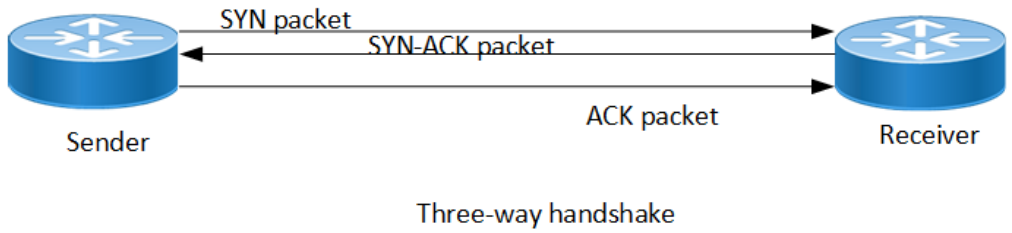
TCP MSS configuration for BGP neighbors

Overview

The manual configuration between the routing devices establishes the BGP peer that creates a TCP session.

This feature enables the configuration of TCP Maximum Segment Size (MSS) that defines the maximum segment size in a single TCP segment during a communication session. TCP segment is a unit of data transmitted in a TCP connection. TCP uses three-way handshake process for initial establishment of a TCP connection. In the three-way handshake process, the sending host sends a SYN packet. Once the receiving host receives the SYN packet, it acknowledges and sends back a SYN-ACK packet to the sending host. Once the sending host receives the SYN-ACK packet from the receiving host, it sends an ACK packet, establishing a reliable connection. In this three way handshake process, the MSS is negotiated between the BGP neighbors.

Figure 90. Three-way handshake



Feature Characteristics

The configuration of the TCP MSS for BGP neighbors helps the neighbors adjust the MSS value of the TCP SYN packet. Configure the TCP MSS through the CLI and NetConf interface. The configurable MSS range is offered from 40-1440 bytes. By default, the MTU value for ethernet cable is 1500 bytes. When configuring the highest MSS value that is 1440, the total MSS becomes 1440 bytes (MSS) plus 20 bytes (IP Header Size), 20 bytes (TCP Header), and Ethernet header which does not cross the default path MTU value.

Figure 91. TCP MSS for BGP neighbor

Benefits

By default, the interface MTU value determines the MSS value of a packet. When the interface MTU value exceeds the default ethernet path MTU value of 1500 bytes, the MSS value also crosses the default ethernet path MTU value, resulting in packet fragmentation. The configuration of the specific MSS value limits the packet size irrespective of the interface MTU value, preventing packet fragmentation.

© 2026 IP Infusion Inc. Proprietary

Prerequisites

Requires the knowledge on TCP handshake and BGP neighbor discovery.

Configuration

This section shows the procedure to configure TCP MSS between BGP peers.

Topology

The below example shows the configuration required to enable BGP on an interface. PE1 and RR1 are routers belonging to the same Autonomous System (AS) with the Autonomous System Number (ASN) as AS100, connecting to network 10.1.1.0/24. First, define the routing process and the ASN to which the routers belong. Then, define BGP neighbors to start exchanging routing updates and configure the TCP MSS for BGP between PE1 and RR1 devices.

Figure 92. Device topology for BGP

Configuration

The configuration shows how to configure the TCP MSS value for the BGP peer.

PE1

`PE1#configure terminal`	Enter Configuration mode.
`PE1(config)#interface lo`	Enter interface mode for loopback.
`PE1(config-if)#ip address 1.1.1.1/32 secondary`	Specify the interface IP address `1.1.1.1`.
`PE1(config-if)#exit`	Exit the interface mode.
`PE1(config)#interface xe1`	Enter interface mode for `xe1`.
`PE1(config-if)#ip address 10.1.1.1/24`	Specify the IP address `10.1.1.1` for the interface.
`PE1(config-if)#exit`	Exit interface mode for `xe1`.
`PE1(config)#router bgp 100`	Define the routing process. The number 100 specifies the ASN of PE1.
`PE1(config-router)#bgp router-id 1.1.1.1`	Configure bgp router-id same as loopback IP address`1.1.1.1`.
`PE1(config-router)#neighbor 10.1.1.2`	Define BGP neighbors, and establish a TCP session.

© 2026 IP Infusion Inc. Proprietary

`remoteas 100`	`10.1.1.2` is the IP address of the neighbor and 100 is the neighbor's ASN.
`PE1(config-router)#neighbor 10.1.1.2 tcp-mss 800`	Configure TCP MSS value.
`PE1(config-router)#address-family ipv4 unicast`	Enter address-family IPv4 unicast mode.
`PE1(config-router-af)#neighbor 10.1.1.2 activate`	Activate neighbor with IP address `10.1.1.2` in the IPv4 address family.
`PE1(config-router-af)#redistribute connected`	Redistributing connected routes inside BGP.
`PE1(config-router-af)#exit-address-family`	Exit address-family mode.
`PE1(config-router)#commit`	Commit the candidate configuration to the running configuration.

RR1

`RR1#configure terminal`	Enter configuration mode.
`RR1(config)#interface lo`	Enter interface mode for loopback.
`RR1(config-if)#ip address 2.2.2.2/32 secondary`	Specify the interface address `2.2.2.2`.
`RR1(config-if)#exit`	Exit interface mode.
`RR1(config)#interface xe47`	Enter interface mode for `xe47`.
`RR1(config-if)#ip address 10.1.1.2/24`	Specify IP address `10.1.1.2/24` for the interface.
`RR1(config-if)#exit`	Exit interface mode for `xe47`.
`RR1(config)#router bgp 100`	Define the routing process. The number 100 specifies the ASN of RR1.
`RR1(config-router)#bgp router-id 2.2.2.2`	Configure BGP router-id same as loopback IP address `2.2.2.2`.
`RR1(config-router)#neighbor 10.1.1.1 remoteas 100`	Define BGP neighbors, and establish a TCP session. `10.1.1.1` is the ip address of the neighbor and 100 is the neighbor's ASN.
`RR1(config-router)#neighbor 10.1.1.1 passive`	Configure BGP neighbor `10.1.1.1` passive.
`RR1(config-router)#address-family ipv4 unicast`	Enter address-family IPv4 unicast mode
`RR1(config-router-af)#neighbor 10.1.1.1 activate`	Activate the neighbor in the IPv4 address family.
`RR1(config-router-af)#neighbor 10.1.1.1 route-reflector-client`	Configure RR1 as the Route-Reflector (RR) and neighbor PE1 as its client.
`RR1(config-router-af)#redistribute connected`	Redistributing connected routes inside BGP.

© 2026 IP Infusion Inc. Proprietary

`RR1(config-router-af)#exit-address-family`	Exit address-family mode.
`RR1(config-router)#commit`	Commit the candidate configuration to the running configuration.

New CLI Commands

neighbor tcp-mss

Use this command to set the BGP TCP MSS of a neighbor.

Use the `no` parameter with this command to remove a TCP MSS setting from a BGP neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) tcp-mss <40-1440>
no neighbor (A.B.C.D|X:X::X:X|WORD) tcp-mss
```

For BGP unnumbered mode:

```
neighbor WORD tcp-mss <40-1440>
no neighbor WORD tcp-mss
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<40-1440>
Configure TCP MSS

Default

Disabled

Command Mode

Router mode, address family-vrf mode and BGP unnumbered mode.

Applicability

Introduced in OcNOS version 6.4.1.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 tcp-mss 1000
(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 tcp-mss 900
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 tcp-mss 800
```

Abbreviations

The following are some key abbreviations and their meanings relevant to this document:

Acronym	Description
ACK	Acknowledgment
BGP	Border Gateway Protocol
TCP	Transmission Control Protocol

© 2026 IP Infusion Inc. Proprietary

MSS	Maximum Segment Size
MTU	Maximum Transmission Unit
SYN	Synchronize

Glossary

The following provides definitions for key terms used throughout this document.

BGP	BGP is an exterior gateway protocol to exchange route information and interconnect various networks on the global internet.
BGP neighbor	BGP neighbors, called peers, are established by manual configuration among routers to create a TCP session on port 179, which exchanges routing information between two systems, defined by their Autonomous System Numbers (ASNs).
MSS	MSS is a TCP parameter that defines the maximum amount of data in a TCP segment that can be transmitted. TCP - TCP is one of the main protocols in the Internet Protocol (IP) suite. It offers a secure and reliable connection between two devices.
TCP	TCP is one of the main protocols in the Internet Protocol (IP) suite. It offers a secure and reliable connection between two devices.
TCP segment	TCP segment is a unit of data transmitted in a TCP connection. The segment consists of header and payload. The header contains the control information to manage the transmission, and the payload contains the actual data that needs to be transmitted.

BGP ORF Prefix-List VPNV4 Address

Overview

The Border Gateway Protocol (BGP) Outbound Route Filtering feature operates as a Prefix-Based filtering system within the BGP. Its primary purpose is to reduce the volume of BGP updates exchanged among peer routers. By selectively screening out unnecessary routing updates at the source, this feature effectively lessens the strain on resources needed for generating and handling routing updates. Its objective is to streamline router processing, especially for routers not set up to accept full BGP route updates from a service provider network.

Feature Characteristics

This feature provides customers with various routing options, such as access to routing information like a full table view, solely a default route, or a tailored subset such as a default route combined with locally originated prefixes from the service provider. Typically, BGP service providers do not impose complex outbound filtering policies on their customers.

Benefits

The advantages of Prefix-Based Outbound Route Filtering:

- Minimize unnecessary routing updates
- Reduces resources required for routing update generation and processing
- Reduces required to receive and discard routes.

Configuration

The BGP Prefix-Based Outbound Route Filtering feature offers support for prefix length matching, wildcard-based prefix matching, and exact address prefix matching across various address families. It allows configuration on a router to enable Outbound Route Filtering (ORF) capabilities for sending or receiving, using the "send" or "receive" keywords. Moreover, it permits configuration to enable both sending and receiving ORF capabilities using the "both" keyword.

Topology

In this topology, the PE1, P1, RR1, and PE2 interface is established. It allows configuration on a router to enable Outbound Route Filtering (ORF) capabilities.

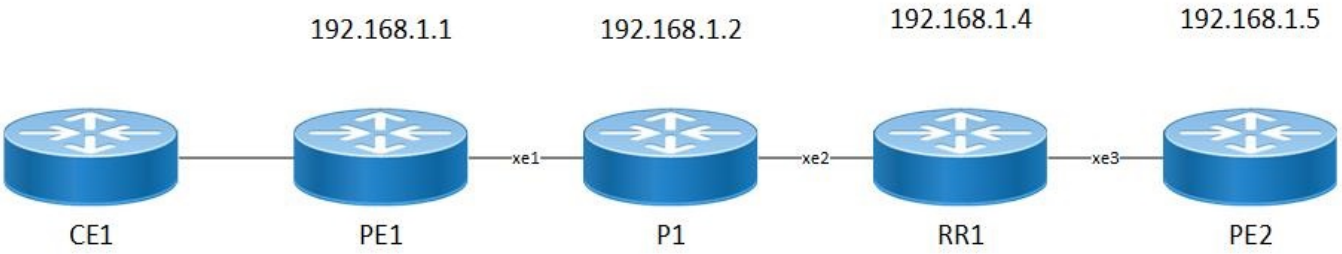
Figure 93. ORF-Prefix VPNv4 Address Topology



PE1

The Provider Edge (PE) 1 is a device at the edge of a service provider's network. For the PE1 configuration, follow these steps.

1. Enable activate the loopback interface, enter the following command while in configuration mode. Then, proceed to set up the IP address for the loopback interface.

```
PE1(config)#interface lo
PE1(config-if)#ip address 192.168.1.1/32 secondary
PE1(config-if)#enable-ldp ipv4
```

2. To exit from the loopback interface, execute the following command.

```
PE1(config)#exit
```

3. Set up the Router ID. Next, configure targeted LDP sessions for PE-1. Once done, exit from targeted-peer mode. Then, configure the transport address for LDP to run on an IPv4 interface for TCP sessions.

```
PE1(config)#router ldp
PE1(config-router)#router-id 192.168.1.1
PE1(config-router)#targeted-peer ipv4 192.168.1.5
PE1(config-router-targeted-peer)#exit-targeted-peer-mode
PE1(config-router)#transport-address ipv4 192.168.1.1
```

4. To exit from the router mode for LDP, execute the following command.

```
PE1(config)#exit
```

5. In interface mode, assign an IP address to the interface. Then, activate label switching capability on the interface and enable LDP on it.

```
PE1(config)#interface xe1
PE1(config-if)#ip address 12.1.1.1/24
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
PE1(config-if)# ip ospf cost 10
```

6. To exit from the interface configuration on network side, execute the following command.

```
PE1(config)#exit
```

7. Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.

```
PE1(config)# router ospf 100
```

© 2026 IP Infusion Inc. Proprietary

8. Configure the OSPF Router ID and define the interface for OSPF operation and link it with the area ID (0).

```
PE1(config-router)# ospf router-id 192.168.1.1
PE1(config-router)# bfd all-interfaces
PE1(config-router)# timers spf exp 50 50
PE1(config-router)# timers throttle lsa all 0 1 1
PE1(config-router)# network 12.1.1.0/24 area 0.0.0.0
PE1(config-router)# network 192.168.1.1/32 area 0.0.0.0
```

9. To exit from the OSPF, execute the following command.

```
PE1(config)#exit
```

10. Switch to BGP router mode. Establish PE1 as an iBGP peer. Specify the loopback as the source for iBGP peering with the remote PE1 router. Activate PE1 in the VPNv4 unicast address family.

```
PE1(config)#router bgp 100
PE1(config-router)# bgp router-id 192.168.1.1
PE1(config-router)# neighbor 192.168.1.4 remote-as 100
PE1(config-router)# neighbor 192.168.1.4 update-source lo
PE1(config-router)# neighbor 192.168.1.4 advertisement-interval 0
PE1(config-router)# address-family vpnv4 unicast
PE1(config-router-af)# neighbor 192.168.1.4 activate
PE1(config-router-af)# neighbor 192.168.1.4 capability orf prefix-list receive
PE1(config-router-af)# exit-address-family
```

11. To exit from the BGP, execute the following command.

```
PE1(config)#exit
```

P

The Provider (P) is a device at the edge of a service provider's network. For the P configuration, follow these steps.

1. Enable activate the loopback interface, enter the following command while in configuration mode. Then, proceed to set up the IP address for the loopback interface.

```
P(config)#interface lo
P(config-if)#ip address 192.168.1.1/32 secondary
P(config-if)#enable-ldp ipv4
```

2. To exit from the loopback interface, execute the following command.

```
P(config)#exit
```

3. Set up the Router ID. Next, configure targeted LDP sessions for P. Once done, exit from targeted-peer mode. Then, configure the transport address for LDP to run on an IPv4 interface for TCP sessions.

```
P(config)#router ldp
P(config-router)#router-id 192.168.1.2
P(config-router)#targeted-peer ipv4 192.168.1.2
```

4. To exit from the router mode for LDP, execute the following command.

```
P(config)#exit
```

5. In interface mode, assign an IP address to the interface. Then, activate label switching capability on the interface and enable LDP on it.

```
P(config)#interface xe1
P(config-if)#ip address 12.1.1.1/24
P(config-if)#label-switching
P(config)#interface xe1
P(config-if)#ip address 13.1.1.2/24
P(config-if)#label-switching
```

6. To exit from the interface configuration on network side, execute the following command.

```
P(config)#exit
```

7. Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.

```
P(config)# router ospf 100
```

8. Configure the OSPF Router ID and define the interface for OSPF operation and link it with the area ID (0).

```
P(config-router)# ospf router-id 192.168.1.2
P(config-router)# bfd all-interfaces
P(config-router)# timers spf exp 50 50
P(config-router)# timers throttle lsa all 0 1 1
P(config-router)# network 12.1.1.0/24 area 0.0.0.0
P(config-router)# network 192.168.1.1/32 area 0.0.0.0
```

9. To exit from the OSPF, execute the following command.

```
P(config)#exit
```

RR

Route Reflector (RR) is a designated router that will reflect routes learned from other iBGP peers. All routers form a peering relationship only with the Route Reflector. For the RR configuration, follow these steps.

1. Enable activate the loopback interface, enter the following command while in configuration mode. Then, proceed to set up the IP address for the loopback interface.

```
RR(config)#interface lo
RR(config-if)#ip address 192.168.1.1/32 secondary
RR(config-if)#enable-ldp ipv4
```

2. To exit from the loopback interface, execute the following command.

```
RR(config)#exit
```

3. Set up the Router ID. Next, configure targeted LDP sessions for P. Once done, exit from targeted-peer mode. Then, configure the transport address for LDP to run on an IPv4 interface for TCP sessions.

```
RR(config)#router ldp
RR(config-router)#router-id 192.168.1.4/32
RR(config-router)#transport-address ipv4 192.168.1.4
```

4. To exit from the router mode for LDP, execute the following command.

```
RR(config)#exit
```

5. In interface mode, set up the IP address for the interface and activate label switching capability on it.

```
RR(config)#interface xe1
RR(config-if)#ip address 12.1.1.1/24
RR(config-if)#label-switching
RR(config-if)#enable-ldp ipv4
RR(config)#interface xe3
RR(config-if)#ip address 14.1.1.1/24
RR(config-if)#label-switching
RR(config-if)#enable-ldp ipv4
```

6. To exit from the interface configuration on network side, execute the following command.

```
RR(config)#exit
```

7. Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.

```
RR(config)# router ospf 100
```

© 2026 IP Infusion Inc. Proprietary

8. Configure the OSPF Router ID and define the interface for OSPF operation and link it with the area ID (0).

```
RR(config-router)# ospf router-id 192.168.1.4
RR(config-router)# bfd all-interfaces
RR(config-router)# timers spf exp 50 50
RR(config-router)# timers throttle lsa all 0 1 1
RR(config-router)# network 12.1.1.0/24 area 0.0.0.0
RR(config-router)# network 192.168.1.1/32 area 0.0.0.0
```

9. To exit from the OSPF, execute the following command.

```
RR(config)#exit
```

10. Switch to BGP router mode. Establish RR as an iBGP peer. Specify the loopback as the source for iBGP peering with the remote RR router. Activate RR in the VPNv4 unicast address family.

```
RR(config)#router bgp 100
RR(config-router)# bgp router-id 192.168.1.1
RR(config-router)# neighbor 192.168.1.4 remote-as 100
RR(config-router)# neighbor 192.168.1.4 update-source lo
RR(config-router)# neighbor 192.168.1.4 advertisement-interval 0
RR(config-router)# address-family vpnv4 unicast
RR(config-router-af)# neighbor 192.168.1.4 active
RR(config-router-af)# neighbor 192.168.1.4 capability orf prefix-list s
RR(config-router-af)# neighbor 192.168.1.1 prefix-list
RR(config-router-af)# exit-address-family
```

11. To exit from the BGP, execute the following command.

```
PE1(config)#exit
```

12. To configure the global prefix, execute the following command in the global mode.

```
RR(config)# ip prefix-list ORF1
RR(config-ip-prefix-list)# seq 1 permit 45.1.1.0/24
```

13. To exit from the BGP, execute the following command.

```
RR(config)#exit
```

PE2

The Provider Edge (PE) 2 is a device at the edge of a service provider's network. For the PE2 configuration, follow these steps.

1. Enable activate the loopback interface, enter the following command while in configuration mode. Then, proceed to set up the IP address for the loopback interface.

```
PE2(config)#interface lo
PE2(config-if)#ip address 192.168.1.1/32 secondary
PE2(config-if)#enable-ldp ipv4
```

2. To exit from the loopback interface, execute the following command.

```
PE2(config)#exit
```

3. Set up the Router ID. Next, configure targeted LDP sessions for P. Once done, exit from targeted-peer mode. Then, configure the transport address for LDP to run on an IPv4 interface for TCP sessions.

```
PE2(config)#router ldp
PE2(config-router)#router-id 192.168.1.1
PE2(config-router)#targeted-peer ipv4 192.168.1.5
PE2(config-router-targeted-peer)#exit-targeted-peer-mode
PE2(config-router)#transport-address ipv4 192.168.1.1
PE2(config-router)#transport-address ipv4 192.168.1.5
```

4. To exit from the router mode for LDP, execute the following command.

© 2026 IP Infusion Inc. Proprietary

```
PE2(config)#exit
```

5. In interface mode, assign an IP address to the interface. Then, activate label switching capability on the interface and enable LDP on it.

```
PE2(config)#interface xe1
PE2(config-if)#ip address 12.1.1.1/24
PE2(config-if)#label-switching
PE2(config-if)#enable-ldp ipv4
PE2(config-if)# ip ospf cost 10
```

6. To exit from the interface configuration on network side, execute the following command.

```
PE2(config)#exit
```

7. Configure the routing process and specify the Process ID, (100). The Process ID should be a unique positive integer to identifying the routing process.

```
PE2(config)# router ospf 100
```

8. Configure the OSPF Router ID and define the interface for OSPF operation and link it with the area ID (0).

```
PE2(config-router)# ospf router-id 192.168.1.1
PE2(config-router)# bfd all-interfaces
PE2(config-router)# timers spf exp 50 50
PE2(config-router)# timers throttle lsa all 0 1 1
PE2(config-router)# network 12.1.1.0/24 area 0.0.0.0
PE2(config-router)# network 192.168.1.1/32 area 0.0.0.0
```

9. To exit from the OSPF, execute the following command.

```
PE2(config)#exit
```

10. Switch to BGP router mode. Establish PE2 as an iBGP peer. Specify the loopback as the source for iBGP peering with the remote PE2 router. Activate PE2 in the VPNv4 unicast address family.

```
PE2(config)#router bgp 100
PE2(config-router)# bgp router-id 192.168.1.1
PE2(config-router)# neighbor 192.168.1.4 remote-as 100
PE2(config-router)# neighbor 192.168.1.4 update-source lo
PE2(config-router)# neighbor 192.168.1.4 advertisement-interval 0
PE2(config-router)# address-family vpnv4 unicast
PE2(config-router-af)# neighbor 192.168.1.4 activate
PE2(config-router-af)# exit-address-family
```

11. To exit from the BGP, execute the following command.

```
PE2(config)#exit
```

Validation

```
PE1-7017#show ip bgp vpnv4 all

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
ORF	ORF stands for Outbound Route Filtering. It is a feature in routing protocols, particularly in BGP (Border Gateway Protocol), that allows a router to advertise to its neighbor routers the set of routes it can accept or reject.
LDP	LDP stands for Label Distribution Protocol. It is a signaling protocol used in MPLS

Key Terms/Acronym	Description
	(Multiprotocol Label Switching) networks to distribute and exchange labels between MPLS-enabled routers.
OSPF	OSPF stands for Open Shortest Path First. It is a routing protocol used in computer networks, particularly in large enterprise and service provider networks.

BGP Bogon Prefix Filtering IPv4

Overview

Bogon filters block invalid or reserved IP addresses, known as Bogon prefixes, from propagating through a network. These prefixes typically include IP ranges not allocated by IANA and should not appear in the global routing table. In BGP, bogon filtering prevents the acceptance of such invalid routes. By default in OcNOS, BGP does not filter bogon prefixes in incoming route updates, except for Class-E Experimental IPv4 Addresses (240.0.0.0/4) and Multicast Addresses (224.0.0.0/4 and 224.0.0.0/24). The command `bgp enable-bogon-filtering` allows users to manage this filtering process, adding flexibility to network security.

Feature Characteristics

A list of BOGON prefixes in OcNOS that should not route on the internet:

- **0.0.0.0/8**: Reserves addresses for special use, typically for traffic from hosts without an assigned IP address.
- **127.0.0.0/8:** Reserves addresses for loopback, used for internal host communication.
- **192.0.0.0/24:** Reserves addresses for IETF Protocol Assignments.
- **192.0.2.0/24:** Reserves addresses for documentation and examples.

BOGON and Class-E Experimental Address Range

240.0.0.0/4: Class-E addresses, reserved for experimental purposes. Avoid using them in production environments.

Notes:

- After filtering or allowing prefixes, BGP bogon filtering policy changes apply only to new incoming updates. The system does not automatically refresh previously filtered or allowed prefixes. When making changes to the BGP bogon filtering configuration, it is recommended to perform a hard reset of BGP or reboot the device.
- No filtering applies to IPv6 prefixes, as BGP allows all IPv6 prefixes by default.

Benefits

Security: Enabling bogon prefix filtering improves network security by preventing the propagation of invalid or reserved IP addresses.

Flexibility: The option to enable or disable filtering provides network administrators control over BGP route updates.

Compliance: Ensures adherence to best practices by allowing for the exclusion of non-routable IP address ranges.

BGP Bogon Prefix Filtering Configuration

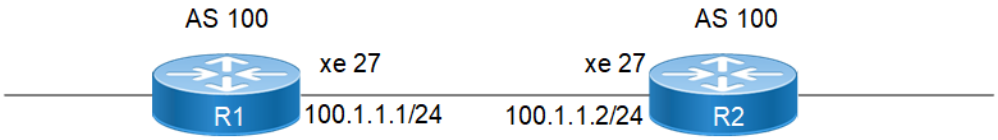
Ensure the OcNOS routers properly filter out bogon prefixes and enhance network security by preventing the routing of invalid or reserved IP addresses with the below configurations

© 2026 IP Infusion Inc. Proprietary

Topology

Two routers (R1 and R2) connect via interface `xe27`, using the same AS number (`AS 100`), to establish a BGP session and exchange routes within the IPv4 unicast address family.

