64
BGP routing table entry for 1090::/64
Paths: (4 available, best #1, table Default-IP-Routing-Table)

Total number of prefixes 2
```

**Implementation Examples**

The following examples shows the bgp additional path entries.

```
OcNOS#show ip bg summary
BGP router identifier 33.33.33.1, local AS number 400
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries
Neighbor          V    AS  MsgRcv   MsgSen  TblVer   InQ   OutQ   Up/Down   State/PfxRcd
1.1.1.2            4    100    19      17       2      0     0    00:06:35      0
Total number of neighbors 1
Total number of Established sessions 1
```

## Cli Commands

The BGP additional path introduces the following configuration commands.

## bgp additional-paths send-receive

Use this command is to enable BGP additional paths send and receive global mode commands in ipv4 vrf address-family.

Use the `no` parameter with this command to disable BGP add-path send and receive global mode commands in ipv4 vrf address-family.

### Command Syntax

```
bgp additional-paths (send-receive)
no bgp additional-paths (send-receive)
```

### Parameters

#### send

Send additional paths to neighbors.

#### receive

Receive additional paths to neighbors.

#### send-receive

Send and receive additional paths from neighbors.

#### select

Specifies the selection criteria to pick the paths.

### Default

BGP additional path is disabled.

### Command Mode

Address Family IPV4 VRF Mode.

### Applicability

This command was introduced before OcNOS version 6.4.1.

### Examples

```
OcNOS#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 vrf ipl
(config-router-af)#bgp additional-paths send
(config-router-af)#no bgp additional-paths send
```

## bgp additional-paths select best 3

Use this command is to enable BGP additional best 3 paths in global mode ipv4 vrf address-family.

Use the `no` parameter with this command to disable BGP add-path select best 3 paths in global mode ipv4 vrf address-family.

### Command Syntax

```
bgp additional-paths(select best 3)
no bgp additional-paths(select best 3)
```

### Parameters

#### best

Send best N paths.

#### 3

Specifies the number of best paths in additional paths to be selected.

#### select

Specifies the selection criteria to pick the paths.

### Default

By default, BGP additional path is disabled.

### Command Mode

Address Family IPV4 VRF Mode.

### Applicability

This command was introduced before OcNOS version 6.4.1.

### Examples

```
OcNOS#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 vrf ip1
(config-router-af)#bgp additional-paths select best 3
(config-router-af)#no bgp additional-paths select best 3
```

## bgp additional-paths select all

Use this command to enable BGP additional paths select all in global mode commands in ipv4 vrf address-family.

Use the `no` parameter with this command to disable all selected BGP add-paths in global mode commands in ipv4 vrf address-family.

### Command Syntax

```
bgp additional-paths(select all)
no bgp additional-paths(select all)
```

### Parameters

#### all

Send all available paths.

#### select

Specifies the selection criteria to pick the paths.

### Default

By default, BGP additional path is disabled.

### Command Mode

Address Family IPV4 VRF Mode.

### Applicability

This command was introduced before OcNOS version 6.4.1.

### Examples

```
OcNOS#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 vrf ip1
(config-router-af)#bgp additional-paths select all
(config-router-af)#no bgp additional-paths select all
```

## neighbor A.B.C.D additional-paths send | receive | send-receive

Use this command to enable BGP add-path at neighbor level to send and receive neighbor level commands added in ipv4 vrf address-family.

Use the `no` parameter with this command to disable BGP add-path at neighbor level to send and receive neighbor level commands added in ipv4 vrf address-family.

### Command Syntax

```
neighbor A.B.C.D additional-paths (send|receive|send-receive|)  
no neighbor A.B.C.D additional-paths (send|receive|send-receive|)
```

### Parameters

#### send

Send additional paths to neighbors.

#### receive

Receive additional paths to neighbors.

#### send-receive

Send and receive additional paths from neighbors.

### Default

By default, neighbor advertise additional path is disabled.

### Command Mode

Address Family IPV4 VRF Mode.

### Applicability

This command was introduced before OcNOS version 6.4.1.

### Examples

```
OcNOS#configure terminal  
(config)#router bgp 2  
(config-router)#address-family ipv4 vrf ipl  
(config-router-af)#neighbor 1.1.1.2 advertise additional-paths all  
(config-router-af)#no neighbor 1.1.1.2 advertise additional-paths all
```

## neighbor A.B.C.D additional-paths all

Use this command to enable BGP add-path at all neighbor level commands added in ipv4 vrf address-family.

Use the `no` parameter with this command to disable BGP add-path at neighbor level commands added in ipv4 vrf address-family.

### Command Syntax

```
neighbor A.B.C.D additional-paths all  
no neighbor A.B.C.D additional-paths all
```

### Parameters

#### all

Select all available paths

### Default

By default, neighbor advertise additional path is disabled.

### Command Mode

Address Family IPV4 VRF Mode.

### Applicability

This command was introduced before OcNOS version 6.4.1.

### Examples

```
OcNOS#configure terminal  
(config)#router bgp 2  
(config-router)#address-family ipv4 vrf ip1  
(config-router-af)#neighbor 1.1.1.2 advertise additional-paths all  
(config-router-af)#no neighbor 1.1.1.2 advertise additional-paths all
```

## neighbor A.B.C.D additional-paths best <2-3>

Use this command to enable BGP add-path at all neighbor level commands added in ipv4 vrf address-family.

Use the `no` parameter with this command to disable BGP add-path at neighbor level commands added in ipv4 vrf address-family.

### Command Syntax

```
neighbor A.B.C.D additional-paths all
no neighbor A.B.C.D additional-paths all
```

### Parameters

#### all

Select all available paths

#### <2-3>

Number of best paths in additional paths to be selected.

### Default

By default, neighbor advertise additional path is disabled.

### Command Mode

Address Family IPV4 VRF Mode.

### Applicability

This command was introduced before OcNOS version 6.4.1.

### Examples

```
OcNOS#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 vrf ip1
(config-router-af)#neighbor 1.1.1.2 advertise additional-paths best 2
(config-router-af)#no neighbor 1.1.1.2 advertise additional-paths best 2
```

---

## Troubleshooting

BGP additional paths for DC is a new feature when it is configured neighbour level resets only the particular peer and global level resets all the peers.

### Abbreviations

List key terms used in this document and add the term and explanation to our existing Glossary.

| Acronym | Description             |
|---------|-------------------------|
| BGP     | Border Gateway Protocol |
| CLI     | Command Line Interface  |
| TLV     | Type Length Values      |

## TCP MSS configuration for BGP neighbors

### Overview

The manual configuration between the routing devices establishes the BGP peer that creates a TCP session.

This feature enables the configuration of TCP Maximum Segment Size (MSS) that defines the maximum segment size in a single TCP segment during a communication session. TCP segment is a unit of data transmitted in a TCP connection. TCP uses three-way handshake process for initial establishment of a TCP connection. In the three-way handshake process, the sending host sends a SYN packet. Once the receiving host receives the SYN packet, it acknowledges and sends back a SYN-ACK packet to the sending host. Once the sending host receives the SYN-ACK packet from the receiving host, it sends an ACK packet, establishing a reliable connection. In this three way handshake process, the MSS is negotiated between the BGP neighbors.

**Figure 58. Three-way handshake**

### Feature Characteristics

The configuration of the TCP MSS for BGP neighbors helps the neighbors adjust the MSS value of the TCP SYN packet. Configure the TCP MSS through the CLI and NetConf interface. The configurable MSS range is offered from 40-1440 bytes. By default, the MTU value for ethernet cable is 1500 bytes. When configuring the highest MSS value that is 1440, the total MSS becomes 1440 bytes (MSS) plus 20 bytes (IP Header Size), 20 bytes (TCP Header), and Ethernet header which does not cross the default path MTU value.

**Figure 59. TCP MSS for BGP neighbor**

### Benefits

By default, the interface MTU value determines the MSS value of a packet. When the interface MTU value exceeds the default ethernet path MTU value of 1500 bytes, the MSS value also crosses the default ethernet path MTU value, resulting in packet fragmentation. The configuration of the specific MSS value limits the packet size irrespective of the interface MTU value, preventing packet fragmentation.

## Prerequisites

Requires the knowledge on TCP handshake and BGP neighbor discovery.

## Configuration

This section shows the procedure to configure TCP MSS between BGP peers.

### Topology

The below example shows the configuration required to enable BGP on an interface. PE1 and RR1 are routers belonging to the same Autonomous System (AS) with the Autonomous System Number (ASN) as AS100, connecting to network 10.1.1.0/24. First, define the routing process and the ASN to which the routers belong. Then, define BGP neighbors to start exchanging routing updates and configure the TCP MSS for BGP between PE1 and RR1 devices.

**Figure 60. Device topology for BGP**

### Configuration

The configuration shows how to configure the TCP MSS value for the BGP peer.

#### PE1

|                                                |                                                                      |
|------------------------------------------------|----------------------------------------------------------------------|
| PE1#configure terminal                         | Enter Configuration mode.                                            |
| PE1(config)#interface lo                       | Enter interface mode for loopback.                                   |
| PE1(config-if)#ip address 1.1.1.1/32 secondary | Specify the interface IP address 1.1.1.1.                            |
| PE1(config-if)#exit                            | Exit the interface mode.                                             |
| PE1(config)#interface xe1                      | Enter interface mode for xe1.                                        |
| PE1(config-if)#ip address 10.1.1.1/24          | Specify the IP address 10.1.1.1 for the interface.                   |
| PE1(config-if)#exit                            | Exit interface mode for xe1.                                         |
| PE1(config)#router bgp 100                     | Define the routing process. The number 100 specifies the ASN of PE1. |
| PE1(config-router)#bgp router-id 1.1.1.1       | Configure bgp router-id same as loopback IP address 1.1.1.1.         |
| PE1(config-router)#neighbor 10.1.1.2           | Define BGP neighbors, and establish a TCP session.                   |

|                                                  |                                                                           |
|--------------------------------------------------|---------------------------------------------------------------------------|
| remoteas 100                                     | 10.1.1.2 is the IP address of the neighbor and 100 is the neighbor's ASN. |
| PE1(config-router)#neighbor 10.1.1.2 tcp-mss 800 | Configure TCP MSS value.                                                  |
| PE1(config-router)#address-family ipv4 unicast   | Enter address-family IPv4 unicast mode.                                   |
| PE1(config-router-af)#neighbor 10.1.1.2 activate | Activate neighbor with IP address 10.1.1.2 in the IPv4 address family.    |
| PE1(config-router-af)#redistribute connected     | Redistributing connected routes inside BGP.                               |
| PE1(config-router-af)#exit-address-family        | Exit address-family mode.                                                 |
| PE1(config-router)#commit                        | Commit the candidate configuration to the running configuration.          |

**RR1**

|                                                                |                                                                                                                              |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| RR1#configure terminal                                         | Enter configuration mode.                                                                                                    |
| RR1(config)#interface lo                                       | Enter interface mode for loopback.                                                                                           |
| RR1(config-if)#ip address 2.2.2.2/32 secondary                 | Specify the interface address 2.2.2.2.                                                                                       |
| RR1(config-if)#exit                                            | Exit interface mode.                                                                                                         |
| RR1(config)#interface xe47                                     | Enter interface mode for xe47.                                                                                               |
| RR1(config-if)#ip address 10.1.1.2/24                          | Specify IP address 10.1.1.2/24 for the interface.                                                                            |
| RR1(config-if)#exit                                            | Exit interface mode for xe47.                                                                                                |
| RR1(config)#router bgp 100                                     | Define the routing process. The number 100 specifies the ASN of RR1.                                                         |
| RR1(config-router)#bgp router-id 2.2.2.2                       | Configure BGP router-id same as loopback IP address 2.2.2.2.                                                                 |
| RR1(config-router)#neighbor 10.1.1.1 remoteas 100              | Define BGP neighbors, and establish a TCP session. 10.1.1.1 is the ip address of the neighbor and 100 is the neighbor's ASN. |
| RR1(config-router)#neighbor 10.1.1.1 passive                   | Configure BGP neighbor 10.1.1.1 passive.                                                                                     |
| RR1(config-router)#address-family ipv4 unicast                 | Enter address-family IPv4 unicast mode                                                                                       |
| RR1(config-router-af)#neighbor 10.1.1.1 activate               | Activate the neighbor in the IPv4 address family.                                                                            |
| RR1(config-router-af)#neighbor 10.1.1.1 route-reflector-client | Configure RR1 as the Route-Reflector (RR) and neighbor PE1 as its client.                                                    |
| RR1(config-router-af)#redistribute connected                   | Redistributing connected routes inside BGP.                                                                                  |

|                                             |                                                                  |
|---------------------------------------------|------------------------------------------------------------------|
| RR1 (config-router-af) #exit-address-family | Exit address-family mode.                                        |
| RR1 (config-router) #commit                 | Commit the candidate configuration to the running configuration. |

## New CLI Commands

### neighbor tcp-mss

Use this command to set the BGP TCP MSS of a neighbor.

Use the `no` parameter with this command to remove a TCP MSS setting from a BGP neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) tcp-mss <40-1440>
no neighbor (A.B.C.D|X:X::X:X|WORD) tcp-mss
```

For BGP unnumbered mode:

```
neighbor WORD tcp-mss <40-1440>
no neighbor WORD tcp-mss
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <40-1440>

Configure TCP MSS

### Default

Disabled

### Command Mode

Router mode, address family-vrf mode and BGP unnumbered mode.

### Applicability

Introduced in OcNOS version 6.4.1.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 tcp-mss 1000
(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 tcp-mss 900
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 tcp-mss 800
```

---

## Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

| Acronym | Description                   |
|---------|-------------------------------|
| ACK     | Acknowledgment                |
| BGP     | Border Gateway Protocol       |
| TCP     | Transmission Control Protocol |

|     |                           |
|-----|---------------------------|
| MSS | Maximum Segment Size      |
| MTU | Maximum Transmission Unit |
| SYN | Synchronize               |

---

## Glossary

The following provides definitions for key terms used throughout this document.

|              |                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP          | BGP is an exterior gateway protocol to exchange route information and interconnect various networks on the global internet.                                                                                                                                        |
| BGP neighbor | BGP neighbors, called peers, are established by manual configuration among routers to create a TCP session on port 179, which exchanges routing information between two systems, defined by their Autonomous System Numbers (ASNs).                                |
| MSS          | <p>MSS is a TCP parameter that defines the maximum amount of data in a TCP segment that can be transmitted.</p> <p>TCP - TCP is one of the main protocols in the Internet Protocol (IP) suite. It offers a secure and reliable connection between two devices.</p> |
| TCP          | TCP is one of the main protocols in the Internet Protocol (IP) suite. It offers a secure and reliable connection between two devices.                                                                                                                              |
| TCP segment  | TCP segment is a unit of data transmitted in a TCP connection. The segment consists of header and payload. The header contains the control information to manage the transmission, and the payload contains the actual data that needs to be transmitted.          |

# BGP Bogon Prefix Filtering IPv4

## Overview

Bogon filters block invalid or reserved IP addresses, known as Bogon prefixes, from propagating through a network. These prefixes typically include IP ranges not allocated by IANA and should not appear in the global routing table. In BGP, bogon filtering prevents the acceptance of such invalid routes. By default in OcNOS, BGP does not filter bogon prefixes in incoming route updates, except for Class-E Experimental IPv4 Addresses (240.0.0.0/4) and Multicast Addresses (224.0.0.0/4 and 224.0.0.0/24). The command [bgp enable-bogon-filtering](#) allows users to manage this filtering process, adding flexibility to network security.

## Feature Characteristics

A list of BOGON prefixes in OcNOS that should not route on the internet:

- **0.0.0.0/8**: Reserves addresses for special use, typically for traffic from hosts without an assigned IP address.
- **127.0.0.0/8**: Reserves addresses for loopback, used for internal host communication.
- **192.0.0.0/24**: Reserves addresses for IETF Protocol Assignments.
- **192.0.2.0/24**: Reserves addresses for documentation and examples.

## BOGON and Class-E Experimental Address Range

**240.0.0.0/4**: Class-E addresses, reserved for experimental purposes. Avoid using them in production environments.

### Notes:

- After filtering or allowing prefixes, BGP bogon filtering policy changes apply only to new incoming updates. The system does not automatically refresh previously filtered or allowed prefixes. When making changes to the BGP bogon filtering configuration, it is recommended to perform a hard reset of BGP or reboot the device.
- No filtering applies to IPv6 prefixes, as BGP allows all IPv6 prefixes by default.

## Benefits

**Security:** Enabling bogon prefix filtering improves network security by preventing the propagation of invalid or reserved IP addresses.

**Flexibility:** The option to enable or disable filtering provides network administrators control over BGP route updates.

**Compliance:** Ensures adherence to best practices by allowing for the exclusion of non-routable IP address ranges.

## BGP Bogon Prefix Filtering Configuration

Ensure the OcNOS routers properly filter out bogon prefixes and enhance network security by preventing the routing of invalid or reserved IP addresses with the below configurations

## Topology

Two routers (R1 and R2) connect via interface xe27, using the same AS number (AS 100), to establish a BGP session and exchange routes within the IPv4 unicast address family.

**Figure 61. BGP Bogon Filter**

## Prerequisites

Based on the running configuration provided for R1 and R2, configure BGP between two routers (R1 and R2) with the same Autonomous System (AS) number and IPv4 unicast address family. This configuration allows both routers to establish a BGP session and exchange routes.

### R1

```
R1#show running-config
!
hostname R1
!
ip vrf management
!
interface eth0
 ip vrf forwarding management
 ip address dhcp
!
interface lo
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface lo.management
 ip vrf forwarding management
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface xe27
 ip address 100.1.1.1/24
!
router bgp 100
 neighbor 100.1.1.2 remote-as 100
!
 address-family ipv4 unicast
  redistribute static
 neighbor 100.1.1.2 activate
 exit-address-family
!
exit
!
!
end
```

### R2

```
R2#show running-config
!
hostname R2
```

```

!
ip vrf management
!
interface eth0
 ip vrf forwarding management
 ip address dhcp
!
interface lo
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface lo.management
 ip vrf forwarding management
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface xe27
 ip address 100.1.1.2/24
!
router bgp 100
 neighbor 100.1.1.1 remote-as 100
!
 address-family ipv4 unicast
 neighbor 100.1.1.1 activate
 exit-address-family
!
exit
!
!
end

```

**Note:** Before configuration, meet all [Prerequisites \(page 652\)](#).

## Configure Invalid IP Addresses on R1 and R2

1. Configure the invalid (bogon) routes before enabling BGP bogon filtering:

```

R2(config)#ip route 12.0.0.0/8 xe27
R2(config)#ip route 192.0.0.0/24 xe27 #Bogon prefixes

```

2. Verify the injected routes (12.0.0.0/8 and 192.0.0.0/24) in the BGP table.

```

R2#show ip bgp
BGP table version is 6, local router ID is 100.1.1.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
                l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

```

|    | Network   | Next Hop | Metric | LocPrf | Weight | Path |
|----|-----------|----------|--------|--------|--------|------|
| *> | 12.0.0.0  | 0.0.0.0  | 0      | 100    | 32768  | ?    |
| *> | 192.0.0.0 | 0.0.0.0  | 0      | 100    | 32768  | ?    |

Total number of prefixes 2

R2#show ip route

```

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

```

```

IP Route Table for VRF "default"
S          12.0.0.0/8 [1/0] is directly connected, xe27, installed 00:07:25, last update
00:07:25 ago
C          100.1.1.0/24 is directly connected, xe27, installed 00:10:25, last update 00:10:25
ago
C          127.0.0.0/8 is directly connected, lo, installed 00:57:51, last update 00:57:51 ago
S          192.0.0.0/24 [1/0] is directly connected, xe27, installed 00:07:25, last update
00:07:25 ago

Gateway of last resort is not set

```

## Enable BGP Bogon Filtering on R1 and R2

Enable the bogon filtering command to block invalid prefixes. This command automatically removes invalid or reserved prefixes from the BGP table.

```
R2(config)#bgp enable-bogon-filtering
```

## Validation

Verify the 192.0.0.0/24 bogon prefix is removed from the BGP table.

```

R2#show ip bgp
BGP table version is 7, local router ID is 100.1.1.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
                l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop          Metric    LocPrf   Weight Path
*>  12.0.0.0         0.0.0.0              0         100     32768  ?

Total number of prefixes 1

R2#show ip route

Gateway of last resort is not set

```

## BGP Bogon Prefix Filtering Command

The bogon prefix filtering introduces the following configuration command:

### bgp enable-bogon-filtering

Use this command to enable or disable the filtering of bogon prefixes from NLRIs in incoming BGP updates.

**Notes:**

- After filtering or allowing prefixes, BGP bogon filtering policy changes apply only to new incoming updates. The system does not automatically refresh previously filtered or allowed prefixes. When making changes to the BGP bogon filtering configuration, it is recommended to perform a hard reset of BGP or reboot the device.
- No filtering applies to IPv6 prefixes, as BGP allows all IPv6 prefixes by default.

**Command Syntax**

```
bgp enable-bogon-filtering
```

**Parameters**

None

**Default**

Disabled

**Command Mode**

Configure mode

**Applicability**

Introduced in OcNOS version 6.5.3.

**Example**

In OcNOS, enable BGP bogon filtering and perform a hard reset or device reboot as recommended.

```
OcNOS#configure terminal
OcNOS(config)#bgp enable-bogon-filtering
OcNOS(config)#commit
2098 Apr 24 21:11:07.665 : OcNOS : BGP : CRITI : % Changing the bogon filter does not automatically
refresh the permitted/filtered routes. A hard reset or device reboot is recommended.
```

---

**Glossary**

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

| Key Terms/Acronym                          | Description                                                                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Bogon Filter                               | A mechanism that blocks invalid or reserved IP addresses, known as Bogon prefixes, from entering a network through routing updates. |
| Bogon Prefix                               | IP address ranges that are not allocated by IANA and should not appear in the global routing table.                                 |
| Internet Assigned Numbers Authority (IANA) | The organization responsible for allocating global IP addresses and managing other critical Internet resources.                     |
| Autonomous System (AS)                     | A collection of IP networks managed by a single entity that presents a unified routing policy to the Internet.                      |

---

# BGP Large Communities

## Overview

BGP routing policies control route distribution and behavior across networks. Communities, optional transitive BGP attributes associate operational metadata with routes, like origin location or specific routing actions. However, standard and extended BGP community attributes fall short in environments using 4-byte Autonomous System Numbers (ASNs).

To solve this issue, BGP introduced the Large Community (LC) attribute. It consists of an unordered set of one or more twelve-octet values, including: A 4-byte Global Administrator field (typically the ASN) and two 4-byte operator-defined fields.

These attributes enable operators to encode information pertinent to their routing policies and operational needs. Operators must not transmit duplicate values, and receiving BGP speakers must silently discard any redundant entries.

## Feature Characteristics

OcNOS enhanced support for BGP Large Communities by:

- Allowing route-maps to match and manipulate multiple large-community values.
- Supporting configuration adjustments for additive operations (appending values) and deleting specific values.
- Introducing [ip large-community-list \(page 676\)](#) to organize and reuse large-community match criteria.

**Note:** For details on upgrading and downgrading versions, refer to the *OcNOS Migration document*.

## Benefits

**Scalable Policy Management:** Named community-lists simplify reuse and maintenance across multiple route-maps.

**Enhanced Flexibility:** Additive and deletion capabilities allow policy controls without impacting other community values.

**Future-Proofing:** Prepares networks for advanced policy frameworks as multi-ASN and operator-specific routing needs evolve.

---

## BGP Large Communities Configuration

This section illustrates the use of BGP Large Communities for scalable and consistent route policy enforcement in a service provider or multi-tenant environment. It highlights how route tagging at the source (Router A), centralized policy processing at a Route Reflector (Router B), and controlled propagation to downstream routers (Router C) enable flexible traffic engineering, service differentiation, or route filtering, without the need for policy replication on every node.

## Topology

The figure below consists of three BGP routers in a route-reflector setup. Router B acts as the Route Reflector (RR), while routers A and C are its RR clients. There are no direct iBGP sessions between A and C; all BGP routing information exchange flows through the RR.

Each client establishes iBGP sessions with B for the following address families:

- IPv4 Unicast
- IPv6 Unicast
- VPNv4 Unicast

In this setup, Router A originates prefixes with large communities. Router B uses a policy engine to match, strip, and overwrite these communities using a route-map. It then advertises the modified routes to Router C. Router C applies a large-community filter to accept only those routes that match the expected community values. This demonstrates policy-based route control using BGP Large Communities in an RR-based MPLS network.

**Figure 62. BGP Large Community-Based Routing Policy Flow**

## Prerequisites

### Routing Configurations On Routers A, B, and C

- Set a loopback-based stable router ID for BGP, OSPF, and LDP.
- Define VRFs and import or export route targets.
- Configure LDP

#### Router A

```
router-id 2.2.2.2
!
```

```
ip vrf A
rd 4200000000:2
route-target both 1:1
route-target both 2:2
route-target both 3:3
route-target both 4:4
route-target both 5:5
route-target both 6:6
route-target both 7:7
route-target both 8:8
route-target both 9:9
!
router ldp
transport-address ipv4 2.2.2.2
!
```

### Router B

```
router-id 5.5.5.5
!
ip vrf A
rd 4200000000:5
route-target both 1:1
route-target both 2:2
route-target both 3:3
route-target both 4:4
route-target both 5:5
route-target both 6:6
route-target both 7:7
route-target both 8:8
route-target both 9:9
!
router ldp
transport-address ipv4 5.5.5.5
!
```

### Router C

```
router-id 4.4.4.4
!
ip vrf A
rd 4200000001:4
route-target both 1:1
route-target both 2:2
route-target both 3:3
route-target both 4:4
route-target both 5:5
route-target both 6:6
route-target both 7:7
route-target both 8:8
route-target both 9:9
!
router ldp
transport-address ipv4 4.4.4.4
!
```

### Interface Setup Configurations on Routers A, B, and C

- Configure the loopback interface for IPv4 or IPv6.
- Configure key interfaces connecting to core, CE, and PE neighbors. Ensure proper VRF bindings and IP assignments.

**Router A**

```
interface eth8
  ip vrf forwarding A
  ip address 20.2.0.2/24
!
interface eth7
  ip address 10.17.0.2/24
!
interface eth6
  ip vrf forwarding B
  ip address 10.19.0.2/24
!
interface eth5
  ip address 10.14.0.2/24
!
interface eth4
  ip address 10.11.0.2/24
  ipv6 address ::10.11.0.2/120
  ipv6 address 2255::2522/120
  ipv6 router ospf area 0.0.0.0 instance-id 0
!
interface eth3
  ip vrf forwarding A
  ip address 10.3.0.2/24
!

    !
interface lo
    ip address 127.0.0.1/8
    ip address 4.4.4.4/32 secondary
    ipv6 address ::1/128

```

```
ipv6 address 4444::4444/128
ipv6 router ospf area 0.0.0.0 instance-id 0
!
exit
!
```

## Configure OSPF on Routers A, B, and C

### Router A

```
router ospf 1
 network 2.2.2.2/32 area 0.0.0.0
 network 10.7.0.0/24 area 0.0.0.0
 network 10.11.0.0/24 area 0.0.0.0
 network 10.14.0.0/24 area 0.0.0.0
 network 10.17.0.0/24 area 0.0.0.0
 network 10.19.0.0/24 area 0.0.0.0
!
router ipv6 ospf
!
```

### Router B

```
router ospf 1
 network 5.5.5.5/32 area 0.0.0.0
 network 10.10.0.0/24 area 0.0.0.0
 network 10.11.0.0/24 area 0.0.0.0
!
router ipv6 ospf
!
```

### Router C

```
router ospf 1
 network 4.4.4.4/32 area 0.0.0.0
 network 10.5.0.0/24 area 0.0.0.0
 network 10.7.0.0/24 area 0.0.0.0
 network 10.8.0.0/24 area 0.0.0.0
 network 10.9.0.0/24 area 0.0.0.0
 network 10.10.0.0/24 area 0.0.0.0
!
router ipv6 ospf
!
```

## Configure Static Routes on Routers A and C

Ensure fallback reachability.

### Router A

```
ip route 150.150.150.150/32 10.14.0.150
!
ipv6 route 1234::4500/120 2244::2423
!
```

### Router C

```
!
ip route vrf A 60.10.10.0/24 20.4.0.60
!
```

## BGP Large Communities Routers Configurations

**Note:** Before configuration, meet all [Prerequisites \(page 657\)](#).

### Router A - Large Community Configuration

Tag outbound BGP routes with two large community values (1:2:3 and 4:5:6) to influence downstream routing behavior.

#### *Define the Route Map to Set Communities*

Router A adds large community values 1:2:3 and 4:5:6 to outbound routes.

```
OcNOS(config)#route-map set-lc-tag-out permit 10
OcNOS(config-route-map)#set large-community 1:2:3 4:5:6
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

#### *Apply the Route Map in BGP*

To all relevant address-families (IPv4, VPNv4, IPv6), apply the route map outbound to peer B (5.5.5.5 and 5555::5555)

```
router bgp 4200000000
 neighbor 5.5.5.5 remote-as 4200000000
 neighbor 5.5.5.5 update-source lo
 neighbor 5555::5555 remote-as 4200000000
 neighbor 5555::5555 update-source lo
 !
 address-family ipv4 unicast
 redistribute static
 neighbor 5.5.5.5 activate
 neighbor 5.5.5.5 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family vpnv4 unicast
 neighbor 5.5.5.5 activate
 neighbor 5.5.5.5 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family ipv6 unicast
 redistribute static
 neighbor 5555::5555 activate
 neighbor 5555::5555 route-map set-lc-tag-out out
 exit-address-family
 !
 exit
 !
```

### Router B - Large Community Match and Rewrite Configuration

Match received BGP routes containing large community 1:2:3 and 4:5:6, strip them, and apply new values 40:50:60 and 10:20:30.

#### *Define a Large Community List*

```
OcNOS(config)#ip large-community-list 1 permit 1:2:3 4:5:6
OcNOS(config)#commit
```

### Create a Route Map with Match and Rewrite

Router B detects and removes original communities, then re-tags the route with updated communities.

```
OcNOS(config)#route-map set-lc-tag-out permit 10
OcNOS(config-route-map)#match large-community 1
OcNOS(config-route-map)#set large-comm-list 1 delete
OcNOS(config-route-map)#set large-community 40:50:60 10:20:30 additive
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

### Apply the Route Map in BGP

Apply route-map outbound only on peer C (4.4.4.4 and 4444::4444).

```
router bgp 4200000000
 neighbor 2.2.2.2 remote-as 4200000000
 neighbor 2.2.2.2 update-source lo
 neighbor 4.4.4.4 remote-as 4200000000
 neighbor 4.4.4.4 update-source lo
 neighbor 2222::2222 remote-as 4200000000
 neighbor 2222::2222 update-source lo
 neighbor 4444::4444 remote-as 4200000000
 neighbor 4444::4444 update-source lo
 !
 address-family ipv4 unicast
 neighbor 2.2.2.2 activate
 neighbor 2.2.2.2 route-reflector-client
 neighbor 4.4.4.4 activate
 neighbor 4.4.4.4 route-reflector-client
 neighbor 4.4.4.4 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family vpnv4 unicast
 neighbor 2.2.2.2 activate
 neighbor 2.2.2.2 route-reflector-client
 neighbor 4.4.4.4 activate
 neighbor 4.4.4.4 route-reflector-client
 neighbor 4.4.4.4 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family ipv6 unicast
 neighbor 2222::2222 activate
 neighbor 2222::2222 route-reflector-client
 neighbor 4444::4444 activate
 neighbor 4444::4444 route-reflector-client
 neighbor 4444::4444 route-map set-lc-tag-out out
 exit-address-family
 !
 exit
 !
```

### Router C - Passive Role in Large Community Policy

Participate in BGP flow and MPLS forwarding. No large community changes or filters. Acts as a transit or receiving node.