Figure 94. BGP Bogon Filter



Prerequisites

Based on the running configuration provided for R1 and R2, configure BGP between two routers (R1 and R2) with the same Autonomous System (AS) number and IPv4 unicast address family. This configuration allows both routers to establish a BGP session and exchange routes.

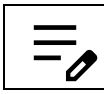
R1

```
R1#show running-config
!
hostname R1
!
ip vrf management
!
interface eth0
 ip vrf forwarding management
 ip address dhcp
!
interface lo
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface lo.management
 ip vrf forwarding management
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface xe27
 ip address 100.1.1.1/24
!
router bgp 100
 neighbor 100.1.1.2 remote-as 100
 !
 address-family ipv4 unicast
 redistribute static
 neighbor 100.1.1.2 activate
 exit-address-family
 !
 exit
!
!
end
```

R2

```
R2#show running-config
!
hostname R2
```

```
!
ip vrf management
!
interface eth0
 ip vrf forwarding management
 ip address dhcp
!
interface lo
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface lo.management
 ip vrf forwarding management
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
interface xe27
 ip address 100.1.1.2/24
!
router bgp 100
 neighbor 100.1.1.1 remote-as 100
 !
 address-family ipv4 unicast
 neighbor 100.1.1.1 activate
 exit-address-family
 !
 exit
!
!
end
```



Note: Before configuration, meet all Prerequisites (page 1149).

Configure Invalid IP Addresses on R1 and R2

1. Configure the invalid (bogon) routes before enabling BGP bogon filtering:

```
R2(config)#ip route 12.0.0.0/8 xe27
R2(config)#ip route 192.0.0.0/24 xe27 #Bogon prefixes
```

2. Verify the injected routes (`12.0.0.0/8 and 192.0.0.0/24`) in the BGP table.

```
R2#show ip bgp
BGP table version is 6, local router ID is 100.1.1.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -

BGP Bogon Prefix Filtering Command

The bogon prefix filtering introduces the following configuration command:

bgp enable-bogon-filtering

Use this command to enable or disable the filtering of bogon prefixes from NLRIs in incoming BGP updates.

Notes:

- After filtering or allowing prefixes, BGP bogon filtering policy changes apply only to new incoming updates. The system does not automatically refresh previously filtered or allowed prefixes. When making changes to the BGP bogon filtering configuration, it is recommended to perform a hard reset of BGP or reboot the device.
- No filtering applies to IPv6 prefixes, as BGP allows all IPv6 prefixes by default.

Command Syntax

```
bgp enable-bogon-filtering
```

Parameters

None

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.5.3.

Example

In OcNOS, enable BGP bogon filtering and perform a hard reset or device reboot as recommended.

```
OcNOS#configure terminal
OcNOS(config)#bgp enable-bogon-filtering
OcNOS(config)#commit
2098 Apr 24 21:11:07.665 : OcNOS : BGP : CRITI : % Changing the bogon filter does not automatically
refresh the permitted/filtered routes. A hard reset or device reboot is recommended.
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Bogon Filter	A mechanism that blocks invalid or reserved IP addresses, known as Bogon prefixes, from entering a network through routing updates.
Bogon Prefix	IP address ranges that are not allocated by IANA and should not appear in the global routing table.
Internet Assigned Numbers Authority (IANA)	The organization responsible for allocating global IP addresses and managing other critical Internet resources.
Autonomous System (AS)	A collection of IP networks managed by a single entity that presents a unified routing policy to the Internet.

BGP Large Communities

Overview

BGP routing policies control route distribution and behavior across networks. Communities, optional transitive BGP attributes associate operational metadata with routes, like origin location or specific routing actions. However, standard and extended BGP community attributes fall short in environments using 4-byte Autonomous System Numbers (ASNs).

To solve this issue, BGP introduced the Large Community (LC) attribute. It consists of an unordered set of one or more twelve-octet values, including: A 4-byte Global Administrator field (typically the ASN) and two 4-byte operator-defined fields.

These attributes enable operators to encode information pertinent to their routing policies and operational needs. Operators must not transmit duplicate values, and receiving BGP speakers must silently discard any redundant entries.

Feature Characteristics

OcNOS enhanced support for BGP Large Communities by:

- Allowing route-maps to match and manipulate multiple large-community values.
- Supporting configuration adjustments for additive operations (appending values) and deleting specific values.
- Introducing ip large-community-list (page 1173) to organize and reuse large-community match criteria.

Note: For details on upgrading and downgrading versions, refer to the *OcNOS Migration document*.

Benefits

Scalable Policy Management: Named community-lists simplify reuse and maintenance across multiple route-maps.

Enhanced Flexibility: Additive and deletion capabilities allow policy controls without impacting other community values.

Future-Proofing: Prepares networks for advanced policy frameworks as multi-ASN and operator-specific routing needs evolve.

BGP Large Communities Configuration

This section illustrates the use of BGP Large Communities for scalable and consistent route policy enforcement in a service provider or multi-tenant environment. It highlights how route tagging at the source (Router A), centralized policy processing at a Route Reflector (Router B), and controlled propagation to downstream routers (Router C) enable flexible traffic engineering, service differentiation, or route filtering, without the need for policy replication on every node.

© 2026 IP Infusion Inc. Proprietary

Topology

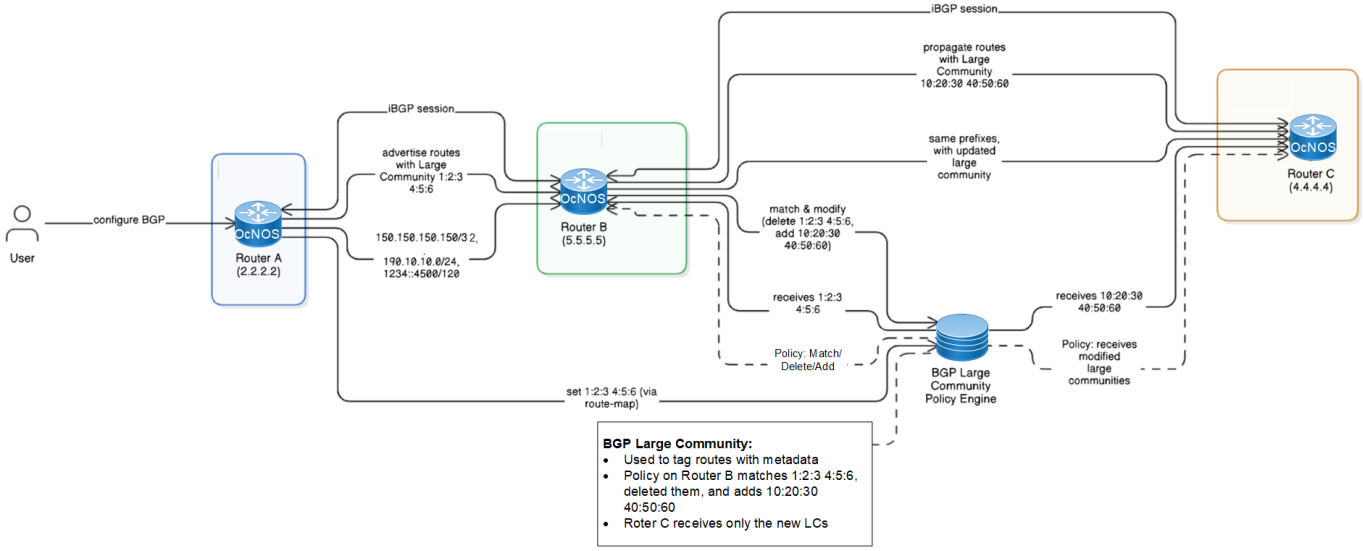
The figure below consists of three BGP routers in a route-reflector setup. Router B acts as the Route Reflector (RR), while routers A and C are its RR clients. There are no direct iBGP sessions between A and C; all BGP routing information exchange flows through the RR.

Each client establishes iBGP sessions with B for the following address families:

- IPv4 Unicast
- IPv6 Unicast
- VPNv4 Unicast

In this setup, Router A originates prefixes with large communities. Router B uses a policy engine to match, strip, and overwrite these communities using a route-map. It then advertises the modified routes to Router C. Router C applies a large-community filter to accept only those routes that match the expected community values. This demonstrates policy-based route control using BGP Large Communities in an RR-based MPLS network.

Figure 95. BGP Large Community-Based Routing Policy Flow



Prerequisites

Routing Configurations On Routers A, B, and C

- Set a loopback-based stable router ID for BGP, OSPF, and LDP.
- Define VRFs and import or export route targets.
- Configure LDP

Router A

```
router-id 2.2.2.2
!
```

```
ip vrf A
 rd 4200000000:2
 route-target both 1:1
 route-target both 2:2
 route-target both 3:3
 route-target both 4:4
 route-target both 5:5
 route-target both 6:6
 route-target both 7:7
 route-target both 8:8
 route-target both 9:9
!
router ldp
 transport-address ipv4 2.2.2.2
!
```

Router B

```
router-id 5.5.5.5
!
ip vrf A
 rd 4200000000:5
 route-target both 1:1
 route-target both 2:2
 route-target both 3:3
 route-target both 4:4
 route-target both 5:5
 route-target both 6:6
 route-target both 7:7
 route-target both 8:8
 route-target both 9:9
!
router ldp
 transport-address ipv4 5.5.5.5
!
```

Router C

```
router-id 4.4.4.4
!
ip vrf A
 rd 4200000001:4
 route-target both 1:1
 route-target both 2:2
 route-target both 3:3
 route-target both 4:4
 route-target both 5:5
 route-target both 6:6
 route-target both 7:7
 route-target both 8:8
 route-target both 9:9
!
router ldp
 transport-address ipv4 4.4.4.4
!
```

Interface Setup Configurations on Routers A, B, and C

- Configure the loopback interface for IPv4 or IPv6.
- Configure key interfaces connecting to core, CE, and PE neighbors. Ensure proper VRF bindings and IP assignments.

© 2026 IP Infusion Inc. Proprietary

Router A

```
interface eth8
 ip vrf forwarding A

BGP Large Communities Routers Configurations

Note: Before configuration, meet all Prerequisites (page 1154).

Router A - Large Community Configuration

Tag outbound BGP routes with two large community values (`1:2:3 and 4:5:6`) to influence downstream routing behavior.

Define the Route Map to Set Communities

Router A adds large community values `1:2:3 and 4:5:6` to outbound routes.

```
OcNOS(config)#route-map set-lc-tag-out permit 10
OcNOS(config-route-map)#set large-community 1:2:3 4:5:6
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Apply the Route Map in BGP

To all relevant address-families (IPv4, VPNv4, IPv6), apply the route map outbound to peer B (`5.5.5.5 and 5555::5555`)

```
router bgp 4200000000
 neighbor 5.5.5.5 remote-as 4200000000
 neighbor 5.5.5.5 update-source lo
 neighbor 5555::5555 remote-as 4200000000
 neighbor 5555::5555 update-source lo
 !
 address-family ipv4 unicast
 redistribute static
 neighbor 5.5.5.5 activate
 neighbor 5.5.5.5 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family vpnv4 unicast
 neighbor 5.5.5.5 activate
 neighbor 5.5.5.5 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family ipv6 unicast
 redistribute static
 neighbor 5555::5555 activate
 neighbor 5555::5555 route-map set-lc-tag-out out
 exit-address-family
 !
 exit
!
```

Router B - Large Community Match and Rewrite Configuration

Match received BGP routes containing large community `1:2:3 and 4:5:6`, strip them, and apply new values `40:50:60 and 10:20:30`.

Define a Large Community List

```
OcNOS(config)#ip large-community-list 1 permit 1:2:3 4:5:6
OcNOS(config)#commit
```

© 2026 IP Infusion Inc. Proprietary

Create a Route Map with Match and Rewrite

Router B detects and removes original communities, then re-tags the route with updated communities.

```
OcNOS(config)#route-map set-lc-tag-out permit 10
OcNOS(config-route-map)#match large-community 1
OcNOS(config-route-map)#set large-comm-list 1 delete
OcNOS(config-route-map)#set large-community 40:50:60 10:20:30 additive
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Apply the Route Map in BGP

Apply route-map outbound only on peer C (`4.4.4.4 and 4444::4444`).

```
router bgp 4200000000
 neighbor 2.2.2.2 remote-as 4200000000
 neighbor 2.2.2.2 update-source lo
 neighbor 4.4.4.4 remote-as 4200000000
 neighbor 4.4.4.4 update-source lo
 neighbor 2222::2222 remote-as 4200000000
 neighbor 2222::2222 update-source lo
 neighbor 4444::4444 remote-as 4200000000
 neighbor 4444::4444 update-source lo
 !
 address-family ipv4 unicast
 neighbor 2.2.2.2 activate
 neighbor 2.2.2.2 route-reflector-client
 neighbor 4.4.4.4 activate
 neighbor 4.4.4.4 route-reflector-client
 neighbor 4.4.4.4 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family vpnv4 unicast
 neighbor 2.2.2.2 activate
 neighbor 2.2.2.2 route-reflector-client
 neighbor 4.4.4.4 activate
 neighbor 4.4.4.4 route-reflector-client
 neighbor 4.4.4.4 route-map set-lc-tag-out out
 exit-address-family
 !
 address-family ipv6 unicast
 neighbor 2222::2222 activate
 neighbor 2222::2222 route-reflector-client
 neighbor 4444::4444 activate
 neighbor 4444::4444 route-reflector-client
 neighbor 4444::4444 route-map set-lc-tag-out out
 exit-address-family
 !
 exit
!
```

Router C - Passive Role in Large Community Policy

Participate in BGP flow and MPLS forwarding. No large community changes or filters. Acts as a transit or receiving node.

- No `ip large-community-list` or `route-map` configuration.
- Standard BGP peerings with B (`5.5.5.5 and 5555::5555`).
- Router C accepts routes tagged with modified large community from B and may forward based on policy.

```
router bgp 4200000000
 neighbor 5.5.5.5 remote-as 4200000000
```

© 2026 IP Infusion Inc. Proprietary

```
 neighbor 5.5.5.5 update-source lo
 neighbor 5555::5555 remote-as 4200000000
 neighbor 5555::5555 update-source lo
 !
 address-family ipv4 unicast
 neighbor 5.5.5.5 activate
 exit-address-family
 !
 address-family vpnv4 unicast
 neighbor 5.5.5.5 activate
 exit-address-family
 !
 address-family ipv6 unicast
 neighbor 5555::5555 activate
 exit-address-family
 !
 address-family ipv4 vrf A
 exit-address-family
 !
 exit
!
ip route vrf A 60.10.10.0/24 20.4.0.60
!
```

BGP Large Communities Validation

Verify that the routes are being advertised correctly to Router B and are carrying the intended community tags (in this case, Large Communities 1:2:3 and 4:5:6).

The `show ip bgp` command confirms that the IPv4 unicast route (e.g. `150.150.150.150/32`) exists in the local BGP table. The BGP session to B (`neighbor 5.5.5.5`) is active and routes are sent.

```
Router A#show ip bgp
BGP table version is 1, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
              l - labeled, S Stale, x-EVPN
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

    Network          Next Hop            Metric    LocPrf   Weight Path   Ext-Color
*>   150.150.150.150/32
                      10.14.0.150          0        100       32768  ?        -

Total number of prefixes 1

Router B#show ip bgp
BGP table version is 3, local router ID is 5.5.5.5
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
              l - labeled, S Stale, x-EVPN
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

    Network          Next Hop            Metric    LocPrf   Weight Path   Ext-Color
*>i  150.150.150.150/32
                      10.14.0.150          0        100       0    ?        -

Total number of prefixes 1
```

The `show ip bgp 150.150.150.150` command confirms that the route is locally originated and advertised to B. It is useful for verifying if the prefix is a candidate for applying the Large Community policy.

```
Router A#show ip bgp 150.150.150.150

```

The command `show bgp ipv6` confirms that IPv6 prefixes (e.g., 1234::4500/120) are present, valid, and advertised to B. It verifies that the IPv6 session to 5555::5555 is working and that the route-map is applied.

Implementation Example

Use Case: A transit provider assigns unique BGP Large Community values to each customer. These values are utilized in route maps to influence outbound policy decisions, such as local preference or AS-path modification.

Define large-community values associated with Customer A:

```
ip large-community-list standard cust_A permit 65001:100:1
ip large-community-list standard cust_A permit 65001:100:2
```

Apply policy using a route-map:

```
route-map export-cust_A permit 10
 match large-community cust_A
 set local-preference 150
```

This configuration applies a higher local preference to prefixes received from Customer A. By using a named large-community list, the setup remains scalable-community values can be updated in one place without editing the route map directly. This approach also simplifies policy management across multiple route maps or peers.

BGP Large Communities Commands

The following are the BGP LC commands.

© 2026 IP Infusion Inc. Proprietary

set large-community

- The existing syntax now includes the new `additive` parameter that allows users to append large community values to a route.
- Users can configure multiple large communities in a route map. The character limit for each community has increased from 32 to 255 characters.

For more details, refer to the set large-community (page 378) command in the section in the , OcNOS Layer 3 document.

© 2026 IP Infusion Inc. Proprietary

ip large-community-list

Use this command to define a set of BGP Large Community values for use in policy configuration (e.g., route-maps). It functions similarly to standard or extended community-lists and allows reuse of defined large-community patterns.

Use `no` parameter of this command to remove the configured large community values.

Command Syntax

```
ip large-community-list {<1-99> | standard WORD | <100-500> | expanded WORD} {permit | deny}
(.AA:NN:MM)
no ip large-community-list {<1-99> | standard WORD | <100-500> | expanded WORD} {permit | deny}
(.AA:NN:MM)
```

Parameters

<1-99>
Specifies a standard large-community-list using a numerical ID. Standard lists match exact values.

standard WORD
Specifies a named standard list that matches exact large-community values.

<100-500>
Specifies an expanded large-community-list using a numerical ID. Expanded lists support regex-style pattern matching.

expanded WORD
Specifies a named expanded list that uses pattern matching for flexible matching criteria.

permit
Permits the specified large-community value(s) to match in a policy.

deny
Denies the specified large-community value(s) from matching.

.AA:NN:MM
A 12-byte large community in the format ASN:Value1:Value2. E.g., 65001:100:1. Large Communities use the format Global Administrator:LocalData1:LocalData2, where each field is a 32-bit integer.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.6.1.

Example

The following example demonstrates how to configure different types of BGP Large Community lists in OcNOS and verify them using the `show` command.

Creates a standard large-community-list with numeric ID `1` and permits the community `4:5:6`.

```
OcNOS#configure terminal
OcNOS(config)#ip large-community-list 1 permit 4:5:6
OcNOS(config)#commit
```

© 2026 IP Infusion Inc. Proprietary

Creates an expanded large-community-list with numeric ID `150` and denies the community `1000:2000:3000`.

```
OcNOS(config)#ip large-community-list 150 deny 1000:2000:3000
OcNOS(config)#commit
```

Defines a named expanded list called `EXPTEST` and permits the community `5500:3000:2000`.

```
OcNOS(config)#ip large-community-list expanded EXPTEST permit 5500:3000:2000
OcNOS(config)#commit
```

Defines a named standard list called `STDTEST` and permits the community `50:50:50`.

```
OcNOS(config)#ip large-community-list standard STDTEST permit 50:50:50
OcNOS(config)#commit
```

Verify the configured lists using `show ip large-community-list` command.

```
OcNOS#show ip large-community-list
Large community standard list 1
    permit 4:5:6
Large community (expanded) list 150
    deny 1000:2000:3000
Named large community expanded list EXPTEST
    permit 5500:3000:2000
Named large community standard list STDTEST
    permit 50:50:50
```

match large-community

Use this command to match BGP routes based on Large Community values. This allows selective policy actions (e.g., setting local preference, AS path, AIGP) for routes carrying specific BGP Large Community attributes.

Use `no` parameter of this command to remove the configured Large Community values.

Note: Only one `match large-community` is allowed per route-map sequence. A new match replaces any previous configuration in the same sequence.

Command Syntax

```
match large-community {<1-99> | <100-500> | WORD} (exact-match|)
no match large-community {<1-99> | <100-500> | WORD} (exact-match|)
```

Parameters

<1-99>
Specifies a standard large-community-list using a numerical ID. Standard lists match exact values.

<100-500>
Specifies an expanded large-community-list using a numerical ID. Expanded lists support regex-style pattern matching.

WORD
Specifies a named standard or expanded large-community list.

exact-match
(Optional) Matches routes only if the communities match exactly, with no additional entries.

Default

None

Command Mode

Route map mode

Applicability

Introduced in OcNOS version 6.6.1.

Example

The following example shows how to reference large-community in route-maps for policy enforcement.

Matches routes containing any large-community permitted by standard list `1`.

```
OcNOS#configure terminal
OcNOS(config)#route-map rmap-set-lc1
OcNOS(config-route-map)#match large-community 1
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Matches routes based on pattern rules defined in expanded list `100`.

```
OcNOS(config)#route-map rmap-set-lc2
OcNOS(config-route-map)#match large-community 100
```

© 2026 IP Infusion Inc. Proprietary

```
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Matches routes using named expanded list `EXPTEST`.

```
OcNOS(config)#route-map rmap-set-lc
OcNOS(config-route-map)#match large-community EXPTEST
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Matches routes that have only the exact large-community entries defined in `STDTEST`.

```
OcNOS(config)#route-map rmap-set-lc3
OcNOS(config-route-map)#match large-community STDTEST exact-match
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Verify the configured lists using `show` command.

```
OcNOS#show route-map
route-map rmap-set-lc, permit, sequence 10
  Match clauses:
    large-community: EXPTEST
  Set clauses:
route-map rmap-set-lc1, permit, sequence 10
  Match clauses:
    large-community: 1
  Set clauses:
route-map rmap-set-lc2, permit, sequence 10
  Match clauses:
    large-community: 100
  Set clauses:
route-map rmap-set-lc3, permit, sequence 10
  Match clauses:
    large-community: STDTEST exact-match
  Set clauses:

OcNOS#show running-config route-map
!
route-map rmap-set-lc permit 10
 match large-community EXPTEST
!
route-map rmap-set-lc1 permit 10
 match large-community 1
!
route-map rmap-set-lc2 permit 10
 match large-community 100
!
route-map rmap-set-lc3 permit 10
 match large-community STDTEST exact-match
!
```

set large-comm-list delete

Use this command within a route-map mode to delete the large-community-list values from matched routes (if present).

Use `no` parameter of this command to add the specified large-community values to matched routes.

Note: Only one set large-comm-list configuration is allowed per route-map sequence. A new one will overwrite the previous configuration.

Command Syntax

```
set large-comm-list {<1-99> | <100-500> | WORD} (delete)
no set large-comm-list {<1-99> | <100-500> | WORD} (delete)
```

Parameters

<1-99>
Specifies a standard large-community-list using a numerical ID. Standard lists match exact values.

<100-500>
Specifies an expanded large-community-list using a numerical ID. Expanded lists support regex-style pattern matching.

WORD
Specifies a named standard or expanded large-community list.

delete
Removes the matching large-community values from matched routes.

Default

None

Command Mode

Route map mode

Applicability

Introduced in OcNOS version 6.6.1.

Example

The following example shows how to remove (delete) selected communities from matched routes using the set large-comm-list command.

Deletes communities defined in list `100` from matched routes (`rmap2`).

```
OcNOS(config)#route-map rmap2
OcNOS(config-route-map)#match large-community 100
OcNOS(config-route-map)#set large-comm-list 100 delete
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Deletes communities defined in list `10` from matched routes (`rmap`).

© 2026 IP Infusion Inc. Proprietary

```
OcNOS(config)#route-map rmap
OcNOS(config-route-map)#match large-community EXPTEST
OcNOS(config-route-map)#set large-comm-list 10 delete
OcNOS(config-route-map)#commit
OcNOS(config-route-map)#exit
```

Verify the configured lists using the `show` command.

- The command `set large-comm-list 100 delete` appears only for `rmap` and `rmap2`, indicating community deletion is configured only for those route-maps.
- When a route-map is configured with the `set large-comm-list <list> delete` command, the `show route-map` output will reflect this under the **Set clauses** field, verifying that the deletion of large-community values is active.

```
OcNOS#show route-map
route-map rmap, permit, sequence 10
  Match clauses:
    large-community: EXPTEST
  Set clauses:
    large-comm-list 10 delete
route-map rmap1, permit, sequence 10
  Match clauses:
    large-community: 1
  Set clauses:
route-map rmap2, permit, sequence 10
  Match clauses:
    large-community: 100
  Set clauses:
    large-comm-list 100 delete
route-map rmap3, permit, sequence 10
  Match clauses:
    large-community: STDTEST exact-match
  Set clauses:

OcNOS(config-route-map)#show running-config route-map
!
route-map rmap permit 10
 match large-community EXPTEST
 set large-comm-list 10 delete
!
route-map rmap1 permit 10
 match large-community 1
!
route-map rmap2 permit 10
 match large-community 100
 set large-comm-list 100 delete
!
route-map rmap3 permit 10
 match large-community STDTEST exact-match
!
```

© 2026 IP Infusion Inc. Proprietary

show ip large-community-list

Use this command to display the configured BGP IPv4 Large Community Lists. This includes both standard and expanded lists, named or numbered. The command helps verify large-community filters applied in route-maps for matching or modifying BGP route attributes.

Command Syntax

```
show ip large-community-list (<1-500> | WORD)
```

Parameters

<1-500>
Specifies numeric ID of a standard or expanded large-community-list.

WORD
Specifies a named standard or expanded large-community list.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced in OcNOS version 6.6.1.