- No `ip large-community-list` or `route-map` configuration.
- Standard BGP peerings with B (5.5.5.5 and 5555::5555).
- Router C accepts routes tagged with modified large community from B and may forward based on policy.

```
router bgp 4200000000
 neighbor 5.5.5.5 remote-as 4200000000
```

```

neighbor 5.5.5.5 update-source lo
neighbor 5555::5555 remote-as 4200000000
neighbor 5555::5555 update-source lo
!
address-family ipv4 unicast
neighbor 5.5.5.5 activate
exit-address-family
!
address-family vpnv4 unicast
neighbor 5.5.5.5 activate
exit-address-family
!
address-family ipv6 unicast
neighbor 5555::5555 activate
exit-address-family
!
address-family ipv4 vrf A
exit-address-family
!
exit
!
ip route vrf A 60.10.10.0/24 20.4.0.60
!

```

## BGP Large Communities Validation

Verify that the routes are being advertised correctly to Router B and are carrying the intended community tags (in this case, Large Communities 1:2:3 and 4:5:6).

The `show ip bgp` command confirms that the IPv4 unicast route (e.g. 150.150.150.150/32) exists in the local BGP table. The BGP session to B (neighbor 5.5.5.5) is active and routes are sent.

```

Router A#show ip bgp
BGP table version is 1, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
                l - labeled, S Stale, x-EVPN
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

   Network          Next Hop           Metric   LocPrf   Weight Path   Ext-Color
*>  150.150.150.150/32
                        10.14.0.150             0         100       32768  ?         -

Total number of prefixes 1

Router B#show ip bgp
BGP table version is 3, local router ID is 5.5.5.5
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
                l - labeled, S Stale, x-EVPN
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

   Network          Next Hop           Metric   LocPrf   Weight Path   Ext-Color
*>i  150.150.150.150/32
                        10.14.0.150             0         100         0  ?         -

Total number of prefixes 1

```

The `show ip bgp 150.150.150.150` command confirms that the route is locally originated and advertised to B. It is useful for verifying if the prefix is a candidate for applying the Large Community policy.

```

Router A#show ip bgp 150.150.150.150
BGP routing table entry for 150.150.150.150/32

```

```

---

## Implementation Example

**Use Case:** A transit provider assigns unique BGP Large Community values to each customer. These values are utilized in route maps to influence outbound policy decisions, such as local preference or AS-path modification.

Define large-community values associated with Customer A:

```
ip large-community-list standard cust_A permit 65001:100:1  
ip large-community-list standard cust_A permit 65001:100:2
```

Apply policy using a route-map:

```
route-map export-cust_A permit 10  
  match large-community cust_A  
  set local-preference 150
```

This configuration applies a higher local preference to prefixes received from Customer A. By using a named large-community list, the setup remains scalable-community values can be updated in one place without editing the route map directly. This approach also simplifies policy management across multiple route maps or peers.

---

## BGP Large Communities Commands

The following are the BGP LC commands.

## set large-community

- The existing syntax now includes the new `additive` parameter that allows users to append large community values to a route.
- Users can configure multiple large communities in a route map. The character limit for each community has increased from 32 to 255 characters.

For more details, refer to the [set large-community \(page 325\)](#) command in the section in the , OcNOS Layer 3 document.

## ip large-community-list

Use this command to define a set of BGP Large Community values for use in policy configuration (e.g., route-maps). It functions similarly to standard or extended community-lists and allows reuse of defined large-community patterns.

Use `no` parameter of this command to remove the configured large community values.

### Command Syntax

```
ip large-community-list {<1-99> | standard WORD | <100-500> | expanded WORD} {permit | deny}
(.AA:NN:MM)
no ip large-community-list {<1-99> | standard WORD | <100-500> | expanded WORD} {permit | deny}
(.AA:NN:MM)
```

### Parameters

#### <1-99>

Specifies a standard large-community-list using a numerical ID. Standard lists match exact values.

#### standard WORD

Specifies a named standard list that matches exact large-community values.

#### <100-500>

Specifies an expanded large-community-list using a numerical ID. Expanded lists support regex-style pattern matching.

#### expanded WORD

Specifies a named expanded list that uses pattern matching for flexible matching criteria.

#### permit

Permits the specified large-community value(s) to match in a policy.

#### deny

Denies the specified large-community value(s) from matching.

#### .AA:NN:MM

A 12-byte large community in the format ASN:Value1:Value2. E.g., 65001:100:1. Large Communities use the format Global Administrator:LocalData1:LocalData2, where each field is a 32-bit integer.

### Default

None

### Command Mode

Configure mode

### Applicability

Introduced in OcNOS version 6.6.1.

### Example

The following example demonstrates how to configure different types of BGP Large Community lists in OcNOS and verify them using the `show` command.

Creates a standard large-community-list with numeric ID 1 and permits the community 4:5:6.

```
OcNOS#configure terminal
OcNOS(config)#ip large-community-list 1 permit 4:5:6
OcNOS(config)#commit
```

Creates an expanded large-community-list with numeric ID 150 and denies the community 1000:2000:3000.

```
OcNOS(config)#ip large-community-list 150 deny 1000:2000:3000
OcNOS(config)#commit
```

Defines a named expanded list called EXPTEST and permits the community 5500:3000:2000.

```
OcNOS(config)#ip large-community-list expanded EXPTEST permit 5500:3000:2000
OcNOS(config)#commit
```

Defines a named standard list called STDTEST and permits the community 50:50:50.

```
OcNOS(config)#ip large-community-list standard STDTEST permit 50:50:50
OcNOS(config)#commit
```

Verify the configured lists using show ip large-community-list command.

```
OcNOS#show ip large-community-list
Large community standard list 1
    permit 4:5:6
Large community (expanded) list 150
    deny 1000:2000:3000
Named large community expanded list EXPTEST
    permit 5500:3000:2000
Named large community standard list STDTEST
    permit 50:50:50
```

## match large-community

Use this command to match BGP routes based on Large Community values. This allows selective policy actions (e.g., setting local preference, AS path, AIGP) for routes carrying specific BGP Large Community attributes.

Use `no` parameter of this command to remove the configured Large Community values.

**Note:** Only one `match large-community` is allowed per route-map sequence. A new `match` replaces any previous configuration in the same sequence.

### Command Syntax

```
match large-community {<1-99> | <100-500> | WORD} (exact-match|)
no match large-community {<1-99> | <100-500> | WORD} (exact-match|)
```

### Parameters

#### <1-99>

Specifies a standard large-community-list using a numerical ID. Standard lists match exact values.

#### <100-500>

Specifies an expanded large-community-list using a numerical ID. Expanded lists support regex-style pattern matching.

#### WORD

Specifies a named standard or expanded large-community list.

#### exact-match

(Optional) Matches routes only if the communities match exactly, with no additional entries.

### Default

None

### Command Mode

Route map mode

### Applicability

Introduced in OcNOS version 6.6.1.

### Example

The following example shows how to reference large-community in route-maps for policy enforcement.

Matches routes containing any large-community permitted by standard list 1.

```
OcNOS#configure terminal
OcNOS(config)#route-map rmap-set-lc1
OcNOS(config-route-map)#match large-community 1
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Matches routes based on pattern rules defined in expanded list 100.

```
OcNOS(config)#route-map rmap-set-lc2
OcNOS(config-route-map)#match large-community 100
```

```
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Matches routes using named expanded list EXPTEST.

```
OcNOS(config)#route-map rmap-set-lc
OcNOS(config-route-map)#match large-community EXPTEST
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Matches routes that have only the exact large-community entries defined in STDTEST.

```
OcNOS(config)#route-map rmap-set-lc3
OcNOS(config-route-map)#match large-community STDTEST exact-match
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Verify the configured lists using `show` command.

```
OcNOS#show route-map
route-map rmap-set-lc, permit, sequence 10
  Match clauses:
    large-community: EXPTEST
  Set clauses:
route-map rmap-set-lc1, permit, sequence 10
  Match clauses:
    large-community: 1
  Set clauses:
route-map rmap-set-lc2, permit, sequence 10
  Match clauses:
    large-community: 100
  Set clauses:
route-map rmap-set-lc3, permit, sequence 10
  Match clauses:
    large-community: STDTEST exact-match
  Set clauses:

OcNOS#show running-config route-map
!
route-map rmap-set-lc permit 10
  match large-community EXPTEST
!
route-map rmap-set-lc1 permit 10
  match large-community 1
!
route-map rmap-set-lc2 permit 10
  match large-community 100
!
route-map rmap-set-lc3 permit 10
  match large-community STDTEST exact-match
!
```

## set large-comm-list delete

Use this command within a route-map mode to delete the large-community-list values from matched routes (if present).

Use `no` parameter of this command to add the specified large-community values to matched routes.

**Note:** Only one set large-comm-list configuration is allowed per route-map sequence. A new one will overwrite the previous configuration.

### Command Syntax

```
set large-comm-list {<1-99> | <100-500> | WORD} (delete)
no set large-comm-list {<1-99> | <100-500> | WORD} (delete)
```

### Parameters

#### <1-99>

Specifies a standard large-community-list using a numerical ID. Standard lists match exact values.

#### <100-500>

Specifies an expanded large-community-list using a numerical ID. Expanded lists support regex-style pattern matching.

#### WORD

Specifies a named standard or expanded large-community list.

#### delete

Removes the matching large-community values from matched routes.

### Default

None

### Command Mode

Route map mode

### Applicability

Introduced in OcNOS version 6.6.1.

### Example

The following example shows how to remove (delete) selected communities from matched routes using the set large-comm-list command.

Deletes communities defined in list 100 from matched routes (rmap2).

```
OcNOS(config)#route-map rmap2
OcNOS(config-route-map)#match large-community 100
OcNOS(config-route-map)#set large-comm-list 100 delete
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Deletes communities defined in list 10 from matched routes (rmap).

```
OcNOS(config)#route-map rmap
OcNOS(config-route-map)#match large-community EXPTEST
OcNOS(config-route-map)#set large-comm-list 10 delete
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Verify the configured lists using the `show` command.

- The command `set large-comm-list 100 delete` appears only for `rmap` and `rmap2`, indicating community deletion is configured only for those route-maps.
- When a route-map is configured with the `set large-comm-list <list> delete` command, the `show route-map` output will reflect this under the **Set clauses** field, verifying that the deletion of large-community values is active.

```
OcNOS#show route-map
route-map rmap, permit, sequence 10
  Match clauses:
    large-community: EXPTEST
  Set clauses:
    large-comm-list 10 delete
route-map rmap1, permit, sequence 10
  Match clauses:
    large-community: 1
  Set clauses:
route-map rmap2, permit, sequence 10
  Match clauses:
    large-community: 100
  Set clauses:
    large-comm-list 100 delete
route-map rmap3, permit, sequence 10
  Match clauses:
    large-community: STDTEST exact-match
  Set clauses:
```

```
OcNOS(config-route-map)#show running-config route-map
!
route-map rmap permit 10
  match large-community EXPTEST
  set large-comm-list 10 delete
!
route-map rmap1 permit 10
  match large-community 1
!
route-map rmap2 permit 10
  match large-community 100
  set large-comm-list 100 delete
!
route-map rmap3 permit 10
  match large-community STDTEST exact-match
!
```

## show ip large-community-list

Use this command to display the configured BGP IPv4 Large Community Lists. This includes both standard and expanded lists, named or numbered. The command helps verify large-community filters applied in route-maps for matching or modifying BGP route attributes.

### Command Syntax

```
show ip large-community-list (<1-500> | WORD)
```

### Parameters

#### <1-500>

Specifies numeric ID of a standard or expanded large-community-list.

#### WORD

Specifies a named standard or expanded large-community list.

### Default

None

### Command Mode

Execution mode and Privileged execution mode

### Applicability

Introduced in OcNOS version 6.6.1.

### Example

Displays all configured large community lists for both numbered and named, standard and expanded.

```
OcNOS#show ip large-community-list
Large community standard list 1
  permit 4:5:6
Large community (expanded) list 150
  deny 1000:2000:3000
Named large community expanded list EXPTEST
  permit 5500:3000:2000
Named large community standard list STDTEST
  permit 50:50:50
```

Displays only the expanded list with the number 150. In the example below, it contains a single rule that denies large community 1000:2000:3000.

```
OcNOS#show ip large-community-list 150
Large community (expanded) list 150
  deny 1000:2000:3000
```

Displays the named expanded list EXPTEST. In the example below, it permits the large community 5500:3000:2000.

```
OcNOS#show ip large-community-list EXPTEST
Named large community expanded list EXPTEST
  permit 5500:3000:2000
```

## Troubleshooting

| Symptom                              | Possible Cause                                                         | Solution                                                                                        |
|--------------------------------------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Route-map fails to match communities | The <code>ip large-community-list</code> is missing or mis-configured. | Check the configuration using <code>show ip large-community-list</code> and correct any errors. |
| Downgrade operation fails            | The configuration includes unsupported LC features.                    | Revert to the previous version and remove all LC configurations before retrying the downgrade.  |
| Routes behave unexpectedly           | Duplicate LC values are being sent                                     | Avoid transmitting redundant LC values; OcNOS automatically removes duplicates on receipt.      |

## Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this feature:

| Key Terms/Acronym                                                              | Description                                                                                                  |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Autonomous System Number (ASN)                                                 | A 2- or 4-byte unique identifier assigned to a network under a single administrative domain.                 |
| Large Community (LC)                                                           | A BGP attribute (RFC 8092) used to tag routes with metadata for policy decisions. Format: ASN:Value1:Value2. |
| Global Administrator (GA)                                                      | The first 4-byte field in a BGP Large Community, typically set to the ASN of the originator.                 |
| Route Reflector (RR)                                                           | A BGP router that reflects routes between RR clients to reduce iBGP session count in large networks.         |
| RR Client                                                                      | A BGP peer that receives and sends updates via the route reflector.                                          |
| Internal BGP (iBGP)                                                            | BGP sessions between routers within the same AS.                                                             |
| Address Family Identifier (AFI) or Subsequent Address Family Identifier (SAFI) | Specifies the type of routes being carried (e.g., IPv4, VPNv4, IPv6).                                        |
| Route Distinguisher (RD)                                                       | A unique identifier prepended to a prefix in MPLS VPNs to distinguish overlapping routes.                    |
| Route Target (RT)                                                              | An extended BGP community used to control the import or export of routes into or from a VRF.                 |
| BGP Attributes                                                                 | Metadata in BGP updates that influence route selection or propagation (e.g., LC, RT, MED, Local Pref).       |
| additive                                                                       | A route-map action keyword that appends new LC values without removing existing ones.                        |
| delete                                                                         | A route-map action keyword used to remove specific LC values from a route.                                   |

# Hide the Remote AS using the neighbor local-as Command

## Overview

In a network, an Autonomous System (AS) is available to define a set of IP routing prefixes that are under a common administration policy control. These defined routing policies are used by other connected routers on the Internet. When an AS is configured in Border Gateway Protocol (BGP), it is used to share routing information to connected peers. The [neighbor local-as \(page 843\)](#) CLI command configures the AS number to be used with External Border Gateway Protocol (EBGP) peers. By default, the configured AS number is included in the AS-PATH message that is exchanged between the peers.

When a BGP router, configured in one network, connects to another router on the network, it will automatically share routing information with the AS number of both the local and remote routers in the AS-PATH message with other connected, external peers. For example, if a router ISP1-R, accesses services from another router, ISP2-R, ISP1-R router will share routing information with local and remote AS numbers in the AS-PATH message when services are merged. This allows the external peers to learn the AS numbers of remote routers not connected to it (in this case, the AS number of ISP2-R). It is not desirable to disclose the AS number of remote routers to external peers.

To avoid advertising the remote peer's AS number, OcNOS provides an option in the [neighbor local-as \(page 843\)](#) CLI to not include (`no-prepend`) the remote AS number and replace (`replace-as`) it with alternate AS number. Configuring an alternate AS in the BGP neighbor system, provides the ability to hide the AS number of the remote router that actually shares the services. Thus, the AS number of the BGP router that is actually providing services is unknown to the external peer.

Hence, the existing [neighbor local-as \(page 843\)](#) CLI command has been modified in this release.

## Feature Characteristics

The [neighbor local-as \(page 843\)](#) CLI is enhanced to hide and replace the AS number of the remote routers not connected to external peer. Two new options '`no-prepend`' and '`replace-as`' have been added. These options replace the AS number with an alternate AS number in the AS\_PATH and BGP OPEN message. Hence, the AS of the remote router is unknown to the respective neighbor peer.

## Benefits

The actual Autonomous System number is never shared to the external network.

## Configuration

The following configuration assumes the router R1 and R2 is assigned with AS300 and AS100 respectively.

## Topology

Figure 63. Disparate Autonomous System Number

**R1**

|                                                     |                                                                         |
|-----------------------------------------------------|-------------------------------------------------------------------------|
| #configure terminal                                 | Enter configure mode.                                                   |
| R1(config)#router bgp 300                           | Start the BGP process with the Autonomous System number 300             |
| R1(config-router)#neighbor 10.10.10.2 remote-as 200 | Establish BGP session with neighbor that has AS number 200              |
| R1(config-router)#address-family ipv4 unicast       | Enter address-family ipv4 unicast mode                                  |
| R1(config-router-af)#neighbor 10.10.10.2 activate   | Enable the neighbor 10.10.10.2 router to exchange address family routes |

```

## Example

The following example show a sample configuration command.

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 20.1.1.3 remote-as 300
(config-router)#neighbor 20.1.1.3 local-as 200 no-prepend replace-as

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 300
(config-router-af)#neighbor 3ffe:15:15:15:15::0 local-as 200
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 local-as 300
```

## Revised CLI Commands

### neighbor local-as

The `neighbor local-as` CLI is enhanced to hide and replace the AS number of the remote routers not connected to external peer. Two new options '`no-prepend`' and '`replace-as`' have been added. These options replace the AS number with an alternate AS number in the AS\_PATH and BGP OPEN message. Hence, the AS of the remote router is unknown to the respective neighbor peer.

For the complete command reference, refer to [neighbor local-as \(page 843\)](#) CLI in [BGP Commands \(page 716\)](#) section.

## Abbreviations

| Acronym | Description                      |
|---------|----------------------------------|
| ASN     | Autonomous System Number         |
| EBGP    | External Border Gateway Protocol |

---

# BGP RPKI-Based Route Validation

## Overview

Resource Public Key Infrastructure (RPKI) is a security framework designed to mitigate the risk of BGP prefix hijacking by cryptographically verifying that an Autonomous System (AS) is authorized to announce a given IP prefix.

In OcNOS, RPKI-based BGP Origin Validation allows the router to download Route Origin Authorizations (ROAs) from an RPKI server via the RTR protocol. The downloaded ROAs are then used to validate incoming BGP routes, ensuring that only legitimate prefixes are considered during best path selection.

This feature improves routing security by reducing the acceptance and propagation of invalid routes.

---

## Feature Characteristics

- **ROA Retrieval:** Supports downloading ROAs from multiple (up to 10) RPKI servers over TCP or SSH transport.
- **Per-AF and Per-VRF Support:** Validation can be enabled on a per-address-family (IPv4/IPv6 unicast) and per-VRF basis.
- **Validation States:** Each route is tagged with one of the three validation state:
  - **Valid (V):** Prefix-AS match found in ROA.
  - **Invalid (I):** Prefix-AS mismatch or not authorized.
  - **Not-Found (N):** No corresponding ROA.
- **Flexible Policy Control:** Route-map support for matching on RPKI state (valid, invalid, not-found) to set attributes such as local preference.
- **Best Path Selection Control:**
  - Option to consider only valid/not-found routes for path selection.
  - Configurable to allow invalid routes in best path preference.
- **Dynamic Updates:** ROA updates are applied in real time from RPKI servers.

---

## Benefits

- **Enhanced Security:** Prevents acceptance of hijacked or misconfigured routes.
- **Operational Flexibility:** Operators can tune route selection with route-maps or allow invalid routes for troubleshooting.
- **Standards Compliance:** Implements BGP Origin Validation as per RPKI-based validation standards.
- **Granular Control:** Policies can be applied per Address Family (AF) or Virtual Routing and Forwarding (VRF), giving operators flexibility in deploying validation gradually.
- **Improved Resilience:** Reduces propagation of invalid prefixes across the Internet routing system.

## Configuration

This section describes the configuration procedure for enabling RPKI-based BGP origin validation.

### Prerequisites

- BGP is already configured (router bgp (ASN)) on the device.
- You have reachable RPKI RTR server IP(s) and credentials (if using SSH).
- Make sure the required transport ports (TCP or SSH) are reachable between the OcNOS and the RPKI server(s).
- Decide per address-family (IPv4/IPv6) and per VRF where you want validation turned on.

### Topology

In this topology, the RPKI Validator stores and distributes Route Origin Authorizations (ROAs), which contain information about the prefixes and its authorized originating AS numbers. The validator communicates these validated ROAs to the BGP RPKI-enabled router.

The BGP RPKI-enabled router establishes a session with the RPKI Validator using either TCP or SSH, depending on the configuration. Upon receiving ROAs, the router validates the BGP route advertisements against the authorized prefix–origin pairs.

Based on the validation results, the router marks each route as Valid, Invalid, or NotFound, and applies routing policies accordingly.

Only routes that pass the validation check (Valid) are used for forwarding or are advertised to other peers.

- ROAs fed to router: The RPKI Validator sends validated prefix-origin data to the BGP RPKI-enabled router.

- Advertise routes based on validated RPKI state: The router advertises only validated routes to its BGP peers.
- iBGP and eBGP peers: Both internal (iBGP) and external (eBGP) peers receive route updates from the RPKI-enabled router.
- Other routers: Routers within the same AS or network domain receive routes that have already been validated, ensuring route authenticity and preventing prefix hijacking.

1. Configure one or more RPKI servers to establish RTR sessions and download Route Origin Authorizations (ROAs).

```
ocnos(config)# router bgp 100
ocnos(config-router)# bgp rpki server 10.30.0.85 ssh user test encrypt 0 password test refresh 1
retry 1 expire 600
ocnos(config-router)# bgp rpki server 192.168.1.233 tcp refresh 1 retry 1 expire 600
ocnos(config-router)# commit
```

2. Enable origin validation on the required address family (AF) or VRF. This allows BGP routes to be tagged with an RPKI validation state:

- V: Valid
- I: Invalid
- N: Not-found

```
ocnos(config)# router bgp 100
ocnos(config-router)# address-family ipv4 unicast
ocnos(config-router-af)# bgp origin-as validation-enable
ocnos(config-router-af)# commit
```

3. Configure BGP to consider RPKI validation state in the best-path selection process. Invalid routes are excluded, and preference is given in the following order: valid > not-found (unless modified by policy).

```
ocnos(config-router-af)# bgp origin-as bestpath use-validity
ocnos(config-router-af)# commit
```

4. Permit invalid routes to participate in best-path selection but assign them the lowest preference.

```
ocnos(config-router-af)# bgp origin-as bestpath allow-invalid
ocnos(config-router-af)# commit
```

5. Use route-maps to define policy actions, such as setting local preference, based on the RPKI validation state of a route.

Example of the route map:

```
route-map RPKI-1 permit 3
match rpki valid
set local-preference 100

route-map RPKI-1 permit 5
match rpki not-found
set local-preference 200

route-map RPKI-1 permit 10
match rpki invalid
set local-preference 300

ocnos(config-router)# address-family ipv4 unicast
ocnos(config-router-af)# neighbor 100.1.1.2 activate
ocnos(config-router-af)# neighbor 100.1.1.2 route-map RPKI-1 in
ocnos(config-router-af)# commit
```

6. Remove or rollback RPKI configuration:

- Disable Validation in an AF/VRF:

```
ocnos(config-router-af)# no bgp origin-as validation-enable
ocnos(config-router-af)# commit
```

- Remove an RPKI Server:

```
ocnos(config)# router bgp 100
ocnos(config-router)# no bgp rpki server 10.30.0.85
ocnos(config-router)# commit
```

## Validation

Verify server session for the following:

State: Established and Synced: TRUE in show bgp rpki server detail.

```
OCNOS#show bgp rpki server detail
BGP RPKI Server Information
  Server Address: 155.155.1.1:
    Transport: TCP:3323
    RTR Version: 1
    State: established
    Synced: TRUE
    Uptime: 00:00:39
    ROAs (IPv4/IPv6): 9/3
    Configured Refresh-Interval: 15 seconds
    Configured Retry-Interval: 10 seconds
    Configured Expire-Interval: 600 seconds
    Actual Refresh-Interval: 5 seconds
    Actual Retry-Interval: 5 seconds
    Actual Expire-Interval: 600 seconds
    Rest of time to Refresh-Interval expiration: 2 seconds
    Rest of time to Expire-Interval expiration: 597 seconds
    ToBeDeleted: FALSE
```

## Verify validation state on routes

```
ocnos# show bgp origin-as validity ipv4

Total number of prefixes 21

## Implementation Examples

### ***Incomplete Global RPKI Adoption***

Not all Internet Service Providers (ISPs) or regional networks fully participate in RPKI validation.

Example Scenario: Peers from regions with limited RPKI coverage advertise valid prefixes that appear as invalid due to missing ROAs.

Action: It may permit invalid routes from trusted peers or specific regions to maintain global connectivity.

### ***Route Leak or Failover Scenarios***

During failover or traffic engineering events, alternate paths may temporarily appear as invalid.

Example Scenario: A backup eBGP link originates a prefix from a different AS path than specified in the ROA.

Action: The route may be allowed conditionally (for example, through route maps) to ensure reachability during the transition period.

---

## Commands

The BGP RPKI as origin validation feature introduces the following commands:

## bgp rpki server

Use this command to configure an RPKI cache server using either TCP or SSH transport, and to set the port and timer parameters (refresh, retry, expire), along with authentication details when SSH is used.

Use the **no** parameter of this command to remove an existing RPKI server configuration from the BGP instance.

### Command Syntax

```
bgp rpki server (A.B.C.D or X:X::X:X) (tcp|) (port (port number)) (refresh (1 - 86400 )) (retry (1 - 7200 )) (expire (600 - 17200))
```

```
bgp rpki server (A.B.C.D or X:X::X:X) ssh user (user name) encrypt (0|1) password (PASSWORD) (port (PORT NUMBER)) (refresh (1 - 86400 )) (retry (1 - 7200 )) (expire (600 - 17200))
```

### Parameters

#### A.B.C.D

Specifies the IPv4 address of the RPKI cache server.

#### X:X::X:X

Specifies the IPv6 address of the RPKI cache server.

#### tcp

Specifies TCP as the communication protocol between the router and the RPKI server.

#### ssh

Specifies SSH as the communication protocol between the router and the RPKI server for secure communication.

#### user

Defines the username used to authenticate with the RPKI server.

#### encrypt

Specifies encrypted or not encrypted for a password

**0**

Defines unencrypted password (key)

**1**

Defines encrypted password (key)

#### password

Defines the BGP encrypted password (key) up to maximum 218 characters for an ssh connection.

#### port

Specifies the TCP or SSH port number to connect to the RPKI server.

#### refresh

Specifies the time interval, in seconds, to refresh the cache from the RPKI server.

#### retry

Specifies the time interval, in seconds, to retry the connection to the RPKI server if the previous attempt fails.

#### expire

Specifies the cache expiration interval, in seconds, after which cached RPKI data is discarded if not refreshed.

### Default

None

**Command Mode**

Router mode

**Applicability**

Introduced in OcNOS version 7.0.0.

**Example**

The following example illustrates how to specify rpki server:

```
OcNOS(config-router)# bgp rpki server 10.30.0.85 tcp port 3323 refresh 600 retry 120 expire 7200  
OcNOS(config-router)# no bgp rpki server 10.30.0.85  
  
OcNOS(config-router)#bgp rpki server 1.1.1.1 ssh user test encrypt 0 password 123  
OcNOS(config-router)#commit
```

## bgp origin-as validation-enable

Use this command to enable BGP Origin-AS (AS Origin) Validation using RPKI. When enabled, the router validates the origin AS of received BGP prefixes against the ROA information downloaded from RPKI servers..

Use the **no** parameter of this command to disable BGP Origin-AS validation.

### Command Syntax

```
bgp origin-as validation-enable  
no bgp origin-as validation-enable
```

### Parameters

None

### Default

None

### Command Mode

Address Family Configuration Mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example enables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config)#router bgp 100  
OcNOS(config-router)#address-family ipv4 unicast  
OcNOS(config-router-af)# bgp origin-as validation-enable
```

The following example disables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config-router-af)# no bgp origin-as validation-enable
```

## bgp origin-as bestpath

Use this command to control how BGP selects the best path when RPKI Origin-AS validation is enabled.

This command determines whether BGP considers RPKI validation results during the bestpath selection process or allows paths with an invalid RPKI state to be selected.

Use the **no** form of this command to restore the default bestpath behavior.

### Command Syntax

```
bgp origin-as bestpath (allow-invalid | use validity)
no bgp origin-as bestpath (allow-invalid | use validity)
```

### Parameters

#### allow-invalid

Enables to handle a route with invalid RPKI state for the best path selection

#### Use-validity

Enables to use origin-as validation for the bestpath selection

### Default

None

### Command Mode

Address Family Configuration Mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example enables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config)#router bgp 100
OcNOS(config-router)#address-family ipv4 unicast
OcNOS(config-router-af)# bgp origin-as bestpath allow-invalid
```

The following example disables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config-router-af)# no bgp origin-as bestpath allow-invalid
```

## match rpki

Use this command to match BGP routes based on their Resource Public Key Infrastructure (RPKI) validation status in a route-map.

Use the **no** parameter of this command to remove an existing RPKI match configuration from the route-map.

### Command Syntax

```
match rpki {valid | invalid | not-found}
no match rpki {valid | invalid | not-found}
```

### Parameters

#### valid

Matches routes that have a valid RPKI validation status.

#### invalid

Matches routes that have an invalid RPKI validation status.

#### not-found

Matches routes whose RPKI validation status is unknown (not found).

### Default

None

### Command Mode

Route map mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example illustrates to match only invalid RPKI routes in a route-map and to remove the invalid RPKI routes.

```
ocnos#config terminal
ocnos(config)#route-map 1
ocnos(config-route-map)# match rpki invalid

ocnos(config-route-map)# no match rpki valid
```

## show bgp rpki table ipv4

Use this command to display the IPv4 RPKI ROA table.

The command shows all validated ROA entries downloaded from configured RPKI servers.

### Command Syntax

```
show bgp rpki table ipv4 (A.B.C.D/M ((covered|matched) (as-no <1-4294967295>)
```

### Parameters

#### A.B.C.D/M

Displays ROA entries that include or relate to the specified IPv4 prefix.

#### covered

Displays ROA entries where the specified prefix is covered by a larger ROA prefix.

#### matched

Filters the ROA table to display entries associated with a specific authorized origin AS number.

#### as-no <1-4294967295>

Filters the ROA table to display entries associated with a specific authorized origin AS number.

### Default

None

### Command Mode

Execution mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example displays IPv4 RPKI ROA table:

```
ocnos#show bgp rpki table ipv4
BGP RPKI, ROA list
1.0.0.0/24                               Maxlen:24 AS:13335 Server:10.30.0.85
                                         Maxlen:24 AS:13335 Server:192.168.1.233
1.0.64.0/18                             Maxlen:18 AS:18144 Server:10.30.0.85
                                         Maxlen:18 AS:18144 Server:192.168.1.233
1.1.1.0/24                              Maxlen:24 AS:13335 Server:10.30.0.85
                                         Maxlen:24 AS:13335 Server:192.168.1.233
1.1.4.0/22                              Maxlen:22 AS:4134 Server:10.30.0.85
                                         Maxlen:22 AS:4134 Server:192.168.1.233
1.1.16.0/20                             Maxlen:20 AS:4134 Server:10.30.0.85
                                         Maxlen:20 AS:4134 Server:192.168.1.233
1.2.9.0/24                              Maxlen:24 AS:4134 Server:10.30.0.85
                                         Maxlen:24 AS:4134 Server:192.168.1.233
1.2.10.0/24                             Maxlen:24 AS:4134 Server:10.30.0.85
                                         Maxlen:24 AS:4134 Server:192.168.1.233
```

Explanation of output fields:

| Field  | Description                                                                                |
|--------|--------------------------------------------------------------------------------------------|
| Prefix | Shows the IPv4 prefix (ROA prefix) published by the RPKI trust anchor.                     |
| Maxlen | Indicates the maximum prefix length allowed by the ROA.                                    |
| AS     | Displays the authorized Origin AS number for the prefix, as specified in the ROA.          |
| Server | Indicates the RPKI server (RPKI RTR server address) from which the ROA entry was received. |

## show bgp rpki table ipv6

Use this command to display the IPv6 RPKI ROA table.

The command shows all validated ROA entries downloaded from configured RPKI servers.

### Command Syntax

```
show bgp rpki table ipv6 (X:X::X:X/M ((covered|matched) (as-no <1-4294967295>|)|)|)
```

### Parameters

#### X:X::X:X/M

Displays ROA entries that include or relate to the specified IPv6 prefix.

#### covered

Displays ROA entries where the specified prefix is covered by a larger ROA prefix.

#### matched

Filters the ROA table to display entries associated with a specific authorized origin AS number.

#### as-no <1-4294967295>

Filters the ROA table to display entries associated with a specific authorized origin AS number.

### Default

None

### Command Mode

Execution mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example displays IPv6 RPKI ROA table:

```
ocnos#show bgp rpki table ipv6
BGP RPKI, ROA list
2001:200::/32           Maxlen:32 AS:2500 Server:192.168.1.233
2001:200:136::/48       Maxlen:48 AS:9367 Server:192.168.1.233
2001:200:1ba::/48        Maxlen:48 AS:24047 Server:192.168.1.233
2001:200:900::/40        Maxlen:40 AS:7660 Server:192.168.1.233
2001:200:e00::/40        Maxlen:40 AS:4690 Server:192.168.1.233
2001:200:8000::/35       Maxlen:35 AS:4690 Server:192.168.1.233
2001:200:c000::/35       Maxlen:35 AS:23634 Server:192.168.1.233
2001:200:e000::/35       Maxlen:35 AS:7660 Server:192.168.1.233
2001:218::/32           Maxlen:32 AS:2914 Server:192.168.1.233
2001:218:2000:2::/64     Maxlen:64 AS:4058 Server:192.168.1.233
2001:218:2000:11::/64    Maxlen:64 AS:55569 Server:192.168.1.233
2001:218:2000:21::/64    Maxlen:64 AS:55569 Server:192.168.1.233
2001:218:2002::/48       Maxlen:48 AS:2914 Server:192.168.1.233
```

Explanation of output fields:

| Field  | Description                                                                                |
|--------|--------------------------------------------------------------------------------------------|
| Prefix | Shows the IPv6 prefix (ROA prefix) published by the RPKI trust anchor.                     |
| Maxlen | Indicates the maximum prefix length allowed by the ROA.                                    |
| AS     | Displays the authorized Origin AS number for the prefix, as specified in the ROA.          |
| Server | Indicates the RPKI server (RPKI RTR server address) from which the ROA entry was received. |

## show bgp origin-as validity ipv4

Use this command to display the RPKI Origin-AS validation state of IPv4 BGP routes. The command shows whether each route is classified as valid, not-found, or invalid based on the ROA information received from RPKI servers.

### Command Syntax

```
show bgp origin-as validity ipv4 (valid|not-found|invalid|) (vrf WORD|)
```

### Parameters

#### valid

Displays only the IPv4 prefixes that passed RPKI Origin-AS validation.

#### not-found

Displays routes for which no corresponding ROA entry exists.

#### invalid

Displays routes that fail RPKI Origin-AS validation.

#### vrf WORD

Displays RPKI validation results for the specified VRF instance.

### Default

None

### Command Mode

Execution mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example displays bgp origin-as validity for IPv4 address:

```
ocnos#show bgp origin-as validity ipv4
BGP table version is 9, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
                l - labeled, S Stale, x-EVPN MPLS
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

Origin-AS validation codes: V valid, I invalid, N not-found, D disabled

## show bgp origin-as validity ipv6

Use this command to display the RPKI Origin-AS validation state of IPv6 BGP routes. The command shows whether each route is classified as valid, not-found, or invalid based on the ROA information received from RPKI servers.

### Command Syntax

```
show bgp origin-as validity ipv6 (valid|not-found|invalid|) (vrf WORD|)
```

### Parameters

#### valid

Displays only the IPv6 prefixes that passed RPKI Origin-AS validation.

#### not-found

Displays routes for which no corresponding ROA entry exists.

#### invalid

Displays routes that fail RPKI Origin-AS validation.

#### vrf WORD

Displays RPKI validation results for the specified VRF instance.

### Default

None

### Command Mode

Execution mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example displays origin-as validity for IPv6 address:

```
ocnos#show bgp origin-as validity ipv6
BGP table version is 270, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
                l - labeled, S Stale, x-EVPN MPLS
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

Origin-AS validation codes: V valid, I invalid, N not-found, D disabled

## show bgp rpki server

Use this command to display the configured RPKI servers, their transport protocol, operational state, uptime, and the number of received Route Origin Authorizations (ROAs) for both IPv4 and IPv6.

### Command Syntax

```
show bgp rpki server (detail|summary)
```

### Parameters

None

### Default

None

### Command Mode

Privileged execution mode

### Applicability

Introduced in OcNOS version 7.0.0.

### Example

The following example displays rpki server show command:

```
ocnos#show bgp rpki server
Server Address                Transport  State      Uptime    ROAs (IPv4/IPv6)
10.16.99.108                 TCP:3323  established 00:02:27  9/3
155.155.1.1                  SSH:2222  established 00:02:26  9/3

ocnos#show bgp rpki server detail
BGP RPKI Server Information
Server Address: 155.155.1.1:
  Transport: TCP:3323
  RTR Version: 1
  State: established
  Synced: TRUE
  Uptime: 00:00:39
  ROAs (IPv4/IPv6): 9/3
  Configured Refresh-Interval: 15 seconds
  Configured Retry-Interval: 10 seconds
  Configured Expire-Interval: 600 seconds
  Actual Refresh-Interval: 5 seconds
  Actual Retry-Interval: 5 seconds
  Actual Expire-Interval: 600 seconds
  Rest of time to Refresh-Interval expiration: 2 seconds
  Rest of time to Expire-Interval expiration: 597 seconds
  ToBeDeleted: FALSE
```

Explanation of output fields:

| Field          | Description                                             |
|----------------|---------------------------------------------------------|
| Server Address | IP address of the configured RPKI server.               |
| Transport      | Transport protocol and port used to connect to the RPKI |

| Field                                       | Description                                                                                                 |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------|
|                                             | server (for example: TCP:or SSH:)                                                                           |
| RTR Version                                 | Version of the RPKI-to-Router (RTR) protocol negotiated with the server.                                    |
| State                                       | Current operational state of the RPKI server                                                                |
| Synced                                      | Indicates whether the router has successfully synchronized ROA data with the server.                        |
| Uptime                                      | Duration for which the server connection has been active or the current status since the last state change. |
| ROAs (IPv4/IPv6)                            | Number of valid Route Origin Authorizations received from the server, separated by IPv4 and IPv6 counts.    |
| Configured Refresh-Interval                 | User-configured refresh timer for requesting updated validation data.                                       |
| Configured Retry-Interval                   | User-configured retry interval for reconnecting after a session failure.                                    |
| Configured Expire-Interval                  | User-configured maximum validity period for cached ROA data.                                                |
| Actual Refresh-Interval                     | Refresh interval currently in use, as negotiated with the server.                                           |
| Actual Retry-Interval                       | Retry interval currently in use, based on server negotiation.                                               |
| Actual Expire-Interval                      | Expire interval currently in use, based on protocol negotiation.                                            |
| Rest of time to Refresh-Interval expiration | Remaining time until the next refresh request is triggered.                                                 |
| Rest of time to Expire-Interval expiration  | Remaining time before cached validation data becomes invalid.                                               |
| ToBeDeleted                                 | Indicates whether the server entry is marked for deletion.                                                  |

## Glossary

| Key Terms/Acronym                         | Description                                                                                                                                                     |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Border Gateway Protocol (BGP)             | The standardized exterior gateway protocol used to exchange routing information between autonomous systems (ASes) on the Internet.                              |
| Resource Public Key Infrastructure (RPKI) | A framework designed to secure the Internet's routing infrastructure by cryptographically verifying that an AS is authorized to originate a specific IP prefix. |
| Origin Validation                         | A process where a BGP router validates the origin AS of a received route against RPKI data to determine if the route is legitimate.                             |

| Key Terms/Acronym                | Description                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------|
| Route Origin Authorization (ROA) | digitally signed object that specifies which AS is authorized to announce a particular IP prefix. |

## BGP Commands

This section provides an organized overview of CLI commands used to configure and manage Border Gateway Protocol (BGP), including both BGP4 for IPv4 and BGP4+ for IPv6 and other network layer protocols.

Refer to [BGP4+ Commands](#) section for IPv6 commands.

BGP/BGP4 commands apply to IPv4 routing and are placed directly under the BGP routing process. BGP4 is used to exchange routing information between Autonomous Systems (AS) in IPv4-based networks. It includes the following commands:

|                                               |     |
|-----------------------------------------------|-----|
| address-family ipv4 .....                     | 720 |
| aggregate-address .....                       | 722 |
| auto-summary .....                            | 724 |
| bgp aggregate-nexthop-check .....             | 725 |
| bgp always-compare-med .....                  | 726 |
| bgp as-local-count .....                      | 727 |
| bgp bestpath as-path ignore .....             | 728 |
| bgp bestpath as-path multipath-relax .....    | 729 |
| bgp bestpath compare-confed-aspath .....      | 730 |
| bgp bestpath compare-routerid .....           | 731 |
| bgp bestpath dont-compare-originator-id ..... | 732 |
| bgp bestpath med .....                        | 733 |
| bgp bestpath tie-break-on-age .....           | 735 |
| bgp client-to-client reflection .....         | 736 |
| bgp cluster-id .....                          | 737 |
| bgp confederation vrf identifier .....        | 738 |
| bgp confederation vrf peers .....             | 739 |
| bgp dampening .....                           | 740 |
| bgp default local-preference .....            | 742 |
| bgp deterministic-med .....                   | 743 |
| bgp enforce-first-as .....                    | 745 |
| bgp extended-asn-cap .....                    | 746 |
| bgp fast-external-failover .....              | 747 |
| bgp implicit-null .....                       | 748 |
| bgp log-neighbor-changes .....                | 750 |
| mpls-nexthop-tracking .....                   | 752 |
| bgp nexthop-trigger delay .....               | 753 |
| bgp nexthop-trigger enable .....              | 754 |
| bgp rfc1771-path-select .....                 | 755 |
| bgp rfc1771-strict .....                      | 756 |

## address-family ipv4

Use the address family command to enter the IPv4 or VPNv4 address family mode allowing configuration of address-family specific parameters. To leave the address family mode and return to the Configure mode use the `exit-address-family` command.

This command configures the routing exchange between Provider Edge (PE) and Customer Edge (CE) devices. The BGP sessions between PE routers can carry different types of routes (VPN-IPv4 and IPv4 routes). Address families are used to control the type of BGP session. Configure a BGP address family for each VRF configured on the PE router and a separate address family to carry VPN-IPv4 routes between PE routers. All non VPN BGP neighbors are defined using router mode. All VPN BGP neighbors are defined under its associated address family mode. The BGP process with no address-family specified is the default address-family, where any sessions are configured that either are not associated with a VRF or are used to carry IPv4 routes.

Use the `no` parameter with this command to disable the address-family configurations.

### Command Syntax

```
address-family ipv4
address-family ipv4 (unicast|multicast)
address-family ipv4 vrf NAME
address-family l2vpn evpn
address-family rtfilter unicast
address-family vpn4
address-family vpn4 unicast
no address-family ipv4 vrf NAME
no address-family ipv4 (unicast|multicast)
no address-family l2vpn evpn
no address-family rtfilter unicast
no address-family vpnv4
no address-family vpnv4 unicast
```

### Parameters

#### ipv4

IPv4 address family

#### unicast

Unicast address prefixes

#### multicast

Multicast address prefixes

#### vrf

Virtual Private Network (VPN) routing/forwarding instance

#### NAME

VPN routing/forwarding instance name

#### unicast

Unicast address prefixes

#### l2vpn evpn

Layer 2 VPN routing sessions with EVPN endpoint information distributed to BGP peers

#### rtfilter

Route target filter: on an iBGP peer or Route Reflector (RR), only send IPv4 and IPv6 prefixes to PE routers when a PE has a VRF that imports those specific prefixes.

**unicast**

Unicast address prefixes

**vpn4**

VPN version 4 address family

**unicast**

Unicast address prefixes

**Applicability**

No default value is specified

**Command Mode**

Router mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Examples**

```
#configure terminal
(config)#router bgp 7657
(config-router)#neighbor 3ffe:506::1 remote-as 7657
(config-router)#neighbor 3ffe:506::1 interface eth1

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 3ffe:506::1 activate
(config-router-af)#exit-address-family
```

---

## aggregate-address

Use this command to configure BGP aggregate entries.

Aggregates are used to minimize the size of routing tables. Aggregation combines the characteristics of several different routes and advertises a single route. The `aggregate-address` command creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available in the specified range. Using the `summary-only` parameter advertises the prefix only, suppressing the more-specific routes to all neighbors. In the following example Router1 will propagate network 172.0.0.0 and suppresses the more specific route 172.10.0.0.

The `as-set` parameter creates an aggregate entry advertising the path for this route, consisting of all elements contained in all paths being summarized. Use this parameter to reduce the size of path information by listing the AS number only once, even if it was included in multiple paths that were aggregated. The `as-set` parameter is useful when aggregation of information results in an incomplete path information.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
aggregate-address A.B.C.D/M
aggregate-address A.B.C.D/M as-set
aggregate-address A.B.C.D/M as-set summary-only
aggregate-address A.B.C.D/M summary only
aggregate-address A.B.C.D/M summary-only as-set
no aggregate-address A.B.C.D/M
```

### Parameters

#### A.B.C.D/M

Aggregate prefix

#### as-set

Generate AS set path information

#### summary-only

Filter more specific routes from updates

### Default

By default, aggregate address A.B.C.D/M is disabled.

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#aggregate-address 10.0.0.0/8 as-set summary-only
```

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#no aggregate-address 10.0.0.0/8
```

## auto-summary

Use this command to enable sending summarized routes by a BGP speaker to its peers in the router configuration mode or in the address-family configuration mode. Auto-summary is used by a BGP router to advertise summarized routes to its peers. Auto-summary can be enabled if certain routes have already been advertised: in this case, configuring auto-summary advertises the summarized routes first, then corresponding non-summarized routes are withdrawn. If certain routes have already been advertised, and auto-summary is disabled, non-summarized routes are first advertised, then the corresponding summarized routes are withdrawn from all the connected peers.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
auto-summary
no auto-summary
```

### Parameters

None

### Default

By default, auto-summary is disabled.

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#auto-summary
```

## bgp aggregate-nexthop-check

Use this command to set the BGP option to perform aggregation only when next-hop matches the specified IP address.

Use the `no` parameter with this command to disable this functionality.

### Command Syntax

```
bgp aggregate-nexthop-check  
no bgp aggregate-nexthop-check
```

### Parameters

None

### Default

By default, bgp aggregate nexthop check is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#bgp aggregate-nexthop-check
```

---

## bgp always-compare-med

Use this command to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal. MED comparison is done only among paths from the same autonomous system (AS). Use `bgp always-compare-med` command to allow comparison of MEDs from different ASs. The MED parameter is used to select the best path. A path with lower MED is preferred. If the bgp table shows the following and the always-compare-med is enabled:

```
Route1: as-path 400, med 300
Route2: as-path 200, med 200
Route3: as-path 400, med 250
```

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If always-compare-med was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the `bgp deterministic-med` command. Please see `bgp deterministic-med` command for details. If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS.

Use the `no` parameter with this command to disallow the comparison.

### Command Syntax

```
bgp always-compare-med
no bgp always-compare-med
```

### Parameters

None

### Default

By default, bgp always compare med is disabled.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp always-compare-med
```

---

## bgp as-local-count

Use this command to set the number of times the local-AS (Autonomous System) is to be prepended.

Use the `no` parameter with this command to stop prepending the local AS count.

### Command Syntax

```
bgp as-local-count <2-64>
no bgp as-local-count <2-64>
```

### Parameter

#### <2-64>

The number of times the local-AS is to be prepended

### Default

By default, bgp as local count is disabled.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)# bgp as-local-count 55

(config)#router bgp 100
(config-router)#no bgp as-local-count 55
```

---

## bgp bestpath as-path ignore

Use this command to prevent the router from considering the autonomous system (AS) path length as a factor in the algorithm for choosing a best path route.

Use the `no` parameter with this command to allow the router to consider the AS path length in choosing a best path route.

### Command Syntax

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
```

### Parameters

None

### Default

By default, `bgp bestpath as-path ignore` is disabled

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath as-path ignore

(config)#router bgp 100
(config-router)#no bgp bestpath as-path ignore
```

## bgp bestpath as-path multipath-relax

Use this command to relax the “same AS-Path” requirement so any candidate eBGP AS-Path with the same AS-path length might be used for eBGP load-balancing.

**Note:** This feature does not load-balance between eBGP and iBGP paths.

Normally eBGP load-balancing requires the candidate routes to be equal-cost paths with identical BGP attributes having the same weight, Local-Pref, AS-Path (both the AS numbers and the AS path length), origin, MED, and different next-hop.

Use the `no` parameter with this command to return to normal operation.

### Command Syntax

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
```

### Parameters

None

### Default

By default, as-path multipath-relax is disabled

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)# bgp bestpath as-path multipath-relax

(config)#router bgp 100
(config-router)# no bgp bestpath as-path multipath-relax
```

## bgp bestpath compare-confed-aspath

Use this command to allow comparing of the confederation AS path length. This command specifies that the AS confederation path length must be used when available in the BGP best path decision process. It is effective only when [bgp bestpath as-path ignore \(page 728\)](#) command has not been used.

Use the `no` parameter with this command to ignore consideration of AS confederation path length in BGP best path selection.

### Command Syntax

```
bgp bestpath compare-confed-aspath
no bgp bestpath compare-confed-aspath
```

### Parameters

None

### Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-confed-aspath

(config)#router bgp 100
(config-router)#no bgp bestpath compare-confed-aspath
```

---

## bgp bestpath compare-routerid

Use this command to compare router IDs for identical eBGP paths. When comparing similar routes from peers, the BGP router does not consider the router ID of the routes. By default, it selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected. The router ID is the highest IP address on the router, with preference given to loopback addresses. Router ID can be manually set by using the [bgp router-id \(page 757\)](#) command.

Use the `no` parameter with this command to disable this functionality.

### Command Syntax

```
bgp bestpath compare-routerid
no bgp bestpath compare-routerid
```

### Parameters

None

### Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-routerid

(config)#router bgp 100
(config-router)#no bgp bestpath compare-routerid
```

---

## bgp bestpath dont-compare-originator-id

Use this command to change the default bestpath selection by not comparing an originator-ID for an identical EBGP path.

Use the `no` parameter with this command to disable this functionality.

### Command Syntax

```
bgp bestpath dont-compare-originator-id
no bgp bestpath dont-compare-originator-id
```

### Parameters

None

### Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath dont-compare-originator-id

(config)#router bgp 100
(config-router)#no bgp bestpath dont-compare-originator-id
```

---

## bgp bestpath med

Use this command to specify two MED (Multi Exit Discriminator) attributes, `confed` and `missing-as-worst`.

The `confed` attribute enables MED comparison along paths learned from confederation peers. The MEDs are compared only if there is no external Autonomous System (an AS not within the confederation) in the path. If there is an external autonomous system in the path, the MED comparison is not made. For example in the following paths, the MED is not compared with Route3 as it is not in the confederation. MED is compared for Route1 and Route2 only.

```
Path1 = 32000 32004, med=4
Path2 = 32001 32004, med=2
Path3 = 32003 1, med=1
```

The `missing-as-worst` attribute to consider a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If `missing-as-worst` is disabled, the missing MED is assigned the value of 0, making the path with the missing MED attribute the best path.

Use the `no` parameter with this command to prevent BGP from considering the MED attribute in comparing paths.

### Command Syntax

```
bgp bestpath med confed missing-as-worst
bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med)
bgp bestpath med missing-as-worst confed
no bgp bestpath med confed missing-as-worst
no bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med)
no bgp bestpath med missing-as-worst confed
```

### Parameters

#### **confed**

Compare MED along confederation paths

#### **missing-as-worst**

Treat missing MED as the least preferred one

#### **remove-recv-med**

Remove received MED attribute

#### **remove-send-med**

Remove sent MED attribute

### Command Mode

Router mode

### Default

By default, MED value is zero.

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath med missing-as-worst

(config)#router bgp 100
(config-router)#bgp bestpath med remove-recv-med
(config-router)#no bgp bestpath med remove-recv-med

(config)#router bgp 100
(config-router)#bgp bestpath med remove-send-med
(config-router)#no bgp bestpath med remove-send-med
```

## bgp bestpath tie-break-on-age

Use this command to always select a preferred older route even when the `bgp bestpath compare-routerid` command is configured.

Use the `no` parameter with this command to disable this functionality.

### Command Syntax

```
bgp bestpath tie-break-on-age
no bgp bestpath tie-break-on-age
```

### Parameters

None

### Default

By default, tie-break-on-age is disabled

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath tie-break-on-age

(config)#router bgp 100
(config-router)#no bgp bestpath tie-break-on-age
```

---

## bgp client-to-client reflection

Use this command to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed. If the clients are fully meshed the route reflector is not required, use `no bgp client-to-client reflection` command to disable the client-to-client route reflection.

Use the `no` parameter with this command to turn off client-to-client reflection.

### Command Syntax

```
bgp client-to-client reflection
no bgp client-to-client reflection
```

### Parameters

None

### Default

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp client-to-client reflection

(config)#router bgp 100
(config-router)#no bgp client-to-client reflection
```

---

## bgp cluster-id

Use this command to configure the cluster ID if the BGP cluster has more than one route reflector. A cluster includes route reflectors and its clients. Usually, each cluster is identified by the router ID of its single route reflector but to increase redundancy sometimes a cluster may have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster ID. The `bgp cluster-id` command is used to configure the 4 byte cluster ID for clusters with more than one route reflectors.

Use the `no` parameter with this command (without any arguments) to remove a previously configured route reflector cluster ID.

### Command Syntax

```
bgp cluster-id <1-4294967295>
bgp cluster-id A.B.C.D
no bgp cluster-id
```

### Parameters

#### <1-4294967295>

Route reflector ID as a 32-bit quantity

#### A.B.C.D

Route reflector ID in an IPv4 address format

### Default

By default, cluster id is set bgp cluster id

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following configuration creates a cluster-id 5 including two route-reflector-clients.

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 5.5.5.5 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 200
(config-router)# bgp cluster-id 5
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 3.3.3.3 route-reflector-client
(config-router-af)#neighbor 5.5.5.5 route-reflector-client
```

## bgp confederation vrf identifier

Use this command to specify a BGP confederation identifier.

Use the `no` parameter with this command to remove a BGP confederation identifier.

### Command Syntax

```
bgp confederation (vrf NAME |) identifier <1-4294967295>
no bgp confederation (vrf NAME |) identifier
```

### Parameter

#### identifier <1-4294967295>

Routing domain confederation AS number

#### vrf NAME

Specify the user-defined VRF instance name.

### Default

No default value is specified

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation vrf vrfl identifier 1000
```

---

## bgp confederation vrf peers

Use this command to configure the Autonomous Systems (AS) that belong to a confederation. A confederation allows an AS to be divided into several ASs. The AS is given a confederation identifier. External BGP (eBGP) routers view only the whole confederation as one AS. Each AS is fully meshed within itself and is visible internally to the confederation.

Use the `no` parameter with this command to remove an autonomous system from the confederation.

### Command Syntax

```
bgp confederation (vrf NAME |) peers <1-4294967295>
no bgp confederation (vrf NAME |) peers <1-4294967295>
```

### Parameter

#### <1-4294967295>

AS numbers of eBGP peers that are in the same confederation

#### vrf NAME

Specify the user-defined VRF instance name.

### Default

No default value is specified

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

In the following configuration example, the neighbor 172.210.30.2 and 172.210.20.1 have iBGP connection within AS 100, neighbor 173.213.30.1 is a BGP connection with a confederation peer 200 and neighbor 6.6.6.6 has an eBGP connection to external AS 300.

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation vrf vrfl identifier 300
(config-router)#bgp confederation vrf vrfl peers 200
(config-router)#neighbor 172.210.30.2 remote-as 100
(config-router)#neighbor 172.210.20.1 remote-as 100
(config-router)#neighbor 173.213.30.1 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 300
```

In the below configuration, the neighbor 5.5.5.4 has an eBGP connection to confederation 300.

```
#configure terminal
(config)#router bgp 500
(config-router)#neighbor 5.5.5.4 remote-as 300
```

## bgp dampening

Use this command to enable BGP route dampening and set various parameters. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the `suppress` limit the advertisement of the route is suppressed. This penalty is decayed according to the configured `half time` value. Once the penalty is lower than the `reuse` limit, the route advertisement is unsuppressed. The dampening information is purged from the router once the penalty becomes less than half of the `reuse` limit.

Use the `no` parameter with this command to unset BGP dampening parameters.

### Command Syntax

```
bgp dampening
bgp dampening <1-45>
bgp dampening <1-45> <1-20000> <1-20000> <1-255>
bgp dampening <1-45> <1-20000> <1-20000> <1-255> <1-45>
bgp dampening route-map WORD
no bgp dampening
```

### Parameters

#### <1-45>

Reachability half-life time for the penalty in minutes. The time for the penalty to decrease to one-half of its current value.

#### <1-20000>

Value to start reusing a route. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.

#### <1-20000>

Value to start suppressing a route. When the penalty for a route exceeds the suppress value, the route is suppressed

#### <1-255>

Maximum duration to suppress a stable route in minutes.

#### <1-45>

Un-reachability half-life time for the penalty in minutes.

#### route-map

Route map to specify criteria for dampening.

#### WORD

Route-map name.

### Defaults

The default reachability half-life is 15 minutes.

The default reuse limit is 750.

The default suppress limit is 2000.

The default max-suppress value is 4 times the half-life time, or 60 minutes.

### Command Mode

Address Family mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp dampening 20 800 2500 80 25
```

## bgp default local-preference

Use this command to change the default local preference value. Local preference indicates the preferred path when there are multiple paths to the same destination. The path having a higher preference is preferred. The preference is sent to all routers and access servers in the local autonomous system.

Use the `no` parameter with this command to revert to the default value for local preference.

### Command Syntax

```
bgp default local-preference <0-4294967295>
no bgp default local-preference
no bgp default local-preference <0-4294967295>
```

### Parameter

**<0-4294967295>**

Local preference value

### Default

By default, local preference value is 100

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp default local-preference 2345555
```

## bgp deterministic-med

Use this command to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal.

For a correct comparison result, enable this command on all routers in a local AS. After enabling this command, all paths for the same prefix are grouped together and arranged according to their MED value. Based on this comparison, the best path is then chosen. This command compares MED variable when choosing routes advertised by different peers in the same AS, to compare MED, when choosing routes from neighbors in different ASs use the `bgp always-compare-med` command.

When the `bgp deterministic-med` command is enabled, routes from the same AS are grouped together, and the best routes of each group are compared. If the BGP table showed:

```
Route1: as-path 200, med 300, internal
Route2: as-path 400, med 200, internal
Route3: as-path 400, med 250, external
```

BGP would have a group of Route1 and a second group of Route2 and Route3 (the same ASs). The best of each group is compared. Route1 is the best of its group because it is the only route from AS 200. Route1 is compared to the Route2, the best of group AS 400 (the lower MED). Since the two routes are not from the same AS, the MED is not considered in the comparison. The external BGP route is preferred over the internal BGP route, making Route3 the best route; the preferred route would be different if `always-compare-med` command is enabled (See `always-compare-med` command).

Use the `no` parameter with this command to disallow this setting.

### Command Syntax

```
bgp deterministic-med
no bgp deterministic-med
```

### Parameters

None

### Default

By default, `bgp deterministic med` is disabled

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp deterministic-med
```

```
(config)#router bgp 100
(config-router)#no bgp deterministic-med
```

---

## bgp enforce-first-as

Use this command to enforce the first AS for eBGP routes. This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS\_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

Using the `no` parameter with this command to disable this feature.

### Command Syntax

```
bgp enforce-first-as
no bgp enforce-first-as
```

### Parameters

None

### Default

By default, enforce-first-as is disabled

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp enforce-first-as

(config)#router bgp 100
(config-router)#no bgp enforce-first-as
```

---

## bgp extended-asn-cap

Use this command to configure a BGP router to send 4-octet ASN capabilities. If attempting to change the AS capability from 2 to 4 or 4 to 2, a prompt occurs to remove the VRF configuration (if it exists), and reconfiguration is required, because the route distinguisher (RD) configuration would have been created with the current (2 octet or 4 octet) capability, and must be reconfigured before attempting to change the capability.

While loading from a saved configuration with AS4 capability and BGP VRF configuration, the capability will not be changed because of the above described reason.

Use the `no` parameter with this command to prevent a BGP router from sending 4-octet ASN capabilities.

### Command Syntax

```
bgp extended-asn-cap
no bgp extended-asn-cap
```

### Parameters

None

### Default

By default, the bgp extended ASN capability and Four-octet capabilities are disabled.

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#bgp extended-asn-cap
```

## bgp fast-external-failover

Use this command to reset a BGP session immediately, if the interface used for BGP connection goes down.

Use the `no` parameter with this command to disable this feature.

### Command Syntax

```
bgp fast-external-failover
no bgp fast-external-failover
```

### Parameters

None

### Default

By default, fast-external failover is enabled

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp fast-external-failover
```

## bgp implicit-null

Use this command to assign the MPLS label implicit-null (with a label value of 3) for locally originated IPv4 routes, whether they are connected or redistributed from other protocols which are found in the BGP IPv4 Unicast RIB.

Use the `no` form of this command to disable the default implicit-null behavior by configuring `no bgp implicit-null` under `address-family ipv4 labeled-unicast`. The `no bgp implicit-null` CLI command prompts BGP to assign a valid label (with a value greater than 16) to all IPv4 prefixes.

### Command Syntax

```
bgp implicit-null
no bgp implicit-null
```

### Parameters

None

### Default

The `bgp implicit-null` is enabled under `address-family ipv4 labeled-unicast`.

### Command Mode

BGP address-family ipv4 labelled-unicast mode

### Applicability

Introduced in OcNOS version 6.5.1.

### Example

```
OcNOS#configure terminal
```

**Note:** Describe the show output fields for new show commands. (Example: Refer the command `show streaming-telemetry dynamic-subscriptions`).

To allocate an MPLS implicit-null label to IPv4 unicast prefix 22.2.2.2/32s

```
!
router bgp 100
  bgp router-id 2.2.2.2
  allocate-label all
  neighbor 1.1.1.1 remote-as 100
  neighbor 1.1.1.1 update-source lo
!
address-family ipv4 unicast
  network 22.2.2.2/32
  exit-address-family
!
address-family ipv4 labeled-unicast
  bgp implicit-null
  neighbor 1.1.1.1 activate
```

```
exit-address-family
!  
exit  
!
```

### Example for non-implicit-null

To allocate a valid MPLS unique label (> 16) to IPv4 unicast prefix 22.2.2.2/32

```
!  
router bgp 100  
  bgp router-id 2.2.2.2  
  allocate-label all  
  neighbor 1.1.1.1 remote-as 100  
  neighbor 1.1.1.1 update-source lo  
  !  
  address-family ipv4 unicast  
    network 22.2.2.2/32  
  exit-address-family  
  !  
  address-family ipv4 labeled-unicast  
    no bgp implicit-null  
    neighbor 1.1.1.1 activate  
  exit-address-family  
  !  
exit  
!
```

---

## bgp log-neighbor-changes

Use this command to enable logging of status change messages without turning on debug bgp commands. OcNOS has many logging services for neighbor status, including `debug bgp fsm` and `debug bgp events`. However, these commands cause system performance degradation. If you need to log neighbor status changes only, IP Infusion Inc. recommends turning off all debug commands and using the `bgp log-neighbor-changes` command instead. A sample output of the log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an `interface down` event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

This command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown
- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

Use the `no` parameter with this command to disable this feature.

### Command Syntax

```
bgp log-neighbor-changes  
no bgp log-neighbor-changes
```

### Parameters

None

### Default

By default, bgp log neighbor changes is disabled

### Command Mode

Router mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
(config)#router bgp 100  
(config-router)#bgp log-neighbor-changes
```

## mpls-nexthop-tracking

Use this command to register and track nexthops of BGP prefixes for MPLS reachability resolution.