Example

Displays all configured large community lists for both numbered and named, standard and expanded.

```
OcNOS#show ip large-community-list
Large community standard list 1
    permit 4:5:6
Large community (expanded) list 150
    deny 1000:2000:3000
Named large community expanded list EXPTEST
    permit 5500:3000:2000
Named large community standard list STDTEST
    permit 50:50:50
```

Displays only the expanded list with the number `150`. In the example below, it contains a single rule that denies large community `1000:2000:3000`.

```
OcNOS#show ip large-community-list 150
Large community (expanded) list 150
    deny 1000:2000:3000
```

Displays the named expanded list `EXPTEST`. In the example below, it permits the large community `5500:3000:2000`.

```
OcNOS#show ip large-community-list EXPTEST
Named large community expanded list EXPTEST
    permit 5500:3000:2000
```

© 2026 IP Infusion Inc. Proprietary

Troubleshooting

Symptom	Possible Cause	Solution
Route-map fails to match communities	The `ip large-community-list` is missing or mis-configured.	Check the configuration using `show ip large-community-list` and correct any errors.
Downgrade operation fails	The configuration includes unsupported LC features.	Revert to the previous version and remove all LC configurations before retrying the downgrade.
Routes behave unexpectedly	Duplicate LC values are being sent	Avoid transmitting redundant LC values; OcNOS automatically removes duplicates on receipt.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this feature:

Key Terms/Acronym	Description
Autonomous System Number (ASN)	A 2- or 4-byte unique identifier assigned to a network under a single administrative domain.
Large Community (LC)	A BGP attribute (RFC 8092) used to tag routes with metadata for policy decisions. Format: ASN:Value1:Value2.
Global Administrator (GA)	The first 4-byte field in a BGP Large Community, typically set to the ASN of the originator.
Route Reflector (RR)	A BGP router that reflects routes between RR clients to reduce iBGP session count in large networks.
RR Client	A BGP peer that receives and sends updates via the route reflector.
Internal BGP (iBGP)	BGP sessions between routers within the same AS.
Address Family Identifier (AFI) or Subsequent Address Family Identifier (SAFI)	Specifies the type of routes being carried (e.g., IPv4, VPNv4, IPv6).
Route Distinguisher (RD)	A unique identifier prepended to a prefix in MPLS VPNs to distinguish overlapping routes.
Route Target (RT)	An extended BGP community used to control the import or export of routes into or from a VRF.
BGP Attributes	Metadata in BGP updates that influence route selection or propagation (e.g., LC, RT, MED, Local Pref).
additive	A route-map action keyword that appends new LC values without removing existing ones.
delete	A route-map action keyword used to remove specific LC values from a route.

Hide the Remote AS using the neighbor local-as Command

Overview

In a network, an Autonomous System (AS) is available to define a set of IP routing prefixes that are under a common administration policy control. These defined routing policies are used by other connected routers on the Internet. When an AS is configured in Border Gateway Protocol (BGP), it is used to share routing information to connected peers. The neighbor local-as (page 1371) CLI command configures the AS number to be used with External Border Gateway Protocol (EBGP) peers. By default, the configured AS number is included in the AS-PATH message that is exchanged between the peers.

When a BGP router, configured in one network, connects to another router on the network, it will automatically share routing information with the AS number of both the local and remote routers in the AS-PATH message with other connected, external peers. For example, if a router ISP1-R, accesses services from another router, ISP2-R, ISP1-R router will share routing information with local and remote AS numbers in the AS-PATH message when services are merged. This allows the external peers to learn the AS numbers of remote routers not connected to it (in this case, the AS number of ISP2-R). It is not desirable to disclose the AS number of remote routers to external peers.

To avoid advertising the remote peer's AS number, OcNOS provides an option in the neighbor local-as (page 1371) CLI to not include (`no-prepend`) the remote AS number and replace (`replace-as`) it with alternate AS number. Configuring an alternate AS in the BGP neighbor system, provides the ability to hide the AS number of the remote router that actually shares the services. Thus, the AS number of the BGP router that is actually providing services is unknown to the external peer.

Hence, the existing neighbor local-as (page 1371) CLI command has been modified in this release.

Feature Characteristics

The neighbor local-as (page 1371) CLI is enhanced to hide and replace the AS number of the remote routers not connected to external peer. Two new options '`no-prepend`' and '`replace-as`' have been added. These options replace the AS number with an alternate AS number in the AS_PATH and BGP OPEN message. Hence, the AS of the remote router is unknown to the respective neighbor peer.

Benefits

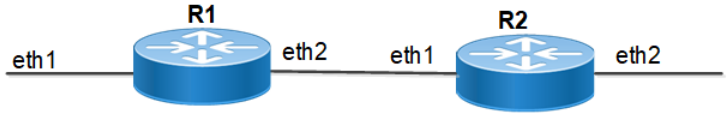
The actual Autonomous System number is never shared to the external network.

Configuration

The following configuration assumes the router R1 and R2 is assigned with AS300 and AS100 respectively.

Topology

Figure 96. Disparate Autonomous System Number



R1

`#configure terminal`	Enter configure mode.
`R1(config)#router bgp 300`	Start the BGP process with the Autonomous System number 300
`R1(config-router)#neighbor 10.10.10.2 remote-as 200`	Establish BGP session with neighbor that has AS number 200
`R1(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`R1(config-router-af)#neighbor 10.10.10.2 activate`	Enable the neighbor 10.10.10.2 router to exchange address family routes
`R1(config-router-af)#redistribute connected`	Redistribute information from connected routes
`R1(config-router-af)#exit-address-family`	Exit address-family IPv4 unicast mode
`R1(config-router)#commit`	Commit the configurations

R2

Perform the following configuration on R2 router.

`#configure terminal`	Enter configure mode
`R2(config)#router bgp 100`	Start the BGP process with the Autonomous System number 100
`R2(config-router)#neighbor 10.10.10.1 remote-as 300`	Establish BGP session with neighbor 10.10.10.1 that has AS number 300
`R2(config-router)#neighbor 10.10.10.1 local-as 200 no-prepend replace-as`	Replace the AS number 300 with AS number 200 that should be used with the neighbor 10.10.10.1
`R2(config-router)#address-family ipv4 unicast`	Enable the neighboring router to exchange address family routes
`R2(config-router-af)#neighbor 10.10.10.2 activate`	Enable the neighbor 10.10.10.2 router to exchange address family routes
`R2(config-router-af)#redistribute connected`	Redistribute information from the connected routes
`R2(config-router-af)#exit-address-family`	Exit address-family ipv4 unicast mode
`R2(config-router)#commit`	Commit the configurations

Validation

Check the AS number 300 running on R1. It has established a BGP connection with 10.10.10.2 router that has AS number of 200.

R1

```
OcNOS#show running-config bgp
!
router bgp 300
 neighbor 10.10.10.2 remote-as 200
 !
 address-family ipv4 unicast
```

```
 redistribute connected
 redistribute static
 neighbor 10.10.10.2 activate
 exit-address-family
!

```

Example

The following example show a sample configuration command.

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 20.1.1.3 remote-as 300
(config-router)#neighbor 20.1.1.3 local-as 200 no-prepend replace-as

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 300
(config-router-af)#neighbor 3ffe:15:15:15:15::0 local-as 200
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 local-as 300
```

Revised CLI Commands

neighbor local-as

The `neighbor local-as` CLI is enhanced to hide and replace the AS number of the remote routers not connected to external peer. Two new options '`no-prepend`' and '`replace-as`' have been added. These options replace the AS number with an alternate AS number in the AS_PATH and BGP OPEN message. Hence, the AS of the remote router is unknown to the respective neighbor peer.

For the complete command reference, refer to `neighbor local-as (page 1371)` CLI in BGP Commands (page 1244) section.

Abbreviations

Acronym	Description
ASN	Autonomous System Number
EBGP	External Border Gateway Protocol

BGP Aggregate-Address in VRF Address-family

Overview

The aggregate-address feature for VRF address-families in BGP is designed to simplify route management by summarizing multiple specific routes into a single, broader prefix. This helps reduce the size of routing tables and minimizes the overhead for both local and remote routers. Below is an functionality explanation of the behavior and implications of this feature during configuration and un-configuration processes.

Benefits

- Route Summarization: Aggregates multiple specific routes into a single summary route, reducing routing table complexity.
- Scalability: Summarized routes optimize resource utilization, particularly in networks with multiple VRFs and large routing tables.
- Stability: Reduces route flapping as changes in individual specific routes do not impact the advertised aggregate route.

Prerequisites

- IPv4: Individual routes are advertised to BGP peers as separate prefixes.
- IPv6: Individual routes are advertised to BGP peers as separate prefixes.
- Each route is treated independently in the BGP table and shared with peers accordingly.

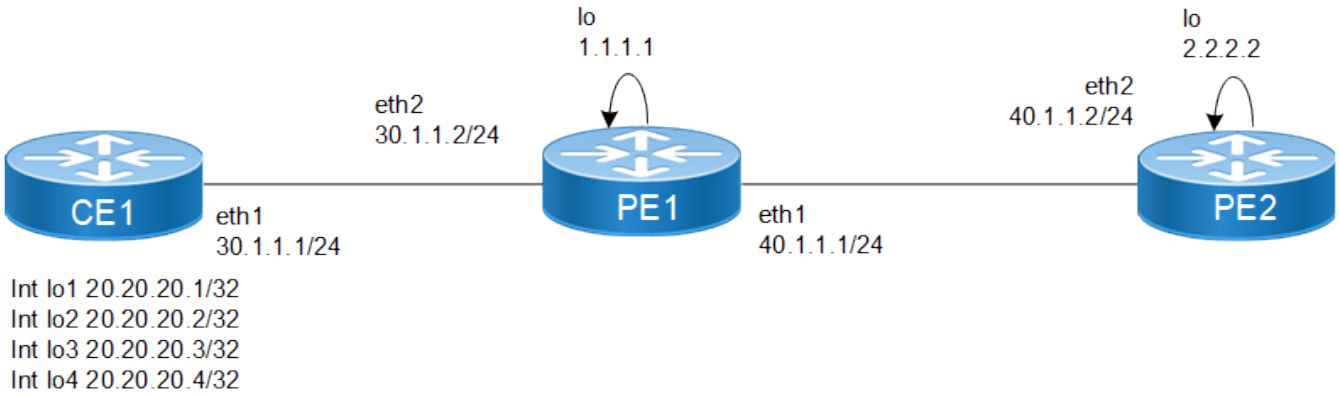
Configuration for Aggregate-Address in VRF Address-Family with IPv4

Note: When the VRF CE access interface flaps (via shutdown/no shutdown), connected routes become inactive, especially when OSPF is used as the PE-CE protocol. Consequently, routes learned over that interface are also inactive. To prevent the loss of these routes, configure redistribute connected under the VRF BGP instance.

Topology

This sample topology provides basic connectivity for IPv4 Aggregated address.

Figure 97. BGP Aggregate-Address in VRF Address-Family with IPv4



PE1

1. Configure the router ID:

```
#configure terminal
PE1 (config)#router ldp
PE1(config- router)#router-id 1.1.1.1
PE1(config- router)#exit
```

2. Create and configure VRFs:

```
PE1 (config)#ip vrf VRF1
PE1 (config-vrf)#rd 100:1
PE1 (config-vrf)#route-target both 100:1
PE1 (config-vrf)#exit
```

3. Enable LDP globally:

```
PE1(config)#router ldp
PE1(config-ldp)#exit
```

4. Configure loopback interface with IPv4 and IPv6:

```
 PE1(config-if)#interface lo
 PE1(config-if)#ip address 127.0.0.1/8
 PE1(config-if)#ip address 1.1.1.1/32 secondary
 PE1(config-if)#ipv6 address ::1/128
 PE1(config-if)#exit
```

5. Configure eth1 under VRF1 with an IP address:

```
PE1(config)#interface eth2
PE1(config-if)#ip vrf forwarding VRF1
PE1(config-if)#ip address 30.1.1.2/24
PE1(config-if)#exit
```

6. Configure eth2 for MPLS and enable LDP:

```
PE1(config)#interface eth1
PE1(config-if)#ip address 40.1.1.1/24
PE1(config-if)#ipv6 address 3000::2/64
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
PE1(config-if)#interface eth3
PE1(config-if)#interface eth4
PE1(config-if)#interface eth5
PE1(config-if)#interface eth6
PE1(config-if)#exit
```

© 2026 IP Infusion Inc. Proprietary

7. Enable OSPF and define networks:

```
PE1(config)#router ospf 100
PE1(config-router)#ospf router-id 1.1.1.1
PE1(config-router)#network 1.1.1.1/32 area 0.0.0.0
PE1(config-router)#network 40.1.1.0/24 area 0.0.0.0
PE1(config-router)#exit
```

8. Configure BGP:

```
PE1(config)#router bgp 100
PE1(config-router)#bgp router-id 1.1.1.1
PE1(config-router)#neighbor 2.2.2.2 remote-as 100
PE1(config-router)#neighbor 2.2.2.2 update-source lo
PE1(config-router)#address-family ipv4 unicast
PE1(config-router-ad)#neighbor 2.2.2.2 activate
PE1(config-router-ad)#exit-address-family
PE1(config-router)#address-family vpnv4 unicast
PE1(config-router-ad)#neighbor 2.2.2.2 activate
PE1(config-router-ad)#exit-address-family
PE1(config-router)#address-family ipv4 vrf VRF1
PE1(config-router-ad)#aggregate-address 20.20.20.0/24 as-set summary-only
PE1(config-router-ad)#neighbor 30.1.1.1 remote-as 200
PE1(config-router-ad)#neighbor 30.1.1.1 activate
PE1(config-router-ad)#neighbor 30.1.1.1 route-map map1 in
PE1(config-router-ad)#exit-address-family
```

PE2

1. Configure the router ID:

```
#configure terminal
PE2(config)#router ldp
PE2(config- router)#router-id 2.2.2.2
PE2(config- router)#exit
```

2. Create and configure VRFs:

```
PE2(config)#ip vrf VRF1
PE2(config-vrf)#rd 200:1
PE2(config-vrf)#route-target both 100:1
PE2(config-vrf)#exit
```

3. Enable LDP globally:

```
PE2(config)#router ldp
PE2(config-ldp)#exit
```

4. Configure loopback interface with IPv4 and IPv6:

```
PE2(config-if)#interface lo
PE2(config-if)#ip address 127.0.0.1/8
PE2(config-if)#ip address 2.2.2.2/32 secondary
PE2(config-if)#ipv6 address ::1/128
PE2(config-if)#exit
```

5. Configure eth1 under VRF1 with an IP address:

```
PE2(config)#interface eth1
PE2(config-if)#ip vrf forwarding VRF1
PE2(config-if)#ip address 50.1.1.2/24
PE2(config-if)#exit
```

6. Configure eth2 for MPLS and enable LDP:

```
PE2(config)#interface eth2
PE2(config-if)#ip address 40.1.1.2/24
PE2(config-if)#ipv6 address 3000::2/64
```

© 2026 IP Infusion Inc. Proprietary

```
PE2(config-if)#label-switching
PE2(config-if)#enable-ldp ipv4
PE2(config-if)#interface eth3
PE2(config-if)#interface eth4
PE2(config-if)#interface eth5
PE2(config-if)#interface eth6
PE2(config-if)#exit
```

7. Enable OSPF and define networks:

```
PE2(config)#router ospf 100
PE2(config-router)#ospf router-id 2.2.2.2
PE2(config-router)#network 2.2.2.2/32 area 0.0.0.0
PE2(config-router)#network 40.1.1.0/24 area 0.0.0.0
PE2(config-router)#exit
```

8. Configure BGP:

```
PE2(config)#router bgp 100
PE2(config-router)#bgp router-id 2.2.2.2
PE2(config-router)#neighbor 1.1.1.1 remote-as 100
PE2(config-router)#neighbor 1.1.1.1 update-source lo
PE2(config-router)#address-family ipv4 unicast
PE2(config-router-ad)#neighbor 1.1.1.1 activate
PE2(config-router-ad)#exit-address-family
PE2(config-router)#address-family vpnv4 unicast
PE2(config-router-ad)#neighbor 1.1.1.1 activate
PE2(config-router-ad)#exit-address-family
PE2(config-router)#address-family ipv4 vrf VRF1
PE2(config-router-ad)#neighbor 50.1.1.1 remote-as 200
PE2(config-router-ad)#neighbor 50.1.1.1 route-map map1 in
PE2(config-router-ad)#exit-address-family
```

CE1

1. Configure Ethernet Interface eth1 with IP Address:

```
(config)#interface eth1
CE1 (config-if)#ip address 30.1.1.1/24
CE1 (config-if)#exit
```

2. Configure Loopback Interfaces

```
(config)#interface lo1
CE1(config-if)#ip address 20.20.20.1/32
CE1(config-if)#exit
CE1(config)#interface lo2
CE1(config-if)#ip address 20.20.20.2/32
CE1(config-if)#exit
CE1(config)#interface lo3
CE1(config-if)#ip address 20.20.20.3/32
CE1(config-if)#exit
CE1(config)#interface lo4
CE1(config-if)#ip address 20.20.20.4/32
CE1(config-if)#exit
```

3. Configure BGP:

```
(config)#router bgp 300
CE1(config-router)#neighbor 30.30.30.2 remote-as 100
CE1(config-router)#address-family ipv4 unicast
CE1(config-router-ad)#neighbor 30.30.30.2 activate
CE1(config-router-ad)#redistribute connected
CE1(config-router-ad)#exit-address-family
CE1(config-router)#exit
```

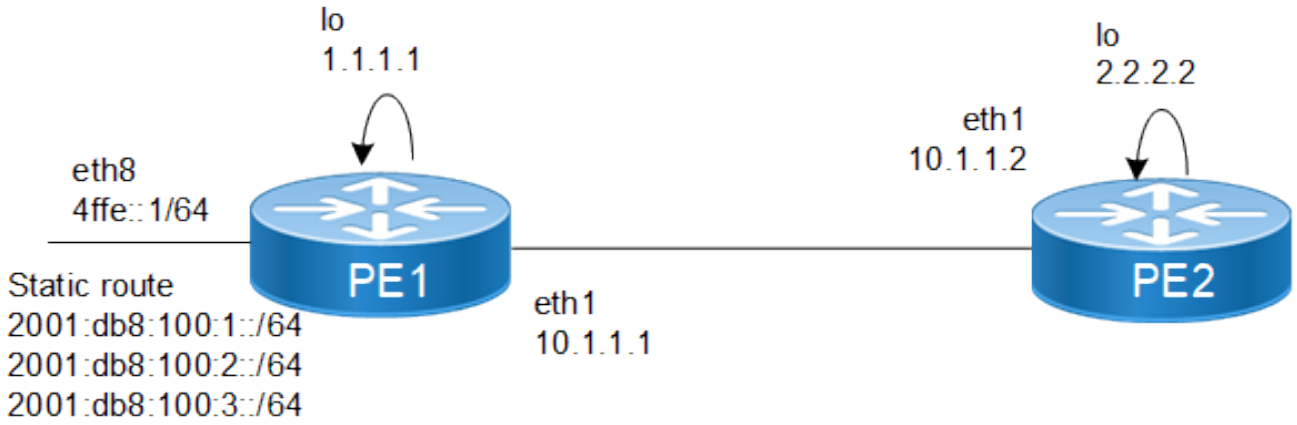
Configuration for Aggregate-Address in VRF Address-Family with IPv6

Topology

This sample topology provides basic connectivity for IPv6 Aggregated address.

Figure 98. BGP Aggregate-Address under Address-Family with IPv6



PE1

1. Configure Interfaces:

```
PE1(config)#interface eth1
PE1(config-if)#ip address 10.1.1.1/24
PE1(config-if)#ipv6 address 3000::1/64
PE1(config-if)#label-switching
PE1(config-if)#enable-ldp ipv4
PE1(config-if)#commit
PE1(config-if)#exit

PE1(config)#interface lo
PE1(config-if)#ip address 127.0.0.1/8
PE1(config-if)#ip address 1.1.1.1/32 secondary
PE1(config-if)#ipv6 address ::1/128
PE1(config-if)#commit
PE1(config-if)#exit
```

2. Configure OSPF (IPv4):

```
PE1(config)#router ospf 100
PE1(config-router)#network 1.1.1.1/32 area 0.0.0.0
PE1(config-router)#network 10.1.1.0/24 area 0.0.0.0
PE1(config-router)#commit
PE1(config-router)#exit
```

3. Configure BGP (IPv4 and IPv6):

```
PE1(config)#router bgp 100
PE1(config-router)#neighbor 2.2.2.2 remote-as 100
PE1(config-router)#neighbor 2.2.2.2 update-source lo
PE1(config-router)#address-family vpnv4 unicast
PE1(config-router-af)#neighbor 2.2.2.2 activate
PE1(config-router-af)#exit-address-family
PE1(config-router)#address-family vpnv6 unicast
PE1(config-router-af)#neighbor 2.2.2.2 activate
PE1(config-router-af)#exit-address-family
PE1(config-router)#address-family ipv6 vrf vrf1
PE1(config-router-af)#aggregate-address 2001:db8:100::/48 summary-only
PE1(config-router-af)#redistribute static
PE1(config-router-af)#exit-address-family
PE1(config-router)#commit
PE1(config-router)#exit
```

4. Configure Static IPv6 Routes in vrf1:

```
PE1(config)#ipv6 route vrf vrf1 2001:db8:100:1::/64 eth8
PE1(config)#ipv6 route vrf vrf1 2001:db8:100:2::/64 eth8
PE1(config)#ipv6 route vrf vrf1 2001:db8:100:3::/64 eth8
```

PE2

1. Configure Interfaces:

```
(config)#interface eth1
(config-if)#ip address 10.1.1.2/24
(config-if)#label-switching
(config-if)#enable-ldp ipv4
(config-if)#commit
(config-if)#exit

(config)#interface lo
(config-if)#ip address 127.0.0.1/8
(config-if)#ip address 2.2.2.2/32 secondary
(config-if)#ipv6 address ::1/128
(config-if)#commit
(config-if)#exit
```

2. Configure OSPF (IPv4):

```
(config)#router ospf 100
```

```
(config-router)#network 2.2.2.2/32 area 0.0.0.0
(config-router)#network 10.1.1.0/24 area 0.0.0.0
```

3. Configure BGP (IPv4/IPv6/VPN):

```
(config)#router bgp 100
(config-router)#neighbor 1.1.1.1 remote-as 100
(config-router)#neighbor 1.1.1.1 update-source lo
(config-router-af)#address-family vpnv4 unicast
(config-router-af)#neighbor 1.1.1.1 activate
(config-router-af)#exit-address-family
(config-router)#address-family vpnv6 unicast
(config-router-af)#neighbor 1.1.1.1 activate
(config-router-af)#exit-address-family
(config-router)#address-family ipv6 vrf vrf1
(config-router-af)#exit-address-family
(config-router)#commit
(config-router)#exit
```

Running Configuration with IPv6

BGP RPKI-Based Route Validation

Overview

Resource Public Key Infrastructure (RPKI) is a security framework designed to mitigate the risk of BGP prefix hijacking by cryptographically verifying that an Autonomous System (AS) is authorized to announce a given IP prefix.

In OcNOS, RPKI-based BGP Origin Validation allows the router to download Route Origin Authorizations (ROAs) from an RPKI server via the RTR protocol. The downloaded ROAs are then used to validate incoming BGP routes, ensuring that only legitimate prefixes are considered during best path selection.

This feature improves routing security by reducing the acceptance and propagation of invalid routes.

Feature Characteristics

- **ROA Retrieval:** Supports downloading ROAs from multiple (up to 10) RPKI servers over TCP or SSH transport.
- **Per-AF and Per-VRF Support:** Validation can be enabled on a per-address-family (IPv4/IPv6 unicast) and per-VRF basis.
- **Validation States:** Each route is tagged with one of the three validation state:
  - **Valid (V):** Prefix-AS match found in ROA.
  - **Invalid (I):** Prefix-AS mismatch or not authorized.
  - **Not-Found (N):** No corresponding ROA.
- **Flexible Policy Control:** Route-map support for matching on RPKI state (valid, invalid, not-found) to set attributes such as local preference.
- **Best Path Selection Control:**
  - Option to consider only valid/not-found routes for path selection.
  - Configurable to allow invalid routes in best path preference.
- **Dynamic Updates:** ROA updates are applied in real time from RPKI servers.

Benefits

- **Enhanced Security:** Prevents acceptance of hijacked or misconfigured routes.
- **Operational Flexibility:** Operators can tune route selection with route-maps or allow invalid routes for troubleshooting.
- **Standards Compliance:** Implements BGP Origin Validation as per RPKI-based validation standards.
- **Granular Control:** Policies can be applied per Address Family (AF)or Virtual Routing and Forwarding (VRF), giving operators flexibility in deploying validation gradually.
- **Improved Resilience:** Reduces propagation of invalid prefixes across the Internet routing system.

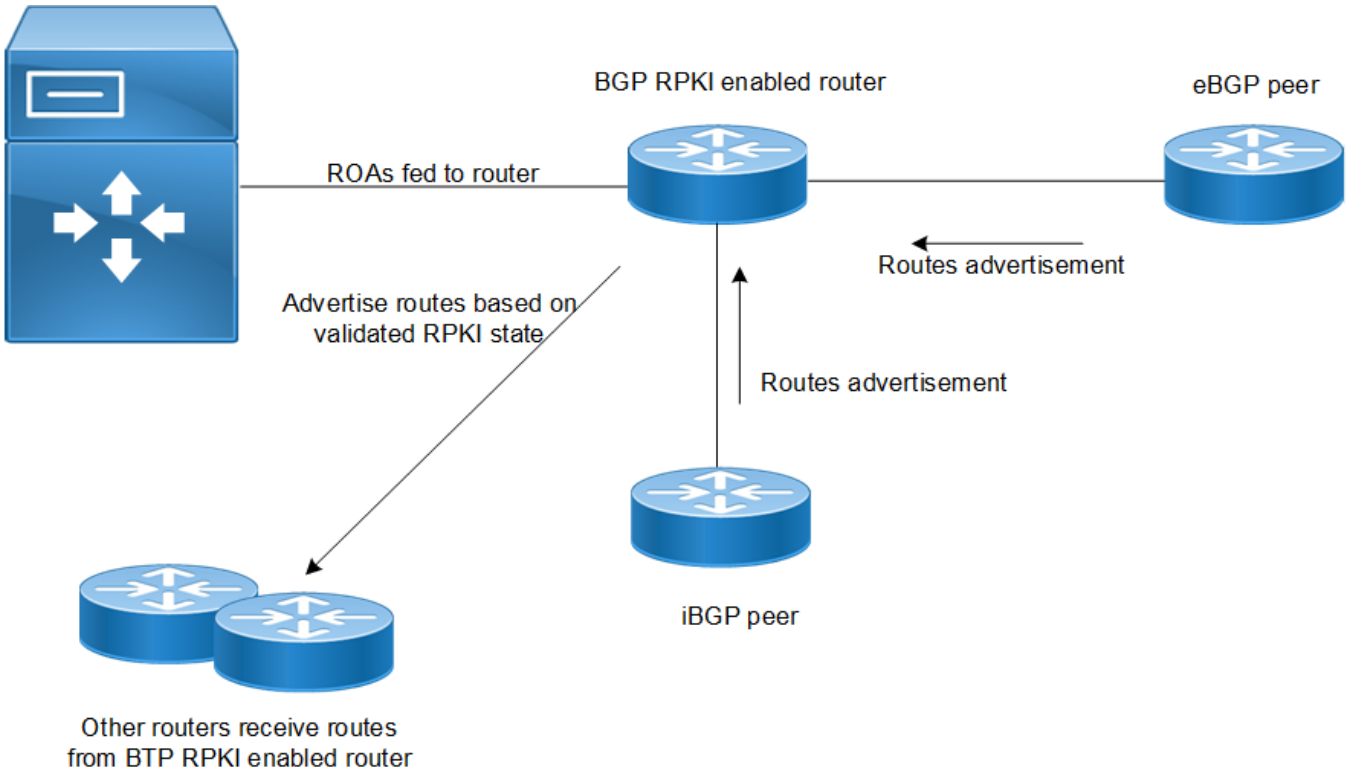
Configuration

This section describes the configuration procedure for enabling RPKI-based BGP origin validation.

Prerequisites

- BGP is already configured (router bgp (ASN)) on the device.
- You have reachable RPKI RTR server IP(s) and credentials (if using SSH).
- Make sure the required transport ports (TCP or SSH) are reachable between the OcNOS and the RPKI server(s).
- Decide per address-family (IPv4/IPv6) and per VRF where you want validation turned on.

Topology



In this topology, the RPKI Validator stores and distributes Route Origin Authorizations (ROAs), which contain information about the prefixes and its authorized originating AS numbers. The validator communicates these validated ROAs to the BGP RPKI-enabled router.

The BGP RPKI-enabled router establishes a session with the RPKI Validator using either TCP or SSH, depending on the configuration. Upon receiving ROAs, the router validates the BGP route advertisements against the authorized prefix–origin pairs.

Based on the validation results, the router marks each route as Valid, Invalid, or NotFound, and applies routing policies accordingly.

Only routes that pass the validation check (Valid) are used for forwarding or are advertised to other peers.

- ROAs fed to router: The RPKI Validator sends validated prefix-origin data to the BGP RPKI-enabled router.

© 2026 IP Infusion Inc. Proprietary

- Advertise routes based on validated RPKI state: The router advertises only validated routes to its BGP peers.
- iBGP and eBGP peers: Both internal (iBGP) and external (eBGP) peers receive route updates from the RPKI-enabled router.
- Other routers: Routers within the same AS or network domain receive routes that have already been validated, ensuring route authenticity and preventing prefix hijacking.

1. Configure one or more RPKI servers to establish RTR sessions and download Route Origin Authorizations (ROAs).

```
ocnos(config)# router bgp 100
ocnos(config-router)# bgp rpki server 10.30.0.85 ssh user test encrypt 0 password test refresh 1
retry 1 expire 600
ocnos(config-router)# bgp rpki server 192.168.1.233 tcp refresh 1 retry 1 expire 600
ocnos(config-router)# commit
```

2. Enable origin validation on the required address family (AF) or VRF. This allows BGP routes to be tagged with an RPKI validation state:
    - V: Valid
    - I: Invalid
    - N: Not-found

```
ocnos(config)# router bgp 100
ocnos(config-router)# address-family ipv4 unicast
ocnos(config-router-af)# bgp origin-as validation-enable
ocnos(config-router-af)# commit
```

3. Configure BGP to consider RPKI validation state in the best-path selection process. Invalid routes are excluded, and preference is given in the following order: valid > not-found (unless modified by policy).

```
ocnos(config-router-af)# bgp origin-as bestpath use-validity
ocnos(config-router-af)# commit
```

4. Permit invalid routes to participate in best-path selection but assign them the lowest preference.

```
ocnos(config-router-af)# bgp origin-as bestpath allow-invalid
ocnos(config-router-af)# commit
```

5. Use route-maps to define policy actions, such as setting local preference, based on the RPKI validation state of a route.

    Example of the route map:

```
route-map RPKI-1 permit 3
 match rpki valid
 set local-preference 100

route-map RPKI-1 permit 5
 match rpki not-found
 set local-preference 200

route-map RPKI-1 permit 10
 match rpki invalid
 set local-preference 300
```

```
ocnos(config-router)# address-family ipv4 unicast
ocnos(config-router-af)# neighbor 100.1.1.2 activate
ocnos(config-router-af)# neighbor 100.1.1.2 route-map RPKI-1 in
ocnos(config-router-af)# commit
```

6. Remove or rollback RPKI configuration:
    - Disable Validation in an AF/VRF:

© 2026 IP Infusion Inc. Proprietary

```
ocnos(config-router-af)# no bgp origin-as validation-enable
ocnos(config-router-af)# commit
```

- Remove an RPKI Server:

```
ocnos(config)# router bgp 100
ocnos(config-router)# no bgp rpki server 10.30.0.85
ocnos(config-router)# commit
```

Validation

Verify server session for the following:

State: Established and Synced: TRUE in show bgp rpki server detail.

```
OCNOS#show bgp rpki server detail
BGP RPKI Server Information
 Server Address: 155.155.1.1:
    Transport: TCP:3323
    RTR Version: 1
    State: established
    Synced: TRUE

Total number of prefixes 21
```

Implementation Examples

Incomplete Global RPKI Adoption

Not all Internet Service Providers (ISPs) or regional networks fully participate in RPKI validation.

Example Scenario: Peers from regions with limited RPKI coverage advertise valid prefixes that appear as invalid due to missing ROAs.

Action: It may permit invalid routes from trusted peers or specific regions to maintain global connectivity.

Route Leak or Failover Scenarios

During failover or traffic engineering events, alternate paths may temporarily appear as invalid.

Example Scenario: A backup eBGP link originates a prefix from a different AS path than specified in the ROA.

Action:The route may be allowed conditionally (for example, through route maps) to ensure reachability during the transition period.

Commands

The BGP RPKI as origin validation feature introduces the following commands:

bgp rpki server

Use this command to configure an RPKI cache server using either TCP or SSH transport, and to set the port and timer parameters (refresh, retry, expire), along with authentication details when SSH is used.

Use the **no** parameter of this command to remove an existing RPKI server configuration from the BGP instance.

Command Syntax

```
bgp rpki server (A.B.C.D or X:X::X:X) (tcp|) (port (port number)) (refresh (1 - 86400 )) (retry (1 -
7200 )) (expire (600 - 17200))

bgp rpki server (A.B.C.D or X:X::X:X) ssh user (user name) encrypt (0|1) password (PASSWORD) (port
(PORT NUMBER)) (refresh (1 - 86400 )) (retry (1 - 7200 )) (expire (600 - 17200))
```

Parameters

A.B.C.D
Specifies the IPv4 address of the RPKI cache server.

X:X::X:X
Specifies the IPv6 address of the RPKI cache server.

tcp
Specifies TCP as the communication protocol between the router and the RPKI server.

ssh
Specifies SSH as the communication protocol between the router and the RPKI server for secure communication.

user
Defines the username used to authenticate with the RPKI server.

encrypt
Specifies encrypted or not encrypted for a password

0
Defines unencrypted password (key)

1
Defines encrypted password (key)

password
Defines the BGP encrypted password (key) up to maximum 218 characters for an ssh connection.

port
Specifies the TCP or SSH port number to connect to the RPKI server.

refresh
Specifies the time interval, in seconds, to refresh the cache from the RPKI server.

retry
Specifies the time interval, in seconds, to retry the connection to the RPKI server if the previous attempt fails.

expire
Specifies the cache expiration interval, in seconds, after which cached RPKI data is discarded if not refreshed.

Default

None

© 2026 IP Infusion Inc. Proprietary

Command Mode

Router mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example illustrates how to specify rpki server:

```
OcNOS(config-router)# bgp rpki server 10.30.0.85 tcp port 3323 refresh 600 retry 120 expire 7200

OcNOS(config-router)# no bgp rpki server 10.30.0.85

OcNOS(config-router)#bgp rpki server 1.1.1.1 ssh user test encrypt 0 password 123
OcNOS(config-router)#commit
```

© 2026 IP Infusion Inc. Proprietary

bgp origin-as validation-enable

Use this command to enable BGP Origin-AS (AS Origin) Validation using RPKI. When enabled, the router validates the origin AS of received BGP prefixes against the ROA information downloaded from RPKI servers..

Use the **no** parameter of this command to disable BGP Origin-AS validation.

Command Syntax

```
bgp origin-as validation-enable
no bgp origin-as validation-enable
```

Parameters

None

Default

None

Command Mode

Address Family Configuration Mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example enables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config)#router bgp 100
OcNOS(config-router)#address-family ipv4 unicast
OcNOS(config-router-af)# bgp origin-as validation-enable
```

The following example disables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config-router-af)# no bgp origin-as validation-enable
```

© 2026 IP Infusion Inc. Proprietary

bgp origin-as bestpath

Use this command to control how BGP selects the best path when RPKI Origin-AS validation is enabled.

This command determines whether BGP considers RPKI validation results during the bestpath selection process or allows paths with an invalid RPKI state to be selected.

Use the **no** form of this command to restore the default bestpath behavior.

Command Syntax

```
bgp origin-as bestpath (allow-invalid | use validity)
no bgp origin-as bestpath (allow-invalid | use validity)
```

Parameters

allow-invalid
Enables to handle a route with invalid RPKI state for the best path selection

Use-validity
Enables to use origin-as validation for the bestpath selection

Default

None

Command Mode

Address Family Configuration Mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example enables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config)#router bgp 100
OcNOS(config-router)#address-family ipv4 unicast
OcNOS(config-router-af)# bgp origin-as bestpath allow-invalid
```

The following example disables Origin-AS validation for BGP bestpath selection in the current address family configuration:

```
OcNOS(config-router-af)# no bgp origin-as bestpath allow-invalid
```

© 2026 IP Infusion Inc. Proprietary

match rpki

Use this command to match BGP routes based on their Resource Public Key Infrastructure (RPKI) validation status in a route-map.

Use the **no** parameter of this command to remove an existing RPKI match configuration from the route-map.

Command Syntax

```
match rpki {valid | invalid | not-found}
no match rpki {valid | invalid | not-found}
```

Parameters

valid
Matches routes that have a valid RPKI validation status.

invalid
Matches routes that have an invalid RPKI validation status.

not-found
Matches routes whose RPKI validation status is unknown (not found).

Default

None

Command Mode

Route map mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example illustrates to match only invalid RPKI routes in a route-map and to remove the invalid RPKI routes.

```
ocnos#config  terminal
ocnos(config)#route-map 1
ocnos(config-route-map)# match rpki invalid

ocnos(config-route-map)# no match rpki valid
```

© 2026 IP Infusion Inc. Proprietary

show bgp rpki table ipv4

Use this command to display the IPv4 RPKI ROA table.

The command shows all validated ROA entries downloaded from configured RPKI servers.

Command Syntax

```
show bgp rpki table ipv4 (A.B.C.D/M ((covered|matched) (as-no <1-4294967295>)
```

Parameters

A.B.C.D/M
Displays ROA entries that include or relate to the specified IPv4 prefix.

covered
Displays ROA entries where the specified prefix is covered by a larger ROA prefix.

matched
Filters the ROA table to display entries associated with a specific authorized origin AS number.

as-no <1–4294967295>
Filters the ROA table to display entries associated with a specific authorized origin AS number.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example displays IPv4 RPKI ROA table:

```
ocnos#show bgp rpki table ipv4
 BGP RPKI, ROA list
 1.0.0.0/24                                Maxlen:24 AS:13335 Server:10.30.0.85

                                           Maxlen:24 AS:4134 Server:192.168.1.233
```

Explanation of output fields:

© 2026 IP Infusion Inc. Proprietary

Field	Description
Prefix	Shows the IPv4 prefix (ROA prefix) published by the RPKI trust anchor.
Maxlen	Indicates the maximum prefix length allowed by the ROA.
AS	Displays the authorized Origin AS number for the prefix, as specified in the ROA.
Server	Indicates the RPKI server (RPKI RTR server address) from which the ROA entry was received.

© 2026 IP Infusion Inc. Proprietary

show bgp rpki table ipv6

Use this command to display the IPv6 RPKI ROA table.

The command shows all validated ROA entries downloaded from configured RPKI servers.

Command Syntax

```
show bgp rpki table ipv6 (X:X::X:X/M ((covered|matched) (as-no <1-4294967295>|)|)|)
```

Parameters

X:X::X:X/M
Displays ROA entries that include or relate to the specified IPv6 prefix.

covered
Displays ROA entries where the specified prefix is covered by a larger ROA prefix.

matched
Filters the ROA table to display entries associated with a specific authorized origin AS number.

as-no <1–4294967295>
Filters the ROA table to display entries associated with a specific authorized origin AS number.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example displays IPv6 RPKI ROA table:

```
ocnos#show bgp rpki table ipv6
 BGP RPKI, ROA list
 2001:200::/32                          Maxlen:32 AS:2500 Server:192.168.1.233
 2001:200:136::/48                      Maxlen:48 AS:9367 Server:192.168.1.233
 2001:200:1ba::/48                      Maxlen:48 AS:24047 Server:192.168.1.233
 2001:200:900::/40                      Maxlen:40 AS:7660 Server:192.168.1.233
 2001:200:e00::/40                      Maxlen:40 AS:4690 Server:192.168.1.233
 2001:200:8000::/35                     Maxlen:35 AS:4690 Server:192.168.1.233
 2001:200:c000::/35                     Maxlen:35 AS:23634 Server:192.168.1.233
 2001:200:e000::/35                     Maxlen:35 AS:7660 Server:192.168.1.233
 2001:218::/32                          Maxlen:32 AS:2914 Server:192.168.1.233
 2001:218:2000:2::/64                   Maxlen:64 AS:4058 Server:192.168.1.233
 2001:218:2000:11::/64                  Maxlen:64 AS:55569 Server:192.168.1.233
 2001:218:2000:21::/64                  Maxlen:64 AS:55569 Server:192.168.1.233
 2001:218:2002::/48                     Maxlen:48 AS:2914 Server:192.168.1.233
```

Explanation of output fields:

Field	Description
Prefix	Shows the IPv6 prefix (ROA prefix) published by the RPKI trust anchor.
Maxlen	Indicates the maximum prefix length allowed by the ROA.
AS	Displays the authorized Origin AS number for the prefix, as specified in the ROA.
Server	Indicates the RPKI server (RPKI RTR server address) from which the ROA entry was received.

show bgp origin-as validity ipv4

Use this command to display the RPKI Origin-AS validation state of IPv4 BGP routes.The command shows whether each route is classified as valid, not-found, or invalid based on the ROA information received from RPKI servers.

Command Syntax

```
show bgp origin-as validity ipv4 (valid|not-found|invalid|) (vrf WORD|)
```

Parameters

valid
Displays only the IPv4 prefixes that passed RPKI Origin-AS validation.

not-found
Displays routes for which no corresponding ROA entry exists.

invalid
Displays routes that fail RPKI Origin-AS validation.

vrf WORD
Displays RPKI validation results for the specified VRF instance.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example displays bgp origin-as validity for IPv4 address:

```
ocnos#show bgp origin-as validity ipv4
BGP table version is 9, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
              l - labeled, S Stale, x-EVPN MPLS

```

show bgp origin-as validity ipv6

Use this command to display the RPKI Origin-AS validation state of IPv6 BGP routes.The command shows whether each route is classified as valid, not-found, or invalid based on the ROA information received from RPKI servers.

Command Syntax

```
show bgp origin-as validity ipv6 (valid|not-found|invalid|) (vrf WORD|)
```

Parameters

valid
Displays only the IPv6 prefixes that passed RPKI Origin-AS validation.

not-found
Displays routes for which no corresponding ROA entry exists.

invalid
Displays routes that fail RPKI Origin-AS validation.

vrf WORD
Displays RPKI validation results for the specified VRF instance.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example displays origin-as validity for IPv6 address:

```
ocnos#show bgp origin-as validity ipv6
BGP table version is 270, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
              l - labeled, S Stale, x-EVPN MPLS
Origin codes: i - IGP, e - EGP, ? - incomplete
Description : Ext-Color - Extended community color

Origin-AS validation codes: V valid, I invalid, N not-found, D disabled

Total number of prefixes 5
```

show bgp rpki server

Use this command to display the configured RPKI servers, their transport protocol, operational state, uptime, and the number of received Route Origin Authorizations (ROAs) for both IPv4 and IPv6.

Command Syntax

```
show bgp rpki server  (detail|summary)
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example displays rpki server show command:

```
ocnos#show bgp rpki server
 Server Address                          Transport   State         Uptime      ROAs (IPv4/IPv6)
 10.16.99.108                            TCP:3323    established   00:02:27    9/3
 155.155.1.1                             SSH:2222    established   00:02:26    9/3

ocnos#show bgp rpki server detail
BGP RPKI Server Information
 Server Address: 155.155.1.1:
    Transport: TCP:3323
    RTR Version: 1
    State: established
    Synced: TRUE
    Uptime: 00:00:39
    ROAs (IPv4/IPv6): 9/3
    Configured Refresh-Interval: 15 seconds
    Configured Retry-Interval: 10 seconds
    Configured Expire-Interval: 600 seconds
    Actual Refresh-Interval: 5 seconds
    Actual Retry-Interval: 5 seconds
    Actual Expire-Interval: 600 seconds
    Rest of time to Refresh-Interval expiration: 2 seconds
    Rest of time to Expire-Interval expiration: 597 seconds
    ToBeDeleted: FALSE
```

Explanation of output fields:

Field	Description
Server Address	IP address of the configured RPKI server.
Transport	Transport protocol and port used to connect to the RPKI

Field	Description
	server (for example: TCP:or SSH:)
RTR Version	Version of the RPKI-to-Router (RTR) protocol negotiated with the server.
State	Current operational state of the RPKI server
Synced	Indicates whether the router has successfully synchronized ROA data with the server.
Uptime	Duration for which the server connection has been active or the current status since the last state change.
ROAs (IPv4/IPv6)	Number of valid Route Origin Authorizations received from the server, separated by IPv4 and IPv6 counts.
Configured Refresh-Interval	User-configured refresh timer for requesting updated validation data.
Configured Retry-Interval	User-configured retry interval for reconnecting after a session failure.
Configured Expire-Interval	User-configured maximum validity period for cached ROA data.
Actual Refresh-Interval	Refresh interval currently in use, as negotiated with the server.
Actual Retry-Interval	Retry interval currently in use, based on server negotiation.
Actual Expire-Interval	Expire interval currently in use, based on protocol negotiation.
Rest of time to Refresh-Interval expiration	Remaining time until the next refresh request is triggered.
Rest of time to Expire-Interval expiration	Remaining time before cached validation data becomes invalid.
ToBeDeleted	Indicates whether the server entry is marked for deletion.

Glossary

Key Terms/Acronym	Description
Border Gateway Protocol (BGP)	The standardized exterior gateway protocol used to exchange routing information between autonomous systems (ASes) on the Internet.
Resource Public Key Infrastructure (RPKI)	A framework designed to secure the Internet's routing infrastructure by cryptographically verifying that an AS is authorized to originate a specific IP prefix.
Origin Validation	A process where a BGP router validates the origin AS of a received route against RPKI data to determine if the route is legitimate.

© 2026 IP Infusion Inc. Proprietary

Key Terms/Acronym	Description
Route Origin Authorization (ROA)	digitally signed object that specifies which AS is authorized to announce a particular IP prefix.

Recursive Next-hop Resolution with MPLS Next-hop

Overview

Recursive Next-hop Resolution with MPLS Next-hop enables OcNOS to resolve recursive BGP and Static routes using MPLS transport paths instead of IP next-hops. This feature allows seamless packet forwarding through an MPLS core where BGP is not active, supporting scalable BGP-Free Core deployments. The system recognizes available MPLS Label Switched Paths (LSPs) as valid forwarding options, ensuring reachability across label-switched domains without requiring additional routing protocols in the backbone.

Feature Characteristics

- Supports route resolution over LDP, RSVP-TE, and Segment Routing (SR-MPLS) tunnels.
- Automatically updates route resolution when the underlying MPLS transport changes.
- Integrates with MPLS ECMP, FRR, and TI-LFA for resiliency and load balancing.
- Displays MPLS-resolved recursive routes in standard routing table views.
- Maintains consistent behavior for both BGP and Static recursive routes.
- Operates transparently without additional configuration changes to the routing process.

Benefits

Enables BGP-Free Core Operation: Backbone routers forward traffic using MPLS without running BGP.

Simplified Architecture: Reduces control-plane load and configuration complexity.

Improved Resiliency: Leverages MPLS protection mechanisms for faster failover.

Optimized Traffic Flow: Supports equal-cost load sharing over multiple MPLS paths.

Operational Visibility: Provides clear differentiation of MPLS-resolved routes for easier troubleshooting.

Limitation

- BGP multipath is not supported for BGP-Free Core deployments.
- If multiple BGP paths exist for the same prefix, the RIB selects only one path for MPLS next-hop resolution.
- Equal-Cost Multipath (ECMP) and Fast Reroute (FRR) are provided only by the underlying MPLS transport for that single resolved path.

Configuration

This section describes the Recursive Next-hop Resolution with MPLS Next-hop feature, illustrating its operation with a sample topology, configuration examples, and validation in an MPLS LDP and SR-MPLS deployments.

Configuration with MPLS LDP

Topology (MPLS LDP)

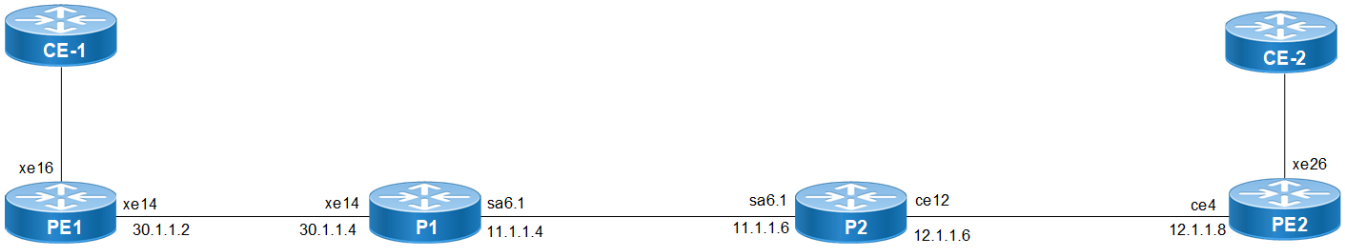
In this topology:

- PE1 or PE2 are Provider Edge routers connected to customer devices (CE1 or CE2).

© 2026 IP Infusion Inc. Proprietary

- P1 or P2 are core Provider routers.
- LDP is enabled on all PE and P routers to exchange MPLS labels and establish LSPs.
- OSPF and IS-IS are used as the IGP to advertise reachability between LDP peers.
- BGP is used between PE routers for VPN route exchange (VRFs).

Figure 99. Recursive Next-hop Resolution with MPLS Next-hop in MPLS LDP Deployment



PE1: 2.2.2.2 (loopback), xe14 to P1, xe16.80 to CE1.
P1: 4.4.4.4 (loopback), sa6.1 to P2, xe14 to PE1.
P2: 6.6.6.6 (loopback), sa6.1 to P1, ce12 to PE2.
PE2: 8.8.8.8 (loopback), ce4 to P2, xe26.80 to CE2.

Enable MPLS LDP on Core and PE Routers

- LDP requires a router ID (typically loopback).
- LDP is enabled per interface connecting MPLS-capable peers.
- OSPF or IS-IS should be running to provide IGP reachability for LDP session establishment.

```
router ldp
 router-id 2.2.2.2
!
!
interface lo
 ip address 2.2.2.2/32 secondary
!
interface xe14
 load-interval 30
 ip address 30.1.1.2/24
 label-switching
 ip ospf network point-to-point
 enable-ldp ipv4
!
interface xe16.80
 encapsulation dot1q 80
 ip address 80.1.1.1/24
 ip ospf network point-to-point
!
```

Configure IGP (OSPF or IS-IS)

- IGP ensures all LDP peers can discover each other.
- BFD is optional for fast detection of failures.