Use “no” form of this command to deactivate MPLS nexthop tracking for BGP routes.

**Note:** `bgp nexthop-trigger enable` must be configured to enable `mpls-nexthop-tracking`

### Command Syntax

```
mpls-nexthop-tracking  
no mpls-nexthop-tracking
```

### Parameters

None

### Command Mode

BGP mode

### Applicability

This command is introduced in OcNOS version 5.0 and is updated in OcNOS version 6.4.0

MPLS NHT can be used to track nexthop LSP's of BGP prefixes, MPLS NHT supports BGP IPv4 Labeled Unicast, VPNv4, VPNv6 (6VPE), 6PE routes.

### Examples

```
#configure terminal  
(config)#bgp nexthop-trigger enable  
(config)#router bgp 100  
(config-router)#mpls-nexthop-tracking
```

---

## bgp nexthop-trigger delay

Use this command to set the delay time for nexthop address tracking. This command configures the delay interval between routing table walks for nexthop delay tracking, after which BGP does a routing table scan on receiving a nexthop change trigger from NSM. The time period determines how long BGP waits before it walks the full BGP table to determine which prefixes are affected by the nexthop changes, after it receives the trigger from NSM about one or more nexthop changes.

Use the `no` parameter with this command to reset the timer value to the default value.

### Command Syntax

```
bgp nexthop-trigger delay <1-100>
no bgp nexthop-trigger delay
```

### Parameter

**<1-100>**

Nexthop trigger delay interval in seconds

### Default

By default, nexthop-trigger delay time is 5 seconds

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)# bgp nexthop-trigger delay 6

#configure terminal
(config)# no bgp nexthop-trigger delay
```

---

## bgp nexthop-trigger enable

Use this command to enable nexthop address tracking. Nexthop address tracking is an event-driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports nexthop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to nexthop changes for routes installed in the RIB.

If nexthop tracking is enabled after certain routes are learned, the registration of all nexthops for selected BGP routes is done after the nexthop tracking feature is enabled. If nexthop tracking is disabled, and if there are still some selected BGP routes, BGP de-registers the nexthops of all selected BGP routes from NSM.

Use the `no` parameter with this command to disable this feature. If the `no` command is given when nexthop tracking is in the process of execution, an error appears and nexthop tracking is not disabled. However, if the nexthop tracking timer is running at the time of negation, the nexthop tracking timer is stopped, and nexthop tracking is disabled.

### Command Syntax

```
bgp nexthop-trigger enable
no bgp nexthop-trigger enable
```

### Parameters

None

### Default

By default, nexthop address tracking is disabled

### Command Mode

Configure modeConfigure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)# bgp nexthop-trigger enable
```

## bgp rfc1771-path-select

Use this command to set RFC 1771 compatible path selection.

Use the `no` parameter with this command to revert this setting.

### Command Syntax

```
bgp rfc1771-path-select  
no bgp rfc1771-path-select
```

### Parameters

None

### Default

Standard compatible path selection mechanism.

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#bgp rfc1771-path-select
```

---

## bgp rfc1771-strict

Use this command to set the origin path attribute to “IGP” when the origin is a protocol such as RIP, OSPF, or ISIS as specified in RFC 1771. Otherwise, the origin is always set to “incomplete” which is the industry standard.

Use the `no` parameter with this command to revert this setting.

### Command Syntax

```
bgp rfc1771-strict
no bgp rfc1771-strict
```

### Parameters

None

### Default

By default, `bgp rfc1771 strict` is disabled.

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#bgp rfc1771-strict
```

## bgp router-id

Use this command to manually configure a fixed router ID as a BGP router identifier. When this command is used to configure a fixed router ID, the current router identifier is overridden and the peers are reset.

Use the `no` parameter with this command to remove a manually configured fixed router ID.

### Command Syntax

```
bgp router-id A.B.C.D
no bgp router-id
no bgp router-id A.B.C.D
```

### Parameter

#### A.B.C.D

Router ID in an IPv4 address format

### Default

Once the BGP router-id is elected, it may be re-elected in the following cases:

When an explicit BGP router-id is configured/un-configured

When the router's (global) router-id is set/unset (holds true when (a) is not applicable),

When the BGP process is cleared (holds true when both (a) & (b) are not applicable and the IP address(es) on the active interfaces are updated, which may result in a change in the router's router-id).

If no loopback interface is configured, the highest IP address is the BGP router-id.

When a loopback interface is configured, the BGP router-id is set to the IP address of the loopback interface.

**Note:** IP Infusion Inc. recommends that you always configure a router identifier to avoid unpredictable behavior if the address of a loopback interface changes.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp router-id 10.1.2.7

(config)#router bgp 100
(config-router)#no bgp router-id 10.1.2.7
```

---

## bgp scan-time

Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database. To disable BGP scanning, set the scan-time interval to 0 seconds.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
bgp scan-time <0-60>
no bgp scan-time
no bgp scan-time <0-60>
```

### Parameter

#### <0-60>

Scanning interval in seconds

### Default

By default, scan-time interval is 60 seconds.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp scan-time 10
```

## table-map

Use this command to enable or disable suppression/modification of incoming BGP updates to IP RIB/FIB table installation.

**Note:** The `table-map filter` configuration in the VRF address family applies only to RIB routes and not to MPLS routes.

In a dedicated route reflector, all the routes it receives may not be required to be stored or only few selected routes need to be stored, because it may not lie in the data path.

Table maps are particularly useful to attain this restriction. Table-map command can be used in two ways:

- When a simple table-map command is given, the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option 'filter' is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Use this command in Address Family mode to set the table map rule per an IPv4 or IPv6 family.

Use the `no` parameter with this command to remove the table-map rule.

## Command Syntax

```
table-map WORD [|filter]
```

### Parameter

#### WORD

Specify the route-map name to apply.

#### filter

Filer the routes. If present, the incoming routes are pruned as per the rule specified in route-map-name. If not, it is used to alter the incoming packet information.

### Default

All BGP routes will be downloaded to IP RIB

### Command Mode

Address Family IPv4 mode, and Address Family IPv6 mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following example shows how to set the table-map command without filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#table-map abc
```

The following example shows how to set the table-map command with filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#table-map abc filter
```

The following example shows how to set the table-map command without filter for BGP for an IPv6 address family.

```
(config)#router bgp 100
(config-router)#address-family ipv6
(config-router-af)#table-map abc
```

The following example shows how to set the table-map command with filter for BGP for an IPv6 address family.

```
(config)#router bgp 100
(config-router)#address-family ipv6
(config-router-af)#table-map abc filter
```

---

## bgp update-delay

Use this command to set the update delay for a graceful-restart capable router. The update-delay value is the maximum time a graceful-restart capable router, which is restarting, will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-RIB markers are received from all its graceful-restart capable neighbors.

Use the `no` form of this command to set to the update delay to its default value.

### Command Syntax

```
bgp update-delay <1-3600>
no bgp update-delay
no bgp update-delay <1-3600>
```

### Parameters

**<1-3600>**

Delay interval in seconds

### Default

By default, update-delay value is 120 seconds

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#bgp update-delay 345
```

---

## bgp unnumbered-mode

Use this command to enter the unnumbered mode in router BGP mode allowing configuration of neighbor specific parameters. In this mode we allow creation of unnumbered peer and allow all the neighbor configuration applicable in router BGP mode.

Use no form of this command to exit unnumbered-mode and return to previous mode.

**Note:** ECMP with BGP unnumbered and numbered together is not supported.

### Command Syntax

```
bgp unnumbered-mode
exit-unnumbered-mode
```

### Parameters

None

### Command Mode

Router BGP mode

### Applicability

This command was introduced in OcNOS version 4.2.

### Examples

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum) #
```

---

## clear bgp (A.B.C.D|X:X::X:X)

Use this command to reset a BGP neighbor address.

### Command Syntax

```
clear bgp (A.B.C.D|X:X::X:X|WORD)
clear bgp (A.B.C.D|X:X::X:X) in
clear bgp (A.B.C.D|X:X::X:X) in prefix-filter
clear bgp (A.B.C.D|X:X::X:X) out
```

### Parameters

**A.B.C.D**

IPv4 neighbor address.

**X:X::X:X**

IPv6 neighbor address.

**WORD**

Interface name

**in**

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#clear bgp 3.3.3.3
```

## clear bgp \*

Use this command to reset the BGP connection for all peers.

**Note:** The auto-clear soft feature that supports route-map modifications, such as new match, set add, replace, or delete does not support the updation of internally associated MAC-lists. For this, the admin must use the explicit `clear bgp * soft in/out` command.

## Command Syntax

```
clear bgp *
clear bgp * in
clear bgp * in prefix-filter
clear bgp * out
clear bgp * soft
clear bgp * soft in
clear bgp * soft out
clear ip bgp *
clear ip bgp * in
clear ip bgp * in prefix-filter
clear ip bgp * out
clear ip bgp * soft
clear ip bgp * soft in
clear ip bgp * soft out
clear ip bgp * ipv4 (unicast|multicast) in
clear ip bgp * ipv4 (unicast|multicast) in prefix-filter
clear ip bgp * ipv4 (unicast|multicast) out
clear ip bgp * ipv4 (unicast|multicast) soft
clear ip bgp * ipv4 (unicast|multicast) soft in
clear ip bgp * ipv4 (unicast|multicast) soft out
```

## Parameters

### in

Incoming advertised routes should be cleared.

### prefix-filter

Push out prefix-list ORF and do inbound soft reconfig.

### out

Clear outgoing advertised routes.

### soft

Clear both incoming and outgoing routes of all the address families.

### in

Soft reconfig inbound update.

### out

Soft reconfig outbound update.

### ipv4

Clear incoming advertised routes.

### multicast

Multicast prefixes.

### unicast

Unicast prefixes.

**in**

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**Command Mode**

Privileged execution mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Examples**

```
#clear bgp *  
#clear ip bgp * ipv4 unicast in prefix-filter
```

## clear bgp \* l2vpn evpn

Use this command to reset the BGP L2VPN EVPN connection for all the BGP peers.

### Command Syntax

```
clear bgp * l2vpn evpn soft (in | out | )
```

### Parameters

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

### Default

None.

### Command Mode

Privileged execution mode

### Applicability

This command was introduced in OcNOS version 6.3.4.

### Examples

```
OcNOS#clear bgp * l2vpn evpn soft
OcNOS#clear bgp * l2vpn evpn soft in
```

---

## clear bgp <1-4294967295>

Use this command to reset a BGP connection for all peers in a specified Autonomous System.

### Command Syntax

```
clear bgp <1-4294967295>
clear bgp <1-4294967295> in
clear bgp <1-4294967295> in prefix-filter
clear bgp <1-4294967295> out
clear bgp <1-4294967295> soft
clear bgp <1-4294967295> soft in
clear bgp <1-4294967295> soft out
clear ip bgp <1-4294967295>
clear ip bgp <1-4294967295> in
clear ip bgp <1-4294967295> in prefix-filter
clear ip bgp <1-4294967295> out
clear ip bgp <1-4294967295> soft
clear ip bgp <1-4294967295> soft in
clear ip bgp <1-4294967295> soft out
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in prefix-filter
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) out
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft in
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft out
```

### Parameters

**in**

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**ipv4**

Clear incoming advertised routes.

**multicast**

Multicast prefixes.

**unicast**

Unicast prefixes.

**in**

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**Command Mode**

Privileged execution mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Examples**

```
#clear bgp 4294967277
#clear ip bgp 4294967277
```

## clear bgp <1-4294967295> l2vpn evpn

Use this command to reset the session for neighbors with a specific Autonomous System Number (ASN) for L2VPN EVPN.

### Command Syntax

```
clear bgp <1-4294967295> l2vpn evpn soft (in | out |)
```

### Parameters

#### bgp <1-4294967295>

Clears the particular BGP peer with the specified Autonomous System Number (ASN). The BGP peer ASN ranges from 1 to 4294967295.

#### soft

Clear both incoming and outgoing routes.

#### in

Soft reconfig inbound update.

#### out

Soft reconfig outbound update.

### Default

None.

### Command Mode

Privileged execution mode

### Applicability

This command was introduced in OcNOS version 6.3.4.

### Examples

```
OcNOS#clear bgp 100 l2vpn evpn soft
OcNOS#clear bgp 100 l2vpn evpn soft in
```

## clear bgp A.B.C.D l2vpn evpn

Use this command to reset the BGP session for neighbor with IPv4 address for L2VPN EVPN.

### Command Syntax

```
clear bgp A.B.C.D l2vpn evpn soft (in | out | )
```

### Parameters

#### bgp A.B.C.D

Clears the particular BGP neighbor with the specified IPv4 address.

#### soft

Clear both incoming and outgoing routes.

#### in

Soft reconfig inbound update.

#### out

Soft reconfig outbound update.

### Default

None.

### Command Mode

Privileged execution mode

### Applicability

This command was introduced in OcNOS version 6.3.4.

### Examples

```
OcNOS#clear bgp 3.3.3.3 l2vpn evpn soft
OcNOS#clear bgp 3.3.3.3 l2vpn evpn soft in
```

## clear bgp dampening

Use this command to reset BGP route flap dampening information.

### Command Syntax

```
clear bgp ipv4 (unicast|multicast) dampening
clear bgp ipv4 (unicast|multicast) dampening A.B.C.D/M
clear ip bgp dampening
clear ip bgp dampening A.B.C.D/M
clear ip bgp ipv4 (unicast|multicast) dampening
clear ip bgp ipv4 (unicast|multicast) dampening A.B.C.D/M
```

### Parameters

#### ipv4

IPv4 address family.

#### multicast

Multicast prefixes

#### unicast

Unicast prefixes

#### A.B.C.D/M

IP prefix (network/length), for example, 35.0.0.0/8

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#clear ip bgp dampening 10.10.0.121/24
#clear ip bgp ipv4 unicast dampening
```

---

## clear bgp external

Use this command to reset the BGP connection for all external peers.

### Command Syntax

```
clear bgp external
clear bgp external in
clear bgp external in prefix-filter
clear bgp external out
clear bgp external soft
clear bgp external soft in
clear bgp external soft out
clear ip bgp external
clear ip bgp external in
clear ip bgp external in prefix-filter
clear ip bgp external out
clear ip bgp external soft
clear ip bgp external soft in
clear ip bgp external soft out
clear ip bgp external ipv4 (unicast|multicast) in
clear ip bgp external ipv4 (unicast|multicast) in prefix-filter
clear ip bgp external ipv4 (unicast|multicast) out
clear ip bgp external ipv4 (unicast|multicast) soft
clear ip bgp external ipv4 (unicast|multicast) soft in
clear ip bgp external ipv4 (unicast|multicast) soft out
```

### Parameters

**in**

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**ipv4**

Clear incoming advertised routes.

**multicast**

Multicast prefixes.

**unicast**

Unicast prefixes.

**in**

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**Command Mode**

Privileged execution mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Example**

```
#clear ip bgp external
```

---

## clear bgp flap-statistics

Use this command to reset BGP flap statistics.

### Command Syntax

```
clear bgp ipv4 (unicast|multicast) flap-statistics
clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default | VRFNAME )
clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M
clear ip bgp flap-statistics
clear ip bgp flap-statistics A.B.C.D/M
clear ip bgp ipv4 (unicast|multicast) flap-statistics
clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default | VRFNAME )
clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M
```

### Parameters

#### ipv4

IPv4 address family.

#### multicast

Multicast prefixes.

#### unicast

Unicast prefixes.

#### A.B.C.D/M

IP prefix (network/length), for example, 35.0.0.0/8

#### VRFNAME

VPN routing or forwarding instance name

#### all

All VRF's

#### default

Default VRF

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#clear ip bgp flap-statistics
#clear ip bgp ipv4 unicast flap-statistics
```

---

## clear bgp peer-group

Use this command to reset the BGP connection for all members of a peer group.

### Command Syntax

```
clear bgp peer-group WORD
clear bgp peer-group WORD in
clear bgp peer-group WORD in prefix-filter
clear bgp peer-group WORD out
clear bgp peer-group WORD soft
clear bgp peer-group WORD soft in
clear bgp peer-group WORD soft out
clear ip bgp peer-group WORD
clear ip bgp peer-group WORD in
clear ip bgp peer-group WORD in prefix-filter
clear ip bgp peer-group WORD out
clear ip bgp peer-group WORD soft
clear ip bgp peer-group WORD soft in
clear ip bgp peer-group WORD soft out
clear ip bgp peer-group WORD ipv4 (unicast|multicast) in
clear ip bgp peer-group WORD ipv4 (unicast|multicast) in prefix-filter
clear ip bgp peer-group WORD ipv4 (unicast|multicast) out
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft in
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft out
```

### Parameters

#### WORD

BGP peer-group name.

#### in

Clear incoming advertised routes.

#### prefix-filter

Push out prefix-list ORF and do inbound soft reconfig.

#### out

Clear outgoing advertised routes.

#### soft

Clear both incoming and outgoing routes.

#### in

Soft reconfig inbound update.

#### out

Soft reconfig outbound update.

#### ipv4

Clear incoming advertised routes.

#### multicast

Multicast prefixes.

#### unicast

Unicast prefixes.

#### in

Clear incoming advertised routes.

**prefix-filter**

Push out prefix-list ORF and do inbound soft reconfig.

**out**

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**Command Mode**

Privileged execution mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Examples**

```
#clear ip bgp peer-group P1
```

## clear bgp peer-group WORD l2vpn evpn

Use this command to reset the BGP L2VPN EVPN connection for all members of a BGP peer group.

### Command Syntax

```
clear bgp peer-group WORD l2vpn evpn soft (in | out | )
```

### Parameters

#### **bgp peer-group WORD**

Clears all the members of the specified peer group.

#### **soft**

Clear both incoming and outgoing routes.

#### **in**

Soft reconfig inbound update.

#### **out**

Soft reconfig outbound update.

### Default

None

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 6.3.4.

### Examples

```
OcNOS#clear bgp peer-group GRP1 l2vpn evpn soft
OcNOS#clear bgp peer-group GRP1 l2vpn evpn soft in
```

## clear bgp statistics

Use this command to reset all BGP statistics.

### Command Syntax

```
clear bgp statistics
```

### Parameters

None

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#clear bgp statistics
```

## clear ip bgp \* (description LINE|)\*

Use this command to reset the BGP connection for all peers.

### Command Syntax

```
clear ip bgp * (description LINE|)
```

### Parameters

#### description

Administratively reset communication msg to neighbor

### Command Mode

Privileged execution mode

### Applicability

This command is introduced in OcNOS version 6.0.0.

### Examples

```
#clear bgp *  
#clear bgp * description peer reset done for refresh
```

---

## clear ip bgp (A.B.C.D|X:X::X:X|WORD) (description LINE|)

Use this command to reset the BGP connection for peer.

### Command Syntax

```
clear ip bgp (A.B.C.D|X:X::X:X|WORD) (description LINE|)
```

### Parameters

**A.B.C.D**

Address of the BGP neighbor in an IPv4 format

**X:X::X:X**

Address of the BGP neighbor in an IPv6 format

**WORD**

Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

**description**

Administratively reset communication msg to neighbor

### Command Mode

Privileged execution mode

### Applicability

This command is introduced in OcNOS version 6.0.0.

### Examples

```
#clear ip bgp 40.1.1.2
#clear ip bgp 40.1.1.2 description peer reset is done
```

---

## clear ip bgp A.B.C.D

Use this command to reset an IPv4 BGP neighbor address.

### Command Syntax

```
clear ip bgp (A.B.C.D|WORD) in
clear ip bgp A.B.C.D in prefix-filter
clear ip bgp (A.B.C.D|WORD) out
clear ip bgp (A.B.C.D|WORD) soft
clear ip bgp (A.B.C.D|WORD) soft in
clear ip bgp (A.B.C.D|WORD) soft out
clear ip bgp A.B.C.D ipv4 (unicast|multicast) in
clear ip bgp A.B.C.D ipv4 (unicast|multicast) in prefix-filter
clear ip bgp A.B.C.D ipv4 (unicast|multicast) out
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft in
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft out
```

### Parameters

#### A.B.C.D

IPv4 address

#### WORD

Interface name

#### in

Clear incoming advertised routes.

#### prefix-filter

Push out prefix-list ORF and do inbound soft reconfig.

#### out

Clear outgoing advertised routes.

#### soft

Clear both incoming and outgoing routes.

#### in

Soft reconfig inbound update.

#### out

Soft reconfig outbound update.

#### ipv4

Clear incoming advertised routes.

#### multicast

Multicast prefixes.

#### unicast

Unicast prefixes.

#### in

Clear incoming advertised routes.

#### prefix-filter

Push out prefix-list ORF and do inbound soft reconfig.

#### out

Clear outgoing advertised routes.

**soft**

Clear both incoming and outgoing routes.

**in**

Soft reconfig inbound update.

**out**

Soft reconfig outbound update.

**Command Mode**

Privileged execution mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Examples**

```
#clear ip bgp 35.0.0.1 in
```

---

## clear ip bgp A.B.C.D vrf

Use this command to reset the VPN Routing/Forwarding (VRF) instance for a peer address.

### Command Syntax

```
clear ip bgp A.B.C.D vrf WORD
clear ip bgp A.B.C.D vrf WORD in
clear ip bgp A.B.C.D vrf WORD out
clear ip bgp A.B.C.D vrf WORD soft
clear ip bgp A.B.C.D vrf WORD soft in
clear ip bgp A.B.C.D vrf WORD soft out
```

### Parameters

#### A.B.C.D

IPv4 address

#### WORD

VPN routing/forwarding instance name

#### in

Clear incoming advertised routes

#### out

Clear outgoing advertised routes

#### soft

Clear both incoming and outgoing routes

#### in

Soft reconfig inbound update

#### out

Soft reconfig outbound update

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#clear ip bgp 35.0.0.1 vrf
```

---

## clear ip bgp all vrf (VRFNAME|all|default) (description LINE|)

Use this command to reset the BGP connection for vrf peer.

### Command Syntax

```
clear ip bgp all vrf (VRFNAME|all|default) (description LINE|)
```

### Parameters

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

#### description

Administratively reset communication msg to neighbor

### Command Mode

Privileged execution mode

### Applicability

This command is introduced in OcNOS version 6.0.0

### Examples

```
#clear ip bgp all vrf vrf1  
#clear ip bgp all vrf all description all peer refresh is done
```

---

## clear ip bgp table-map

Use this command to apply the modified table map or route map rules to the BGP routes in the existing IP routing table.

### Command Syntax

```
clear ip bgp table-map (vrf (VRFNAME|all|default))
clear ip bgp ipv4 (unicast | multicast) table-map(vrf (VRFNAME|all|default))
```

### Parameters

**vrf**

Select a VPN Routing/Forwarding Instance.

**VRFNAME**

Specify a VPN Routing/Forwarding instance name.

**all**

Select all VRFs.

**default**

Select default VRFs.

**unicast**

Unicast prefixes.

**multicast**

Multicast prefixes.

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#clear ip bgp table-map vrf all
```

## clear ip bgp vrf WORD (A.B.C.D|X:X::X:X|WORD) (description LINE|)

Use this command to reset the BGP connection for vrf peer.

### Command Syntax

```
clear ip bgp vrf WORD (A.B.C.D|X:X::X:X|WORD) (description LINE|)
```

### Parameters

#### WORD

VPN routing/forwarding instance name

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

#### description

Administratively reset communication msg to neighbor

### Command Mode

Privileged execution mode

### Applicability

This command is introduced in OcNOS version 6.0.0

### Examples

```
#clear ip bgp vrf vrf1 10.1.1.2  
#clear ip bgp vrf vrf1 10.1.1.2 description peer reset is done
```

---

## debug bgp

Use this command to enable all BGP troubleshooting functions. Use this command without any parameters to turn on normal bgp debug information.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
debug bgp (all|)
debug bgp bfd
debug bgp dampening
debug bgp events
debug bgp filters
debug bgp fsm
debug bgp keepalives
debug bgp mpls
debug bgp nht
debug bgp nsm
debug bgp updates
debug bgp updates (in|out)
debug bgp vpls
debug bgp evpn
debug bgp route-process
no debug bgp evpn
no debug bgp route-process
no debug bgp (all|)
no debug bgp bfd
no debug bgp dampening
no debug bgp events
no debug bgp filters
no debug bgp fsm
no debug bgp keepalives
no debug bgp mpls
no debug bgp nht
no debug bgp nsm
no debug bgp updates
no debug bgp vpls
```

### Parameters

#### all

Used only with the `no` form; turns off all debugging for BGP

#### bfd

Enable debugging for BGP Bidirectional Forwarding Detection

#### dampening

Enable debugging for BGP dampening

#### events

Enable debugging for BGP events

#### filters

Enable debugging for BGP filters

#### fsm

Enable debugging for BGP Finite State Machine (FSM)

#### keepalives

Enable debugging for BGP keepalives

**mpls**

Enable debugging for BGP Multiprotocol Label Switching (MPLS)

**nht**

Enable debugging for BGP NHT

**nsm**

Enable debugging for NSM messages

**updates**

Enable debugging for BGP updates

**in**

Debug inbound updates

**out**

Debug outbound updates

**vpls**

Enable debugging for BGP Virtual Private LAN Service (VPLS)

**Command Mode**

Privileged execution mode and Configure mode

**Applicability**

This command was introduced before OcNOS version 1.3. Introduced the following options:

- debug bgp evpn
- debug bgp route-process
- no debug bgp evpn
- no debug bgp route-process

and removed undebug options in the release OcNOS version 6.6.0

**Examples**

```
#debug bgp
#debug bgp events
```

---

## distance

Use this command to define OSPFv3 route administrative distances based on route type. This command sets the distance for an entire group of routes rather than a specific route that passes an access list.

The administrative distance rates the trustworthiness of a routing information source. A higher distance value means a lower trust rating. For example, an administrative distance of 254 means that the routing information source cannot be trusted and should be ignored.

Use the `no` form of this command to restore the default value.

### Command Syntax

```
distance <1-254>
distance ospfv3 {intra-area <1-254>|inter-area <1-254>|external <1-254>}
no distance (<1-254>|)
no distance ospfv3 {intra-area |inter-area |external}
```

### Parameters

#### <1-254>

Used alone, this parameter specifies a default administrative distance used when no other specification exists for a routing information source.

#### intra-area

Routes within an area.

#### <1-254>

Distance for all routes within an area

#### inter-area

Routes from one area to another area.

#### <1-254>

Distance for all routes from one area to another area.

#### external

Routes from other routing domains learned by redistribution.

#### <1-254>

Distance for routes from other routing domains learned by redistribution.

### Default

By default, distance value for each type of route is 110

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#configure terminal
(config)#router ipv6 ospf 100
(config-router)#distance ospfv3 inter-area 20 intra-area 10 external 40
```

---

## exit-address-family

Use this command to exit Address-Family-vrf, Address-Family-vpnv4 mode.

For information on how to enter the address family mode (IPv4, VPNv4), see .

### Command Syntax

```
exit-address-family
```

### Parameters

None

### Default

No default value is specified

### Command Mode

Address Family-vrf and Address Family-vpnv4 mode.

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following examples shows the change in the prompt after using this command.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 multicast
(config-router-af)#exit-address-family
(config-router)#
```

---

## ip as-path access-list

Use this command to define a BGP Autonomous System (AS) path access list. A named community list is a filter based on regular expressions. If the regular expression matches the specified string representing the AS path of the route, then the permit or deny condition applies. Use this command to define the BGP access list globally; use the neighbor router configuration command to apply a specific access list.

Use the no parameter with this command to disable use of the access list .

### Command Syntax

```
ip as-path access-list WORD (deny|permit) LINE
no ip as-path access-list WORD (deny | permit) LINE
```

### Parameters

#### WORD

Access list name

#### deny

Reject packets

#### permit

Forward packets

#### LINE

An ordered list as a regular expression.

**Note:** In regular expression, for number value use {0,n} instead of {,n}.

### Default

No default value is specified

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 6.4.

### Examples

```
#configure terminal
(config)#ip as-path access-list mylist deny ^65535$
```

---

## ip community-list <1-99>

Use this command to specify a standard community list (1 to 99) that specifies BGP community attributes.

Use the `no` parameter with this command to delete the community list entry.

### Command Syntax

```
ip community-list <1-99> (deny|permit)
ip community-list <1-99> (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list <1-99> (deny|permit)
no ip community-list <1-99> (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

### Parameters

**deny**

Reject the community

**permit**

Accept the community

**AA:NN**

Community number

**internet**

Advertise routes to the internet community

**local-AS**

Do not advertise routes to external BGP peers

**no-advertise**

Do not advertise routes to other BGP peers

**no-export**

Do not advertise routes outside of Autonomous System boundary

### Default

By default, ip community list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip community-list 55 permit 7675:80 7675:90
(config)#no ip community-list 55 permit 7675:80 7675:90
```

---

## ip community-list <100-500>

Use this command to specify an expanded community list (100 to 500) that specifies BGP community attributes.

Use the `no` parameter with this command to delete the community list entry.

### Command Syntax

```
ip community-list <100-500> (deny|permit)
ip community-list <100-500> (deny|permit) LINE
no ip community-list <100-500>
no ip community-list <100-500> (deny|permit) LINE
```

### Parameters

**deny**

Reject community

**permit**

Accept community

**LINE**

An ordered list as a regular expression

### Default

By default, ip community list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip community-list 225 permit 6789906
(config)#ip community-list expanded CLIST permit .*
```

---

## ip community-list expanded

Use the community-lists to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. It includes community values that are 32-bits long.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes in a specified format and not with regular expressions. The expanded community-list defines the community attributes with regular expressions. Use the `no` parameter with this command to delete the community list entry.

### Command Syntax

```
ip community-list expanded WORD (deny|permit) LINE
no ip community-list expanded WORD
no ip community-list expanded WORD (deny|permit) LINE
```

### Parameters

#### WORD

Community list name

#### deny

Reject community

#### permit

Accept community

#### LINE

An ordered list as a regular expression

### Default

By default, ip community list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip community-list 125 permit 6789906
(config)#ip community-list expanded CLIST permit .*
```

---

## ip community-list standard

Use the community-lists to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. It includes community values that are 32-bits long. There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes in a specified format without regular expressions. The expanded community-list defines the community attributes with regular expressions.

Use this command to add a standard community-list entry. The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

Use the `no` parameter with this command to delete the standard community-list entry.

### Command Syntax

```
ip community-list standard WORD (deny|permit)
ip community-list standard WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list standard WORD
no ip community-list standard WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

### Parameters

#### WORD

Community list name

#### deny

Rejects a specified community when a community value is provided. If no community value is configured, it will reject all prefixes or routes listed in the community-list.

#### permit

Accepts a specified community when a community value is provided. If no community value is configured, it will accept all prefixes or routes listed in the community-list.

#### AA:NN

Community number

#### internet

Advertise routes to the internet community

#### local-AS

Do not advertise routes to external BGP peers

#### no-advertise

Do not advertise routes to other BGP peers

#### no-export

Do not advertise routes outside of Autonomous System boundary

### Default

By default, ip community list is disabled

### Command Mode

Configure mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#ip community-list standard CLIST permit 7675:80 7675:90 no-export
```

## ip community-list WORD

Use the community-list commands to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. There are two kinds of community-lists: the expanded and standard. The `standard community-list` defines the community attributes in a specified format and not with regular expressions. The `expanded community-list` defines the community attributes with regular expressions.