```
!
router ospf 1
 ospf router-id 2.2.2.2
 bfd all-interfaces
 network 2.2.2.2/32 area 0.0.0.0
 network 30.1.1.0/24 area 0.0.0.0
!
```

© 2026 IP Infusion Inc. Proprietary

Configure BGP (for VPNs or PE-to-PE routes)

- BGP exchanges prefixes between PE routers.
- MPLS labels are used to forward traffic between PE routers over the LDP-established LSPs.

```
!
router bgp 64000
 bgp router-id 2.2.2.2
  neighbor 8.8.8.8 remote-as 64000
 neighbor 8.8.8.8 update-source lo
 !
 address-family ipv4 unicast
 redistribute connected
  neighbor 8.8.8.8 activate
 exit-address-family
 !
!
```

Validation (MPLS LDP)

Verify LDP Sessions

- **Expected output:** Session state = OPERATIONAL
- Confirms label exchange between LDP peers (e.g., PE1 ↔ P1).

```
PE1#show mpls ldp session
! [execution timestamp : 2025 Oct 09 16:25:19]
Codes: m - MD5 password is not set/unset.
       g - GR configuration not set/unset.
       t - TCP MSS not set/unset.
       Session has to be cleared manually

Code  Peer IP Address      IF Name    My Role    State      KeepAlive  UpTime  AutoCreate
       4.4.4.4            xe14       Passive   OPERATIONAL   30    00:40:43      No
```

Verify IP Routes

- Check that all networks (PE, P, CE) are reachable.
- Routes learned via OSPF or ISI-S or BGP should point to next-hop over MPLS.

```
PE1#show ip route
! [execution timestamp : 2025 Oct 09 16:25:08]
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,

6.6.6.6/32   24960       xe14       30.1.1.4
8.8.8.8/32   24961       xe14       30.1.1.4
```

Verify MPLS Recursive Route Resolution on PE1

The `show ip route database` and `show ip route mpls` outputs confirm that PE1 resolves BGP routes via MPLS Label Switched Paths (LSPs) established through LDP.

- The BGP route `81.1.1.0/24` (customer network behind PE2) is learned from the BGP peer `8.8.8.8` (PE2).
- The next hop `8.8.8.8` is not directly connected; it is recursively resolved via the IGP route to `30.1.1.4` (toward P1).
- The additional line (`recursive via MPLS FTN-ID 3, nhlfe-ix 12`) indicates that PE1 uses an MPLS forwarding entry (FTN-ID 3) for this BGP route, proving that traffic destined for the remote CE network (`81.1.1.0/24`) is label-switched through the MPLS core rather than IP-routed.

Test End-to-End Reachability (MPLS LDP)

- Ping or traceroute should reach CE2 via MPLS LSPs (PE1 → P1 → P2 → PE2).
- MPLS labels are swapped at core nodes (P1, P2) automatically.

```
PE1#ping 81.1.1.1
Press CTRL+C to exit
PING 81.1.1.1 (81.1.1.1) 100(128) bytes of data.
108 bytes from 81.1.1.1: icmp_seq=1 ttl=64 time=0.709 ms

PE1#
PE1#
PE1#traceroute 81.1.1.1
traceroute to 81.1.1.1 (81.1.1.1), 30 hops max, 60 byte packets
 1  81.1.1.1 (81.1.1.1)  0.901 ms  0.852 ms  0.981 ms
```

Observed Behavior (MPLS LDP)

- **LDP Sessions:** PE1 establishes LDP with P1, P1 with P2, and P2 with PE2.
- **MPLS Forwarding:** Labels assigned to each destination allow PE1 to reach PE2's CE network (`81.1.1.0/24`) via core LSP.
- **BGP and MPLS Interaction:** BGP routes for customer networks are advertised and attached to labels. PE1 forwards traffic using MPLS labels without IP routing lookup at core routers.
- **Validation confirms:**
  - IP routes are correct (`show ip route`).
  - MPLS label tables are populated (`show mpls ilm-table and show mpls forwarding-table`).
  - End-to-end connectivity works (`ping and traceroute`).

Configuration with Segment Routing MPLS (SR-MPLS)

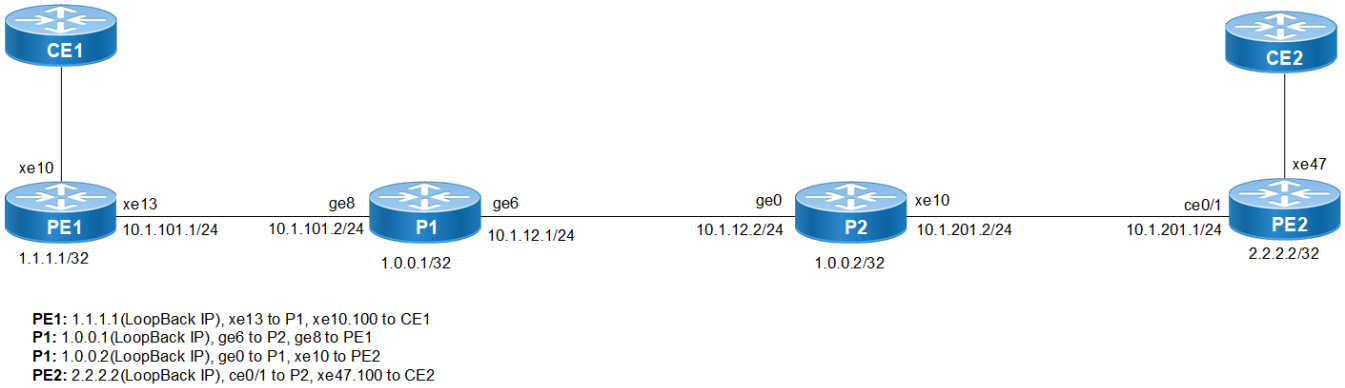
Topology (SR-MPLS)

In this topology:

- PE1 or PE2 are Provider Edge routers connected to customer devices (CE1 or CE2).
- P1 or P2 are core Provider routers.
- SR-MPLS is enabled on PE and P routers to provide MPLS transport using IGP-advertised Prefix-SIDs (no LDP sessions are required).
- OSPF is used as the IGP to advertise reachability and distribute Prefix-SID mappings across the network.
- BGP is enabled between PE routers to exchange customer prefixes; recursive next-hop resolution uses the SR-MPLS transport path for forwarding.

© 2026 IP Infusion Inc. Proprietary

Figure 100. Recursive Next-hop Resolution with MPLS Next-hop in SR-MPLS Deployment



Configure Loopback and Prefix-SID

Each router must have a loopback router-id and a Prefix-SID used by SR-MPLS to build labeled transport paths.

- `prefix-sid index` assigns the SID index for the loopback prefix.
- `no-php` disables penultimate hop popping for the Prefix-SID label.

```
!
interface lo
 ip address 127.0.0.1/8
 ip address 1.0.0.1/32 secondary
 ipv6 address ::1/128
 prefix-sid index 101 no-php
!
interface lo.management
 ip vrf forwarding management
 ip address 127.0.0.1/8
 ipv6 address ::1/128
!
```

Enable Label Switching on Core-facing Interfaces

Enable MPLS label switching on interfaces that participate in the SR-MPLS transport. This ensures SR labels are pushed or swapped or popped through the MPLS transport path.

P1

```
!
interface ge6
 load-interval 30
 ip address 10.1.12.1/24
 mtu 9216
 label-switching
 ip router isis 100
!
interface ge7
!
interface ge8
 load-interval 30
 ip address 10.1.101.2/24
 mtu 9216
 label-switching
 ip router isis 100
!
```

Configure IGP with SR enabled (OSPF)

OSPF provides reachability and distributes Prefix-SID mappings required for SR-MPLS transport.

© 2026 IP Infusion Inc. Proprietary

- `segment-routing mpls` command enables SR-MPLS in the OSPF process.
- (Optional) `fast-reroute per-prefix ti-lfa` command enables fast reroute using TI-LFA.

```
!
router ospf 100
 ospf router-id 1.0.0.1
 network 1.0.0.1/32 area 0.0.0.0
 network 10.1.12.0/24 area 0.0.0.0
 network 10.1.101.0/24 area 0.0.0.0
 segment-routing mpls
 fast-reroute per-prefix ti-lfa area 0.0.0.0
!
```

Configure BGP (PE-to-PE routes)

BGP exchanges customer prefixes between PE routers. With this feature, recursive BGP next-hops can be resolved via SR-MPLS transport.

```
!
router bgp 100
 bgp router-id 1.1.1.1
 neighbor 2.2.2.2 remote-as 100
 neighbor 2.2.2.2 update-source lo
 neighbor 2.2.2.2 advertisement-interval 0
 !
 address-family ipv4 unicast
 redistribute connected
 neighbor 2.2.2.2 activate
 exit-address-family
 !
 exit
!
```

Validation (SR-MPLS)

Verify Segment Routing State

- **Expected output:** `SR State: SR_ENABLED` and `Operational state: enabled`
- Confirms Segment Routing is enabled for the OSPF process and SR-MPLS transport is operational.

```
PE1#show ip ospf segment-routing state

OSPF process 100 Segment-Routing:
SR State: SR_ENABLED
SRGB Start: 16000,  SRGB Range: 8000
SRLB Start: 14080,  SRLB Range: 1920
Operational state: enabled

PE2#show ip ospf segment-routing state

OSPF process 100 Segment-Routing:
SR State: SR_ENABLED
SRGB Start: 16000,  SRGB Range: 8000
SRLB Start: 14080,  SRLB Range: 1920
Operational state: enabled
```

Verify Prefix-SID Mapping

- **Expected output:** Mapping table lists loopback prefixes with SID indexes for all nodes.
- Confirms Prefix-SIDs are advertised and learned across the SR domain.

```
PE1#show ip ospf segment-routing mapping-table active
OSPF process ID: 100
```

© 2026 IP Infusion Inc. Proprietary

```

Verify MPLS Recursive Route Resolution on PE Routers

The `show ip route database` and `show ip route mpls` outputs confirm that PE routers resolve BGP routes via SR-MPLS transport.

On PE1

- The BGP route `200.200.1.0/24` (remote network behind PE2) is learned from the BGP peer `2.2.2.2` (PE2 loopback).
- The BGP next-hop `2.2.2.2` is recursively reachable through OSPF via `10.1.101.2` (toward P1).
- The additional line (`recursive via MPLS FTN-ID 3, nhlfe-ix 12`) confirms that the route is installed using an MPLS forwarding entry, proving SR-MPLS label forwarding through the core.

```
PE1#show ip route  database

PE2#traceroute 100.100.1.1
traceroute to 100.100.1.1 (100.100.1.1), 30 hops max, 60 byte packets
 1  100.100.1.1 (100.100.1.1)  0.782 ms  0.881 ms  0.915 ms
```

Observed Behavior (SR-MPLS)

- **Segment Routing State: PE1** and **PE2** report `SR_ENABLED` under OSPF, confirming SR-MPLS is active and operational in the transport domain.
- **Prefix-SID Distribution: PE1 (1.1.1.1/32, SID 111)**, **P1 (1.0.0.1/32, SID 101)**, **P2 (1.0.0.2/32, SID 102)**, and **PE2 (2.2.2.2/32, SID 222)** are present in the SR mapping table, confirming end-to-end Prefix-SID learning

across the core.

- **MPLS Forwarding (SR Labels):** SR-OSPF label entries are installed on **PE1** and **PE2**, and labels are used for transport forwarding across **P1** and **P2** (no LDP sessions are required).
- **BGP and MPLS Interaction: PE1** learns the remote customer prefix **200.200.1.0/24** from **PE2 (2.2.2.2)** and resolves it through SR-MPLS transport (`recursive via MPLS FTN-ID 3, nhlfe-ix 12`). Similarly, **PE2** learns **100.100.1.0/24** from **PE1 (1.1.1.1)** and resolves it through SR-MPLS (`recursive via MPLS FTN-ID 3, nhlfe-ix 16`).
- **Validation confirms:**
  - IP routes are correct (**PE1/PE2** `show ip route`).
  - SR state and Prefix-SIDs are present (**PE1/PE2** `show ip ospf segment-routing state` and `mapping-table active`).
  - MPLS SR label tables are populated (**PE1/PE2** `show mpls ilm-table` and `show mpls forwarding-table`).
  - End-to-end connectivity works (`ping` and `traceroute`).

Implementation Example

Use Case: Simplified MPLS Core for BGP-Free Operation

In a large network backbone, the service provider's core is designed for label-switched forwarding using MPLS. Dynamic routing, such as BGP, is enabled only at the network edges where service routes are originated or terminated. The core routers focus solely on MPLS transport, without maintaining full BGP tables.

With Recursive Next-Hop Resolution, OcNOS edge or aggregation routers can automatically resolve BGP or static routes through available MPLS paths, even when the next-hop is not directly reachable via IP. This allows traffic to traverse the MPLS core seamlessly, enabling a scalable and operationally efficient BGP-free core design. The feature also leverages MPLS protection mechanisms for rapid failover and improved resiliency within the core.

Revised Commands

show ip route mpls

Added the `mpls` and `mpls summary` parameters to the `show ip route` command to display routing table entries resolved through MPLS next-hops (NHLFE). For more details, refer to the `show ip route` command section in the *OcNOS System Management Guide*.

show ip route database

Added the `MPLS FTN-ID <ID>, nhlfe-ix <INDEX>` field to the `show ip route database` command output. This field specifies the MPLS next-hop used for recursive resolution. For more details, refer to the `show ip route database` command section in the *OcNOS System Management Guide*.

show rib txlist

The show rib txlist (page 1234) command includes the fields (`req_mpls, new_req_mpls, fib_notify_mpls, seq_mpls`) to display MPLS-specific route installation and synchronization details between RIB and FIB.

© 2026 IP Infusion Inc. Proprietary

Troubleshooting

The following steps can be used to validate recursive next-hop resolution through MPLS paths:

1. Verify that RIB has MPLS transport information: Use the diagnostic command `show rib mpls ipv4` (hidden debug command) to confirm that MPLS transport details are received and available for resolution.
2. Verify that recursive routes are installed: Check the routing table entries resolved via MPLS next-hops using the show commands `show ip route (|summary | database)` and `show ip route mpls (|summary)`.
3. Verify recursive route installation in hardware: Confirm that MPLS-resolved prefixes are programmed in the forwarding tables using the following show commands:
    - `show hsl prefix-table ipv4 fib-id 0`
    - For MPLS transport validation:
        - LDP or SR-MPLS tunnels: `show hsl mpls ftn nhlfe-ix <index>`
        - RSVP-TE tunnels: `show hsl mpls tunnel tunnel-id <id>`

© 2026 IP Infusion Inc. Proprietary

show rib txlist

Use this command to display internal Routing Information Base (RIB) transaction lists that are pending or currently being transmitted to the Forwarding Information Base (FIB). This command helps monitor routes awaiting installation or synchronization between the routing and forwarding planes. It is mainly used for debugging and operational verification of route processing states.

Command Syntax

```
show rib (txlist | pending-txlist) (ipv4 | ipv6) (vrf WORD|)
```

Parameters

txlist
Displays the list of routes that are currently being transmitted from RIB to FIB.

pending-txlist
Displays the list of routes queued for transmission to the FIB.

ipv4
Displays information for IPv4 routes.

ipv6
Displays information for IPv6 routes.

vrf WORD
Specifies the VRF name for which the RIB transaction information is displayed.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 1.3.

Added the fields (`req_mpls, new_req_mpls, fib_notify_mpls, seq_mpls`) in OcNOS version 7.0.0.

Example

The fields (`req_mpls, new_req_mpls, fib_notify_mpls, seq_mpls`) show MPLS-specific route installation and synchronization details between RIB and FIB.

```
#show rib txlist ipv4
    IPv4:
    0x02739a6c: 127.0.0.0/8        req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Term or Acronym	Description
BGP-Free Core	Network design where MPLS transport is used in the core without running BGP between core routers. Edge devices handle route advertisement and resolution.
Routing Information Base (RIB)	The routing table in control plane that maintains best route selections and recursive next-hop information.
Forwarding Information Base (FIB)	The hardware forwarding table that programs routes installed by the RIB for packet forwarding.
Recursive Resolution	The process of resolving a route's next-hop through another route or transport (e.g., MPLS tunnel) instead of a directly connected IP interface.
Multiprotocol Label Switching (MPLS)	Label-based forwarding technology used for scalable and efficient transport within the core network.
Next Hop Label Forwarding Entry (NHLFE)	MPLS data structure that defines label operations (push, swap, pop) and the next-hop interface for labeled forwarding.
FEC-to-NHLFE Mapping (FTN)	Mapping between Forwarding Equivalence Class (FEC) and NHLFE entries used to associate IP prefixes with MPLS label paths.
Label Distribution Protocol (LDP)	Protocol that distributes labels for MPLS forwarding paths dynamically across routers.
Resource Reservation Protocol - Traffic Engineering (RSVP-TE)	Protocol used to establish MPLS-TE LSPs with defined resource and path constraints.
Segment Routing - MPLS (SR-MPLS)	MPLS forwarding model where segment identifiers (SIDs) define packet paths without per-flow signaling.
Equal-Cost Multi-Path (ECMP)	Mechanism that enables load sharing across multiple equal-cost routes.
Fast Reroute (FRR)	Protection mechanism that provides rapid failover by pre-installing backup label paths.
Topology Independent Loop-	Advanced FRR mechanism ensuring near-instantaneous recovery for link or

Key Term or Acronym	Description
Free Alternate (TI-LFA)	node failures.
Hardware Support Layer (HSL)	OcNOS subsystem responsible for programming and managing hardware forwarding entries in FIB.
FTN-ID	Identifier assigned to an MPLS Forwarding Equivalence Class entry used in recursive resolution.
NHLFE-IX	Index that uniquely identifies the NHLFE used by the MPLS forwarding path.
BGP Multipath	Capability that allows installation of multiple equal-cost BGP paths; not supported in current release for BGP-Free Core scenarios.

BGP Commands

This section provides an organized overview of CLI commands used to configure and manage Border Gateway Protocol (BGP), including both BGP4 for IPv4 and BGP4+ for IPv6 and other network layer protocols.

Refer to BGP4+ Commands (page 1423) section for IPv6 commands.

BGP/BGP4 commands apply to IPv4 routing and are placed directly under the BGP routing process. BGP4 is used to exchange routing information between Autonomous Systems (AS) in IPv4-based networks. It includes the following commands:

address-family ipv4 1248
aggregate-address 1250
auto-summary 1252
bgp aggregate-nexthop-check 1253
bgp always-compare-med 1254
bgp as-local-count 1255
bgp bestpath as-path ignore 1256
bgp bestpath as-path multipath-relax 1257
bgp bestpath compare-confed-aspath 1258

address-family ipv4

Use the address family command to enter the IPv4 or VPNv4 address family mode allowing configuration of address-family specific parameters. To leave the address family mode and return to the Configure mode use the `exit-address-family` command.

This command configures the routing exchange between Provider Edge (PE) and Customer Edge (CE) devices. The BGP sessions between PE routers can carry different types of routes (VPN-IPv4 and IPv4 routes). Address families are used to control the type of BGP session. Configure a BGP address family for each VRF configured on the PE router and a separate address family to carry VPN-IPv4 routes between PE routers. All non VPN BGP neighbors are defined using router mode. All VPN BGP neighbors are defined under its associated address family mode. The BGP process with no address-family specified is the default address-family, where any sessions are configured that either are not associated with a VRF or are used to carry IPv4 routes.

Use the `no` parameter with this command to disable the address-family configurations.

Command Syntax

```
address-family ipv4
address-family ipv4 (unicast|multicast)
address-family ipv4 vrf NAME
address-family l2vpn evpn
address-family rtfilter unicast
address-family vpn4
address-family vpn4 unicast
no address-family ipv4 vrf NAME
no address-family ipv4 (unicast|multicast)
no address-family l2vpn evpn
no address-family rtfilter unicast
no address-family vpnv4
no address-family vpnv4 unicast
```

Parameters

ipv4
IPv4 address family

unicast
Unicast address prefixes

multicast
Multicast address prefixes

vrf
Virtual Private Network (VPN) routing/forwarding instance

NAME
VPN routing/forwarding instance name

unicast
Unicast address prefixes

l2vpn evpn
Layer 2 VPN routing sessions with EVPN endpoint information distributed to BGP peers

rtfilter
Route target filter: on an iBGP peer or Route Reflector (RR), only send IPv4 and IPv6 prefixes to PE routers when a PE has a VRF that imports those specific prefixes.

© 2026 IP Infusion Inc. Proprietary

unicast
Unicast address prefixes

vpnv4
VPN version 4 address family

unicast
Unicast address prefixes

Applicability

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#neighbor 3ffe:506::1 remote-as 7657
(config-router)#neighbor 3ffe:506::1 interface eth1

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 3ffe:506::1 activate
(config-router-af)#exit-address-family
```

© 2026 IP Infusion Inc. Proprietary

aggregate-address

Use this command to configure BGP aggregate entries.

Aggregates are used to minimize the size of routing tables. Aggregation combines the characteristics of several different routes and advertises a single route.The `aggregate-address` command creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available in the specified range. Using the `summary-only` parameter advertises the prefix only, suppressing the more-specific routes to all neighbors. In the following example Router1 will propagate network 172.0.0.0 and suppresses the more specific route 172.10.0.0.

The `as-set` parameter creates an aggregate entry advertising the path for this route, consisting of all elements contained in all paths being summarized. Use this parameter to reduce the size of path information by listing the AS number only once, even if it was included in multiple paths that were aggregated. The `as-set` parameter is useful when aggregation of information results in an incomplete path information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
aggregate-address A.B.C.D/M
aggregate-address A.B.C.D/M as-set
aggregate-address A.B.C.D/M as-set summary-only
aggregate-address A.B.C.D/M summary only
aggregate-address A.B.C.D/M summary-only as-set
no aggregate-address A.B.C.D/M
```

Parameters

A.B.C.D/M
Aggregate prefix

as-set
Generate AS set path information

summary-only
Filter more specific routes from updates

Default

By default, aggregate address A.B.C.D/M is disabled.

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#aggregate-address 10.0.0.0/8 as-set summary-only
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#no aggregate-address 10.0.0.0/8
```

© 2026 IP Infusion Inc. Proprietary

auto-summary

Use this command to enable sending summarized routes by a BGP speaker to its peers in the router configuration mode or in the address-family configuration mode. Auto-summary is used by a BGP router to advertise summarized routes to its peers. Auto-summary can be enabled if certain routes have already been advertised: in this case, configuring auto-summary advertises the summarized routes first, then corresponding non-summarized routes are withdrawn. If certain routes have already been advertised, and auto-summary is disabled, non-summarized routes are first advertised, then the corresponding summarized routes are withdrawn from all the connected peers.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
auto-summary
no auto-summary
```

Parameters

None

Default

By default, auto-summary is disabled.

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#auto-summary
```

© 2026 IP Infusion Inc. Proprietary

bgp aggregate-nexthop-check

Use this command to set the BGP option to perform aggregation only when next-hop matches the specified IP address.

Use the `no` parameter with this command to disable this functionality.

Command Syntax

```
bgp aggregate-nexthop-check
no bgp aggregate-nexthop-check
```

Parameters

None

Default

By default, bgp aggregate nexthop check is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp aggregate-nexthop-check
```

bgp always-compare-med

Use this command to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal. MED comparison is done only among paths from the same autonomous system (AS). Use `bgp always-compare-med` command to allow comparison of MEDs from different ASs. The MED parameter is used to select the best path. A path with lower MED is preferred. If the bgp table shows the following and the always-compare-med is enabled:

```
Route1: as-path 400, med 300
Route2: as-path 200, med 200
Route3: as-path 400, med 250
```

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If always-compare-med was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the `bgp deterministic-med` command. Please see `bgp deterministic-med` command for details. If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS.

Use the `no` parameter with this command to disallow the comparison.

Command Syntax

```
bgp always-compare-med
no bgp always-compare-med
```

Parameters

None

Default

By default, bgp always compare med is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp always-compare-med
```

© 2026 IP Infusion Inc. Proprietary

bgp as-local-count

Use this command to set the number of times the local-AS (Autonomous System) is to be prepended.

Use the `no` parameter with this command to stop prepending the local AS count.

Command Syntax

```
bgp as-local-count <2-64>
no bgp as-local-count <2-64>
```

Parameter

<2-64>
The number of times the local-AS is to be prepended

Default

By default, bgp as local count is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)# bgp as-local-count 55

(config)#router bgp 100
(config-router)#no  bgp as-local-count 55
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath as-path ignore

Use this command to prevent the router from considering the autonomous system (AS) path length as a factor in the algorithm for choosing a best path route.

Use the `no` parameter with this command to allow the router to consider the AS path length in choosing a best path route.

Command Syntax

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
```

Parameters

None

Default

By default, bgp bestpath as-path ignore is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath as-path ignore

(config)#router bgp 100
(config-router)#no bgp bestpath as-path ignore
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath as-path multipath-relax

Use this command to relax the “same AS-Path” requirement so any candidate eBGP AS-Path with the same AS-path length might be used for eBGP load-balancing.

Note: This feature does not load-balance between eBGP and iBGP paths.

Normally eBGP load-balancing requires the candidate routes to be equal-cost paths with identical BGP attributes having the same weight, Local-Pref, AS-Path (both the AS numbers and the AS path length), origin, MED, and different next-hop.

Use the `no` parameter with this command to return to normal operation.

Command Syntax

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
```

Parameters

None

Default

By default, as-path multipath-relax is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)# bgp bestpath as-path multipath-relax

(config)#router bgp 100
(config-router)# no bgp bestpath as-path multipath-relax
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath compare-confed-aspath

Use this command to allow comparing of the confederation AS path length. This command specifies that the AS confederation path length must be used when available in the BGP best path decision process. It is effective only when bgp bestpath as-path ignore (page 1256) command has not been used.