Use the `no` parameter with this command to delete the community list entry.

### Command Syntax

```
ip community-list WORD (deny|permit)
ip community-list WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list WORD
no ip community-list WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

### Parameters

#### WORD

Community list name

#### deny

Rejects a specified community when a community value is provided. If no community value is configured, it will reject all prefixes or routes listed in the community-list.

#### permit

Accepts a specified community when a community value is provided. If no community value is configured, it will accept all prefixes or routes listed in the community-list.

#### AA:NN

Community number

#### internet

Advertise routes to the internet community

#### local-AS

Do not advertise routes to external BGP peers

#### no-advertise

Do not advertise routes to other BGP peers

#### no-export

Do not advertise routes outside of Autonomous System boundary

### Default

By default, ip community list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#ip community-list mylist permit 7675:80 7675:90
(config)#no ip community-list mylist permit 7675:80 7675:90
```

---

## ip extcommunity-list <1-99>

Use this command to create an entry for a standard extended community list.

Use the `no` parameter with this command to delete the community-list entry.

### Command Syntax

```
ip extcommunity-list <1-99> (deny|permit) LINE (rt|soo)
no ip extcommunity-list <1-99> (deny|permit) LINE (rt|soo)
```

### Parameters

#### deny

Reject community

#### permit

Accept community

#### LINE

One of the following:

#### rt

Route target extended community in aa:nn or IPaddr:nn format

#### soo

Site-of-origin extended community in aa:nn or IPaddr:nn format

### Default

By default, ip extcommunity list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip extcommunity-list 3 permit rt 10.10.23.123:67
(config)#ip extcommunity-list 25 deny soo 1465:22
```

---

## ip extcommunity-list <100-500>

Use this command to create an extended community list.

Use the `no` parameter with this command to delete the community-list entry.

### Command Syntax

```
ip extcommunity-list <100-500> (deny|permit) LINE
no ip extcommunity-list <100-500> (deny|permit) LINE
```

### Parameters

#### <100-500>

Extended community list number (expanded)

#### deny

Reject the community

#### permit

Accept the community

#### LINE

Any regular expression:

### Default

By default, ip extcommunity list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip extcommunity-list 125 permit 4567:335
(config)#ip extcommunity-list 231 deny *.
```

---

## ip extcommunity-list expanded

Use this command to create an expanded community list. The expanded community-list defines the community attributes with regular expressions. The expanded community-list match will happen based on input given for regular expressions.

Use the `no` parameter with this command to delete the expanded community-list entry.

### Command Syntax

```
ip extcommunity-list expanded WORD
ip extcommunity-list expanded WORD (deny|permit) LINE
no ip extcommunity-list expanded WORD
no ip extcommunity-list expanded WORD (deny|permit) LINE
```

### Parameters

#### WORD

Expanded community list name

#### deny

Reject the community

#### permit

Accept the community

#### LINE

One of the following:

#### rt

Route target extended community in aa:nn or IPaddr:nn format

#### soo

Site-of-origin extended community in aa:nn or IPaddr:nn format

### Default

By default, ip extcommunity list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#ip extcommunity-list e1 permit 2001:1 300:1
(config)#ip extcommunity-list expanded CLIST permit ^[2001:1 300:1]$
```

---

## ip extcommunity-list standard

Use this command to create and delete a standard extended-community list. The extended community attribute is 8 bytes in 2 formats. The sub-type can be route target (`rt`) or site of origin (`soo`). Thus, the sub-type of each community must be specified when creating the extended community list. Regarding the formats, an extended community is based on a 6-byte value. These 6-bytes are represented in 4-byte:2-byte format, and may be entered in one of the following forms:

- Format 1, `aa.nn`: The 16-bit value of the AS (`aa`) number is represented in the higher-order 4-bytes. If the extended ASN capability is enabled, the AS number is represented using higher-order 4-bytes. The `nn` assigned value is represented in the low-order 2-bytes in both cases.
- Format 2, `IPAddr:nn`: In this format, the higher-order 4-bytes are used to represent the IP address, and the low-order 2-bytes are used to represent the assigned value.

Use the `no` parameter with this command to delete the extended-community-list entry.

### Command Syntax

```
ip extcommunity-list standard WORD (deny|permit) (rt|soo) (AA:NN)
no ip extcommunity-list standard WORD (deny|permit) (rt|soo) (AA:NN)
no ip extcommunity-list standard WORD AA:NN
```

### Parameters

#### WORD

Extended community list name

#### deny

Reject the community

#### permit

Accept the community

#### rt

Route target extended community in `aa:nn` or `IPAddr:nn` format

#### soo

Site-of-origin extended community in `aa:nn` or `IPAddr:nn` format

### Default

By default, ip extcommunity list is disabled

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
```

```
(config)#ip extcommunity-list standard 36 permit rt 5675:50
(config)#ip extcommunity-list standard CLIST permit soo 10.10.32.15:70
```

---

## l2vpn-unnumbered-mode

Use this command to configure the unnumbered peer with all the neighbor configs applicable in L2VPN EVPN address family.

Use the `exit` parameter with this command to leave L2VPN unnumbered mode.

### Command Syntax

```
bgp l2vpn-unnumbered-mode  
exit-l2vpn-unnumbered-mode
```

### Parameters

None

### Applicability

No default value is specified

### Command Mode

Address-family IPv4 Unicast Mode

### Applicability

This command was introduced in OcNOS version 4.2.

### Examples

```
#configure terminal  
(config)#router bgp 100  
(config-router)#address-family l2vpn evpn  
(config-router-af)#bgp l2vpn-unnumbered-mode  
(config-router-l2vpn-unnum)#
```

## match ip peer

Use this command to apply policies based on the route source of which the BGP TCP/IP session formed using an IPv4 address in the update message.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
match ip peer (<1-199>|<1300-2699>|WORD)
no match ip peer (<1-199>|<1300-2699>|WORD)
```

### Parameters

#### <1-199>

IP access-list number

#### <1300-2699>

IP access-list number (expanded range)

#### WORD

Access-list name

### Default

By default, import bgp route is disabled

### Command Mode

Route-map mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#route-map in-A permit 10
(route-map)#match ip peer 1
```

---

## max-paths

Use this command to set the number of equal-cost multi-path (ECMP) routes for eBGP or iBGP. You can install multiple BGP paths to the same destination to balance the load on the forwarding path.

Use the `no` parameter with this command to disable this feature.

### Command Syntax

```
max-paths (ebgp|ibgp|) <2-64>
no max-paths ebgp (<2-64>|)
no max-paths ibgp (<2-64>|)
```

### Parameters

#### ebgp

eBGP ECMP session

#### ibgp

iBGP ECMP session

#### <2-64>

Number of routes

### Default

Available for the IPv4 and IPv6 unicast addresses.

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following example configures 7 routes for ECMP for iBGP.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#max-paths ibgp 7
```

---

## max-paths eibgp

Use this command to set the number of equal-cost multi-path (ECMP) routes for both eBGP and iBGP. This feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in BGP networks.

Use the `no` parameter with this command to disable this feature and set the BGP path selection to the default single best path.

### Command Syntax

```
max-paths eibgp <2-64>
no max-paths eibgp (<2-64>|)
```

### Parameters

#### <2-64>

Number of routes

### Default

Not applicable

### Command Mode

IPv4 and IPv6 unicast address-family mode

### Applicability

This command was introduced in OcNOS version 5.0.

### Exception with Administrative Distance

Administrative distance (AD) is the feature that routers use to select the best path when there are two or more different routes to the same destination from two different routing protocols.

In OcNOS, AD is per route. With `max-paths eibgp`, BGP programs the AD(200)/AD20 for eiBGP routes. If there is a route from IGP with a lower AD, it will be preferred and get installed in the FIB.

A BGP route cannot have a different AD for each path. Multipath candidates of eibgp max-paths can be programmed either with AD20 or AD200.

Currently AD20/AD200 will be programmed for all eiBGP routes as per best path selected by BGP. For example, if the best path is learned via iBGP peering, then AD200 is programmed for all the installed multipaths (including paths from eBGP peering) or If the best path is learned via eBGP peering, then AD20 is programmed for all the installed multipaths (including paths from iBGP peering).

### Example

This example configures the number of parallel iBGP and eBGP routes that can be installed into a routing table.

```
(config)#router bgp 100
(config-router)#neighbor 11.0.0.2 remote-as 100
(config-router)#neighbor 12.0.0.1 remote-as 200
(config-router)#neighbor 1101::2 remote-as 200
```

```
(config-router)#neighbor 1201::1 remote-as 100
(config-router)#address-family ipv4 unicast
(config-router-af)#max-paths eibgp 2
(config-router-af)#network 11.0.0.2 activate
(config-router-af)#network 12.0.0.1 activate
(config-router-af)#exit-address-family
(config-router)#address-family ipv6 unicast
(config-router-af)#max-paths eibgp 3
(config-router-af)#network 1101::2 activate
(config-router-af)#network 1201::1 activate
(config-router-af)#exit-address-family
```

---

## neighbor activate

Use this command to enable the exchange of specific address family routes with a neighboring router. After a TCP connection is opened with a neighboring router, use this command to enable or disable the exchange of address family information. To enable the exchange of multicast and VPNv4 address prefix types, activate neighbors using this command in address family mode.

Use the `no` parameter with this command to disable exchange of information with a neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) activate
no neighbor (A.B.C.D|X:X::X:X|WORD) activate
```

For L2VPN-unnumbered mode:

```
neighbor WORD activate
no neighbor WORD activate
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default activate is disabled. For all address-families, use this command to enable a neighbor to exchange routing information of a specific address-family with a neighbor.

### Command Mode

Address Family mode and l2vpn-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 10.10.20.1 activate

(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#bgp l2vpn-unnumbered-mode
(config-router-l2vpn-unnum)#neighbor eth1 activate
```

---

## neighbor advertisement-interval

Use this command to set a minimum interval between the sending of BGP routing updates. To reduce the flapping of routes, set a minimum advertisement interval so that the BGP routing updates are sent only per interval seconds. BGP dampening can also be used to control the effects of flapping routes.

Use the `no` parameter with this command to set the interval time to default.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval
no neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval <0-65535>
```

For BGP unnumbered mode:

```
neighbor WORD advertisement-interval <0-65535>
no neighbor WORD advertisement-interval
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <0-65535>

Advertisement interval value in seconds

### Default

By default, neighbor value for ebgp peer is 30 seconds and IBGP peer is 5 seconds

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.3 advertisement-interval 45
```

For unnumbered peer this configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 advertisement-interval 20
```

## neighbor allowas-in

Use this command to advertise prefixes (routes) even when the source of the prefixes is from the same Autonomous System (AS) number.

Use this command in a scenario where two routers at different locations use the same Autonomous System number and are connected via an ISP. Once prefixes arrive from one branch at the ISP, they are tagged with the customer's AS number. By default, when the ISP passes the prefixes to the other router, the prefixes are dropped if the other router uses the same AS number. Use this command to advertise the prefixes at the other side. Control the number of times an AS number is advertised by specifying a number.

In a hub and spoke configuration in a VPN, a PE (Provider Edge) router advertises all prefixes containing duplicate AS numbers. Use this command to configure two VRFs on each PE router to receive and advertise prefixes. One of the VRFs receives prefixes with AS numbers from all PE routers and then advertises them to neighboring PE routers. The other VRF receives prefixes with AS numbers from the CE (Customer Edge) router and advertises them to all PE routers in the hub and spoke configuration.

Use the `no` parameter with this command to remove the configuration.

For unnumbered peer IPv4 unicast mode commands are configured under `v4-unnumbered-mode`.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in <1-10>
no neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in
```

For v4-unnumbered mode:

```
neighbor WORD allowas-in
neighbor WORD allowas-in <1-10>
no neighbor WORD allowas-in
```

### Parameters

#### A.B.C.D

IPv4 neighbor address.

#### X:X::X:X

IPv6 neighbor address.

#### WORD

Name of peer group.

**Note:** For information on how to create peer groups, refer to the `neighbor peer-group` and `neighbor remote-as` commands. When this parameter is used with a command, the command applies on all peers in the specified group.

#### <1-10>

Number of times to allow the advertisement of an AS number

### Default

No default value is specified.

## Command Mode

This CLI command is available to configure in all address-family modes (v4-unnumbered mode, IPv4 unicast, IPv6 unicast, IPv4 labeled-unicast, IPv6 labeled-unicast, VPNv4 unicast, VPNv6 unicast, IPv4/IPv6 VRF, L2VPN EVPN), with the following limitation:

– Under address-family ipv4 labeled-unicast, neighbor allowas-in is supported for individual neighbors only; it is not supported for peer-group neighbors (neighbor <peer-group-name>). Use per-neighbor configuration instead of neighbor <peer-group-name> allowas-in.

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 allowas-in 3

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 allowas-in 3

#con terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 allowas-in 6
```

For unnumbered peer configs in L2vpn evpn mode are configured under l2vpn-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#neighbor eth1 allowas-in 7
```

---

## neighbor as-origination-interval

Use this command to set the minimum interval between sending of AS-origination routing updates.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval
no neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval <1-65535>
```

For BGP unnumbered mode:

```
neighbor WORD as-origination-interval interval <0-65535>
no neighbor WORD as-origination-interval
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-65535>

AS origination interval in seconds

### Default

By default, neighbor as origination interval is 15 seconds

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.75 as-origination-interval 555
```

For unnumbered peer this configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 as-origination-interval 50
```

---

## neighbor attribute-unchanged

Use this command to advertise unchanged BGP attributes to the specified neighbor.

Use the `no` parameter with this command to disable this function.

For unnumbered peer IPv4 unicast mode commands are configured under `v4-unnumbered-mode`.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) attribute-unchanged ({ as-path|next-hop|med })  
no neighbor (A.B.C.D|X:X::X:X|WORD) attribute-unchanged ({ as-path|next-hop|med })
```

For `v4-unnumbered mode`:

```
neighbor WORD attribute-unchanged ({ as-path|next-hop|med })  
no neighbor WORD attribute-unchanged ({ as-path|next-hop|med })
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### as-path

AS path attribute

#### next-hop

Nexthop attribute

#### med

Multi-exit discriminator attribute

### Default

By default, the `neighbor attribute-unchanged` is disabled

### Command Mode

Address Family mode and `v4-unnumbered mode`

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#router bgp 10  
(config-router)#address-family ipv4 unicast  
(config-router-af)#neighbor 10.10.0.75 attribute-unchanged as-path med
```

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#OcNOS (config-router-v4-unnum)#neighbor eth1 attribute-unchanged as-path
```

---

## neighbor authentication-key

Use this command to enable message digest5 (MD5) authentication on a TCP connection between two BGP peers. Configuring MD5 authentication between two BGP peers, means that each segment sent on the TCP connection between the peers is verified. MD5 authentication must be configured with the same password on both BGP peers; otherwise, the connection between them will not be established.

Use the `no` parameter with this command to delete the MD5 authentication.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key (0 | 1 |) <WORD>
<WORD> plain text password
neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key <WORD>
<WORD> encrypted password
no neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key <WORD>
<WORD> encrypted password
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of the BGP peer group

#### 0

Unencrypted password

#### WORD

Unencrypted password (maximum length 80 characters)

#### 1

Encrypted password (default)

#### WORD

Encrypted password (maximum length 162 characters)

### Default

Not applicable

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
```

```
(config)#router bgp 11
(config-router)#neighbor 10.10.0.73 authentication-key 0 myPass
(config-router)#no neighbor 10.10.0.73 authentication-key 0xba76ef302e2f20af
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-annum)#neighbor eth1 authentication-key 0 key1
```

## neighbor capability graceful-restart

Use this command to advertise the graceful restart capability to its neighbor. This configuration indicates that the BGP speaker has the ability to preserve its forwarding state for the address family when BGP restarts.

You must first specify a neighbor's `remote-as` identification number assigned by the neighbor router.

**Note:** The graceful restart capability is advertised only when the graceful restart capability has been enabled using the [bgp graceful-restart \(page 1008\)](#) command.

Use the `no` parameter with this command to not advertise the graceful restart capability to its neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
no neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, the graceful-restart is disabled

### Command Mode

Address family mode - Applicable for ipv4, ipv6 and vpnv4

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.50 capability graceful-restart

(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 2.2.2.2 activate
(config-router-af)#neighbor 2.2.2.2 capability graceful-restart
(config-router-af)#neighbor 3.3.3.3 activate
(config-router-af)#neighbor 3.3.3.3 capability graceful-restart
(config-router-af)#exit-address-family
```

---

## neighbor capability orf prefix-list

Use this command to enable Outbound Router Filtering (ORF) and advertise the ORF capability to its neighbors. The ORFs send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates.

The two routers exchange updates to maintain the ORF for each router:

- The local router advertises the ORF capability in `send` mode.
- The remote router receives the ORF capability in `receive` mode, applying the filter as outbound policy.

Only an individual router or a peer group can be configured to be in `receive` or `send` mode. A peer-group member cannot be configured to be in `receive` or `send` mode.

Use the `no` parameter with this command to disable this function.

For unnumbered peer, IPv4 unicast mode commands are configured under `v4-unnumbered-mode`.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability orf prefix-list (both|receive|send)
no neighbor (A.B.C.D|X:X::X:X|WORD) capability orf prefix-list (both|receive|send)
```

For `v4-unnumbered mode`:

```
neighbor WORD capability orf prefix-list (both|receive|send)
no neighbor WORD capability orf prefix-list (both|receive|send)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### both

The local router can send ORF entries to its peer, as well as receive ORF entries from its peer.

#### receive

The local router is willing to receive ORF entries from its peer

#### send

The local router is willing to send ORF entries to its peer

### Default

By default, the `orf prefix-list` is disabled

### Command Mode

Router Address Family (IPv4 unicast, IPv4 multicast, ipv4 labeled-unicast, vpnv4 unicast, v4-unnumbered, ipv6 unicast, ipv6 labeled-unicast, vpnv6 unicast) mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.5 capability orf prefix-list both
(config-router-af)#neighbor effe:2897::0003:3ed5 capability orf prefix-list receive

(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 capability orf prefix-list both
```

---

## neighbor collide-established

Use this command to include a neighbor already in an established state for conflict resolution when a TCP connection collision is detected. This command is not required for most network deployments, so users should only use this command when required.

**Note:** The associated functionality of including an “established” neighbor into TCP connection collision conflict resolution is automatically enabled when a neighbor is configured for BGP graceful-restart.

Use the `no` option with this command to turn this feature off.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) collide-established
no neighbor (A.B.C.D|X:X::X:X|WORD) collide-established
```

For BGP unnumbered mode:

```
neighbor WORD collide-established
no neighbor WORD collide-established
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, neighbor collide is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 3.3.3.3 collide-established
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-annum)#neighbor eth1 collide-established
```

## neighbor de-activate

Use this command to disable the exchange of specific address family routes with a neighboring router for peer-group member. After a TCP connection is opened with a neighboring router, use this command to enable or disable the exchange of address family information for peer-group member.

Use the `no` parameter with this command to inherit the properties of peer-group. i.e., If peer-group is activated in the given address-family, no of this command will activate the peer member as peer-group is activated in address-family..

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X) de-activate
no neighbor (A.B.C.D|X:X::X:X) de-activate
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

### Default

By default de-activate is disabled for all peer-group members. For all address-families, Use this command to disable a neighbor to exchange routing information of a specific address-family with a neighbor.

### Command Mode

Address Family mode

### Applicability

This command is introduced in OcNOS version 6.0.0. This command is applicable only to neighbor which is a member of peer-group.

### Examples

```
#configure terminal
router bgp 100
neighbor pgl peer-group
neighbor pgl remote-as 100
neighbor 10.1.1.2 peer-group pgl
neighbor 20.1.1.2 peer-group pgl
neighbor 30.1.1.2 remote-as 100
!
address-family ipv4 unicast
neighbor pgl activate
neighbor 30.1.1.2 activate
exit-address-family
!
(config-router-af)#neighbor 10.1.1.2 de-activate
(config-router-af)#show running-config bgp
!
router bgp 100
```

```
neighbor pgl peer-group
neighbor pgl remote-as 100
neighbor 10.1.1.2 peer-group pgl
neighbor 20.1.1.2 peer-group pgl
neighbor 30.1.1.2 remote-as 100
!
address-family ipv4 unicast
neighbor pgl activate
neighbor 10.1.1.2 de-activate
neighbor 30.1.1.2 activate
exit-address-family
!
(config-router-af)#no neighbor 10.1.1.2 de-activate
(config-router-af)#commit
(config-router-af)#
(config-router-af)#show running-config bgp
!
router bgp 100
neighbor pgl peer-group
neighbor pgl remote-as 100
neighbor 10.1.1.2 peer-group pgl
neighbor 20.1.1.2 peer-group pgl
neighbor 30.1.1.2 remote-as 100
!
address-family ipv4 unicast
neighbor pgl activate
neighbor 30.1.1.2 activate
exit-address-family
!
```

---

## neighbor default-originate

Use this command to allow a BGP local router to send the default route 0.0.0.0 to a neighbor to use as a default route. This command can be used with standard or extended access lists.

Use the `no` parameter with this command to send no route as a default.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) default-originate
neighbor (A.B.C.D|X:X::X:X|WORD) default-originate route-map WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) default-originate
no neighbor (A.B.C.D|X:X::X:X|WORD) default-originate route-map WORD
```

For v4-unnumbered mode:

```
neighbor WORD default-originate
neighbor WORD default-originate route-map WORD
no neighbor WORD default-originate
no neighbor WORD default-originate route-map WORD
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### WORD

Route map name

### Default

By default, neighbor default originate is disabled

### Command Mode

Route Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.1 default-originate route-map myroute
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 default-originate
```

---

## neighbor description

Use this command to associate a description with a neighbor. This command helps to identify a neighbor quickly. This command is useful for an ISP that has multiple neighbor relationships.

Use the `no` parameter with this command to remove the description.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) description LINE
no neighbor (A.B.C.D|X:X::X:X|WORD) description
no neighbor (A.B.C.D|X:X::X:X|WORD) description LINE
```

For BGP unnumbered mode:

```
neighbor WORD description LINE
no neighbor WORD description
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### LINE

Neighbor description (up to 80 characters)

### Default

By default, the neighbor description is disabled

### Command Mode

Router mode and Address Family and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 1.2.3.4 description Backup router for sales

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 description Bank of America
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-annum)#neighbor eth1 description unnumbered-peer1
```

---

## neighbor disallow-infinite-holdtime

Use this command to disallow configuration of infinite hold-time. This command enables the local BGP speaker to reject a hold-time of “0” seconds from a peer (during exchange of open messages) or a user (during configuration). The no form of this command allows the BGP speaker to accept a hold-time of “0” from a peer or during configuration.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) disallow-infinite-holdtime
no neighbor (A.B.C.D|X:X::X:X|WORD) disallow-infinite-holdtime
```

For BGP unnumbered mode:

```
neighbor WORD disallow-infinite-holdtime
no neighbor WORD disallow-infinite-holdtime
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, neighbor disallow infinite holdtime is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
(config-router)#neighbor 10.11.4.26 disallow-infinite-holdtime
(config-router)#neighbor 3ffe::45 disallow-infinite-holdtime
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 disallow-infinite-holdtime
```

---

## neighbor distribute-list

Use this command to filter route updates from a particular BGP neighbor. Use only one distribute list per BGP neighbor.

Use the `no` parameter with this command to remove an entry.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
no neighbor WORD distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-199>

IP access-list number

#### <1300-2699>

IP access-list number (expanded-range)

#### WORD

Access-list name

#### in

Filter incoming advertised routes

#### out

Filter outgoing advertised routes

### Default

By default, neighbor distribute list is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 1.2.3.4 distribute-list mylist out
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 distribute-list list1 in
```

---

## neighbor ebgp-multihop

Use this command to accept and try BGP connections to external peers on indirectly connected networks. Multihop is not established if the only route to the multihop peer is a default route. This avoids loop formation.

Use the `no` parameter with this command to return to the default.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop
neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop <1-255>
no neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop
no neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop <1-255>
```

For BGP unnumbered mode:

```
neighbor WORD ebgp-multihop
neighbor WORD ebgp-multihop <1-255>
no neighbor WORD ebgp-multihop
no neighbor WORD ebgp-multihop <1-255>
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-255>

Maximum hop count

### Default

By default, maximum hop count is 255

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.10.34 remote-as 20
(config-router)#neighbor 10.10.10.34 ebgp-multihop 5
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-annum)#neighbor eth1 ebgp-multihop
```

---

## neighbor enforce-multihop

Use this command to enforce BGP neighbors to perform multihop.

Use the `no` parameter with this command to turn off this feature.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) enforce-multihop
no neighbor (A.B.C.D|X:X::X:X|WORD) enforce-multihop
```

For BGP unnumbered mode:

```
neighbor WORD enforce-multihop
no neighbor WORD enforce-multihop
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, the maximum hop count is 255

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 remote-as 20
(config-router)#neighbor 10.10.0.34 enforce-multihop
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 enforce-multihop
```

---

## neighbor extended-optional-param

Use this command enable extended optional parameter length for BGP OPEN messages as specified in RFC 9072. Use the `no` form of this command to disable extended optional parameter length.

### Command Syntax

```
neighbor A.B.C.D|X:X::X:X|WORD extended-optional-param
no neighbor A.B.C.D|X:X::X:X|WORD extended-optional-param
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command.

When you specify this parameter, the command applies to all peers in the group.

### Default

Extended optional parameter length is disabled by default.

### Command Mode

BGP router mode

### Applicability

This command was introduced in OcNOS version 6.0.0.

### Example

```
(config)#router bgp 100
(config-router)#neighbor 1.1.1.1 extended-optional-param
(config-router)#commit
(config-router)#show run bgp
!
router bgp 100
  bgp router-id 11.11.11.11
  neighbor 1.1.1.1 remote-as 100
  neighbor 1.1.1.1 extended-optional-param
```

## neighbor fall-over bfd

Use this command to enable the BFD for BGP peers.

Use the `no` form of the command to disable the BFD option for BGP peers.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) fall-over bfd (multihop|)
no neighbor (A.B.C.D|X:X::X:X|WORD) fall-over bfd (multihop|)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format.

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### multihop

Enable multihop

### Default

Bidirectional Forwarding Detection for BGP peers is disabled by default.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
(config)#router bgp 100
(config-router)#neighbor 10.2.3.4 fall-over bfd
(config-router)#
(config-router)#neighbor 10.2.3.4 fall-over bfd multihop
```

---

## neighbor filter-list

Use this command to set up a BGP filter. This command specifies an access list filter on updates based on the BGP autonomous system paths. Each filter is an access list based on regular expressions.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) filter-list WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) filter-list WORD (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD filter-list WORD (in|out)
no neighbor WORD filter-list WORD (in|out)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### WORD

Name of an autonomous system path access list

#### in

Filter incoming advertised routes

#### out

Filter outgoing advertised route

### Default

By default, filter list is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 remote-as 20
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.34 filter-list out in
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 filter-list list2 in
```

## neighbor g-shut

Use this command to start a graceful shutdown for the BGP session of the specified BGP neighbor. The BGP session for this neighbor is shut down after the graceful shutdown timer expires.

If there is no alternate path available for traffic to flow prior the actual shutdown of the BGP session, this path is made available for 60 seconds or for configured time after which the path is no longer available and traffic is dropped.

Use the `no` parameter with this command to bring up the session again for the specified BGP neighbor whose BGP session had been shut down using the `neighbor g-shut` command.

**Note:** The graceful shutdown capability is not supported on iBGP sessions

## Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
```

## Parameters

### A.B.C.D

Neighbor IPv4 address

### X:X::X:X|

Neighbor IPv6 address

### WORD

Neighbor tag

## Default

By default, neighbor g-shut is disabled

## Command Mode

Router mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut

#configure terminal
(config)#router bgp 100
(config-router)#no neighbor 1.1.1.2 g-shut
```

---

## neighbor g-shut-timer

Use this command to configure the value of the graceful shutdown timer . After the timer expires, the BGP session initiated for graceful shutdown is shut down.

Use the `no` parameter with this command to revert to the default setting.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
```

### Parameters

#### A.B.C.D

Neighbor IPv4 address

#### X:X::X:X

Neighbor IPv6 address

#### WORD

Neighbor tag

#### <10-65535>

Graceful shutdown timer in seconds

### Default

By default, the timer value is set to 60 seconds

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut-timer 120
```

---

## neighbor limit

Use this command to specify the maximum number of peers that can be configured in the BGP dynamic peer-group. Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor WORD limit <1-512>
no neighbor WORD (limit <1-512>|)
```

### Parameters

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command.

#### <1-512>

The maximum number of peers that can be configured in a BGP dynamic peer-group.

### Default

By default, neighbor word limit is disabled

### Command Mode

Router mode and Address Family VRF mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor group1 limit 120
```

## neighbor local-as

Use this command to specify an AS (autonomous system) number to use with BGP neighbor.

Use the `no` parameter with this command to disable this command.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295> (no-prepend|) (replace-as|)
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295>
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295> no-prepend
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295> replace-as
```

For BGP unnumbered mode:

```
neighbor WORD local-as <1-4294967295> (no-prepend|) (replace-as|)
no neighbor WORD local-as <1-4294967295>
no neighbor WORD local-as <1-4294967295> no-prepend
no neighbor WORD local-as <1-4294967295> replace-as
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-4294967295>

Neighbor's AS number when extended capabilities are configured

#### no-prepend

Do not prepend local-as to updated from ebgp peers

#### replace-as

Replace real AS with local-as in the EBGp updates

**Note:** The AS number 23456 is a reserved 2-byte AS number. An old BGP speaker (2-byte implementation) should be configured with 23456 as its remote AS number while peering with a non-mappable new BGP speaker (4-byte implementation).

### Default

By default, local-as is disabled.

### Command Mode

Router mode and Address Family-vrf mode and BGP unnumbered mode

## Applicability

This command was introduced before OcNOS version 1.3. The new version of the command with “no-prepend” and “replace-as” option is introduced in OcNOS version 6.4.1.

## Example

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 20.1.1.3 remote-as 300
(config-router)#neighbor 20.1.1.3 local-as 200 no-prepend replace-as

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 300
(config-router-af)#neighbor 3ffe:15:15:15:15::0 local-as 200
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 local-as 300
```

## neighbor maximum-prefix

Use this command to set the number of prefixes that can be received from a neighbor.

Use the `no` parameter with this command to disable this function.

**Note:** For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> <1-100|>
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> stop-update
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> warning-only
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> <1-100> warning-only
no neighbor (A.B.C.D|X:X::X:X) maximum-prefix <1-4294967295>
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-4294967295>

Maximum number of prefixes accepted from this peer

#### stop-update

Stop installing routes when the maximum number of prefixes is exceeded.

#### <1-100>

Threshold value percent <1-100>

#### warning-only

Only give a warning message when the limit is exceeded. When this parameter is not specified and extra prefixes are received, the router ends the peering. A terminated peer remains down until the [clear ip bgp A.B.C.D \(page 781\)](#) command is given.

### Default

By default, neighbor maximum prefix is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.72 maximum-prefix 1244 warning-only

(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 maximum-prefix 3
```

---

## neighbor next-hop-self

Use this command to make the router the next hop for a BGP-speaking neighbor or peer group. This command allows a BGP router to change the nexthop information that is sent to the iBGP peer. The nexthop information is set to the IP address of the interface used to communicate with the neighbor.

Use the `no` parameter with this command to disable this feature.

For unnumbered peer, IPv4 unicast mode commands are configured under `v4-unnumbered-mode`.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) next-hop-self
no neighbor (A.B.C.D|X:X::X:X|WORD) next-hop-self
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, next hop self is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 remote-as 100
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.72 next-hop-self

(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 next-hop-self
```

---

## neighbor optional-as

Use this command to specify an AS (autonomous system) number to use with BGP dynamic peer-group.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor WORD optional-as <1-4294967295>  
no neighbor WORD optional-as <1-4294967295>
```

### Parameters

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-4294967295>

The range from which the optional AS number must be configured.

### Default

By default, neighbor optional as is disabled

### Command Mode

Router mode and Address Family VRF mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#router bgp 12  
(config-router)#neighbor group1 optional-as 400
```

---

## neighbor override-capability

Use this command to ignore received capabilities and use locally configured values.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) override-capability
no neighbor (A.B.C.D|X:X::X:X|WORD) override-capability
```

For BGP unnumbered mode:

```
neighbor WORD override-capability
no neighbor WORD override-capability
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, override-capability is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 override-capability
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 override-capability
```

---

## neighbor passive

Use this command to make a BGP neighbor passive.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) passive
no neighbor (A.B.C.D|X:X::X:X|WORD) passive
```

For BGP unnumbered mode:

```
neighbor WORD passive
no neighbor WORD passive
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, neighbor passive is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 passive
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 passive
```

## neighbor peer-group

Use this command to add a neighbor to an existing peer group. Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as distribute and filter lists. The peer group is then configured easily with any of the neighbor commands. Any changes made to the peer group affect all members.

### Notes:

- See [Usage \(page 852\)](#) below for when a peer group and a neighbor have conflicting attribute configurations.
- When a peer is detached from a peer-group and if an attempt is made to create a static peer with the same address immediately within the single commit transaction, then the system throws the error: %% Peer deletion is in progress, peer cannot be created. For example, refer to the [Peer Creation Error During Deletion \(page 852\)](#) section.

To create a peer group, use the [neighbor WORD peer-group \(page 883\)](#) command, and then use this command to add neighbors to the group.

Use the no parameter with this command to remove a neighbor from a named peer group.

## Command Syntax

```
neighbor (A.B.C.D|X:X::X:X) peer-group WORD
no neighbor (A.B.C.D|X:X::X:X) peer-group WORD
```

For BGP unnumbered mode:

```
neighbor WORD peer-group WORD
no neighbor WORD peer-group WORD
```

## Parameters

### A.B.C.D

Address of the BGP neighbor in IPv4 format

### X:X::X:X

Address of the BGP neighbor in IPv6 format

### WORD

Peer group name

## Default

No default value is specified

## Command Mode

Router mode and BGP unnumbered mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

**Note:** For unnumbered peer we use peergroup key word to bind the unnumbered peer in group.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 peergroup ipi
```

## Peer Creation Error During Deletion

Attempting to re-create a BGP peer immediately after removing it from a peer-group within the same commit:

```
OcNOS#show running-config router bgp
!
router bgp 65000
 neighbor RR peer-group
 neighbor RR remote-as 65000
 neighbor RR update-source loopback200
 neighbor 223.223.223.2 peer-group RR
 neighbor 223.223.223.3 peer-group RR
!
 address-family vpnv4 unicast
 neighbor RR activate
 exit-address-family
!
exit
!
```

```
OcNOS#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
OcNOS(config)#router bgp 65000
OcNOS(config-router)#no neighbor 223.223.223.2 peer-group RR
OcNOS(config-router)#neighbor 223.223.223.2 remote-as 65000
OcNOS(config-router)#neighbor 223.223.223.2 update-source loopback200
OcNOS(config-router)#address-family vpnv4 unicast
OcNOS(config-router-af)#neighbor 223.223.223.2 activate
OcNOS(config-router-af)#commit
%% Peer deletion is in progress, peer cannot be created - /bgp/bgp-instances/bgp-instance[bgp-as='65000']/peers/peer[peer-address='223.223.223.2']/config/peer-as
%% bgpd config validation failed
Error
%% Delete not supported at the Peer Address-family. Delete at the global address-family
% Failed to commit .. As error(s) encountered during commit operation...
Uncommitted configurations are retained in the current transaction session, check 'show transaction current'.
Correct the reason for the failure and re-issue the commit.
Use 'abort transaction' to terminate current transaction session and discard all uncommitted changes.
%% Peer deletion is in progress, peer cannot be created
OcNOS(config-router-af)#
```

## Usage

When a *peer group* and a *peer* (neighbor) have conflicting attribute configurations the following rules apply:

- Outbound attribute configurations of a peer group *replace* peer member configurations of the same attributes when a peer becomes member of that peer group. Outbound attribute modifications to group members are not allowed.
- A peer group member's inbound attribute configurations take precedence over the peer group configuration.

These commands control outbound attribute updates:

- [neighbor activate \(page 810\)](#)
- [neighbor advertisement-interval \(page 811\)](#)
- [neighbor as-origination-interval \(page 814\)](#)
- [neighbor attribute-unchanged \(page 815\)](#)
- [neighbor capability orf prefix-list \(page 820\)](#)
- [neighbor distribute-list \(page 831\)](#) with an access-list number and the `out` parameter
- [neighbor dont-capability-negotiate](#)
- [neighbor filter-list \(page 838\)](#) with the `out` parameter
- [neighbor next-hop-self \(page 847\)](#)
- [neighbor prefix-list \(page 857\)](#) with an access-list name and the `out` parameter
- [neighbor remove-private-AS \(page 861\)](#)
- [neighbor route-map \(page 863\)](#) with the `out` parameter
- [neighbor route-reflector-client \(page 865\)](#)
- [neighbor route-server-client \(page 867\)](#)
- [neighbor send-community \(page 868\)](#)
- [neighbor unsuppress-map \(page 876\)](#)

These commands control inbound attribute updates:

- [neighbor allowas-in \(page 812\)](#)
- [neighbor collide-established \(page 822\)](#)
- [neighbor description \(page 828\)](#)
- [neighbor distribute-list \(page 831\)](#) with an access-list number and the `in` parameter
- [neighbor ebgp-multihop \(page 833\)](#)
- [neighbor enforce-multihop \(page 835\)](#)
- [neighbor filter-list \(page 838\)](#) with the `in` parameter
- [neighbor g-shut \(page 840\)](#)
- [neighbor g-shut-timer \(page 841\)](#)
- [neighbor local-as \(page 843\)](#)
- [neighbor maximum-prefix \(page 845\)](#)
- [neighbor override-capability \(page 849\)](#)
- [neighbor passive \(page 850\)](#)
- [neighbor authentication-key \(page 817\)](#)
- [neighbor port \(page 856\)](#)

- [neighbor prefix-list \(page 857\)](#) with an access-list name and the `in` parameter
- [neighbor remote-as \(page 859\)](#)
- [neighbor restart-time \(page 862\)](#)
- [neighbor route-map \(page 863\)](#) with the `in` parameter
- [neighbor shutdown \(page 871\)](#)
- [neighbor strict-capability-match \(page 873\)](#)
- [neighbor update-source \(page 878\)](#)
- [neighbor weight \(page 881\)](#)

### BGP Peer Group Activation and Binding Guidelines

A BGP peer group can contain peer group members, including BGP IPv4, BGP IPv6, or BGP unnumbered peers. A peer group can consist of peer group members of different types; however, a restriction arises when the user attempts to activate the peer group across multiple address-families. Specifically, the user can only activate a BGP peer in a supported address family. This limitation can lead to functional issues and discrepancies in the show-running configuration.

To address this issue, limitations are implemented regarding the activation of the BGP peer group and the binding of peer group members.

- An error will occur if no peer group member is bound to the peer group during the activation attempt.
- A peer group that includes an IPv4 peer group member cannot also contain an IPv6 peer group member.
- Similarly, a peer group that includes an IPv6 peer group member cannot also contain an IPv4 peer group member.
- Additionally, a peer group that includes either an IPv4 or an IPv6 peer group member cannot contain an unnumbered peer.
- The BGP peer group type must remain unnumbered and cannot have IPv4 or IPv6 peers.
- Users cannot bind a peer to a peer group if it is already activated in address-family mode. Therefore, it is necessary to deactivate the peer first.

Applicability: OcNOS version 6.6.0

**Note:** Users must manually correct configurations after an upgrade or downgrade, as no scripts are available to facilitate this process.

---

## neighbor WORD peer-group range

Use this command to create a dynamic peer group.

Use the no parameter with this command to remove a peer group.

### Command Syntax

```
neighbor WORD peer-group range (A.B.C.D/M|X:X::X:X/M)
no neighbor WORD peer-group range (A.B.C.D/M|X:X::X:X/M)
```

### Parameters

#### A.B.C.D/M

IP Prefix

#### X:X::X:X/M

IPv6 Prefix

#### WORD

Peer group name

### Default

No default value is specified

### Command Mode

Router mode and Address Family VRF mode.

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group range 10.10.10.0/24
```

---

## neighbor port

Use this command to set the BGP port number of a neighbor.

Use the `no` parameter with this command to remove a port number from a BGP neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) port <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) port
no neighbor (A.B.C.D|X:X::X:X|WORD) port <0-65535>
```

For BGP unnumbered mode:

```
neighbor WORD port <0-65535>
no neighbor WORD port
no neighbor WORD port <0-65535>
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <0-65535>

Port number

### Default

By default, neighbor port is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 port 643
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 port 500
```

---

## neighbor prefix-list

Use this command to specify a prefix list for filtering BGP advertisements.

Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access. When multiple entries of a prefix list match a prefix, the entry with the smallest sequence number is considered to be a real match.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top. The [neighbor distribute-list \(page 831\)](#) command is an alternative to this command and only one of them can be used to filter the same neighbor in any direction.

Use the `no` parameter with this command to remove an entry.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) prefix-list WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) prefix-list WORD (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD prefix-list WORD (in|out)
no neighbor WORD prefix-list WORD (in|out)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### WORD

Name of an access list

#### in

Apply access list to incoming advertisements

#### out

Apply access list to outgoing advertisements

### Default

By default, neighbor prefix list is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#ip prefix-list list1 deny 30.0.0.0/24
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.10 prefix-list list1 in
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 prefix-list list2 out
```

---

## neighbor remote-as

Use this command to establish a BGP peering relationship with a customer edge router.

The specified neighbor only exchanges unicast address prefixes, unless the neighbor is also activated using the [neighbor activate \(page 810\)](#) command, which allows the exchange of other routing information.

Use the `no` parameter with this command to delete this peering.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) remote-as (<1-4294967295>|internal|external)
no neighbor (A.B.C.D|X:X::X:X|WORD) remote-as (<1-4294967295>|internal|external)
```

For BGP unnumbered mode:

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

For an unnumbered interface (RFC 5549), specify an interface name configured with neighbor discovery or an IPv4 address with /31 or /30.

#### <1-4294967295>

Neighbor's autonomous system number (ASN) when extended capabilities are configured. If the specified ASN matches the ASN number specified in the router BGP global configuration, the neighbor is identified as internal. If the ASN does no match, the neighbor is identified as external to the local AS.

#### internal

iBGP peer.

#### external

eBGP peer.

### Default

By default, neighbor remote is disabled.

### Command Mode

Router mode, Address Family-vrf mode, and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.6.

## Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor 10.10.0.73 remote-as 345
(config-router)#neighbor 11.11.0.74 remote-as 23456
```

**Note:** The last command in the example above should be used when the local speaker is OBGp and the neighbor is NBGP with a 4-octet ASN.

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 remote-as 65000

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 65000

(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 remote-as internal
(config-router-unnum)#show running bgp

router bgp 100
!
  bgp unnumbered-mode
  neighbor eth1 remote-as internal
  neighbor eth2 remote-as external
  exit-unnumbered-mode
!
```

---

## neighbor remove-private-AS

Use this command to remove the private autonomous system number (ASN) from outbound updates. Private ASNs are not advertised to the Internet. This command is used with external BGP peers only. The router removes the ASNs only if the update includes private ASNs. If the update includes both private and public ASNs, the system treats it as an error.

Use the `no` parameter with this command to revert to default.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) remove-private-AS
no neighbor (A.B.C.D|X:X::X:X|WORD) remove-private-AS
```

For v4-unnumbered mode:

```
neighbor WORD remove-private-AS
no neighbor WORD remove-private-AS
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, neighbor remove private AS is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.63 remove-private-AS
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 remove-private-AS
```

---

## neighbor restart-time

Use this command to set a different restart-time than the global restart-time configured using the [bgp graceful-restart \(page 1008\)](#) command.

Use the `no` parameter with this command to restore the router to its default state.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>  
no neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <1-3600>

The maximum time that a graceful-restart neighbor waits to come back up after a restart. Make sure that this value does not exceed the stalepath-time specified in router mode.

### Default

By default, restart time is 90 seconds

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal  
(config)#router bgp 10  
(config-router)#neighbor 3.3.3.3 restart-time 45
```

## neighbor route-map

Use this command to apply a route map to incoming or outgoing routes. This command filters updates and modifies attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Use the `no` parameter with this command to a route map.

**Note:** Route maps enable filtering and modification of BGP routes using 'match' and 'set' clauses. They can be applied to a BGP peer or peer-group in either the inbound or outbound direction to influence received or advertised routes. However, for route-map updates to take effect, a manual command such as [clear ip bgp A.B.C.D \(page 781\)](#) <neighbor> soft must be executed for each BGP peer or peer-group address-family. This manual step is required in all software releases except for release 6.6.x and later, provided that the 'bgp auto-policy-soft-reset enable' feature is configured.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-map WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) route-map WORD (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD route-map WORD (in|out)
no neighbor WORD route-map WORD (in|out)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### WORD

Name of the route map

#### in

Apply access list to incoming advertisements

#### out

Apply access list to outgoing advertisements

### Default

No default value is specified

### Command Mode

Address Family mode and v4-unnumbered mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

The following example shows the configuration of the route map named `rmap2` and then the use of this map name in the `neighbor route-map` command.

```
#configure terminal
(config)#route-map rmap2 permit 6
(config-route-map)#match origin incomplete
(config-route-map)#set metric 100
(config-route-map)#exit
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.10 route-map rmap2 in
```

For unnumbered peer, IPv4 unicast mode commands are configured under `v4-unnumbered-mode`.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 route-map rmap1 in
```

---

## neighbor route-reflector-client

Use this command to make the router a BGP route reflector and set a specified neighbor as its client.

Using route reflectors reduces the number of iBGP peers within an AS. An AS can have more than one route reflector. A route reflector treats other route reflectors as other iBGP speakers.

Use the `no` parameter with this command to indicate that the neighbor is not a client.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-reflector-client
no neighbor (A.B.C.D|X:X::X:X|WORD) route-reflector-client
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

No default value is specified

### Command Mode

This command is supported in all Address Family modes.

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

In the following configuration, Router1 is the route reflector for clients 3.3.3.3 and 2.2.2.2; it also has a non-client peer 6.6.6.6.

```
#configure terminal
(config)#router bgp 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 200
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 3.3.3.3 route-reflector-client
(config-router-af)#neighbor 2.2.2.2 route-reflector-client
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 route-reflector-client
```

For unnumbered peer, configs in L2vpn EVPN mode are configured under l2vpn-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#neighbor eth1 route-reflector-client
```

---

## neighbor route-server-client

Use this command to make a neighbor a route server client.

Use the `no` parameter with this command to remove the configuration of a neighbor as route server client.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-server-client
no neighbor (A.B.C.D|X:X::X:X|WORD) route-server-client
```

For v4-unnumbered mode:

```
neighbor WORD route-server-client
no neighbor WORD route-server-client
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

No default value is specified

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.72 route-server-client

#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#no neighbor 10.10.0.72 route-server-client
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 route-server-client
```

---

## neighbor send-community

Use this command to send that a community attribute to a BGP neighbor.

The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes, the router reannounces them to the neighbor.

By default, both `standard` and `extended` community attributes are sent to a neighbor. To explicitly send only the `standard` or `extended` community attribute, run the [bgp dampening \(page 740\)](#) command with the `standard` parameter before running this command.

Use the `no` parameter with this command to not announce community attributes to the neighbor. Use the `extended` and `no` parameters to remove extended communities. Specifying no other parameter with `no` removes standard communities only.

See also [neighbor send-community \(page 905\)](#) in [BGP Virtual Private Network Commands](#).

### Command Syntax

```
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
neighbor (A.B.C.D|X:X::X:X|WORD) send-community
neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### both

Send Standard and Extended Community attributes

#### extended

Send Extended Community attributes

#### standard

Send Standard Community attributes

### Default

By default, both communities (standard and extended) are sent to every BGP neighbor.

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.10.1 remote-as 200
(config-router-af)#no neighbor 10.10.0.1 send-community extended
```

---

## neighbor send-community large

Use this command to send that a community attribute to a BGP neighbor.

Use the `no` parameter with this command to not announce community attributes to the neighbor.

### Command Syntax

```
neighbor A.B.C.D send-community large
no neighbor A.B.C.D send-community large
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

### Default

By default `send-community large` is enabled for peer

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 6.1.0.

### Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 1.1.1.1 activate
(config-router-af)#neighbor 1.1.1.1 send-community large
```

---

## neighbor shutdown

Use this command to terminate active sessions for a specified neighbor and clear all related routing information.

If a peer group is specified, a large number of peering sessions might be terminated. The `show ip bgp summary` command displays a summary of BGP neighbors and their connections.

Use `description` option for operators to transmit a short free-form message to describe why a BGP session was shut down.

Use the `no` parameter with this command to re-enable a neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) shutdown (description LINE|)
no neighbor (A.B.C.D|X:X::X:X|WORD) shutdown
```

For BGP unnumbered mode:

```
neighbor WORD shutdown (description LINE|)
no neighbor WORD shutdown
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### description

Administratively shutdown communication msg to neighbor.

### Default

By default, neighbor shutdown is disabled.

### Command Mode

Router mode and Address Family-vrf mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3. The new version of the command with “description” option is introduced in OcNOS version 6.0.0.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 shutdown

(config)#router bgp 100
```

```
(config-router)#address-family ipv6 vrf VRF_A  
(config-router-af)#neighbor 3ffe:15:15:15:15::0 shutdown description software upgrade; back in 2  
hours
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100  
(config-router)#bgp unnumbered-mode  
(config-router-unnum)#neighbor eth1 shutdown
```

---

## neighbor strict-capability-match

Use this command to close the BGP connection if a capability value does not match the remote peer.

Use the `no` parameter with this command to disable this function.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) strict-capability-match  
no neighbor (A.B.C.D|X:X::X:X|WORD) strict-capability-match
```

For BGP unnumbered mode:

```
neighbor WORD strict-capability-match  
no neighbor WORD strict-capability-match
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, strict capability match is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#router bgp 12  
(config-router)#neighbor 10.10.10.10 strict-capability-match
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100  
(config-router)#bgp unnumbered-mode  
(config-router-unnum)#neighbor eth1 strict-capability-match
```

---

## neighbor timers

Use this command to set the timers for a specific BGP neighbor.

Use the `no` parameter with this command to clear the timers for a BGP neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) timers <0-65535> <0-65535>
neighbor (A.B.C.D|X:X::X:X|WORD) timers connect <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) timers
no neighbor (A.B.C.D|X:X::X:X|WORD) timers connect
```

For BGP unnumbered mode:

```
neighbor WORD timers <0-65535> <0-65535>
neighbor WORD timers connect <1-65535>
no neighbor WORD timers
no neighbor WORD timers connect
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <0-65535>

Keepalive interval. Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router.

#### <0-65535>

Holdtime interval which is the time the router waits to receive a keepalive message. If the router does not receive a message in this period, the router declares the neighbor dead. The holdtime value should be at least 3 times the keepalive time.

#### connect

BGP connect timer

#### <1-65535>

Connect timer

### Defaults

By default, keepalive timer value is 30 seconds.

### Command Mode

Router mode and BGP unnumbered mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 timers 60 230
(config-router)#neighbor 10.10.10.10 timers connect 10

(config-router)#no neighbor 10.10.10.10 timers
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 timers 40 120
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 timers connect 50
```

## neighbor unsuppress-map

Use this command to selectively leak more-specific routes to a particular neighbor.

When the [aggregate-address \(page 722\)](#) command is used with the `summary-only` option, the more-specific routes of the aggregate are suppressed to all neighbors. Use the `neighbor unsuppress-map` command to selectively leak more-specific routes to a particular neighbor.

Use the `no` parameter with this command to restore the setting to the default level.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) unsuppress-map WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) unsuppress-map WORD
```

For v4-unnumbered mode:

```
neighbor WORD unsuppress-map WORD
no neighbor WORD unsuppress-map WORD
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### WORD

Name of the route map used to select routes to unsuppress

### Default

By default, neighbor unsuppress map is disabled

### Command Mode

Address Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.70 unsuppress-map mymap
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
```

```
(config-router)#address-family ipv4 unicast  
(config-router-af)#bgp v4-unnumbered-mode  
(config-router-v4-unnum)#neighbor eth1 unsuppress-map map2
```

---

## neighbor update-source

Use this command to allow internal BGP sessions to use any operating interface for TCP connections.

A loopback interface is most commonly used with this command. The use of loopback interface eliminates a dependency and BGP does not have to rely on the availability of a particular interface for making TCP connections.

Use the `no` parameter with this command to restore the interface assignment to the closest interface.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) update-source WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) update-source
```

For BGP unnumbered mode:

```
neighbor WORD update-source WORD
no neighbor WORD update-source
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### WORD

Interface name

### Default

By default, neighbor update source is disabled

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 update-source myif
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 update-source myif
```

---

## neighbor version

Use this command to accept only a particular BGP version.

By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

Use the `no` parameter with this command to use the default version level of a neighbor.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) version 4
no neighbor (A.B.C.D|X:X::X:X|WORD) version
```

For BGP unnumbered mode:

```
neighbor WORD version 4
no neighbor WORD version
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### 4

BGP version number

### Default

By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2.

### Command Mode

Router mode and BGP unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 version 4

(config)#router bgp 12
(config-router)#no neighbor 10.10.10.10 version
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-annum)#neighbor eth1 version 4
```

---

## neighbor weight

Use this command to specify a weight value, per address-family, for all routes learned from a neighbor.

The route with the highest weight gets preference when the same prefix is learned from more than one peer. Unlike the local-preference attribute, the weight attribute is relevant only to the local router. The weights assigned using the `set weight` command override the weights assigned using this command.

Use this command in router mode to specify a weight value for all address families. Use this command in address family mode to specify a weight value per IPv4/IPv6/VPNv4/6PE address family,

When the weight is set for a peer group, all members of the peer group get the same weight. This command can also be used to assign a different weight to an individual peer-group member. When an individually-configured weight of a peer-group member is removed, its weight is reset to its peer group's weight.

Use the `no` parameter with this command to remove a weight assignment.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) weight <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) weight
no neighbor (A.B.C.D|X:X::X:X|WORD) weight <0-65535>
```

For v4-unnumbered mode:

```
neighbor WORD weight <0-65535>
no neighbor WORD weight
no neighbor WORD weight <0-65535>
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### <0-65535>

Weight value

### Default

By default, neighbor weight value is 0

### Command Mode

Router Address-Family mode and v4-unnumbered mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.10 weight 60

(config-router-af)#no neighbor 10.10.10.10 weight 60
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 weight 44
```

---

## neighbor WORD peer-group

Use this command to create a peer group.

Use the `no` parameter with this command to remove a peer group.

### Command Syntax

```
neighbor WORD peer-group  
no neighbor WORD peer-group
```

### Parameters

#### WORD

Name of BGP peer group

### Default

None

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

This example shows how to create a peer group named `group1`.

```
#configure terminal  
(config)#router bgp 10  
(config-router)#neighbor group1 peer-group
```

---

## network

Use this command to specify the networks to be advertised by the BGP routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Use the backdoor parameter to specify a backdoor route to a BGP border router that will provide better information about the network. For data to be advertised by BGP, its routing table must include a route to the specified network. This command specifies the networks to be advertised. The network command works if the network being advertised is known to the router.

The backdoor parameter enables a route to be the preferred route even if it has a greater distance. A network that is specified as a backdoor network is dynamically assigned an administrative distance of 200 ensuring that IGP learned routes are preferred. If a backdoor network is not sourced by the local router, the network is learned from the external routers. If the route is learned from eBGP for a backdoor network, the distance is set to 20 or 200.

Use the no form of this command to remove a network route entry.

### Command Syntax

```
network A.B.C.D (backdoor|)
network A.B.C.D/M (backdoor|)
network A.B.C.D mask A.B.C.D (backdoor|)
network A.B.C.D mask A.B.C.D route-map WORD (backdoor|)
network A.B.C.D route-map WORD (backdoor|)
network A.B.C.D/M route-map WORD (backdoor|)
no network A.B.C.D
no network A.B.C.D/M
```

### Parameters

#### A.B.C.D

IP prefix <network>, for example, 35.0.0.0

#### A.B.C.D/M

IP prefix <network>/<length>, for example., 35.0.0.0/8

#### backdoor

BGP backdoor route

#### route-map

Route map used to modify the attributes

#### WORD

Name of the route map

#### mask

Network mask, for example, 255.255.0.0

#### A.B.C.D

Network mask, e.g., 255.255.0.0

### Default

No default value is specified

## Command Mode

Router Address-family mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Examples

The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 is internally derived, that is, 2.0.0.0/8.

```
(config)#router bgp 1
(config-router)#address-family ipv4 unicast
(config-router-af)#network 2.0.0.0
```

## network synchronization

Use this command to enable IGP synchronization for BGP static network routes.

Use this no parameter with this command to disable synchronization of BGP static routes.

### Command Syntax

```
network synchronization
no network synchronization
```

### Parameters

None

### Default

By default, network synchronization is disabled.

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following example enables IGP synchronization of BGP static network routes in the router configuration mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv6 unicast address-family mode.

```
#configure terminal
(config)#router bgp 11
(config)#address-family ipv6 unicast
(config-router-af)#network synchronization
```

---

## redistribute

Use this command to inject routes from one routing process into another. Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Use the no parameter with this command to disable this function.

### Command Syntax

```
redistribute [connected|isis|ospf|rip|static]
redistribute [connected|isis|ospf|rip|static] route-map WORD
no redistribute [connected|isis|ospf|rip|static]
no redistribute [connected|isis|ospf|rip|static] route-map
no redistribute [connected|isis|ospf|rip|static] route-map WORD
```

### Parameters

**connected**

Redistribute connected routes

**isis**

Redistribute connected ISO IS-IS routes

**ospf**

Redistribute OSPFv2 routes

**rip**

Redistribute RIP routes

**static**

Redistribute static routes

**route-map**

Route map reference

**WORD**

Route map entires

### Default

Disabled

### Command Mode

Address Family mode and Address Family-vrf mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following example shows the configuration of the route-map name rmap1 and then the use of this map name in the redistribute route-map command.

```
#configure terminal
(config)#route-map rmap1 permit 1
(config-route-map)#match origin incomplete
(config-route-map)#set metric 100
(config-route-map)#exit
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#redistribute ospf route-map rmap1

(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#redistribute static

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#redistribute static
```

## restart bgp graceful

Use this command to enable a BGP-speaker router for graceful restart. This command stops the whole BGP process and makes OcNOS retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all address families received in the Graceful Restart Capability exchange.

### Command Syntax

```
restart bgp graceful
```

### Parameters

None

### Default

Disabled

### Command Mode

Privileged execution mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#restart bgp graceful
% Warning : BGP process will stop and needs to restart manually,
You may loose ospf configuration, if not saved
Proceed for graceful restart? (y/n):y
```

---

## router bgp

Use this command to start a BGP process.

Use the `no` parameter with this command to disable an existing routing process.

### Command Syntax

```
router bgp <1-4294967295>  
no router bgp <1-4294967295>
```

### Parameters

#### <1-4294967295>

Associate the routing process with this autonomous system number

### Default

No default value is specified

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#router bgp 12  
(config-router)#
```

## snmp restart bgp

Use this command to restart SNMP in Border Gateway Protocol (BGP)

### Command Syntax

```
snmp restart bgp
```

### Parameters

None

### Default

No default value is specified

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#snmp restart bgp
```

---

## synchronization

Use this command to enable IGP synchronization of Internal BGP (iBGP) learned routes with the Internal Gateway Protocol (IGP) system in the router configuration mode or in the address-family configuration mode.

Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

The no synchronization command is used when BGP router can advertise routes learned from its iBGP neighbors without waiting for the IGP reachability to be present.

### Command Syntax

```
synchronization
no synchronization
```

### Parameters

None

### Default

No default value is specified

### Command Mode

Address Family modes

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

The following example enables IGP synchronization of iBGP routes in Router mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6-Unicast address family.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv6 unicast
(config-router-af)#synchronization
```

---

## timers bgp

Use this command to globally set or reset the keepalive and holdtime values for all the neighbors.

Use the `no` parameter with this command to reset timers to default value.

### Command Syntax

```
timers bgp <0-65535> <0-65535>  
no timers bgp
```

### Parameters

#### <0-65535>

Frequency with which keepalive messages are sent to the neighbors

#### <0-65535>

Interval after which a neighbor is considered dead if keepalive messages are not received

### Default

By default, keepalive timer value is 30 seconds

By default, holdtime value is 90 seconds

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal  
(config)#router bgp 10  
(config-router)#timers bgp 40 120
```

---

## v4-unnumbered-mode

Use this command to configure the unnumbered peer with all the neighbor configs applicable in IPv4 unicast address family.

Use the `exit` parameter with this command to leave IPv4 BGP unnumbered mode.

### Command Syntax

```
bgp v4-unnumbered-mode  
exit-v4-unnumbered-mode
```

### Parameters

None

### Applicability

No default value is specified.

### Command Mode

Address-family IPv4 Unicast Mode

### Applicability

This command was introduced in OcNOS version 4.2.

### Examples

```
#configure terminal  
(config)#router bgp 100  
(config-router)#address-family ipv4 unicast  
(config-router-af)#bgp v4-unnumbered-mode  
(config-router-v4-unnum)#
```

## BGP Virtual Private Network Commands

This section describes the BGP Virtual Private Network (VPN) configuration commands.

**Notes:** For the following commands refer to the [BGP Commands \(page 716\)](#) and [BGP4+ Commands](#) sections

- [address-family ipv4 \(page 720\)](#)
- [address-family ipv6](#)
- [exit-address-family \(page 791\)](#)
- [neighbor activate \(page 810\)](#)
- [neighbor allowas-in \(page 812\)](#)
- [neighbor as-origination-interval \(page 814\)](#)
- [neighbor description \(page 828\)](#)
- [neighbor remote-as \(page 859\)](#)
- [neighbor send-community \(page 868\)](#)
- [neighbor shutdown \(page 871\)](#)
- [redistribute \(page 887\)](#)

|                                |     |
|--------------------------------|-----|
| bgp external-route-leak .....  | 896 |
| bgp inbound-route-filter ..... | 897 |
| export map .....               | 898 |
| import map .....               | 901 |
| ip vrf .....                   | 902 |
| neighbor allow-ebgp-vpn .....  | 903 |
| neighbor as-override .....     | 904 |
| neighbor send-community .....  | 905 |
| neighbor soo .....             | 906 |
| rd (route distinguisher) ..... | 907 |
| route-target .....             | 908 |

---

## bgp external-route-leak

Use this command to control the external route leaking. An external imported route (those received from VPN neighbor and imported to an IP-VRF) is further leaked to another IP-VRF. The route-target exports the source VRF, matches the route-target, and imports the destination VRF.

Use the no parameter with this command to disable external route leaking.

External route leaking is only supported for BGP EVPN routes. It is not support for other types of VPN routes.

### Command Syntax

```
bgp external-route-leak
no bgp external-route-leak
```

### Parameters

None

### Default

Enable

### Command Mode

Router mode

### Applicability

This command was introduced in OcNOS version 6.3.4

### Examples

```
OcNOS#configure terminal
(config)#router bgp 100
(config-router)#no bgp external-route-leak
```

---

## bgp inbound-route-filter

Use this command to control the filtering of received VPN routes with route-target extended community attributes. The inbound route filtering is applicable for both `bgp inbound-route-filter` and `route-target import` commands.

When a router is configured as VPNv4/EVPN Route-Reflector, it exchanges VRF routing information with a route distinguisher and route-target extended communities.

By default, OcNOS discards the received routes that does not match the local IP/MAC VRF's route-target import value. We can use command `no bgp inbound-route-filter` to override this behavior.

When the local box is acting as a VPNv4/EVPN route-reflector and not in the forwarding path, it may not be configured with an IP/MAC VRF terminations. In such case, `no bgp inbound-route-filter` is required to be configured to keep all the routes into RD (route-distinguisher) table.

### Command Syntax

```
bgp inbound-route-filter
no bgp inbound-route-filter
```

### Parameter

None

### Default

By default, OcNOS does not import routing information that does not match the local IP or MAC VRF's route-target import value.

### Command Mode

Router mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp inbound-route-filter
```

## export map

Use this command in VRF configuration mode to apply a route-map that controls which routes are exported from the VRF into the global routing table or into other VRFs. The route-map can filter routes using match clauses and modify BGP attributes using set clauses, enabling granular control over inter-VRF route export policies.