Use the `no` parameter with this command to ignore consideration of AS confederation path length in BGP best path selection.

Command Syntax

```
bgp bestpath compare-confed-aspath
no bgp bestpath compare-confed-aspath
```

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-confed-aspath

(config)#router bgp 100
(config-router)#no bgp bestpath compare-confed-aspath
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath compare-routerid

Use this command to compare router IDs for identical eBGP paths. When comparing similar routes from peers, the BGP router does not consider the router ID of the routes. By default, it selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected. The router IS is the highest IP address on the router, with preference given to loopback addresses. Router ID can be manually set by using the bgp router-id (page 1285) command.

Use the `no` parameter with this command to disable this functionality.

Command Syntax

```
bgp bestpath compare-routerid
no bgp bestpath compare-routerid
```

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-routerid

(config)#router bgp 100
(config-router)#no bgp bestpath compare-routerid
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath dont-compare-originator-id

Use this command to change the default bestpath selection by not comparing an originator-ID for an identical EBGP path.

Use the `no` parameter with this command to disable this functionality.

Command Syntax

```
bgp bestpath dont-compare-originator-id
no bgp bestpath dont-compare-originator-id
```

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath dont-compare-originator-id

(config)#router bgp 100
(config-router)#no bgp bestpath dont-compare-originator-id
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath med

Use this command to specify two MED (Multi Exit Discriminator) attributes, `confed` and `missing-as-worst`.

The `confed` attribute enables MED comparison along paths learned from confederation peers. The MEDs are compared only if there is no external Autonomous System (an AS not within the confederation) in the path. If there is an external autonomous system in the path, the MED comparison is not made. For example in the following paths, the MED is not compared with Route3 as it is not in the confederation. MED is compared for Route1 and Route2 only.

```
Path1 = 32000 32004, med=4
Path2 = 32001 32004, med=2
Path3 = 32003 1, med=1
```

The `missing-as-worst` attribute to consider a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If `missing-as-worst` is disabled, the missing MED is assigned the value of 0, making the path with the missing MED attribute the best path.

Use the `no` parameter with this command to prevent BGP from considering the MED attribute in comparing paths.

Command Syntax

```
bgp bestpath med confed missing-as-worst
bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med)
bgp bestpath med missing-as-worst confed
no bgp bestpath med confed missing-as-worst
no bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med)
no bgp bestpath med missing-as-worst confed
```

Parameters

confed
Compare MED along confederation paths

missing-as-worst
Treat missing MED as the least preferred one

remove-recv-med
Remove received MED attribute

remove-send-med
Remove sent MED attribute

Command Mode

Router mode

Default

By default, MED value is zero.

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath med missing-as-worst

(config)#router bgp 100
(config-router)#bgp bestpath med remove-recv-med
(config-router)#no bgp bestpath med remove-recv-med

(config)#router bgp 100
(config-router)#bgp bestpath med remove-send-med
(config-router)#no bgp bestpath med remove-send-med
```

© 2026 IP Infusion Inc. Proprietary

bgp bestpath tie-break-on-age

Use this command to always select a preferred older route even when the `bgp bestpath compare-routerid` command is configured.

Use the `no` parameter with this command to disable this functionality.

Command Syntax

```
bgp bestpath tie-break-on-age
no bgp bestpath tie-break-on-age
```

Parameters

None

Default

By default, tie-break-on-age is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath tie-break-on-age

(config)#router bgp 100
(config-router)#no bgp bestpath tie-break-on-age
```

© 2026 IP Infusion Inc. Proprietary

bgp client-to-client reflection

Use this command to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed. If the clients are fully meshed the route reflector is not required, use `no bgp client-to-client reflection` command to disable the client-to-client route reflection.

Use the `no` parameter with this command to turn off client-to-client reflection.

Command Syntax

```
bgp client-to-client reflection
no bgp client-to-client reflection
```

Parameters

None

Default

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp client-to-client reflection

(config)#router bgp 100
(config-router)#no bgp client-to-client reflection
```

© 2026 IP Infusion Inc. Proprietary

bgp cluster-id

Use this command to configure the cluster ID if the BGP cluster has more than one route reflector. A cluster includes route reflectors and its clients. Usually, each cluster is identified by the router ID of its single route reflector but to increase redundancy sometimes a cluster may have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster ID. The `bgp cluster-id` command is used to configure the 4 byte cluster ID for clusters with more than one route reflectors.

Use the `no` parameter with this command (without any arguments) to remove a previously configured route reflector cluster ID.

Command Syntax

```
bgp cluster-id <1-4294967295>
bgp cluster-id A.B.C.D
no bgp cluster-id
```

Parameters

<1-4294967295>
Route reflector ID as a 32-bit quantity

A.B.C.D
Route reflector ID in an IPv4 address format

Default

By default, cluster id is set bgp cluster id

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following configuration creates a cluster-id 5 including two route-reflector-clients.

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 5.5.5.5 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 200
(config-router)# bgp cluster-id 5
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 3.3.3.3 route-reflector-client
(config-router-af)#neighbor 5.5.5.5 route-reflector-client
```

© 2026 IP Infusion Inc. Proprietary

bgp confederation vrf identifier

Use this command to specify a BGP confederation identifier.

Use the `no` parameter with this command to remove a BGP confederation identifier.

Command Syntax

```
bgp confederation (vrf NAME |) identifier <1-4294967295>
no bgp confederation (vrf NAME |) identifier
```

Parameter

identifier <1-4294967295>
Routing domain confederation AS number

vrf NAME
Specify the user-defined VRF instance name.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation vrf vrf1 identifier 1000
```

© 2026 IP Infusion Inc. Proprietary

bgp confederation vrf peers

Use this command to configure the Autonomous Systems (AS) that belong to a confederation. A confederation allows an AS to be divided into several ASs. The AS is given a confederation identifier. External BGP (eBGP) routers view only the whole confederation as one AS. Each AS is fully meshed within itself and is visible internally to the confederation.

Use the `no` parameter with this command to remove an autonomous system from the confederation.

Command Syntax

```
bgp confederation (vrf NAME |) peers <1-4294967295>
no bgp confederation (vrf NAME |) peers <1-4294967295>
```

Parameter

<1-4294967295>
AS numbers of eBGP peers that are in the same confederation

vrf NAME
Specify the user-defined VRF instance name.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following configuration example, the neighbor 172.210.30.2 and 172.210.20.1 have iBGP connection within AS 100, neighbor 173.213.30.1 is a BGP connection with a confederation peer 200 and neighbor 6.6.6.6 has an eBGP connection to external AS 300.

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation vrf vrf1 identifier 300
(config-router)#bgp confederation vrf vrf1 peers 200
(config-router)#neighbor 172.210.30.2 remote-as 100
(config-router)#neighbor 172.210.20.1 remote-as 100
(config-router)#neighbor 173.213.30.1 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 300
```

In the below configuration, the neighbor 5.5.5.4 has an eBGP connection to confederation 300.

```
#configure terminal
(config)#router bgp 500
(config-router)#neighbor 5.5.5.4 remote-as 300
```

© 2026 IP Infusion Inc. Proprietary

bgp dampening

Use this command to enable BGP route dampening and set various parameters. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the `suppress` limit the advertisement of the route is suppressed. This penalty is decayed according to the configured `half time` value. Once the penalty is lower than the `reuse` limit, the route advertisement is un-suppressed. The dampening information is purged from the router once the penalty becomes less than half of the `reuse` limit.

Use the `no` parameter with this command to unset BGP dampening parameters.

Command Syntax

```
bgp dampening
bgp dampening <1-45>
bgp dampening <1-45> <1-20000> <1-20000> <1-255>
bgp dampening <1-45> <1-20000> <1-20000> <1-255> <1-45>
bgp dampening route-map WORD
no bgp dampening
```

Parameters

<1-45>
Reachability half-life time for the penalty in minutes. The time for the penalty to decrease to one-half of its current value.

<1-20000>
Value to start reusing a route. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.

<1-20000>
Value to start suppressing a route. When the penalty for a route exceeds the suppress value, the route is suppressed

<1-255>
Maximum duration to suppress a stable route in minutes.

<1-45>
Un-reachability half-life time for the penalty in minutes.

route-map
Route map to specify criteria for dampening.

WORD
Route-map name.

Defaults

The default reachability half-life is 15 minutes.

The default reuse limit is 750.

The default suppress limit is 2000.

The default max-suppress value is 4 times the half-life time, or 60 minutes.

Command Mode

Address Family mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp dampening 20 800 2500 80 25
```

© 2026 IP Infusion Inc. Proprietary

bgp default local-preference

Use this command to change the default local preference value.Local preference indicates the preferred path when there are multiple paths to the same destination. The path having a higher preference is preferred. The preference is sent to all routers and access servers in the local autonomous system.

Use the `no` parameter with this command to revert to the default value for local preference.

Command Syntax

```
bgp default local-preference <0-4294967295>
no bgp default local-preference
no bgp default local-preference <0-4294967295>
```

Parameter

<0-4294967295>
Local preference value

Default

By default, local preference value is 100

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp default local-preference 2345555
```

bgp deterministic-med

Use this command to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal.

For a correct comparison result, enable this command on all routers in a local AS. After enabling this command, all paths for the same prefix are grouped together and arranged according to their MED value. Based on this comparison, the best path is then chosen. This command compares MED variable when choosing routes advertised by different peers in the same AS, to compare MED, when choosing routes from neighbors in different ASs use the bgp always-compare-med command.

When the bgp deterministic-med command is enabled, routes from the same AS are grouped together, and the best routes of each group are compared. If the BGP table showed:

```
Route1: as-path 200, med 300, internal
Route2: as-path 400, med 200, internal
Route3: as-path 400, med 250, external
```

BGP would have a group of Route1 and a second group of Route2 and Route3 (the same ASs). The best of each group is compared. Route1 is the best of its group because it is the only route from AS 200. Route1 is compared to the Route2, the best of group AS 400 (the lower MED). Since the two routes are not from the same AS, the MED is not considered in the comparison. The external BGP route is preferred over the internal BGP route, making Route3 the best route; the preferred route would be different if `always-compare-med` command is enabled (See `always-compare-med` command).

Use the `no` parameter with this command to disallow this setting.

Command Syntax

```
bgp deterministic-med
no bgp deterministic-med
```

Parameters

None

Default

By default, bgp deterministic med is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp deterministic-med
```

```
(config)#router bgp 100
(config-router)#no bgp deterministic-med
```

© 2026 IP Infusion Inc. Proprietary

bgp enforce-first-as

Use this command to enforce the first AS for eBGP routes. This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

Using the `no` parameter with this command to disable this feature.

Command Syntax

```
bgp enforce-first-as
no bgp enforce-first-as
```

Parameters

None

Default

By default, enforce-first-as is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp enforce-first-as

(config)#router bgp 100
(config-router)#no bgp enforce-first-as
```

© 2026 IP Infusion Inc. Proprietary

bgp extended-asn-cap

Use this command to configure a BGP router to send 4-octet ASN capabilities. If attempting to change the AS capability from 2 to 4 or 4 to 2, a prompt occurs to remove the VRF configuration (if it exists), and reconfiguration is required, because the route distinguisher (RD) configuration would have been created with the current (2 octet or 4 octet) capability, and must be reconfigured before attempting to change the capability.

While loading from a saved configuration with AS4 capability and BGP VRF configuration, the capability will not be changed because of the above described reason.

Use the `no` parameter with this command to prevent a BGP router from sending 4-octet ASN capabilities.

Command Syntax

```
bgp extended-asn-cap
no bgp extended-asn-cap
```

Parameters

None

Default

By default, the bgp extended ASN capability and Four-octet capabilities are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp extended-asn-cap
```

© 2026 IP Infusion Inc. Proprietary

bgp fast-external-failover

Use this command to reset a BGP session immediately, if the interface used for BGP connection goes down.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
bgp fast-external-failover
no bgp fast-external-failover
```

Parameters

None

Default

By default, fast-external failover is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp fast-external-failover
```

© 2026 IP Infusion Inc. Proprietary

bgp implicit-null

Use this command to assign the MPLS label implicit-null (with a label value of 3) for locally originated IPv4 routes, whether they are connected or redistributed from other protocols which are found in the BGP IPv4 Unicast RIB.

Use the `no` form of this command to disable the default implicit-null behavior by configuring `no bgp implicit-null` under `address-family ipv4 labeled-unicast.` The `no bgp implicit-null` CLI command prompts BGP to assign a valid label (with a value greater than 16) to all IPv4 prefixes.

Command Syntax

```
bgp implicit-null
no bgp implicit-null
```

Parameters

None

Default

The `bgp implicit-null` is enabled under `address-family ipv4 labeled-unicast`.

Command Mode

BGP address-family ipv4 labelled-unicast mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
OcNOS#configure terminal
```

Note: Describe the show output fields for new show commands. (Example: Refer the command `show streaming-telemetry dynamic-subscriptions`).

To allocate an MPLS implicit-null label to IPv4 unicast prefix 22.2.2.2/32s

```
!
router bgp 100
bgp router-id 2.2.2.2
allocate-label all
neighbor 1.1.1.1 remote-as 100
neighbor 1.1.1.1 update-source lo
!
address-family ipv4 unicast
network 22.2.2.2/32
exit-address-family
!
address-family ipv4 labeled-unicast
bgp implicit-null
neighbor 1.1.1.1 activate
```

© 2026 IP Infusion Inc. Proprietary

```
exit-address-family
!
exit
!
```

Example for non-implicit-null

To allocate a valid MPLS unique label (> 16) to IPv4 unicast prefix 22.2.2.2/32

```
!
router bgp 100
bgp router-id 2.2.2.2
allocate-label all
neighbor 1.1.1.1 remote-as 100
neighbor 1.1.1.1 update-source lo
!
address-family ipv4 unicast
network 22.2.2.2/32
exit-address-family
!
address-family ipv4 labeled-unicast
no bgp implicit-null
neighbor 1.1.1.1 activate
exit-address-family
!
exit
!
```

© 2026 IP Infusion Inc. Proprietary

bgp log-neighbor-changes

Use this command to enable logging of status change messages without turning on debug bgp commands. OcNOS has many logging services for neighbor status, including `debug bgp fsm` and `debug bgp events`. However, these commands cause system performance degradation. If you need to log neighbor status changes only, IP Infusion Inc. recommends turning off all debug commands and using the `bgp log-neighbor-changes` command instead. A sample output of the log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an `interface down` event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

This command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown
- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
```

Parameters

None

Default

By default, bgp log neighbor changes is disabled

Command Mode

Router mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#router bgp 100
(config-router)#bgp log-neighbor-changes
```

© 2026 IP Infusion Inc. Proprietary

mpls-nexthop-tracking

Use this command to register and track nexthops of BGP prefixes for MPLS reachability resolution.

Use “no” form of this command to deactivate MPLS nexthop tracking for BGP routes.

Note: `bgp nexthop-trigger enable` must be configured to enable `mpls-nexthop-tracking`

Command Syntax

```
mpls-nexthop-tracking
no mpls-nexthop-tracking
```

Parameters

None

Command Mode

BGP mode

Applicability

This command is introduced in OcNOS version 5.0 and is updated in OcNOS version 6.4.0

MPLS NHT can be used to track nexthop LSP's of BGP prefixes, MPLS NHT supports BGP IPv4 Labeled Unicast, VPNv4, VPNv6 (6VPE), 6PE routes.

Examples

```
#configure terminal
(config)#bgp nexthop-trigger enable
(config)#router bgp 100
(config-router)#mpls-nexthop-tracking
```

© 2026 IP Infusion Inc. Proprietary

bgp nexthop-trigger delay

Use this command to set the delay time for nexthop address tracking. This command configures the delay interval between routing table walks for nexthop delay tracking, after which BGP does a routing table scan on receiving a nexthop change trigger from NSM. The time period determines how long BGP waits before it walks the full BGP table to determine which prefixes are affected by the nexthop changes, after it receives the trigger from NSM about one or more nexthop changes.

Use the `no` parameter with this command to reset the timer value to the default value.

Command Syntax

```
bgp nexthop-trigger delay <1-100>
no bgp nexthop-trigger delay
```

Parameter

<1-100>
Nexthop trigger delay interval in seconds

Default

By default, nexthop-trigger delay time is 5 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# bgp nexthop-trigger delay 6

#configure terminal
(config)# no bgp nexthop-trigger delay
```

© 2026 IP Infusion Inc. Proprietary

bgp nexthop-trigger enable

Use this command to enable nexthop address tracking. Nexthop address tracking is an event-driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports nexthop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to nexthop changes for routes installed in the RIB.

If nexthop tracking is enabled after certain routes are learned, the registration of all nexthops for selected BGP routes is done after the nexthop tracking feature is enabled. If nexthop tracking is disabled, and if there are still some selected BGP routes, BGP de-registers the nexthops of all selected BGP routes from NSM.

Use the `no` parameter with this command to disable this feature. If the no command is given when nexthop tracking is in the process of execution, an error appears and nexthop tracking is not disabled. However, if the nexthop tracking timer is running at the time of negation, the nexthop tracking timer is stopped, and nexthop tracking is disabled.

Command Syntax

```
bgp nexthop-trigger enable
no bgp nexthop-trigger enable
```

Parameters

None

Default

By default, nexthop address tracking is disabled

Command Mode

Configure modeConfigure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# bgp nexthop-trigger enable
```

© 2026 IP Infusion Inc. Proprietary

bgp rfc1771-path-select

Use this command to set RFC 1771 compatible path selection.

Use the `no` parameter with this command to revert this setting.

Command Syntax

```
bgp rfc1771-path-select
no bgp rfc1771-path-select
```

Parameters

None

Default

Standard compatible path selection mechanism.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp rfc1771-path-select
```

© 2026 IP Infusion Inc. Proprietary

bgp rfc1771-strict

Use this command to set the origin path attribute to “IGP” when the origin is a protocol such as RIP, OSPF, or ISIS as specified in RFC 1771. Otherwise, the origin is always set to “incomplete” which is the industry standard.

Use the `no` parameter with this command to revert this setting.

Command Syntax

```
bgp rfc1771-strict
no bgp rfc1771-strict
```

Parameters

None

Default

By default, `bgp rfc1771` strict is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp rfc1771-strict
```

© 2026 IP Infusion Inc. Proprietary

bgp router-id

Use this command to manually configure a fixed router ID as a BGP router identifier. When this command is used to configure a fixed router ID, the current router identifier is overridden and the peers are reset.

Use the `no` parameter with this command to remove a manually configured fixed router ID.

Command Syntax

```
bgp router-id A.B.C.D
no bgp router-id
no bgp router-id A.B.C.D
```

Parameter

A.B.C.D
Router ID in an IPv4 address format

Default

Once the BGP router-id is elected, it may be re-elected in the following cases:

When an explicit BGP router-id is configured/un-configured

When the router's (global) router-id is set/unset (holds true when (a) is not applicable),

When the BGP process is cleared (holds true when both (a) & (b) are not applicable and the IP address(es) on the active interfaces are updated, which may result in a change in the router's router-id).

If no loopback interface is configured, the highest IP address is the BGP router-id.

When a loopback interface is configured, the BGP router-id is set to the IP address of the loopback interface.

Note: IP Infusion Inc. recommends that you always configure a router identifier to avoid unpredictable behavior if the address of a loopback interface changes.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp router-id 10.1.2.7

(config)#router bgp 100
(config-router)#no bgp router-id 10.1.2.7
```

© 2026 IP Infusion Inc. Proprietary

bgp scan-time

Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database. To disable BGP scanning, set the scan-time interval to 0 seconds.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
bgp scan-time <0-60>
no bgp scan-time
no bgp scan-time <0-60>
```

Parameter

<0-60>
Scanning interval in seconds

Default

By default, scan-time interval is 60 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp scan-time 10
```

table-map

Use this command to enable or disable suppression/modification of incoming BGP updates to IP RIB/FIB table installation.

Note: The `table-map filter` configuration in the VRF address family applies only to RIB routes and not to MPLS routes.

In a dedicated route reflector, all the routes it receives may not be required to be stored or only few selected routes need to be stored, because it may not lie in the data path.

Table maps are particularly useful to attain this restriction. Table-map command can be used in two ways:

- When a simple table-map command is given, the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option 'filter' is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Use this command in Address Family mode to set the table map rule per an IPv4 or IPv6 family.

Use the `no` parameter with this command to remove the table-map rule.

Command Syntax

```
table-map WORD (|filter)
```

Parameter

WORD
Specify the route-map name to apply.

filter
Filer the routes. If present, the incoming routes are pruned as per the rule specified in route-map-name. If not, it is used to alter the incoming packet information.

Default

All BGP routes will be downloaded to IP RIB

Command Mode

Address Family IPv4 mode, and Address Family IPv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to set the table-map command without filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#table-map abc
```

The following example shows how to set the table-map command with filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#table-map abc filter
```

The following example shows how to set the table-map command without filter for BGP for an IPv6 address family.

```
(config)#router bgp 100
(config-router)#address-family ipv6
(config-router-af)#table-map abc
```

The following example shows how to set the table-map command with filter for BGP for an IPv6 address family.

```
(config)#router bgp 100
(config-router)#address-family ipv6
(config-router-af)#table-map abc filter
```

© 2026 IP Infusion Inc. Proprietary

bgp update-delay

Use this command to set the update delay for a graceful-restart capable router. The update-delay value is the maximum time a graceful-restart capable router, which is restarting, will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-RIB markers are received from all its graceful-restart capable neighbors.

Use the `no` form of this command to set to the update delay to its default value.

Command Syntax

```
bgp update-delay <1-3600>
no bgp update-delay
no bgp update-delay <1-3600>
```

Parameters

<1-3600>
Delay interval in seconds

Default

By default, update-delay value is 120 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#bgp update-delay 345
```

© 2026 IP Infusion Inc. Proprietary

bgp unnumbered-mode

Use this command to enter the unnumbered mode in router BGP mode allowing configuration of neighbor specific parameters. In this mode we allow creation of unnumbered peer and allow all the neighbor configuration applicable in router BGP mode.

Use no form of this command to exit unnumbered-mode and return to previous mode.

Note: ECMP with BGP unnumbered and numbered together is not supported.

Command Syntax

```
bgp unnumbered-mode
exit-unnumbered-mode
```

Parameters

None

Command Mode

Router BGP mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#
```

clear bgp (A.B.C.D|X:X::X:X)

Use this command to reset a BGP neighbor address.

Command Syntax

```
clear bgp (A.B.C.D|X:X::X:X|WORD)
clear bgp (A.B.C.D|X:X::X:X) in
clear bgp (A.B.C.D|X:X::X:X) in prefix-filter
clear bgp (A.B.C.D|X:X::X:X) out
```

Parameters

A.B.C.D
IPv4 neighbor address.

X:X::X:X
IPv6 neighbor address.

WORD
Interface name

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp 3.3.3.3
```

© 2026 IP Infusion Inc. Proprietary

clear bgp *

Use this command to reset the BGP connection for all peers.

Note: The auto-clear soft feature that supports route-map modifications, such as new match, set add, replace, or delete does not support the updation of internally associated MAC-lists. For this, the admin must use the explicit `clear bgp * soft in/out` command.

Command Syntax

```
clear bgp *
clear bgp * in
clear bgp * in prefix-filter
clear bgp * out
clear bgp * soft
clear bgp * soft in
clear bgp * soft out
clear ip bgp *
clear ip bgp * in
clear ip bgp * in prefix-filter
clear ip bgp * out
clear ip bgp * soft
clear ip bgp * soft in
clear ip bgp * soft out
clear ip bgp * ipv4 (unicast|multicast) in
clear ip bgp * ipv4 (unicast|multicast) in prefix-filter
clear ip bgp * ipv4 (unicast|multicast) out
clear ip bgp * ipv4 (unicast|multicast) soft
clear ip bgp * ipv4 (unicast|multicast) soft in
clear ip bgp * ipv4 (unicast|multicast) soft out
```

Parameters

in
Incoming advertised routes should be cleared.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes of all the address families.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

ipv4
Clear incoming advertised routes.

multicast
Multicast prefixes.

unicast
Unicast prefixes.

© 2026 IP Infusion Inc. Proprietary

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear bgp *
#clear ip bgp * ipv4 unicast in prefix-filter
```

© 2026 IP Infusion Inc. Proprietary

clear bgp * l2vpn evpn

Use this command to reset the BGP L2VPN EVPN connection for all the BGP peers.

Command Syntax

```
clear bgp * l2vpn evpn soft (in | out | )
```

Parameters

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Default

None.

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.3.4.

Examples

```
OcNOS#clear bgp * l2vpn evpn soft
OcNOS#clear bgp * l2vpn evpn soft in
```

© 2026 IP Infusion Inc. Proprietary

clear bgp <1-4294967295>

Use this command to reset a BGP connection for all peers in a specified Autonomous System.

Command Syntax

```
clear bgp <1-4294967295>
clear bgp <1-4294967295> in
clear bgp <1-4294967295> in prefix-filter
clear bgp <1-4294967295> out
clear bgp <1-4294967295> soft
clear bgp <1-4294967295> soft in
clear bgp <1-4294967295> soft out
clear ip bgp <1-4294967295>
clear ip bgp <1-4294967295> in
clear ip bgp <1-4294967295> in prefix-filter

clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in prefix-filter
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) out
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft in
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft out
```

Parameters

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

ipv4
Clear incoming advertised routes.

multicast
Multicast prefixes.

unicast
Unicast prefixes.

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

© 2026 IP Infusion Inc. Proprietary

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear bgp  4294967277
#clear ip bgp  4294967277
```

clear bgp <1-4294967295> l2vpn evpn

Use this command to reset the session for neighbors with a specific Autonomous System Number (ASN) for L2VPN EVPN.

Command Syntax

```
clear bgp <1-4294967295> l2vpn evpn soft (in | out |)
```

Parameters

bgp <1-4294967295>
Clears the particular BGP peer with the specified Autonomous System Number (ASN). The BGP peer ASN ranges from 1 to 4294967295.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Default

None.

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.3.4.

Examples

```
OcNOS#clear bgp 100 l2vpn evpn soft
OcNOS#clear bgp 100 l2vpn evpn soft in
```

© 2026 IP Infusion Inc. Proprietary

clear bgp A.B.C.D l2vpn evpn

Use this command to reset the BGP session for neighbor with IPv4 address for L2VPN EVPN.

Command Syntax

```
clear bgp A.B.C.D l2vpn evpn soft (in | out | )
```

Parameters

bgp A.B.C.D
Clears the particular BGP neighbor with the specified IPv4 address.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Default

None.

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.3.4.

Examples

```
OcNOS#clear bgp 3.3.3.3 l2vpn evpn soft
OcNOS#clear bgp 3.3.3.3 l2vpn evpn soft in
```

© 2026 IP Infusion Inc. Proprietary

clear bgp dampening

Use this command to reset BGP route flap dampening information.

Command Syntax

```
clear bgp ipv4 (unicast|multicast) dampening
clear bgp ipv4 (unicast|multicast) dampening A.B.C.D/M
clear ip bgp dampening
clear ip bgp dampening A.B.C.D/M
clear ip bgp ipv4 (unicast|multicast) dampening
clear ip bgp ipv4 (unicast|multicast) dampening A.B.C.D/M
```

Parameters

ipv4
IPv4 address family.

multicast
Multicast prefixes

unicast
Unicast prefixes

A.B.C.D/M
IP prefix (network/length), for example, 35.0.0.0/8

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp dampening 10.10.0.121/24
#clear ip bgp ipv4 unicast dampening
```

© 2026 IP Infusion Inc. Proprietary

clear bgp external

Use this command to reset the BGP connection for all external peers.

Command Syntax

```
clear bgp external
clear bgp external in
clear bgp external in prefix-filter
clear bgp external out
clear bgp external soft
clear bgp external soft in
clear bgp external soft out
clear ip bgp external
clear ip bgp external in
clear ip bgp external in prefix-filter
clear ip bgp external out
clear ip bgp external soft
clear ip bgp external soft in
clear ip bgp external soft out
clear ip bgp external ipv4 (unicast|multicast) in
clear ip bgp external ipv4 (unicast|multicast) in prefix-filter
clear ip bgp external ipv4 (unicast|multicast) out
clear ip bgp external ipv4 (unicast|multicast) soft
clear ip bgp external ipv4 (unicast|multicast) soft in
clear ip bgp external ipv4 (unicast|multicast) soft out
```

Parameters

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

ipv4
Clear incoming advertised routes.

multicast
Multicast prefixes.

unicast
Unicast prefixes.

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

© 2026 IP Infusion Inc. Proprietary

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip bgp external
```

© 2026 IP Infusion Inc. Proprietary

clear bgp flap-statistics

Use this command to reset BGP flap statistics.

Command Syntax

```
clear bgp ipv4 (unicast|multicast) flap-statistics
clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default | VRFNAME )
clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M
clear ip bgp flap-statistics
clear ip bgp flap-statistics A.B.C.D/M
clear ip bgp ipv4 (unicast|multicast) flap-statistics
clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default | VRFNAME )
clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M
```

Parameters

ipv4
IPv4 address family.

multicast
Multicast prefixes.

unicast
Unicast prefixes.

A.B.C.D/M
IP prefix (network/length), for example, 35.0.0.0/8

VRFNAME
VPN routing or forwarding instance name

all
All VRF’s

default
Default VRF

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp flap-statistics
#clear ip bgp ipv4 unicast flap-statistics
```

© 2026 IP Infusion Inc. Proprietary

clear bgp peer-group

Use this command to reset the BGP connection for all members of a peer group.

Command Syntax

```
clear bgp peer-group WORD
clear bgp peer-group WORD in
clear bgp peer-group WORD in prefix-filter
clear bgp peer-group WORD out
clear bgp peer-group WORD soft
clear bgp peer-group WORD soft in
clear bgp peer-group WORD soft out
clear ip bgp peer-group WORD
clear ip bgp peer-group WORD in
clear ip bgp peer-group WORD in prefix-filter
clear ip bgp peer-group WORD out
clear ip bgp peer-group WORD soft
clear ip bgp peer-group WORD soft in
clear ip bgp peer-group WORD soft out
clear ip bgp peer-group WORD ipv4 (unicast|multicast) in
clear ip bgp peer-group WORD ipv4 (unicast|multicast) in prefix-filter
clear ip bgp peer-group WORD ipv4 (unicast|multicast) out
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft in
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft out
```

Parameters

WORD
BGP peer-group name.

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

ipv4
Clear incoming advertised routes.

multicast
Multicast prefixes.

unicast
Unicast prefixes.

in
Clear incoming advertised routes.

© 2026 IP Infusion Inc. Proprietary

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp peer-group P1
```

clear bgp peer-group WORD l2vpn evpn

Use this command to reset the BGP L2VPN EVPN connection for all members of a BGP peer group.

Command Syntax

```
clear bgp peer-group WORD l2vpn evpn soft (in | out | )
```

Parameters

bgp peer-group WORD
Clears all the members of the specified peer group.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 6.3.4.

Examples

```
OcNOS#clear bgp peer-group GRP1 l2vpn evpn soft
OcNOS#clear bgp peer-group GRP1 l2vpn evpn soft in
```

© 2026 IP Infusion Inc. Proprietary

clear bgp statistics

Use this command to reset all BGP statistics.

Command Syntax

```
clear bgp statistics
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear bgp statistics
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp * (description LINE|)*

Use this command to reset the BGP connection for all peers.

Command Syntax

```
clear ip bgp * (description LINE|)
```

Parameters

description
Administratively reset communication msg to neighbor

Command Mode

Privileged execution mode

Applicability

This command is introduced in OcNOS version 6.0.0.

Examples

```
#clear bgp *
#clear bgp * description peer reset done for refresh
```

clear ip bgp (A.B.C.D|X:X::X:X|WORD) (description LINE|)

Use this command to reset the BGP connection for peer.

Command Syntax

```
clear ip bgp (A.B.C.D|X:X::X:X|WORD) (description LINE|)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

description
Administratively reset communication msg to neighbor

Command Mode

Privileged execution mode

Applicability

This command is introduced in OcNOS version 6.0.0.

Examples

```
#clear ip bgp 40.1.1.2
#clear ip bgp 40.1.1.2 description peer reset is done
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp A.B.C.D

Use this command to reset an IPv4 BGP neighbor address.

Command Syntax

```
clear ip bgp (A.B.C.D|WORD) in
clear ip bgp A.B.C.D in prefix-filter
clear ip bgp (A.B.C.D|WORD) out
clear ip bgp (A.B.C.D|WORD) soft
clear ip bgp (A.B.C.D|WORD) soft in
clear ip bgp (A.B.C.D|WORD) soft out
clear ip bgp A.B.C.D ipv4 (unicast|multicast) in
clear ip bgp A.B.C.D ipv4 (unicast|multicast) in prefix-filter
clear ip bgp A.B.C.D ipv4 (unicast|multicast) out
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft in
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft out
```

Parameters

A.B.C.D
IPv4 address

WORD
Interface name

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

ipv4
Clear incoming advertised routes.

multicast
Multicast prefixes.

unicast
Unicast prefixes.

in
Clear incoming advertised routes.

prefix-filter
Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

© 2026 IP Infusion Inc. Proprietary

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 35.0.0.1 in
```

clear ip bgp A.B.C.D vrf

Use this command to reset the VPN Routing/Forwarding (VRF) instance for a peer address.

Command Syntax

```
clear ip bgp A.B.C.D vrf WORD
clear ip bgp A.B.C.D vrf WORD in
clear ip bgp A.B.C.D vrf WORD out
clear ip bgp A.B.C.D vrf WORD soft
clear ip bgp A.B.C.D vrf WORD soft in
clear ip bgp A.B.C.D vrf WORD soft out
```

Parameters

A.B.C.D
IPv4 address

WORD
VPN routing/forwarding instance name

in
Clear incoming advertised routes

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 35.0.0.1 vrf
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp all vrf (VRFNAME|all|default) (description LINE|)

Use this command to reset the BGP connection for vrf peer.

Command Syntax

```
clear ip bgp all vrf (VRFNAME|all|default) (description LINE|)
```

Parameters

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

description
Administratively reset communication msg to neighbor

Command Mode

Privileged execution mode

Applicability

This command is introduced in OcNOS version 6.0.0

Examples

```
#clear ip bgp all vrf vrf1
#clear ip bgp all vrf all description all peer refresh is done
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp table-map

Use this command to apply the modified table map or route map rules to the BGP routes in the existing IP routing table.

Command Syntax

```
clear ip bgp table-map (vrf (VRFNAME|all|default))
clear ip bgp ipv4 (unicast | multicast) table-map(vrf (VRFNAME|all|default))
```

Parameters

vrf
Select a VPN Routing/Forwarding Instance.

VRFNAME
Specify a VPN Routing/Forwarding instance name.

all
Select all VRFs.

default
Select default VRFs.

unicast
Unicast prefixes.

multicast
Multicast prefixes.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp table-map vrf all
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp vrf WORD (A.B.C.D|X:X::X:X|WORD) (description LINE|)

Use this command to reset the BGP connection for vrf peer.

Command Syntax

```
clear ip bgp vrf WORD (A.B.C.D|X:X::X:X|WORD) (description LINE|)
```

Parameters

WORD
VPN routing/forwarding instance name

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

description
Administratively reset communication msg to neighbor

Command Mode

Privileged execution mode

Applicability

This command is introduced in OcNOS version 6.0.0

Examples

```
#clear ip bgp vrf vrf1 10.1.1.2
#clear ip bgp vrf vrf1 10.1.1.2 description peer reset is done
```

© 2026 IP Infusion Inc. Proprietary

debug bgp

Use this command to enable all BGP troubleshooting functions. Use this command without any parameters to turn on normal bgp debug information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug bgp (all|)
debug bgp bfd
debug bgp dampening
debug bgp events
debug bgp filters
debug bgp fsm
debug bgp keepalives
debug bgp mpls
debug bgp nht
debug bgp nsm
debug bgp updates
debug bgp updates (in|out)
debug bgp vpls
debug bgp evpn
debug bgp route-process
no debug bgp evpn
no debug bgp route-process
no debug bgp (all|)
no debug bgp bfd
no debug bgp dampening
no debug bgp events
no debug bgp filters
no debug bgp fsm
no debug bgp keepalives
no debug bgp mpls
no debug bgp nht
no debug bgp nsm
no debug bgp updates
no debug bgp vpls
```

Parameters

all
Used only with the `no` form; turns off all debugging for BGP

bfd
Enable debugging for BGP Bidirectional Forwarding Detection

dampening
Enable debugging for BGP dampening

events
Enable debugging for BGP events

filters
Enable debugging for BGP filters

fsm
Enable debugging for BGP Finite State Machine (FSM)

keepalives
Enable debugging for BGP keepalives

© 2026 IP Infusion Inc. Proprietary

mpls
Enable debugging for BGP Multiprotocol Label Switching (MPLS)

nht
Enable debugging for BGP NHT

nsm
Enable debugging for NSM messages

updates
Enable debugging for BGP updates

in
Debug inbound updates

out
Debug outbound updates

vpls
Enable debugging for BGP Virtual Private LAN Service (VPLS)

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Introduced the following options:

- debug bgp evpn
- debug bgp route-process
- no debug bgp evpn
- no debug bgp route-process

and removed undebug options in the release OcNOS version 6.6.0

Examples

```
#debug bgp
#debug bgp events
```

© 2026 IP Infusion Inc. Proprietary

distance

Use this command to define OSPFv3 route administrative distances based on route type. This command sets the distance for an entire group of routes rather than a specific route that passes an access list.

The administrative distance rates the trustworthiness of a routing information source. A higher distance value means a lower trust rating. For example, an administrative distance of 254 means that the routing information source cannot be trusted and should be ignored.

Use the `no` form of this command to restore the default value.

Command Syntax

```
distance <1-254>
distance ospfv3 {intra-area <1-254>|inter-area <1-254>|external <1-254>}
no distance (<1-254>|)
no distance ospfv3 {intra-area |inter-area |external}
```

Parameters

<1-254>
Used alone, this parameter specifies a default administrative distance used when no other specification exists for a routing information source.

intra-area
Routes within an area.

<1-254>
Distance for all routes within an area

inter-area
Routes from one area to another area.

<1-254>
Distance for all routes from one area to another area.

external
Routes from other routing domains learned by redistribution.

<1-254>
Distance for routes from other routing domains learned by redistribution.

Default

By default, distance value for each type of route is 110

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Example

```
#configure terminal
(config)#router ipv6 ospf 100
(config-router)#distance ospfv3 inter-area 20 intra-area 10 external 40
```

© 2026 IP Infusion Inc. Proprietary

exit-address-family

Use this command to exit Address-Family-vrf, Address-Family-vpnv4 mode.

For information on how to enter the address family mode (IPv4, VPNv4), see .

Command Syntax

```
exit-address-family
```

Parameters

None

Default

No default value is specified

Command Mode

Address Family-vrf and Address Family-vpnv4 mode.

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following examples shows the change in the prompt after using this command.

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 multicast
(config-router-af)#exit-address-family
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

ip as-path access-list

Use this command to define a BGP Autonomous System (AS) path access list. A named community list is a filter based on regular expressions. If the regular expression matches the specified string representing the AS path of the route, then the permit or deny condition applies. Use this command to define the BGP access list globally; use the neighbor router configuration command to apply a specific access list.

Use the no parameter with this command to disable use of the access list .

Command Syntax

```
ip as-path access-list WORD (deny|permit) LINE
no ip as-path access-list WORD (deny | permit) LINE
```

Parameters

WORD
Access list name

deny
Reject packets

permit
Forward packets

LINE
An ordered list as a regular expression.

Note: In regular expression, for number value use {0,n} instead of {,n}.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 6.4.

Examples

```
#configure terminal
(config)#ip as-path access-list mylist deny ^65535$
```

© 2026 IP Infusion Inc. Proprietary

ip community-list <1-99>

Use this command to specify a standard community list (1 to 99) that specifies BGP community attributes.

Use the `no` parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list <1-99> (deny|permit)
ip community-list <1-99> (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list <1-99> (deny|permit)
no ip community-list <1-99> (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

deny
Reject the community

permit
Accept the community

AA:NN
Community number

internet
Advertise routes to the internet community

local-AS
Do not advertise routes to external BGP peers

no-advertise
Do not advertise routes to other BGP peers

no-export
Do not advertise routes outside of Autonomous System boundary

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list 55 permit 7675:80 7675:90
(config)#no ip community-list 55 permit 7675:80 7675:90
```

© 2026 IP Infusion Inc. Proprietary

ip community-list <100-500>

Use this command to specify an expanded community list (100 to 500) that specifies BGP community attributes.

Use the `no` parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list <100-500> (deny|permit)
ip community-list <100-500> (deny|permit) LINE
no ip community-list <100-500>
no ip community-list <100-500> (deny|permit) LINE
```

Parameters

deny
Reject community

permit
Accept community

LINE
An ordered list as a regular expression

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list 225 permit 6789906
(config)#ip community-list expanded CLIST permit .*
```

© 2026 IP Infusion Inc. Proprietary

ip community-list expanded

Use the community-lists to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. It includes community values that are 32-bits long.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes in a specified format and not with regular expressions. The expanded community-list defines the community attributes with regular expressions.Use the `no` parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list expanded WORD (deny|permit) LINE
no ip community-list expanded WORD
no ip community-list expanded WORD (deny|permit) LINE
```

Parameters

WORD
Community list name

deny
Reject community

permit
Accept community

LINE
An ordered list as a regular expression

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list 125 permit 6789906
(config)#ip community-list expanded CLIST permit .*
```

© 2026 IP Infusion Inc. Proprietary

ip community-list standard

Use the community-lists to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. It includes community values that are 32-bits long. There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes in a specified format without regular expressions. The expanded community-list defines the community attributes with regular expressions.

Use this command to add a standard community-list entry. The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

Use the `no` parameter with this command to delete the standard community-list entry.

Command Syntax

```
ip community-list standard WORD (deny|permit)
ip community-list standard WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list standard WORD
no ip community-list standard WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

WORD
Community list name

deny
Rejects a specified community when a community value is provided. If no community value is configured, it will reject all prefixes or routes listed in the community-list.

permit
Accepts a specified community when a community value is provided. If no community value is configured, it will accept all prefixes or routes listed in the community-list.

AA:NN
Community number

internet
Advertise routes to the internet community

local-AS
Do not advertise routes to external BGP peers

no-advertise
Do not advertise routes to other BGP peers

no-export
Do not advertise routes outside of Autonomous System boundary

Default

By default, ip community list is disabled

Command Mode

Configure mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list standard CLIST permit 7675:80 7675:90 no-export
```

© 2026 IP Infusion Inc. Proprietary

ip community-list WORD

Use the community-list commands to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. There are two kinds of community-lists: the expanded and standard. The `standard community-list` defines the community attributes in a specified format and not with regular expressions. The `expanded community-list` defines the community attributes with regular expressions.

Use the `no` parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list WORD (deny|permit)
ip community-list WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list WORD
no ip community-list WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

WORD
Community list name

deny
Rejects a specified community when a community value is provided. If no community value is configured, it will reject all prefixes or routes listed in the community-list.

permit
Accepts a specified community when a community value is provided. If no community value is configured, it will accept all prefixes or routes listed in the community-list.

AA:NN
Community number

internet
Advertise routes to the internet community

local-AS
Do not advertise routes to external BGP peers

no-advertise
Do not advertise routes to other BGP peers

no-export
Do not advertise routes outside of Autonomous System boundary

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#ip community-list mylist permit 7675:80 7675:90
(config)#no ip community-list mylist permit 7675:80 7675:90
```

© 2026 IP Infusion Inc. Proprietary

ip extcommunity-list <1-99>

Use this command to create an entry for a standard extended community list.

Use the `no` parameter with this command to delete the community-list entry.

Command Syntax

```
ip extcommunity-list <1-99> (deny|permit) LINE (rt|soo)
no ip extcommunity-list <1-99> (deny|permit) LINE (rt|soo)
```

Parameters

deny
Reject community

permit
Accept community

LINE
One of the following:

rt
Route target extended community in aa:nn or IPaddr:nn format

soo
Site-of-origin extended community in aa:nn or IPaddr:nn format

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list 3 permit rt 10.10.23.123:67
(config)#ip extcommunity-list 25 deny soo 1465:22
```

© 2026 IP Infusion Inc. Proprietary

ip extcommunity-list <100-500>

Use this command to create an extended community list.

Use the `no` parameter with this command to delete the community-list entry.

Command Syntax

```
ip extcommunity-list <100-500> (deny|permit) LINE
no ip extcommunity-list <100-500> (deny|permit) LINE
```

Parameters

<100-500>
Extended community list number (expanded)

deny
Reject the community

permit
Accept the community

LINE
Any regular expression:

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list 125 permit 4567:335
(config)#ip extcommunity-list 231 deny *.
```

© 2026 IP Infusion Inc. Proprietary

ip extcommunity-list expanded

Use this command to create an expanded community list. The expanded community-list defines the community attributes with regular expressions. The expanded community-list match will happen based on input given for regular expressions.

Use the `no` parameter with this command to delete the expanded community-list entry.

Command Syntax

```
ip extcommunity-list expanded WORD
ip extcommunity-list expanded WORD (deny|permit) LINE
no ip extcommunity-list expanded WORD
no ip extcommunity-list expanded WORD (deny|permit) LINE
```

Parameters

WORD
Expanded community list name

deny
Reject the community

permit
Accept the community

LINE
One of the following:

rt
Route target extended community in aa:nn or IPaddr:nn format

soo
Site-of-origin extended community in aa:nn or IPaddr:nn format

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list e1 permit 2001:1 300:1
(config)#ip extcommunity-list expanded CLIST permit ^[2001:1 300:1]$
```

© 2026 IP Infusion Inc. Proprietary

ip extcommunity-list standard

Use this command to create and delete a standard extended-community list. The extended community attribute is 8 bytes in 2 formats. The sub-type can be route target (`rt`) or site of origin (`soo`). Thus, the sub-type of each community must be specified when creating the extended community list. Regarding the formats, an extended community is based on a 6-byte value. These 6-bytes are represented in 4-btye:2-byte format, and may be entered in one of the following forms:

- Format 1, aa.nn: The 16-bit value of the AS (aa) number is represented in the higher-order 4-bytes. If the extended ASN capability is enabled, the AS number is represented using higher-order 4-bytes. The nn assigned value is represented in the low-order 2-bytes in both cases.
- Format 2, IPaddr:nn: In this format, the higher-order 4-bytes are used to represent the IP address, and the low-order 2-bytes are used to represent the assigned value.

Use the `no` parameter with this command to delete the extended-community-list entry.

Command Syntax

```
ip extcommunity-list standard WORD (deny|permit) (rt|soo) (AA:NN)
no ip extcommunity-list standard WORD (deny|permit) (rt|soo) (AA:NN)
no ip extcommunity-list standard WORD AA:NN
```

Parameters

WORD
Extended community list name

deny
Reject the community

permit
Accept the community

rt
Route target extended community in aa:nn or IPaddr:nn format

soo
Site-of-origin extended community in aa:nn or IPaddr:nn format

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#ip extcommunity-list standard 36 permit rt 5675:50
(config)#ip extcommunity-list standard CLIST permit soo 10.10.32.15:70
```

© 2026 IP Infusion Inc. Proprietary

l2vpn-unnumbered-mode

Use this command to configure the unnumbered peer with all the neighbor configs applicable in L2VPN EVPN address family.

Use the `exit` parameter with this command to leave L2VPN unnumbered mode.

Command Syntax

```
bgp l2vpn-unnumbered-mode
exit-l2vpn-unnumbered-mode
```

Parameters

None

Applicability

No default value is specified

Command Mode

Address-family IPv4 Unicast Mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#bgp l2vpn-unnumbered-mode
(config-router-l2vpn-unnum)#
```

© 2026 IP Infusion Inc. Proprietary

match ip peer

Use this command to apply policies based on the route source of which the BGP TCP/IP session formed using an IPv4 address in the update message.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
match ip peer (<1-199>|<1300-2699>|WORD)
no match ip peer (<1-199>|<1300-2699>|WORD)
```

Parameters

<1-199>
IP access-list number

<1300-2699>
IP access-list number (expanded range)

WORD
Access-list name

Default

By default, import bgp route is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map in-A permit 10
(route-map)#match ip peer 1
```

© 2026 IP Infusion Inc. Proprietary

max-paths

Use this command to set the number of equal-cost multi-path (ECMP) routes for eBGP or iBGP. You can install multiple BGP paths to the same destination to balance the load on the forwarding path.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
max-paths (ebgp|ibgp|) <2-64>
no max-paths ebgp (<2-64>|)
no max-paths ibgp (<2-64>|)
```

Parameters

ebgp
eBGP ECMP session

ibgp
iBGP ECMP session

<2-64>
Number of routes

Default

Available for the IPv4 and IPv6 unicast addresses.

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures 7 routes for ECMP for iBGP.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#max-paths ibgp 7
```

© 2026 IP Infusion Inc. Proprietary

max-paths eigbp

Use this command to set the number of equal-cost multi-path (ECMP) routes for both eBGP and iBGP. This feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in BGP networks.

Use the `no` parameter with this command to disable this feature and set the BGP path selection to the default single best path.

Command Syntax

```
max-paths eibgp <2-64>
no max-paths eibgp (<2-64>|)
```

Parameters

<2-64>
Number of routes

Default

Not applicable

Command Mode

IPv4 and IPv6 unicast address-family mode

Applicability

This command was introduced in OcNOS version 5.0.

Exception with Administrative Distance

Administrative distance (AD) is the feature that routers use to select the best path when there are two or more different routes to the same destination from two different routing protocols.

In OcNOS, AD is per route. With max-paths eibgp, BGP programs the AD(200)/AD20 for eiBGP routes. If there is a route from IGP with a lower AD, it will be preferred and get installed in the FIB.

A BGP route cannot have a different AD for each path. Multipath candidates of eibgp max-paths can be programmed either with AD20 or AD200.

Currently AD20/AD200 will be programmed for all eiBGP routes as per best path selected by BGP. For example, if the best path is learned via iBGP peering, then AD200 is programmed for all the installed multipaths (including paths from eBGP peering) or If the best path is learned via eBGP peering, then AD20 is programmed for all the installed multipaths (including paths from iBGP peering).

Example

This example configures the number of parallel iBGP and eBGP routes that can be installed into a routing table.