### Notes:

- An export-map with a `permit route-map` that contains no `match` or `set` clauses functions as a **permit-all**.
- An export-map with a `deny route-map` that contains no `match` or `set` clauses functions as a **deny-all**.

Use the `no` parameter of this command to remove the applied route-map.

## Command Syntax

```
export map WORD
no export map
```

## Parameters

### WORD

Specifies the name of the route-map to apply as the VRF export-map.

- `match` clauses filter the routes to export (for example, using prefix lists, community values, or AS path).
- `set` clauses adjust BGP attributes for exported routes (for example, route targets, local preference, AS path, MED).

## Default

If no export-map is configured, all eligible VRF routes are exported unmodified.

## Command Mode

VRF mode

## Applicability

Introduced in OcNOS version 4.1. OcNOS version 7.0.0 adds support for VRF-level BGP export-maps with route-map match and set clauses, enabling granular control of exported routes and attributes.

## Examples

This example shows how to configure an export-map with a route-map that filters specific prefixes and modifies their BGP attributes before exporting them from the VRF.

- The VRF `vrf1` is created, with route-distinguisher `1:1` and route-target `100:1`.
- The `export map export-r1` is applied to control which routes `vrf1` exports.
- The prefix-list `p1_ipv4` permits only `121.1.1.1/32`.

- The route-map `export-r1` matches the permitted prefix and modifies its attributes by:
  - Setting local preference to 1000
  - Setting BGP community to 650:650
  - Adding extended communities (route-targets) 110:1 and 220:1

As a result, only the permitted prefix (121.1.1.1/32) is exported from `vrf1` with the modified BGP attributes.

```
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#export map export-r1
OcNOS(config-vrf)#
```

### Prefix-list Definition

```
OcNOS#show running-config prefix-list
!
ip prefix-list p1_ipv4
 seq 5 permit 121.1.1.1/32
!
```

### Route-map Definition

```
OcNOS#show running-config route-map
!
route-map export-r1 permit 10
 match ip address prefix-list p1_ipv4
 set local-preference 1000
 set community 650:650
 set extcommunity rt 110:1 220:1 additive
!
```

### VRF Configuration

```
OcNOS#show running-config vrf
!
ip vrf management
!
ip vrf vrf1
 rd 1:1
  route-target both 100:1
  export map export-r1
!
ip vrf vrf2
 rd 2:2
  route-target import 100:1
  route-target both 200:1
!
```

### BGP Configuration

```
OcNOS#show running-config bgp
!
router bgp 200
 bgp auto-policy-soft-reset enable
 neighbor 5.5.5.5 remote-as 200
 neighbor 5.5.5.5 update-source lo
!
 address-family vpnv4 unicast
 neighbor 5.5.5.5 activate
 exit-address-family
!
 address-family ipv4 vrf vrf1
 neighbor 1.1.1.1 remote-as 100
 neighbor 1.1.1.1 activate
 neighbor 2.2.2.2 remote-as 300
 neighbor 2.2.2.2 activate
 exit-address-family
```

```
!  
address-family ipv4 vrf vrf2  
exit-address-family  
!  
exit  
!
```

## import map

Use this command to assign a route-map to the VRF. This route-map is applied to routing information imported from another PE or VRF.

Also, apply this command when finer control is required over the routes imported into a VRF than what is provided by the standard import and export extended communities.

The route-map can be used to filter specific routes that are eligible for import into the VRF. Routes that match a deny clause in the route-map are excluded, while those that match a permit clause are imported.

**Note:** Only match rules (permit or deny) in the route-map are applied for imported routes. Any set rules defined in the route-map are ignored.

Use the `no` parameter of this command to remove the assigned route-map.

## Command Syntax

```
import map WORD
no import map
```

## Parameters

### WORD

Specifies the name of the route-map to be applied for import control.

## Default

None

## Command Mode

VRF mode

## Applicability

Introduced in OcNOS version 1.3.

## Examples

Applies the route-map `set-pref` to control which routes are imported into the VRF `myVRF`.

```
(config)#ip vrf myVRF
(config-vrf)#import map set-pref
(config-vrf)#
```

---

## ip vrf

Use this command to assign a VPN Routing Forwarding (VRF) instance.

Use the `no` option with this command to remove the VRF from the instance.

### Command Syntax

```
ip vrf WORD  
no ip vrf WORD
```

### Parameter

#### WORD

Name of the VRF instance

### Default

No default value is specified

### Command Mode

Configure mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Command Example

```
(config)#ip vrf myVRF  
(config-vrf)#
```

---

## neighbor allow-ebgp-vpn

Use this command to allow an eBGP neighbor to be a VPN peer. By default, BGP VPN functionality is allowed only for iBGP peers.

Use the `no` parameter with this command to remove the configuration.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) allow-ebgp-vpn
no neighbor (A.B.C.D|X:X::X:X|WORD) allow-ebgp-vpn
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in IPv4 format

#### X:X::X:X

Address of the BGP neighbor in IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, BGP VPN functionality is allowed only for iBGP peers

### Command Mode

Address Family-vpnv6 mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
(config-router)#neighbor 66.66.66.66 remote-as 100
(config-router)#neighbor 66.66.66.66 update-source lo
(config-router-af)#neighbor 66.66.66.66 allow-ebgp-vpn
(config-router-af)#neighbor 66.66.66.66 activate
(config-router-af)#exit-address-family
```

---

## neighbor as-override

Use this command to configure a provider edge (PE) router to override the autonomous system number (ASN) of a site with the ASN of a provider. BGP normally ignores routes from the same autonomous system. However, this command is used so that the Customer Edge (CE) routers router accepts and installs routes from the same autonomous system.

Typically, this command is used when CE routers have the same ASN in some or all sites. As per BGP requirement, a BGP speaker rejects a route that has the same ASN as itself in the `AS_PATH` attribute. Thus the CE routers having the same ASN do not accept routes from each other. Giving this command on the PE router removes the CE neighbor's ASN from the `AS_PATH` attribute allowing CE routers with the same ASN to accept routes from each other.

Use the `no` parameter with this command to remove VPN IPv4 prefixes from a specified router.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) as-override
no neighbor (A.B.C.D|X:X::X:X|WORD) as-override
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in IPv4 format

#### X:X::X:X

Address of the BGP neighbor in IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

### Default

By default, neighbor as override is disabled

### Command Mode

Address Family-vrf mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 as-override

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 as-override
```

---

## neighbor send-community

Use this command to send the extended-community attribute to a customer edge router. In VPN, the route-distinguisher and route-target are encoded in BGP extended-community.

see also [neighbor send-community](#) in [BGP Commands](#).

### Command Syntax

```
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
neighbor (A.B.C.D|X:X::X:X|WORD) send-community
neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in an IPv4 format

#### X:X::X:X

Address of the BGP neighbor in an IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### both

Send Standard and Extended Community attributes

#### extended

Send Extended Community attributes

#### standard

Send Standard Community attributes

### Default

By default, both communities (standard and extended) are sent to every BGP neighbor.

### Command Mode

Address Family mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.10.1 remote-as 200
(config-router-af)#no neighbor 10.10.0.1 send-community extended
```

---

## neighbor soo

Use this command to enable the site-of-origin (SOO) feature. If the customer AS is multi-homed to the ISP, this command ensures that the PE does not advertise the routes back to the same AS.

Use the `no` parameter with this command to disable this feature.

### Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) soo AS:nn_or_IP:nn  
no neighbor (A.B.C.D|X:X::X:X|WORD) soo
```

### Parameters

#### A.B.C.D

Address of the BGP neighbor in IPv4 format

#### X:X::X:X

Address of the BGP neighbor in IPv6 format

#### WORD

Name of a BGP peer group created with the [neighbor WORD peer-group \(page 883\)](#) command. When you specify this parameter, the command applies to all peers in the group.

#### ASN:nn\_or\_IP-address:nn

An AS number and an arbitrary number (for example, 100:1), or a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

### Default

By default, the site-of-origin (SOO) feature is disabled.

### Command Mode

Address Family VRF mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
(config)#router bgp 100  
(config-router)#address-family ipv4 vrf VRF_A  
(config-router-af)#neighbor 1.1.1.1 remote-as 200  
(config-router-af)#neighbor 10.10.0.1 soo 100:1
```

## rd (route distinguisher)

Use this command to assign a route distinguisher (RD) for the VRF. The route distinguisher value must be a unique value on the router.

This command creates routing and forwarding tables and specifies the default RD for a VPN. The RD is added to the customer's IPv4 prefixes, changing them into globally unique VPN-IPv4 prefixes.

Use `no` form command to remove the RD configuration.

**Note:** RD configuration cannot be changed, it needs to be removed and added back with new value. When RD configuration is removed the RT configuration is also lost and needs to be reconfigured.

### Command Syntax

```
rd ASN:nn_or_IP-address:nn
no rd ASN:nn_or_IP-address:nn
```

### Parameters

#### ASN:nn\_or\_IP-address:nn

AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

### Default

No default value is specified

### Command Mode

VRF mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
(config)#ip vrf VRF_A
(config-vrf)#rd 100:1
```

---

## route-target

Use this command to add a list of import and export route-target extended communities to the VRF.

This command creates lists of import and export route-target extended communities for the VRF. It specifies a target VPN extended community. Execute the command once for each community. All routes with the specific route-target extended community are imported into all VRFs with the same extended community as an import route-target.

Use the `no` parameter with this command to delete a route target.

### Command Syntax

```
route-target (import|export|both) ASN:nn_or_IP-address:nn  
no route-target (import|export|both) ASN:nn_or_IP-address:nn
```

### Parameters

#### import

Import routing information

#### export

Export routing information

**Note:** Users can configure up to 128 export route-targets under "IP VRF mode".

#### both

Import and export routing information

#### ASN:nn\_or\_IP-address:nn

AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

### Default

No default value is specified

### Command Mode

VRF mode

### Applicability

This command was introduced before OcNOS version 1.3

### Examples

```
(config)#ip vrf VRF_A  
(config-vrf)#route-target both 100:10  
  
(config)#ip vrf VRF_A  
(config-vrf)#route-target import 100:20
```

## BGP Show Commands

This section describes the BGP show commands.

|                                                 |     |
|-------------------------------------------------|-----|
| show bgp .....                                  | 911 |
| show bgp A.B.C.D .....                          | 912 |
| show bgp A.B.C.D/M .....                        | 914 |
| show bgp client .....                           | 916 |
| show bgp community .....                        | 917 |
| show bgp community-list .....                   | 919 |

## show bgp

Use this command to display the status of BGP routes.

### Command Syntax

```
show bgp ipv4
show bgp (ipv6)
show bgp (ipv4|ipv6) (unicast|multicast)
show ip bgp
show ip bgp ipv4 (unicast|multicast)
show bgp (vrf (VRFNAME|all|default))
show ip bgp (vrf (VRFNAME|all|default))
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show ip bgp
BGP table version is 1, local router ID is 12.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network        Next Hop      Metric      LocPrf   Weight   Path
*> 1.1.1.1/32   0.0.0.0        0           100     32768    i

Total number of prefixes 1
```

## show bgp A.B.C.D

Use this command to display BGP route information for a network.

### Command Syntax

```
show bgp (ipv4) (unicast|multicast) A.B.C.D
show ip bgp A.B.C.D
show ip bgp ipv4 (unicast|multicast) A.B.C.D
```

### Parameters

#### ipv4

IPv4 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### A.B.C.D

IP prefix (network), for example, 35.0.0.0

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show ip bgp 80.80.80.0

BGP routing table entry for 80.80.80.0/24
Paths: (1 available, no best path)
Not advertised to any peer
300
15.15.15.1 (inaccessible) from 11.11.11.2 (15.15.15.2)
Origin incomplete, metric 0, localpref 100, valid, internal
rx path_id: 0      tx path_id: -1
Last update: Wed May 11 15:22:36 2016
```

[Table 17](#) explains the output fields.

**Table 17. show ip bgp output details**

| Field     | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| Paths     | The paths listed in the routing table, along with path information, and whether the path are being advertised. |
| Metric    | If shown, the value of the inter-autonomous system metric.                                                     |
| LocalPref | Local preference value as set with the set local-preference route-map configuration                            |

**Table 17. show ip bgp output details (continued)**

| Field       | Description                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------|
|             | command.                                                                                                                                 |
| rx path_id  | Autonomous system receive path to the source network. There can be one entry in this field for each autonomous system in the path.       |
| tx path_id  | Autonomous system transmit path to the destination network. There can be one entry in this field for each autonomous system in the path. |
| Last update | Last time since the neighbor transitioned to or from the established state.                                                              |

---

## show bgp A.B.C.D/M

Use this command to display BGP route information for a network prefix.

### Command Syntax

```
show bgp ipv4 (unicast|multicast) A.B.C.D/M
show ip bgp A.B.C.D/M
show ip bgp ipv4 (unicast|multicast) A.B.C.D/M
show ip bgp A.B.C.D/M (vrf (VRFNAME|all|default))
show ip bgp A.B.C.D/M longer-prefixes
show ip bgp ipv4 (unicast|multicast) A.B.C.D/M longer-prefixes
show ip bgp A.B.C.D/M longer-prefixes (vrf (VRFNAME|all|default))
```

### Parameters

**ipv4**

IPv4 routes

**unicast**

Unicast prefixes

**multicast**

Multicast prefixes

**A.B.C.D/M**

IP prefix (network/length), for example, 35.0.0.0/8

**longer-prefixes**

Display route and more specific routes

**VRFNAME**

VPN routing/forwarding instance name

**all**

All VRFs

**default**

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show bgp ipv4 unicast 22.22.22.22/32
BGP routing table entry for 22.22.22.22/32
Paths: (2 available, best #1, table Default-IP-Routing)
  Not advertised to any peer
  Local
    11.11.11.2 from 11.11.11.2 (2.2.2.2)
      Origin IGP, metric 0, localpref 100, valid, internal, best
      Last update: Fri Feb 16 09:46:54 2001
```

```
Local
11.11.12.2 from 11.11.12.2 (2.2.2.2)
  Origin IGP, metric 0, localpref 100, valid, internal
  Last update: Fri Feb 16 09:46:52 2001
```

## show bgp client

Use this command to display BGP client information.

### Command Syntax

```
show bgp client
```

### Parameters

None

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
R1#sh bgp client
BGP client ID: 11
  PIM, socket 10
    Service: AS number service, Route Service
    Message received 1, sent 1
    Connection time: Tue May 14 03:11:01 2019
    Last message read: Service Request
    Last message write: Service Reply
R1#
```

---

## show bgp community

Use this command to display BGP routes that match a community.

### Command Syntax

```
show bgp ip (unicast|multicast) community
show bgp ip (unicast|multicast) community (vrf (VRFNAME|all|default))
show bgp ip (unicast|multicast) community [AA:NN|local-AS|no-advertise|no-export] (exact-match|)
show ip bgp community
show ip bgp community [AA:NN|local-AS|no-advertise|no-export|internet] (exact-match|)
show ip bgp community (vrf (VRFNAME|all|default))
show ip bgp community [AA:NN|local-AS|no-advertise|no-export|internet] (exact-match|)
show ip bgp community-list WORD (exact-match|) (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) community
show ip bgp ipv4 (unicast|multicast) community (vrf (VRFNAME|all|default))
```

### Parameters

**ipv4**

IPv4 routes

**ipv6**

IPv6 routes

**unicast**

Unicast prefixes

**multicast**

Multicast prefixes

**VRFNAME**

VPN routing/forwarding instance name

**all**

All VRFs

**default**

Default VRF

**AA:NN**

Community number

**local-AS**

Do not send outside local AS (well-known community)

**no-advertise**

Do not advertise to any peer (well-known community)

**no-export**

Do not export to next AS (well-known community)

**internet**

Internet community (well-known community)

**exact-match**

Exact match of the communities

### Command Mode

Execution modePrivilege mode

## Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#show bgp community
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next H      Metric    LocPrf    Weight    Path
*> 2001:43f8:bb1::/64  ::         0         100       32768     ?

Total number of prefixes 1
```

## show bgp community-list

Use this command to display BGP routes that match a community list.

### Command Syntax

```
show bgp community-list WORD (exact-match|)show bgp ip (unicast|multicast) community-list WORD (exact-match|)
show bgp ip (unicast|multicast) community-list WORD (exact-match|)
show bgp (ipv4|ipv6) (unicast|multicast) community-list WORD (exact-match|)
show bgp (ipv6) community-list WORD (exact-match|)
show ip bgp community-list WORD (exact-match|)
show ip bgp ipv4 (unicast|multicast) community-list WORD (exact-match|)
```

### Parameters

#### **WORD**

Community list name

#### **ipv4**

IPv4 routes

#### **ipv6**

IPv6 routes

#### **unicast**

Unicast prefixes

#### **multicast**

Multicast prefixes

#### **exact-match**

Only routes that exactly match the community

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp community-list Originate
Named Community expanded list Originate
  permit 37721:1[0-2]0[05]$
  permit 37721:1[0-2]0[05]
```

---

## show bgp dampening dampened-paths

Use this command to display detailed information about paths suppressed due to dampening.

### Command Syntax

```
show bgp dampening dampened-paths
show bgp (ipv4|ipv6) (unicast|multicast) dampening dampened-paths
show bgp (ipv6) dampening dampened-paths
show ip bgp dampening dampened-paths
show ip bgp dampening dampened-paths (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) dampening dampened-paths
```

### Parameters

**ipv4**

IPv4 routes

**ipv6**

IPv6 routes

**unicast**

Unicast prefixes

**multicast**

Multicast prefixes

**VRFNAME**

VPN routing/forwarding instance name

**all**

All VRFs

**default**

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show ip bgp dampening dampened-paths
BGP table version is 32, local router ID is 3.3.3.3
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

| Network         | From       | Reuse    | Path  |
|-----------------|------------|----------|-------|
| d 11.11.11.0/24 | 90.90.90.1 | 00:27:20 | 200 i |

[Table 18](#) shows the status codes displayed at the start of a route entry.

**Table 18. Status details**

| Status Code | Description | Comments                                                                                                                                                                 |
|-------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s           | suppressed  | Whether the route is suppressed and is not advertised to neighbors.                                                                                                      |
| d           | damped      | When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit. |
| h           | history     | When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.                      |
| p           | stale       | When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale .                        |
| *           | valid       | Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.                                                              |
| >           | best        | The selected route to be installed in the kernel routing table.                                                                                                          |
| i           | internal    | The prefix was learned from an iBGP peer.                                                                                                                                |

[Table 19](#) shows the codes at the end of each route entry that indicate where the route originated.

**Table 19. Origin details**

| Origin Code | Description | Comments                                                                 |
|-------------|-------------|--------------------------------------------------------------------------|
| i           | IGP         | The route is from an Interior Gateway Protocol.                          |
| e           | EGP         | The route is from an Exterior Gateway Protocol.                          |
| ?           | incomplete  | Origin not known. Typically, these are routes redistributed from an IGP. |

[Table 20](#) explains the output fields.

**Table 20. show bgp dampening dampened-paths output details**

| Field   | Description                                                                                |
|---------|--------------------------------------------------------------------------------------------|
| Network | Internet address of a network.                                                             |
| From    | IP address of the advertising peer.                                                        |
| Reuse   | The amount of time remaining until this route will be un-suppressed and can be used again. |
| Path    | Autonomous system path to the destination network.                                         |

## show bgp dampening flap-statistics

Use this command to display BGP dampening flap statistics.

### Command Syntax

```
show bgp dampening flap-statistics
show bgp (ipv4|ipv6) (unicast|multicast) dampening flap-statistics
show bgp (ipv6) dampening flap-statistics
show ip bgp dampening flap-statistics
show ip bgp dampening flap-statistics (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) dampening flap-statistics
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

This sample output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

```
#show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network                From              Flaps   Duration   Reuse     Path
```

```
hi1.1.1.0/24 10.100.0.62 3 00:01:20 i
```

[Table 21](#) shows the status codes displayed at the start of a route entry.

**Table 21. status details**

| Status Code | Description | Comments                                                                                                                                                                 |
|-------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s           | suppressed  | Whether the route is suppressed and is not advertised to neighbors.                                                                                                      |
| d           | damped      | When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit. |
| h           | history     | When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.                      |
| p           | stale       | When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale .                        |
| *           | valid       | Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.                                                              |
| >           | best        | The selected route to be installed in the kernel routing table.                                                                                                          |
| i           | internal    | The prefix was learned from an iBGP peer.                                                                                                                                |

[Table 22](#) shows the codes at the end of each route entry that indicate where the route originated.

**Table 22. origin details**

| Origin Code | Description | Comments                                                                 |
|-------------|-------------|--------------------------------------------------------------------------|
| i           | IGP         | The route is from an Interior Gateway Protocol.                          |
| e           | EGP         | The route is from an Exterior Gateway Protocol.                          |
| ?           | incomplete  | Origin not known. Typically, these are routes redistributed from an IGP. |

[Table 23](#) explains the output fields.

**Table 23. show bgp dampening flap-statistics output details**

| Field    | Description                                                                                |
|----------|--------------------------------------------------------------------------------------------|
| Network  | Internet address of a network.                                                             |
| From     | IP address of the advertising peer.                                                        |
| Flaps    | Number of times this route has failed and returned (flapped).                              |
| Duration | Elapsed time since the first penalty points were assessed.                                 |
| Reuse    | The amount of time remaining until this route will be un-suppressed and can be used again. |
| Path     | Autonomous system path to the destination network.                                         |

---

## show bgp dampening parameters

Use this command to display the BGP dampening parameters.

### Command Syntax

```
show bgp dampening parameters
show bgp (ipv4|ipv6) (unicast|multicast) dampening parameters
show bgp (ipv6) dampening parameters
show ip bgp dampening parameters
show ip bgp ipv4 (unicast|multicast) dampening parameters (vrf (VRFNAME|all|default))
show ip bgp dampening parameters (vrf (VRFNAME|all|default))
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show ip bgp dampening parameters
dampening 5 750 2000 60 15
Dampening Control Block(s):
  Reachability Half-Life time      : 5 min
  Reuse penalty                    : 750
  Suppress penalty                 : 2000
  Max suppress time                : 60 min
  Un-reachability Half-Life time   : 15 min
  Max penalty (ceil)              : 11999
  Min penalty (floor)             : 375
#
```

[Table 24](#) explains the output fields.

**Table 24. show ip bgp dampening parameters output details**

| Field                          | Description                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Dampening Control Block(s)     | Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route. |
| Reachability Half-Life time    | Number of minutes after which an arbitrary value is halved if a route stays stable.                                                 |
| Reuse penalty                  | Reuse threshold—Arbitrary value below which a suppressed route can be used again.                                                   |
| Suppress penalty               | Cutoff (suppression) threshold—Arbitrary value above which a route can no longer be used or included in advertisements.             |
| Max suppress time              | Maximum hold-down time for a route, in minutes.                                                                                     |
| Un-reachability Half-Life time | Number of minutes after which an arbitrary value is not halved if a route stays stable.                                             |
| Max penalty (ceil)             | Maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level (ceil).                       |
| Min penalty (floor)            | Maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level (floor).                      |

---

## show bgp filter-list

Use this command to display routes that match a regular expression filter list.

### Command Syntax

```
show bgp filter-list WORD
show bgp (ipv4|ipv6) (unicast|multicast) filter-list WORD
show bgp (ipv6) filter-list WORD
show ip bgp filter-list WORD
show ip bgp ipv4 (unicast|multicast) filter-list WORD
show ip bgp filter-list WORD (exact-match)
show ip bgp filter-list WORD (exact-match) (vrf (VRFNAME|all|default))
show ip bgp filter-list WORD (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) filter-list WORD (exact-match) (vrf (VRFNAME|all|default))
```

### Parameters

#### WORD

Regular-expression filter list

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### exact-match

Exact match of the filter list

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

#### vrf

VPN Routing/Forwarding instance name

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

## Example

```
#show bgp filter-list bgp-local-onlyBGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop      Metric   LocPrf   Weight   Path
*> 2001:43f8:bb1::/6    ::              0        100      32768    ?

Total number of prefixes 1
```

---

## show bgp inconsistent-as

Use this command to display routes with inconsistent AS paths.

### Command Syntax

```
show bgp inconsistent-as
show bgp (ipv4|ipv6) (unicast|multicast) inconsistent-as
show bgp (ipv6) inconsistent-as
show ip bgp inconsistent-as
show ip bgp ipv4 inconsistent-as
show ip bgp ipv4 (unicast|multicast) inconsistent-as
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show bgp inconsistent-as
BGP table version is 3, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete
```

| Network     | Next Hop      | Metric | LocPrf | Weight | Path |
|-------------|---------------|--------|--------|--------|------|
| *> 10.1.0.0 | 172.29.232.55 | 0      | 0      | 100    | ?    |

## show bgp ipv6

Use this command to display the BGP routing table.

### Command Syntax

```
show bgp ipv6 (unicast|multicast|labeled|)
show bgp ipv6 (unicast|multicast|labeled|) X:X::X:X/M
```

### Parameters

#### multicast

IPv6 multicast address prefixes

#### unicast

IPv6 unicast address prefixes

#### labeled

Labeled IPv6 routes

#### X:X::X:X/M

IPv6 prefix network/length, such as 3ffe:a::/64

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example: iBGP and eBGP Routes

This example shows routes learned from both iBGP and eBGP.

```
#show bgp ipv6
BGP table version is 0, local router ID is 10.100.0.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal S stale,
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network                               Metric LocPrf Weight  Path
*> 2001:58::/32                           0      20 ?
    fe80::202:b3ff:fec8:9fdb
*> 2002:58::/32                           0      20 i
    fe80::202:b3ff:fec8:9fdb
*>i2003:58::/32                          100     0 i
    fe80::208:a1ff:fe16:797d
```

### Header

```
BGP table version is 0, local router ID is 10.100.0.77
```

- BGP table version
- BGP router ID is 10.100.0.77

```
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i - internal
```

[Table 25](#) shows the status codes displayed at the start of a route entry.

**Table 25. status details**

| Status Code | Description | Comments                                                                                                                                                                 |
|-------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s           | suppressed  | Whether the route is suppressed and is not advertised to neighbors.                                                                                                      |
| d           | damped      | When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit. |
| h           | history     | When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.                      |
| p           | stale       | When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale .                        |
| *           | valid       | Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.                                                              |
| >           | best        | The selected route to be installed in the kernel routing table.                                                                                                          |
| i           | internal    | The prefix was learned from an iBGP peer.                                                                                                                                |

Origin codes: i - IGP, e - EGP, ? - incomplete

[Table 26](#) shows the codes at the end of each route entry that indicate where the route originated.

**Table 26. origin codes**

| Origin Code | Description | Comments                                                                 |
|-------------|-------------|--------------------------------------------------------------------------|
| i           | IGP         | The route is from an Interior Gateway Protocol.                          |
| e           | EGP         | The route is from an Exterior Gateway Protocol.                          |
| ?           | incomplete  | Origin not known. Typically, these are routes redistributed from an IGP. |

## Route Entry Examples

```
*> 2002:58::/32    fe80::202:b3ff:fec8:9fdb                0 20 i
```

- This route entry shows that this route is learned from eBGP.
- The origin code “i” means that the prefix is added by the network statement at originating AS.
- The path 20 indicates that the prefix advertisement originated from AS20.
- The administrative weight parameter applies only to routes within an individual router.
- Since this route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.

```
*> 2001:58::/32    fe80::202:b3ff:fec8:9fdb                0 20 ?
```

- This route entry shows that the prefix is learnt from eBGP. The origin code i indicates that the prefix is added by network statement at originating AS. The path attribute 20 indicates that the route advertisement originated from AS20. The administrative weight parameter applies only to routes within an individual router. Since this route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768. The origin code “?” means the route was learned through redistribution.

```
*>i2003:58::/32 fe80::208:a1ff:fe16:797d 100 0 i
```

- The status code “i” means that the route was learned through iBGP. The Local Preference attribute of the route, which is used only with the local AS, is set to 100 (the default value).

## Example: IPv6 Prefix Routes

This example shows labeled routes for a given IPv6 prefix:

```
#show bgp ipv6 labeled 3ffe:a::/64
BGP routing table entry for 3ffe:a::/64
Paths: (1 available, best #1, table Default-IP-Routing-Table)
Not advertised to any peer
Local
::ffff:114:1414 from 20.20.20.1 (92.92.92.92)
Origin incomplete metric 0, localpref 100, label    5420,
valid, internal, best
Last update: Mon May 26 17:48:18 2008
```

[Table 27](#) explains the output fields.

**Table 27. show bgp ipv6 output details**

| Field       | Description                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Paths       | The paths listed in the routing table, along with path information, and whether the path are being advertised.                           |
| Metric      | If shown, the value of the inter-autonomous system metric.                                                                               |
| LocalPref   | Local preference value as set with the set local-preference route-map configuration command.                                             |
| rx path_id  | Autonomous system receive path to the source network. There can be one entry in this field for each autonomous system in the path.       |
| tx path_id  | Autonomous system transmit path to the destination network. There can be one entry in this field for each autonomous system in the path. |
| Last update | Last time since the neighbor transitioned to or from the established state.                                                              |

---

## show bgp ipv6 peer-group

Use this command to list the BGP peer group information in ipv6 unicast.

### Command Syntax

```
show bgp ipv6 peer-group (WORD|)
```

### Parameters

#### WORD

Name of the peer group

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced in OcNOS version 4.2.

### Example

```
#show bgp ipv6 peer-group p2
BGP dynamic peer-group is p2, IBGP, remote AS 42949672
  BGP dynamic peer-group p2 listen range group members:
  5ffe:3::/64
  BGP version 4
Minimum time between advertisement runs is 5 seconds
For address family: IPv6 Unicast
  Peer-group member:
  *5ffe:3::1
  Index 2, Offset 0, Mask 0x4
  0 accepted prefixes, 0 announced prefixes
#
```

## show bgp l2vpn vpls

### Command Syntax

```
show bgp l2vpn vpls (rr|) (detail|)
```

### Parameters

#### rr

Display the information of auto-discovered peers at Route reflector node.

#### detail

Display the detailed information of auto-discovered peers.

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced in version OcNOS version 1.3.

### Example

```
#show bgp l2vpn vpls
VPLS-ID   VE-ID   Discovered-Peers   Route-Target
10        3       1                  10:100

#show bgp l2vpn vpls detail

VPLS ID: 10
VE-ID: 3
Discovered Peers: 1
Route-Target: 10:100
Local RD: 10:100
Mesh Peers:
  Address:3.3.3.3, RD:10:100, VE-ID:4
  VC Details: VC-ID:34
  Remote (LB:52480,VBO:1,VBS:64) Local (LB:52480,VBO:1,VBS:64)
  LB sent on known VEID:Yes
  In Label:52483, Out Label:52482
  PW Status:Established
```

[Table 28](#) explains the output fields.

**Table 28. show bgp l2vpn vpls output details**

| Field            | Description                                                                           |
|------------------|---------------------------------------------------------------------------------------|
| VPLS-ID          | L2VPN address family database information for the Virtual Private LAN Service (VPLS). |
| VE-ID            | L2VPN address family database information for the Virtual Expansion.                  |
| Discovered Peers | Peer discovery is used to find peers that are available for data using LLDP.          |

**Table 28. show bgp l2vpn vpls output details (continued)**

| Field                 | Description                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Route-Target          | An identifier prepended to IP addresses to assure the uniqueness of the address.                                                       |
| Local RD              | The Local Route Descriptor – the first two numbers of the Route-Target.                                                                |
| Mesh Peers            | Internal BGP peers – devices that do not re-advertise routes to other IBGP devices.                                                    |
| Address               | Mesh session information for the peer specified with the ip-address argument.                                                          |
| RD                    | Mesh peer's Route-Descriptor.                                                                                                          |
| VC Details            | The virtual circuit session information with the ip-address for the Provider Edge (PE) routers.                                        |
| Remote                | LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. |
|                       | VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router.                         |
|                       | VBS (VE Block Size) – the size of the label block.                                                                                     |
| Local                 | LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. |
|                       | VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router.                         |
|                       | VBS (VE Block Size) – the size of the label block.                                                                                     |
| LB sent on known VEID | Whether the Label Base came on a known Virtual Expansion Identifier – yes or no.                                                       |
| In Label              | The ingress (incoming interface) label for this segment.                                                                               |
| Out Label             | Label received from downstream neighbor for route.                                                                                     |
| PW Status             | The status of the VPLS Pseudo-Wire. Values can be: Idle, Active, Open, or Established.                                                 |

```
#show bgp l2vpn vpls rr

[Table 29](#) explains the output fields.

**Table 29. show bgp l2vpn vpls rr output details**

| Field        | Description                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Route-Target | An identifier prepended to IP addresses to assure the uniqueness of the address.                                                       |
| Peer         | Internal BGP peers – devices that do not re-advertise routes to other IBGP devices.                                                    |
| RR Client    | Device is a client of the Route Reflector – yes or no.                                                                                 |
| VE-ID        | L2VPN address family database information for the Virtual Expansion.                                                                   |
| LB           | LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. |
| VBO          | VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router.                         |
| VBS          | VBS (VE Block Size) – the size of the label block.                                                                                     |

---

## show bgp label-pool

Use this command to display the label management in BGP protocol.

### Command Syntax

```
show bgp label-pool (block-id <0-1638>|)
```

### Parameters

#### block-id

Block identifier of a block that is allocated to the protocol.

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced in version OcNOS version 6.5.4.

### Example

```
#show bgp label-pool
Module: BGP, Label range: 16-1048575, Current block: 78
+-----+-----+-----+-----+-----+-----+
block_id label_min label_max usable_labels free_labels first_free_label
+-----+-----+-----+-----+-----+-----+
78 49920 50559 640 96 50464
Total - blocks: 1, used-labels: 544, free-labels: 96
```

## show bgp neighbors

Use this command to display information about BGP neighbor connections.

### Command Syntax

```
show bgp neighbors
show bgp ipv6 neighbors
show ip bgp ipv4 (unicast|multicast) neighbors
show ip bgp neighbors
show ip bgp neighbors (A.B.C.D|X:X::X:X) (advertise-routes|)
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X)
show ip bgp neighbors (A.B.C.D|X:X::X:X) (hold-time|keepalive-interval|connection-retrytime)
show ip bgp neighbors (A.B.C.D|X:X::X:X) (sent-msgs|rcvd-msgs|notification|update|open|keepalive)
```

### Parameters

#### ipv4

IPv4 neighbors

#### ipv6

IPv6 neighbors

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### A.B.C.D

IPv4 neighbor

#### X:X::X:X

IPv6 neighbor

#### advertised-routes

Routes advertised to a BGP neighbor

#### hold-time

Hold time

#### keepalive-interval

Keepalive interval

#### connection-retrytime

Connection retry time

#### sent-msgs

Sent packets

#### rcvd-msgs

Received packets

#### notification

Notification messages

**update**

Update messages

**open**

Open messages

**keepalive**

Keepalive messages

**Command Mode**

Execution modePrivilege mode

**Applicability**

This command was introduced before OcNOS version 1.3.

**Examples**

```
#show bgp neighbors
BGP neighbor is 2.2.2.2, remote AS 200, local AS 200, internal link
Member of peer-group myPeer for session parameters
  BGP version 4, remote router ID 10.12.7.155
  BGP state = Established, up for 00:04:55
  Last read 00:04:55, hold time is 90, keepalive interval is 30 seconds
Neighbor capabilities:
  Route refresh: advertised and received (old and new)
  Address family IPv4 Unicast: advertised and received
Received 11 messages, 0 notifications, 0 in queue
Sent 11 messages, 0 notifications, 0 in queue
Route refresh request: received 0, sent 0
Minimum time between advertisement runs is 5 seconds
For address family: IPv4 IPv4
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  myPeer peer-group member
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

Connections established 1; dropped 0
Local host: 2.2.2.1, Local port: 33865
Foreign host: 2.2.2.2, Foreign port: 179
TCP MSS: (800), Advertise TCP MSS: (800), Send TCP MSS: (800), Receive TCP MSS:
(536)
Nexthop: 2.2.2.1
Nexthop global: 1111::1
Nexthop local: fe80::a00:27ff:fecc:47a6
BGP connection: non shared network
Last Reset: 00:32:48, due to BGP Notification sent
Notification Error Message: (OPEN Message Error/Bad Peer AS.)
```

**BGP Neighbor Fields**[Table 30](#) explains the output fields.**Table 30. show bgp neighbor output details**

| Field        | Description                                                            |
|--------------|------------------------------------------------------------------------|
| BGP neighbor | BGP session information for the neighbor with the ip-address argument. |

**Table 30. show bgp neighbor output details (continued)**

| Field                                    | Description                                                                                                                                                                                                                                                                                    |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remote AS                                | Remote Autonomous system used to exchange exterior routing information between neighboring ASs.                                                                                                                                                                                                |
| local AS                                 | Local Autonomous system used to exchange internal routing information within AS.                                                                                                                                                                                                               |
| internal link<br>external link           | Internal link is used to forward route advertisements received from an external BGP router through the internal network (in the same AS).<br>External link is used for exchanging routing information between Autonomous Systems (AS) and routing traffic across the Internet (eBGP neighbor). |
| member of peer-group                     | Peer group information for the peer group specified with the peer-group argument.                                                                                                                                                                                                              |
| BGP version                              | Negotiated BGP version for this session.                                                                                                                                                                                                                                                       |
| remote router ID                         | IP address of the neighbor. BGP uses the highest loopback address as the Router ID. If no loopback interface is configured, BGP uses the highest configured IP address on a system.                                                                                                            |
| BGP state                                | Session state as explained in <a href="#">Table 35</a> . The exchange of routing information begins between peers only after the neighbor session is in an Established state.                                                                                                                  |
| up for                                   | Time that the underlying TCP connection has been up.                                                                                                                                                                                                                                           |
| last read                                | Time since BGP last received a message from this neighbor.                                                                                                                                                                                                                                     |
| hold time                                | Time, in seconds, that BGP will maintain the session with this neighbor without receiving messages.<br>The maximum time that can elapse between successive messages from this neighbor is 180 seconds. If no message is received for 180 seconds, this neighbor will be declared dead.         |
| last write                               | Time since BGP last sent a message to this neighbor.                                                                                                                                                                                                                                           |
| keepalive interval                       | Time interval, in seconds, at which keepalive messages are transmitted to this neighbor.<br>The time interval between successive keepalive messages is 60 seconds. Typically, the hold time value is set to three times the keepalive interval.                                                |
| neighbor capabilities                    | BGP capabilities advertised and received from this neighbor. "Advertised and received" is displayed when a capability is successfully exchanged between two routers.                                                                                                                           |
| received                                 | Total number of received messages.<br>notifications: Number of notification (error) messages received.<br>in queue: Number of messages in the input queue                                                                                                                                      |
| sent                                     | Total number of sent messages.<br>notifications: Number of notification (error) messages sent.<br>in queue: Number of messages in the output queue                                                                                                                                             |
| route refresh request                    | Number of route refresh request messages sent and received.                                                                                                                                                                                                                                    |
| minimum time between advertisement runs. | The minimum time gap, in seconds, between successive route updates sent to the neighbor.<br>Generally, a jitter (of 25%) is applied to this time interval, which means that if the time                                                                                                        |

**Table 30. show bgp neighbor output details (continued)**

| Field                      | Description                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | between advertisements is configured as 30, successive advertisements can have a time gap of as low as 22.5 (after applying a 25% jitter to the 30 seconds, which is 7.5 seconds).                                                                                                 |
| for address family         | The peers have exchanged address family capability.                                                                                                                                                                                                                                |
| BGP table version          | For each of the address families agreed upon, BGP maintains a separate table.                                                                                                                                                                                                      |
| neighbor version           | Tracks prefixes that have been sent and those that need to be sent.                                                                                                                                                                                                                |
| connections established    | The number of times the router has established a TCP connection and the two peers have agreed to speak BGP with each other.<br>“Dropped” means the number of time the connection has failed or gone down.                                                                          |
| local host<br>foreign host | Local host is the IP address and the port number of the local system used for the peering session.<br>Foreign host is the IP address and the port of the neighbor.<br>BGP always uses the TCP port number 179 for the peer originating the session.                                |
| TCP MSS                    | This value indicates the configured TCP MSS value using the <code>neighbor A.B.C.D tcp-mss &lt;40-1440&gt;</code> command. If the TCP MSS value is not configured explicitly, the system shows a value of 0.                                                                       |
| Advertise TCP MSS          | The host communicates this value during the TCP connection establishment phase, specifically during the TCP handshake. It is based on the network path's Maximum Transmission Unit (MTU) and any TCP options set on the host.                                                      |
| Send TCP MSS               | This value represents the MSS for the connection, typically the lesser of the two MSS values exchanged.                                                                                                                                                                            |
| Receive TCP MSS            | This value reflects the MSS that the Kernel believes the client TCP stack uses for receiving data, indicating the largest TCP segment size the client can handle for incoming packets.                                                                                             |
| nexthop                    | The IP address of the next hop used to reach the neighbor.<br>eBGP or iBGP peers do not need to be directly connected. Peering sessions can be set up across multiple hops. If the neighbors are directly connected, the IP address of the local system is listed as the next hop. |
| nexthop global             | The global IPv6 address of the next hop                                                                                                                                                                                                                                            |
| nexthop local              | The link-local IPv6 address of the next hop                                                                                                                                                                                                                                        |
| non shared network         | The peering session is running on a non shared network.                                                                                                                                                                                                                            |
| last reset                 | Time since this peering session was last reset. The reason for the reset is displayed on this line.                                                                                                                                                                                |
| notification error message | Last error message sent.                                                                                                                                                                                                                                                           |

## show bgp neighbors advertised-routes

Use this command to display the routes advertised to a BGP neighbor.

### Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes (vrf (VRFNAME|all|default))
show ip bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) advertised-routes
```

### Parameters

#### A.B.C.D

IPv4 neighbor

#### X:X::X:X

IPv6 neighbor

#### ipv4

IPv4 addresses

#### multicast

Multicast prefixes

#### unicast

Unicast prefixes

#### vrf

VPN Routing/Forwarding instance name

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp neighbors 11.11.11.2 advertised-routes
BGP table version is 3, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop        Metric      LocPrf        Weight      Path
*>i 33.33.33.33/32  11.11.11.1      0           100           32768       i

Total number of prefixes 1
```

---

## show bgp neighbors received prefix-filter

Use this command to display the prefix list filter.

### Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) received prefix-filter
show ip bgp neighbors (A.B.C.D|X:X::X:X) received prefix-filter
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) received prefix-filter
```

### Parameters

**A.B.C.D**

IPv4 address

**X:X::X:X**

IPv6 address

**ipv4**

IPv4 addresses

**unicast**

Unicast prefixes

**multicast**

Multicast prefixes

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp neighbors 100.1.1.1 received prefix-filter
Address family: IPv4 Unicast
ip prefix-list 100.1.1.1.1: 1 entries
seq 5 permit 1.1.1.1/32
```

---

## show bgp neighbors received-routes

Use this command to view all the received routes, including all AFI/SAFI routes, from a BGP neighbour. Executing this CLI displays the received routes from accessing:

- BGP local RIB or
- BGP ADJ\_IN RIB only if the 'soft-reconfiguration inbound' feature is supported.

### Command Syntax

```
show ip bgp neighbors (A.B.C.D|X:X::X:X) received-routes (vrf (VRFNAME|all|default)|)
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) received-routes
```

### Parameters

**A.B.C.D**

IPv4 address

**X:X::X:X**

IPv6 address

**ipv4**

IPv4 addresses

**unicast**

Unicast prefixes

**multicast**

Multicast prefixes

**VRFNAME**

VPN Routing/Forwarding instance name

**all**

All VRFs

**default**

Default VRF (Global routing)

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3. and updated in OcNOS version 6.3.1.

### Example

```
OcNOS#show bgp neighbors 77.242.226.32 received-routes
% Inbound soft reconfiguration is not supported, displaying the received routes from accessing BGP
local RIB
For address family: IPv4 Unicast
BGP table version is 610, local router ID is 14.14.14.14
Status codes: s suppressed, d damped, h history, a add-path, * valid, > best, i - internal,
l - labeled, S Stale
```

```

Origin codes: i - IGP, e - EGP, ? - incomplete
Network Next Hop Metric LocPrf Weight Path
* i 20.20.20.0/24 77.242.226.32 0 100 0 ?
*>i 77.242.226.32/32 77.242.226.32 0 100 0 ?
*>i 200.10.1.0 77.242.226.32 0 100 0 ?
Total number of prefixes 3
For address family: VPNv4 Unicast
Status codes: s suppressed, d damped, h history, a add-path, * valid, > best, i - internal, l -
labeled
S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network Next Hop Metric LocPrf Weight Path
Route Distinguisher: 77.242.226.32:100
*>i 200.10.1.0 77.242.226.32 0 100 0 ?
Accepted routes count = 1
Route Distinguisher: 65535:22
*>i 10.50.100.160/30 10.10.40.133 0 100 0 ?
*>i 10.202.167.0/24 10.10.40.133 0 100 0 ?
Accepted routes count = 2

OcNOS#sh bgp neighbors 10.10.40.133 received-routes | begin VPNv4
...skipping
For address family: VPNv4 Unicast
Status codes: s suppressed, d damped, h history, a add-path, * valid, > best, i - internal, l -
labeled
S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network Next Hop Metric LocPrf Weight Path
Route Distinguisher: 65535:22
*>i 10.50.100.160/30 10.10.40.133 0 100 0 ?
*>i 10.202.167.0/24 10.10.40.133 0 100 0 ?
Accepted routes count = 2
To view the received-routes of particular address-family, use below filter.
"sh bgp neighbors 10.10.40.133 received-routes | begin LINE"
LINE can be of { IPv4 Unicast or
IPv4 Labeled-Unicast or
VPNv4 Unicast or
IPv6 Unicast or
6PE Labeled Unicast or
VPNv6 Unicast
}

```

## show bgp neighbors routes

Use this command to display all accepted routes learned from neighbors.

### Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) routes
```

### Parameters

#### A.B.C.D

IPv4 address

#### X:X::X:X

IPv6 address

#### ipv4

IPv4 addresses

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

The following output displays detailed information about the neighbor.

```
#show bgp neighbors 10.10.10.2 routes
BGP neighbor is fe80::203:47ff:feb0:d72b, remote AS 10, local AS 10, internal link
  BGP version 4, remote router ID 10.10.10.50
  BGP state = Established, up for 00:02:01
  Last read 00:00:01, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 3 messages, 0 notifications, 0 in queue
  Sent 5 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes
```

[Table 31](#) explains the output fields.

**Table 31. show bgp neighbors routes output details**

| Field                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP neighbor                               | Neighbor identifier along with the local and remote Autonomous System numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| BGP version                                | The version of BGP being used by the neighbor device, along with the remote router ID number.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BGP state                                  | The current state of the neighbor connection and length of time within the current state. Possible states are: Idle, Connect, Active, and Established.                                                                                                                                                                                                                                                                                                                                                                        |
| Last read                                  | The amount of time in Hours : Minutes : Seconds since this device last checked the Hold Time parameters.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| hold time                                  | The amount of time this device waits for a Keepalive or Update message before the BGP connection is closed.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Keepalive interval                         | KEEPALIVE messages are sent periodically to ensure that the connection is live.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Neighbor capabilities                      | <p>New or optional parameters called “Capabilities.” Provides a graceful way to advertise new or unique options without causing peering to terminate. The capabilities are communicated in TLV fields. (see RFC 3392).</p> <p>In the example output above, the following capabilities were advertised by the neighbor and were received and understood by this device:</p> <ol style="list-style-type: none"> <li>1. Route refresh</li> <li>2. Address family IPv4 Unicast</li> <li>3. Address family IPv6 Unicast</li> </ol> |
| Route refresh                              | This helps to identify that and synchronize the peers without a hard reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| For address family                         | Address Family Identifier (AFI) IPv4 Unicast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Community attributes sent to this neighbor | Both the standard and the extended community information has been sent to the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| accepted prefixes                          | Configure a limit to the number of prefixes that can be accepted in a BGP peer session.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| announced prefixes                         | A prefix announced in BGP consists of the IPV4 or IPV6 address block being announced.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## show bgp nexthop-tracking

Use this command to display BGP nexthop-tracking status.

### Command Syntax

```
show bgp nexthop-tracking
```

### Parameters

None

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp nexthop-tracking

Configured NHT: ENABLED
NHT Delay time-interval : 6
BGP VRF: (Default) VRF_ID 0
BGP Instance: (Default), AS: 100, router-id 4.4.4.40
NHT is Enabled
Rcvd Msg count from RIB: 0
NHT delay-timer remaining seconds: 0
BGP nexthop(s):
Total number of IPV4 nexthops : 0
Total number of IPV6 nexthops : 0

BGP VRF: VRF_A VRF_ID 2
BGP Instance: (Default), AS: 100, router-id 4.4.4.40
NHT is Enabled
Rcvd Msg count from RIB: 0
NHT delay-timer remaining seconds: 0
BGP nexthop(s):
Total number of IPV4 nexthops : 0
Total number of IPV6 nexthops : 0
```

[Table 32](#) explains the output fields.

**Table 32. show bgp nexthop-tracking output details**

| Field                   | Description                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------|
| Configured NHT          | Whether Next Hop Tracking (NHT) is enabled or disabled.                                      |
| NHT Delay time-interval | A delay timer that indicates how long this device waits before checking its RIB for changes. |
| BGP VRF                 | Name and ID number of this BGP VRF.                                                          |

**Table 32. show bgp nexthop-tracking output details (continued)**

| Field                             | Description                                                        |
|-----------------------------------|--------------------------------------------------------------------|
| BGP Instance                      | Autonomous System number and router ID.                            |
| NHT is Enabled                    | NHT Network enables the measurement and comparison of performance. |
| Recvd Msg count from RIB          | Number of received change-messages from the RIB.                   |
| NHT delay-timer remaining seconds | Time remaining until the next decision cycle.                      |
| BGP nexthop(s)                    | Nexthop in the BGP to reach a certain destination.                 |
| Total number of IPV4 nexthops     | Number of nexthops in the IPv4 Address Family.                     |
| Total number of IPV6 nexthops     | Number of nexthops in the IPv6 Address Family.                     |

---

## show bgp nexthop-tree-details

Use this command to display BGP nexthop-tree details.

### Command Syntax

```
show bgp nexthop-tree-details
```

### Parameters

None

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp nexthop-tree-details
BGP Instance: (Default), AS: 65534, router-id 51.1.1.3
AFI_IP Nexthop count : 0
AFI_IP6 Nexthop count : 0

BGP Instance: (Default), AS: 0, router-id 51.1.1.3
AFI_IP Nexthop count : 0
AFI_IP6 Nexthop count : 0
```

[Table 33](#) explains the output fields.

**Table 33. show bgp nexthop-tree-details output details**

| Field                 | Description                                 |
|-----------------------|---------------------------------------------|
| Bgp Instance          | The Autonomous System number and router ID. |
| AFI_IP Nexthop count  | Nexthop count for the IPv4 Address Family   |
| AFI_IP6 Nexthop count | Nexthop count for the IPv6 Address Family   |

## show bgp paths

Use this command to display BGP path information.

### Command Syntax

```
show bgp paths
show bgp (ipv6) paths
show ip bgp paths
show ip bgp ipv4 (unicast|multicast) paths
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp paths

Address          Refcnt    Path
[0x1af8ee0:0]    (21)
[0x1b3ceb0:345] (14)      64602
[0x1c71d40:821] (12008) 64602 65500
[0x1d03fb0:822] (12008) 64602 65501
```

[Table 34](#) explains the output fields.

**Table 34. show bgp paths output details**

| Field   | Description                                         |
|---------|-----------------------------------------------------|
| Address | Hash and hash key separated by the colon character. |
| Refcnt  | Number of routed using that path.                   |
| Path    | Autonomous System Number (ASN) for the route.       |

---

## show bgp prefix-list

Use this command to display routes matching the prefix-list.

### Command Syntax

```
show bgp prefix-list WORD
show bgp (ipv4|ipv6) (unicast|multicast|) prefix-list WORD (vrf (VRFNAME|all|default|))
show ip bgp prefix-list WORD
show ip bgp prefix-list WORD (exact-match)
show ip bgp prefix-list WORD (exact-match) (vrf (VRFNAME|all|default|))
show ip bgp ipv4 (unicast|multicast) prefix-list WORD
show ip bgp ipv4 (unicast|multicast) prefix-list WORD (exact-match)
```

### Parameters

#### WORD

Name of the IP prefix list

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### exact-match

Exact match of the prefix list

#### vrf

VPN Routing/Forwarding instance

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show ip bgp prefix-list Route1
BGP table version is 1, local router ID is 12.0.0.1
```

```
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network      Next Hop      Metric    LocPrf    Weight    Path
*>1.1.1.1/32  0.0.0.0          0         100       32768     i

Total number of prefixes 1
```

## show bgp quote-regexp

Use this command to display route matching an AS path quoted regular expression.

### Command Syntax

```
show bgp quote-regexp WORD
show bgp (ipv4|ipv6) (unicast|multicast|) quote-regexp WORD
show ip bgp quote-regexp WORD
show ip bgp ipv4 (unicast|multicast) quote-regexp WORD
```

### Parameters

#### WORD

A regular expression to match the AS paths. Use quotes to enclose the regular expression.

#### ipv4

IPv4 route information

#### ipv6

IPv6 route information

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp quote-regexp ^$
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop      Metric    LocPrf    Weight    Path
*> 2001:43f8:bb1::/64      :           0         100       32768     ?

Total number of prefixes 1
```

## show bgp regexp

Use this command to display routes matching the AS path regular expression.

### Command Syntax

```
show bgp regexp LINE
show bgp (ipv4|ipv6) (unicast|multicast) regexp LINE
show bgp (ipv6) regexp LINE
show ip bgp regexp LINE
show ip bgp vrf (VRFNAME|all|default) regexp LINE
show ip bgp ipv4 (unicast|multicast) regexp LINE
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### LINE

A regular expression to match the AS paths

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp regexp ^$
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop    Metric    LocPrf    Weight    Path
*> 2001:43f8:bb1::/64    ::          0         100       32768     ?

Total number of prefixes 1
```

---

## show bgp route-map

Use this command to display routes that match the specified route map.

### Command Syntax

```
show bgp route-map WORD
show bgp (ipv4|ipv6) (unicast|multicast) route-map WORD
show bgp (ipv6) route-map WORD
show ip bgp route-map WORD
show ip bgp route-map WORD (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) route-map WORD
```

### Parameters

#### WORD

Routes matching the route-map

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### vrf

VPN routing/forwarding instance

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show ip bgp prefix-list Route1
BGP table version is 1, local router ID is 12.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

| Network      | Next Hop | Metric | LocPrf | Weight | Path |
|--------------|----------|--------|--------|--------|------|
| *>1.1.1.1/32 | 0.0.0.0  | 0      | 100    | 32768  | i    |

## show bgp statistics

Use this command to display BGP statistics.

### Command Syntax

```
show bgp statistics
```

### Parameters

None

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show bgp statistics

## show bgp summary

Use this command to display a summary of BGP neighbor status.

### Command Syntax

```
show bgp summary
show bgp (ipv4|ipv6) (unicast|multicast|) summary
show ip bgp summary
show ip bgp summary (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) summary
```

### Parameters

#### ipv4

IPv4 routes

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp summary

BGP router identifier 6.6.6.6, local AS number 64601

BGP table version is 1

1 BGP AS-PATH entries

0 BGP community entries

Neighbor V    AS    MsgRcv   MsgSen  TblVer   InQ    OutQ    Up/Down   State/PfxRcd
*12.1.1.24 64902    7         7        1        0      0    00:02:54      0
```

```
* Dynamically created based on a listen range command

BGP dynamic peer-group: group1

listen range: 12.1.0.0/16

Total number of dynamically created neighbors: 1
Total number of activated dynamic peer-groups for IPv4 Unicast address-family:
Total number of neighbors 1
Total number of Established sessions 1

BGP dynamic peer-group: group2
listen range: 12.2.0.0/16
Total number of dynamically created neighbors/limit: 0/(200)
Total number of dynamically created neighbors: 0
Total number of activated dynamic peer-groups for IPv4 Unicast address-family: 1
```

## Header

```
BGP router identifier 10.10.15.50, local AS number 65000
1 BGP AS-PATH entries
0 BGP community entries
```

- The BGP router identifier is 10.10.15.50 and the local router AS number is 65000.
- The BGP table version tracks the local BGP table version. Any time the BGP best path algorithm executes, the table version increments.
- There is one BGP AS-PATH entry and no community entries.

## Neighbor Entry Fields

[Table 35](#) explains the fields for each neighbor entry.

**Table 35. neighbor entry fields**

| Field        | Description                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor     | IP address of peer.                                                                                                                                                              |
| V            | BGP version of peer.                                                                                                                                                             |
| AS           | Autonomous system number of peer.                                                                                                                                                |
| MsgRcvd      | Messages received since the BGP connection was established.                                                                                                                      |
| MsgSent      | Messages sent since the BGP connection was established.                                                                                                                          |
| TblVer       | Last version of the local router's BGP database advertised to the peer.                                                                                                          |
| InQ          | Received messages waiting in the input queue for further processing.                                                                                                             |
| OutQ         | Messages waiting in the output queue to be sent.                                                                                                                                 |
| Up/Down      | Connection up time and down time.                                                                                                                                                |
| State/PfxRcd | <p>If the TCP session is up and the BGP peers have formed an adjacency, this field shows how many prefixes have been received from the remote neighbor.</p> <p>Other states:</p> |

**Table 35. neighbor entry fields (continued)**

| Field | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <p>Idle: The local router has not allocated resources for the peer connection, so incoming connection requests are refused</p> <p>Idle (Admin): The peer has shut down</p> <p>Idle (PfxCt): Prefix overflow</p> <p>Idle (G-shut): Graceful shutdown</p> <p>Connect: BGP is waiting for the TCP connection to complete</p> <p>Active: the local router is trying to establish a TCP connection to the remote peer. You might see this if the local peer has been configured, but the remote peer is unreachable or has not been configured.</p> <p>OpenSent: BGP is waiting for an open message from its peer</p> <p>OpenConfirm: BGP received an open message from the peer and is now waiting for a keepalive or notification message. If BGP receives a keepalive message from the peer, the state changes to established. If the message is a notification, the state changes to idle.</p> <p>Established: BGP is ready to exchange update, notification, and keepalive messages with its peer</p> <p>Invalid: The session state is invalid</p> |

**Neighbor Entry Example**

```
10.10.14.51  4   100  93      120    0    0    0    00:42:16    0
```

- The neighbor has the IP address 10.10.14.51 and AS number 100.
- The neighbor uses BGP version 4.
- 93 messages have been received.
- 120 messages have been sent.
- The BGP routing table version is 0.
- There are no received messages waiting in the input queue for further processing.
- There are no messages waiting in the output queue to be sent.
- The connection has been up for 0 hours, 42 minutes and 53 seconds.
- The local router has received no prefixes from this neighbor.

## show bgp X:X::X:X

Use this command to display BGP network information in an IPv6 environment.

### Command Syntax

```
show bgp X:X::X:X
show bgp (ipv6) X:X::X:X
show bgp (ipv6) (unicast|multicast) X:X::X:X
```

### Parameters

#### ipv6

IPv6 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### X:X::X:X

IPv6 prefix (network), for example, 2003::

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

```
#show bgp ipv6 6666::/64
BGP routing table entry for 6666::/64
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Advertised to peer-groups:
    Book-v6
    Local
      :: from :: (102.67.98.95)
        Origin incomplete,metric 0, localpref 100, weight 32768      valid, sourced, best, source safi:
0      Community: 37721:2000
      Last update: Thu Feb  4 09:00:50 2021
```

---

## show bgp X:X::X:X/M longer prefixes

Use this command to display BGP network information along with mask information.

### Command Syntax

```
show bgp X:X::X:X/M longer-prefixes
```

### Parameters

#### X:X::X:X/M

IPv6 prefix (network/length), for example, 2003::/16

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

```
#show bgp 2001:43f8:bb1::/64 longer-prefixes
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop    Metric    LocPrf    Weight    Path
*>2001:43f8:bb1::/64  ::          0         100       32768     ?

Total number of prefixes 1
```

## show debugging bgp

Use this command to display BGP debugging options.

### Command Syntax

```
show debugging bgp
```

### Parameters

None

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Example

This is a sample output from the show debugging bgp command.

```
#show debugging bgp
BGP debugging status:
  BGP debugging is on
  BGP events debugging is on
  BGP updates debugging is on
  BGP fsm debugging is on
```

## show ip bgp

Use this command to display BGP routes.

### Command Syntax

```
show ip bgp
show ip bgp ipv4 (unicast|multicast) (vrf (VRFNAME|all|default))
```

### Parameters

#### ipv4

IPv4 routes

#### unicast

Unicast prefixes

#### multicast

Multicast prefixes

#### VRFNAME

VPN routing/forwarding instance name

#### all

All VRFs

#### default

Default VRF

### Command Mode

Execution modePrivilege mode

### Applicability

This command was introduced before OcNOS version 1.3.

### Examples

This example shows routes learned from both iBGP and eBGP peers.

```
#show ip bgp
BGP table version is 0, local router ID is 10.100.0.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S stale,
Origin codes: i - IGP, e - EGP, ? - incomplete
      Network          Next Hop      Metric LocPrf   Weight    Path
*> 172.16.1.0/24      10.10.10.78              0         1 4 i
*> 192.16.1.0         10.10.10.78          200              1 4 ?
*                    10.100.0.62          100              3 4 ?
*>i 192.17.1.0        10.100.0.62           100              i

Total number of prefixes 2
```

### Header

```
BGP table version is 0, local router ID is 10.100.0.77
```

- The BGP table version tracks the local BGP table version. Any time the BGP best path algorithm executes, the table version increments.
- The Router ID of the local router is 10.100.0.77.

Status codes: s suppressed, d damped, h history, p stale, \* valid, > best, i - internal

[Table 36](#) explains the status codes in the header.

**Table 36. status codes**

| Status code | Description | Comments                                                                                                                                                                 |
|-------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s           | suppressed  | Whether the route is suppressed and will not be advertised to the neighbors.                                                                                             |
| d           | damped      | When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit. |
| h           | history     | When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.                      |
| p           | stale       | When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale.                         |
| *           | valid       | Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.                                                              |
| >           | best        | The route selected as the best path and installed in the kernel routing table.                                                                                           |
| i           | internal    | Whether the route is learned from an iBGP peer. If this symbol is not present, the route was learned from an eBGP peer.                                                  |

Origin codes: i - IGP, e - EGP, ? - incomplete

[Table 37](#) explains the codes are at the end of each routing entry that show where the route originated.

**Table 37. origin codes**

| Origin code | Description | Comments                                                                                       |
|-------------|-------------|------------------------------------------------------------------------------------------------|
| i           | IGP         | The route originated from an Interior Gateway Protocol.                                        |
| e           | EGP         | The route originated from an Exterior Gateway Protocol.                                        |
| ?           | incomplete  | Origin not known. Typically, these are routes redistributed from an Interior Gateway Protocol. |

## Route Entry Fields

[Table 38](#) explains the fields shows for each route.

**Table 38. route entry fields**

| Field   | Description                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Network | Network prefix installed in BGP. If multiple routes exist for the same prefix, only the first prefix is identified and others have blank spaces. |

**Table 38. route entry fields (continued)**