```
(config)#router bgp 100
(config-router)#neighbor 11.0.0.2 remote-as 100
(config-router)#neighbor 12.0.0.1 remote-as 200
(config-router)#neighbor 1101::2 remote-as 200
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#neighbor 1201::1 remote-as 100
(config-router)#address-family ipv4 unicast
(config-router-af)#max-paths eibgp 2
(config-router-af)#network 11.0.0.2 activate
(config-router-af)#network 12.0.0.1 activate
(config-router-af)#exit-address-family
(config-router)#address-family ipv6 unicast
(config-router-af)#max-paths eibgp 3
(config-router-af)#network 1101::2 activate
(config-router-af)#network 1201::1 activate
(config-router-af)#exit-address-family
```

© 2026 IP Infusion Inc. Proprietary

neighbor activate

Use this command to enable the exchange of specific address family routes with a neighboring router. After a TCP connection is opened with a neighboring router, use this command to enable or disable the exchange of address family information. To enable the exchange of multicast and VPNv4 address prefix types, activate neighbors using this command in address family mode.

Use the `no` parameter with this command to disable exchange of information with a neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) activate
no neighbor (A.B.C.D|X:X::X:X|WORD) activate
```

For L2VPN-unnumbered mode:

```
neighbor WORD activate
no neighbor WORD activate
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default activate is disabled. For all address-families, use this command to enable a neighbor to exchange routing information of a specific address-family with a neighbor.

Command Mode

Address Family mode and l2vpn-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 10.10.20.1 activate

(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#bgp l2vpn-unnumbered-mode
(config-router-l2vpn-unnum)#neighbor eth1 activate
```

© 2026 IP Infusion Inc. Proprietary

neighbor advertisement-interval

Use this command to set a minimum interval between the sending of BGP routing updates. To reduce the flapping of routes, set a minimum advertisement interval so that the BGP routing updates are sent only per interval seconds. BGP dampening can also be used to control the effects of flapping routes.

Use the `no` parameter with this command to set the interval time to default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval
no neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval <0-65535>
```

For BGP ununbered mode:

```
neighbor WORD advertisement-interval <0-65535>
no neighbor WORD advertisement-interval
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<0-65535>
Advertisement interval value in seconds

Default

By default, neighbor value for ebgp peer is 30 seconds and IBGP peer is 5 seconds

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.3 advertisement-interval 45
```

For unnumbered peer this configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 advertisement-interval 20
```

© 2026 IP Infusion Inc. Proprietary

neighbor allowas-in

Use this command to advertise prefixes (routes) even when the source of the prefixes is from the same Autonomous System (AS) number.

Use this command in a scenario where two routers at different locations use the same Autonomous System number and are connected via an ISP. Once prefixes arrive from one branch at the ISP, they are tagged with the customer's AS number. By default, when the ISP passes the prefixes to the other router, the prefixes are dropped if the other router uses the same AS number. Use this command to advertise the prefixes at the other side. Control the number of times an AS number is advertised by specifying a number.

In a hub and spoke configuration in a VPN, a PE (Provider Edge) router advertises all prefixes containing duplicate AS numbers. Use this command to configure two VRFs on each PE router to receive and advertise prefixes. One of the VRFs receives prefixes with AS numbers from all PE routers and then advertises them to neighboring PE routers. The other VRF receives prefixes with AS numbers from the CE (Customer Edge) router and advertises them to all PE routers in the hub and spoke configuration.

Use the `no` parameter with this command to remove the configuration.

For unnumbered peer IPv4 unicast mode commands are configured under v4-unnumbered-mode.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in <1-10>
no neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in
```

For v4-unnumbered mode:

```
neighbor WORD allowas-in
neighbor WORD allowas-in <1-10>
no neighbor WORD allowas-in
```

Parameters

A.B.C.D
IPv4 neighbor address.

X:X::X:X
IPv6 neighbor address.

WORD
Name of peer group.

Note: For information on how to create peer groups, refer to the neighbor peer-group and neighbor remote-as commands. When this parameter is used with a command, the command applies on all peers in the specified group.

<1-10>
Number of times to allow the advertisement of an AS number

Default

No default value is specified.

© 2026 IP Infusion Inc. Proprietary

Command Mode

This CLI command is available to configure in all address-family modes (`v4-unnumbered mode, IPv4 unicast, IPv6 unicast, IPv4 labeled-unicast, IPv6 labeled-unicast, VPNv4 unicast, VPNv6 unicast, IPv4/IPv6 VRF, L2VPN EVPN`), with the following limitation:

– Under `address-family ipv4 labeled-unicast, neighbor allowas-in` is supported for individual neighbors only; it is not supported for `peer-group neighbors` (neighbor <peer-group-name>). Use per-neighbor configuration instead of `neighbor <peer-group-name> allowas-in.`

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 allowas-in 3

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 allowas-in 3

#con terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 allowas-in 6
```

For unnumbered peer configs in L2vpn evpn mode are configured under l2vpn-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#neighbor eth1 allowas-in 7
```

© 2026 IP Infusion Inc. Proprietary

neighbor as-origination-interval

Use this command to set the minimum interval between sending of AS-origination routing updates.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval
no neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval <1-65535>
```

For BGP unnumbered mode:

```
neighbor WORD as-origination-interval interval <0-65535>
no neighbor WORD as-origination-interval
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-65535>
AS origination interval in seconds

Default

By default, neighbor as origination interval is 15 seconds

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.75 as-origination-interval 555
```

For unnumbered peer this configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 as-origination-interval 50
```

© 2026 IP Infusion Inc. Proprietary

neighbor attribute-unchanged

Use this command to advertise unchanged BGP attributes to the specified neighbor.

Use the `no` parameter with this command to disable this function.

For unnumbered peer IPv4 unicast mode commands are configured under v4-unnumbered-mode.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) attribute-unchanged ({ as-path|next-hop|med }|)
no neighbor (A.B.C.D|X:X::X:X|WORD) attribute-unchanged (({ as-path|next-hop|med }|)
```

For v4-unnumbered mode:

```
neighbor WORD attribute-unchanged ({ as-path|next-hop|med }|)
no neighbor WORD attribute-unchanged (({ as-path|next-hop|med }|)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

as-path
AS path attribute

next-hop
Nexthop attribute

med
Multi-exit discriminator attribute

Default

By default, the neighbor attribute-unchanged is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.75 attribute-unchanged as-path med
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#OcNOS(config-router-v4-unnum)#neighbor eth1 attribute-unchanged as-path
```

neighbor authentication-key

Use this command to enable message digest5 (MD5) authentication on a TCP connection between two BGP peers. Configuring MD5 authentication between two BGP peers, means that each segment sent on the TCP connection between the peers is verified. MD5 authentication must be configured with the same password on both BGP peers; otherwise, the connection between them will not be established.

Use the `no` parameter with this command to delete the MD5 authentication.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key (0 | 1 |) <WORD>
<WORD> plain text password
neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key <WORD>
<WORD> encrypted password
no neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key <WORD>
<WORD> encrypted password
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of the BGP peer group

0
Unencrypted password

WORD
Unencrypted password (maximum length 80 characters)

1
Encrypted password (default)

WORD
Encrypted password (maximum length 162 characters)

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 11
(config-router)#neighbor 10.10.0.73  authentication-key 0 myPass
(config-router)#no neighbor 10.10.0.73  authentication-key 0xba76ef302e2f20af
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 authentication-key 0 key1
```

© 2026 IP Infusion Inc. Proprietary

neighbor capability graceful-restart

Use this command to advertise the graceful restart capability to its neighbor. This configuration indicates that the BGP speaker has the ability to preserve its forwarding state for the address family when BGP restarts.

You must first specify a neighbor's `remote-as` identification number assigned by the neighbor router.

Note: The graceful restart capability is advertised only when the graceful restart capability has been enabled using the bgp graceful-restart (page 1603) command.

Use the `no` parameter with this command to not advertise the graceful restart capability to its neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
no neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, the graceful-restart is disabled

Command Mode

Address family mode - Applicable for ipv4, ipv6 and vpnv4

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.50 capability graceful-restart

(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 2.2.2.2 activate
(config-router-af)#neighbor 2.2.2.2 capability graceful-restart
(config-router-af)#neighbor 3.3.3.3 activate
(config-router-af)#neighbor 3.3.3.3 capability graceful-restart
(config-router-af)#exit-address-family
```

© 2026 IP Infusion Inc. Proprietary

neighbor capability orf prefix-list

Use this command to enable Outbound Router Filtering (ORF) and advertise the ORF capability to its neighbors. The ORFs send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates.

The two routers exchange updates to maintain the ORF for each router:

- The local router advertises the ORF capability in `send` mode.
- The remote router receives the ORF capability in `receive` mode, applying the filter as outbound policy.

Only an individual router or a peer group can be configured to be in `receive` or `send` mode. A peer-group member cannot be configured to be in `receive` or `send` mode.

Use the `no` parameter with this command to disable this function.

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability orf prefix-list (both|receive|send)
no neighbor (A.B.C.D|X:X::X:X|WORD) capability orf prefix-list (both|receive|send)
```

For v4-unnumbered mode:

```
neighbor WORD capability orf prefix-list (both|receive|send)
no neighbor WORD capability orf prefix-list (both|receive|send)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

both
The local router can send ORF entries to its peer, as well as receive ORF entries from its peer.

receive
The local router is willing to receive ORF entries from its peer

send
The local router is willing to send ORF entries to its peer

Default

By default, the orf prefix-list is disabled

Command Mode

Router Address Family (IPv4 unicast, IPv4 multicast, ipv4 labeled-unicast, vpnv4 unicast, v4-unnumbered, ipv6 unicast, ipv6 labeled-unicast, vpnv6 unicast) mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.5 capability orf prefix-list both
(config-router-af)#neighbor effe:2897::0003:3ed5 capability orf prefix-list receive

(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 capability orf prefix-list both
```

© 2026 IP Infusion Inc. Proprietary

neighbor collide-established

Use this command to include a neighbor already in an established state for conflict resolution when a TCP connection collision is detected. This command is not required for most network deployments, so users should only use this command when required.

Note: The associated functionality of including an “established” neighbor into TCP connection collision conflict resolution is automatically enabled when a neighbor is configured for BGP graceful-restart.

Use the `no` option with this command to turn this feature off.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) collide-established
no neighbor (A.B.C.D|X:X::X:X|WORD) collide-established
```

For BGP unnumbered mode:

```
neighbor WORD collide-established
no neighbor WORD collide-established
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor collide is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 3.3.3.3 collide-established
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 collide-established
```

© 2026 IP Infusion Inc. Proprietary

neighbor de-activate

Use this command to disable the exchange of specific address family routes with a neighboring router for peer-group member. After a TCP connection is opened with a neighboring router, use this command to enable or disable the exchange of address family information for peer-group member.

Use the `no` parameter with this command to inherit the properties of peer-group. i.e., If peer-group is activated in the given address-family, no of this command will activate the peer member as peer-group is activated in address-family..

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X) de-activate
no neighbor (A.B.C.D|X:X::X:X) de-activate
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

Default

By default de-activate is disabled for all peer-group members. For all address-families, Use this command to disable a neighbor to exchange routing information of a specific address-family with a neighbor.

Command Mode

Address Family mode

Applicability

This command is introduced in OcNOS version 6.0.0. This command is applicable only to neighbor which is a member of peer-group.

Examples

```
#configure terminal
router bgp 100
neighbor pg1 peer-group
neighbor pg1 remote-as 100
neighbor 10.1.1.2 peer-group pg1
neighbor 20.1.1.2 peer-group pg1
neighbor 30.1.1.2 remote-as 100
!
address-family ipv4 unicast
neighbor pg1 activate
neighbor 30.1.1.2 activate
exit-address-family
!
(config-router-af)#neighbor 10.1.1.2 de-activate
(config-router-af)#show running-config bgp
!
router bgp 100
```

© 2026 IP Infusion Inc. Proprietary

```
neighbor pg1 peer-group
neighbor pg1 remote-as 100
neighbor 10.1.1.2 peer-group pg1
neighbor 20.1.1.2 peer-group pg1
neighbor 30.1.1.2 remote-as 100
!
address-family ipv4 unicast
neighbor pg1 activate
neighbor 10.1.1.2 de-activate
neighbor 30.1.1.2 activate
exit-address-family
!
(config-router-af)#no neighbor 10.1.1.2 de-activate
(config-router-af)#commit
(config-router-af)#
(config-router-af)#show running-config bgp
!
router bgp 100
neighbor pg1 peer-group
neighbor pg1 remote-as 100
neighbor 10.1.1.2 peer-group pg1
neighbor 20.1.1.2 peer-group pg1
neighbor 30.1.1.2 remote-as 100
!
address-family ipv4 unicast
neighbor pg1 activate
neighbor 30.1.1.2 activate
exit-address-family
!
```

© 2026 IP Infusion Inc. Proprietary

neighbor default-originate

Use this command to allow a BGP local router to send the default route 0.0.0.0 to a neighbor to use as a default route. This command can be used with standard or extended access lists.

Use the `no` parameter with this command to send no route as a default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) default-originate
neighbor (A.B.C.D|X:X::X:X|WORD) default-originate route-map WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) default-originate
no neighbor (A.B.C.D|X:X::X:X|WORD) default-originate route-map WORD
```

For v4-unnumbered mode:

```
neighbor WORD default-originate
neighbor WORD default-originate route-map WORD
no neighbor WORD default-originate
no neighbor WORD default-originate route-map WORD
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

WORD
Route map name

Default

By default, neighbor default originate is disabled

Command Mode

Route Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.1 default-originate route-map myroute
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

© 2026 IP Infusion Inc. Proprietary

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 default-originate
```

© 2026 IP Infusion Inc. Proprietary

neighbor description

Use this command to associate a description with a neighbor. This command helps to identify a neighbor quickly. This command is useful for an ISP that has multiple neighbor relationships.

Use the `no` parameter with this command to remove the description.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) description LINE
no neighbor (A.B.C.D|X:X::X:X|WORD) description
no neighbor (A.B.C.D|X:X::X:X|WORD) description LINE
```

For BGP unnumbered mode:

```
neighbor WORD description LINE
no neighbor WORD description
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

LINE
Neighbor description (up to 80 characters)

Default

By default, the neighbor description is disabled

Command Mode

Router mode and Address Family and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 1.2.3.4 description Backup router for sales

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 description Bank of America
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 description unnbered-peer1
```

© 2026 IP Infusion Inc. Proprietary

neighbor disallow-infinite-holdtime

Use this command to disallow configuration of infinite hold-time. This command enables the local BGP speaker to reject a hold-time of “0” seconds from a peer (during exchange of open messages) or a user (during configuration).

The no form of this command allows the BGP speaker to accept a hold-time of “0” from a peer or during configuration.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) disallow-infinite-holdtime
no neighbor (A.B.C.D|X:X::X:X|WORD) disallow-infinite-holdtime
```

For BGP unnumbered mode:

```
neighbor WORD disallow-infinite-holdtime
no neighbor WORD disallow-infinite-holdtime
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor disallow infinite holdtime is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config-router)#neighbor 10.11.4.26 disallow-infinite-holdtime
(config-router)#neighbor 3ffe::45 disallow-infinite-holdtime
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 disallow-infinite-holdtime
```

© 2026 IP Infusion Inc. Proprietary

neighbor distribute-list

Use this command to filter route updates from a particular BGP neighbor. Use only one distribute list per BGP neighbor.

Use the `no` parameter with this command to remove an entry.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
no neighbor WORD distribute-list (<1-199>|<1300-2699>|WORD) (in|out)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-199>
IP access-list number

<1300-2699>
IP access-list number (expanded-range)

WORD
Access-list name

in
Filter incoming advertised routes

out
Filter outgoing advertised routes

Default

By default, neighbor distribute list is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 1.2.3.4 distribute-list mylist out
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 distribute-list list1 in
```

© 2026 IP Infusion Inc. Proprietary

neighbor ebgp-multihop

Use this command to accept and try BGP connections to external peers on indirectly connected networks. Multihop is not established if the only route to the multihop peer is a default route. This avoids loop formation.

Use the `no` parameter with this command to return to the default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop
neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop <1-255>
no neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop
no neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop <1-255>
```

For BGP unnumbered mode:

```
neighbor WORD ebgp-multihop
neighbor WORD ebgp-multihop <1-255>
no neighbor WORD ebgp-multihop
no neighbor WORD ebgp-multihop <1-255>
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-255>
Maximum hop count

Default

By default, maximum hop count is 255

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.10.34 remote-as 20
(config-router)#neighbor 10.10.10.34 ebgp-multihop 5
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 ebgp-multihop
```

© 2026 IP Infusion Inc. Proprietary

neighbor enforce-multihop

Use this command to enforce BGP neighbors to perform multihop.

Use the `no` parameter with this command to turn off this feature.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) enforce-multihop
no neighbor (A.B.C.D|X:X::X:X|WORD) enforce-multihop
```

For BGP unnumbered mode:

```
neighbor WORD enforce-multihop
no neighbor WORD enforce-multihop
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, the maximum hop count is 255

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 remote-as 20
(config-router)#neighbor 10.10.0.34 enforce-multihop
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 enforce-multihop
```

© 2026 IP Infusion Inc. Proprietary

neighbor extended-optional-param

Use this command enable extended optional parameter length for BGP OPEN messages as specified in RFC 9072.

Use the `no` form of this command to disable extended optional parameter length.

Command Syntax

```
neighbor A.B.C.D|X:X::X:X|WORD extended-optional-param
no neighbor A.B.C.D|X:X::X:X|WORD extended-optional-param
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command.

When you specify this parameter, the command applies to all peers in the group.

Default

Extended optional parameter length is disabled by default.

Command Mode

BGP router mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
(config)#router bgp 100
(config-router)#neighbor 1.1.1.1 extended-optional-param
(config-router)#commit
(config-router)#show run bgp
!
router bgp 100
bgp router-id 11.11.11.11
neighbor 1.1.1.1 remote-as 100
neighbor 1.1.1.1 extended-optional-param
```

© 2026 IP Infusion Inc. Proprietary

neighbor fall-over bfd

Use this command to enable the BFD for BGP peers.

Use the `no` form of the command to disable the BFD option for BGP peers.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) fall-over bfd (multihop|)
no neighbor (A.B.C.D|X:X::X:X|WORD) fall-over bfd (multihop|)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format.

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

multihop
Enable multihop

Default

Bidirectional Forwarding Detection for BGP peers is disabled by default.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
(config)#router bgp 100
(config-router)#neighbor 10.2.3.4 fall-over bfd
(config-router)#
(config-router)#neighbor 10.2.3.4 fall-over bfd multihop
```

© 2026 IP Infusion Inc. Proprietary

neighbor filter-list

Use this command to set up a BGP filter. This command specifies an access list filter on updates based on the BGP autonomous system paths. Each filter is an access list based on regular expressions.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) filter-list WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) filter-list WORD (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD filter-list WORD (in|out)
no neighbor WORD filter-list WORD (in|out)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

WORD
Name of an autonomous system path access list

in
Filter incoming advertised routes

out
Filter outgoing advertised route

Default

By default, filter list is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 remote-as 20
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.34 filter-list out in
```

© 2026 IP Infusion Inc. Proprietary

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 filter-list list2 in
```

neighbor g-shut

Use this command to start a graceful shutdown for the BGP session of the specified BGP neighbor. The BGP session for this neighbor is shut down after the graceful shutdown timer expires.

If there is no alternate path available for traffic to flow prior the actual shutdown of the BGP session, this path is made available for 60 seconds or for configured time after which the path is no longer available and traffic is dropped.

Use the `no` parameter with this command to bring up the session again for the specified BGP neighbor whose BGP session had been shut down using the `neighbor g-shut` command.

Note: The graceful shutdown capability is not supported on iBGP sessions

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
```

Parameters

A.B.C.D
Neighbor IPv4 address

X:X::X:X|
Neighbor IPv6 address

WORD
Neighbor tag

Default

By default, neighbor g-shut is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut

#configure terminal
(config)#router bgp 100
(config-router)#no neighbor 1.1.1.2 g-shut
```

© 2026 IP Infusion Inc. Proprietary

neighbor g-shut-timer

Use this command to configure the value of the graceful shutdown timer . After the timer expires, the BGP session initiated for graceful shutdown is shut down.

Use the `no` parameter with this command to revert to the default setting.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
```

Parameters

A.B.C.D
Neighbor IPv4 address

X:X::X:X
Neighbor IPv6 address

WORD
Neighbor tag

<10-65535>
Graceful shutdown timer in seconds

Default

By default, the timer value is set to 60 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut-timer 120
```

© 2026 IP Infusion Inc. Proprietary

neighbor limit

Use this command to specify the maximum number of peers that can be configured in the BGP dynamic peer-group.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor WORD limit <1-512>
no neighbor WORD (limit <1-512>|)
```

Parameters

WORD

Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command.

<1-512>

The maximum number of peers that can be configured in a BGP dynamic peer-group.

Default

By default, neighbor word limit is disabled

Command Mode

Router mode and Address Family VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor group1 limit 120
```

© 2026 IP Infusion Inc. Proprietary

neighbor local-as

Use this command to specify an AS (autonomous system) number to use with BGP neighbor.

Use the `no` parameter with this command to disable this command.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295>  (no-prepend|) (replace-as|)
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295>
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295> no-prepend
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295> replace-as
```

For BGP unnumbered mode:

```
neighbor WORD local-as <1-4294967295>  (no-prepend|) (replace-as|)
no neighbor WORD local-as <1-4294967295>
no neighbor WORD local-as <1-4294967295> no-prepend
no neighbor WORD local-as <1-4294967295> replace-as
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-4294967295>
Neighbor's AS number when extended capabilities are configured

no-prepend
Do not prepend local-as to updated from ebgp peers

replace-as
Replace real AS with local-as in the EBGP updates

Note: The AS number 23456 is a reserved 2-byte AS number. An old BGP speaker (2-byte implementation) should be configured with 23456 as its remote AS number while peering with a non-mappable new BGP speaker (4-byte implementation).

Default

By default, local-as is disabled.

Command Mode

Router mode and Address Family-vrf mode and BGP unnumbered mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3. The new version of the command with “no-prepend” and “replace-as“ option is introduced in OcNOS version 6.4.1.

Example

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 20.1.1.3 remote-as 300
(config-router)#neighbor 20.1.1.3 local-as 200 no-prepend replace-as

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 300
(config-router-af)#neighbor 3ffe:15:15:15:15::0 local-as 200
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 local-as 300
```

© 2026 IP Infusion Inc. Proprietary

neighbor maximum-prefix

Use this command to set the number of prefixes that can be received from a neighbor.

Use the `no` parameter with this command to disable this function.

Note: For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> <1-100|>
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> stop-update
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> warning-only
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> <1-100> warning-only
no neighbor (A.B.C.D|X:X::X:X) maximum-prefix <1-4294967295>
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-4294967295>
Maximum number of prefixes accepted from this peer

stop-update
Stop installing routes when the maximum number of prefixes is exceeded.

<1-100>
Threshold value percent <1-100>

warning-only
Only give a warning message when the limit is exceeded. When this parameter is not specified and extra prefixes are received, the router ends the peering. A terminated peer remains down until the `clear ip bgp A.B.C.D (page 1309)` command is given.

Default

By default, neighbor maximum prefix is disabled

Command Mode

Address Family mode ad v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.72 maximum-prefix 1244 warning-only

(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 maximum-prefix 3
```

© 2026 IP Infusion Inc. Proprietary

neighbor next-hop-self

Use this command to make the router the next hop for a BGP-speaking neighbor or peer group. This command allows a BGP router to change the nexthop information that is sent to the iBGP peer. The nexthop information is set to the IP address of the interface used to communicate with the neighbor.

Use the `no` parameter with this command to disable this feature.

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) next-hop-self
no neighbor (A.B.C.D|X:X::X:X|WORD) next-hop-self
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, next hop self is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 remote-as 100
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.72 next-hop-self

(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 next-hop-self
```

© 2026 IP Infusion Inc. Proprietary

neighbor optional-as

Use this command to specify an AS (autonomous system) number to use with BGP dynamic peer-group.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor WORD optional-as <1-4294967295>
no neighbor WORD optional-as <1-4294967295>
```

Parameters

WORD

Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-4294967295>

The range from which the optional AS number must be configured.

Default

By default, neighbor optional as is disabled

Command Mode

Router mode and Address Family VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor group1 optional-as 400
```

© 2026 IP Infusion Inc. Proprietary

neighbor override-capability

Use this command to ignore received capabilities and use locally configured values.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) override-capability
no neighbor (A.B.C.D|X:X::X:X|WORD) override-capability
```

For BGP unnumbered mode:

```
neighbor WORD override-capability
no neighbor WORD override-capability
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, override-capability is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 override-capability
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 override-capability
```

© 2026 IP Infusion Inc. Proprietary

neighbor passive

Use this command to make a BGP neighbor passive.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) passive
no neighbor (A.B.C.D|X:X::X:X|WORD) passive
```

For BGP unnumbered mode:

```
neighbor WORD passive
no neighbor WORD passive
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor passive is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 passive
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 passive
```

© 2026 IP Infusion Inc. Proprietary

neighbor peer-group

Use this command to add a neighbor to an existing peer group. Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as distribute and filter lists. The peer group is then configured easily with any of the neighbor commands. Any changes made to the peer group affect all members.

Notes:

- See Usage (page 1380) below for when a peer group and a neighbor have conflicting attribute configurations.
- When a peer is detached from a peer-group and if an attempt is made to create a static peer with the same address immediately within the single commit transaction, then the system throws the error: `%% Peer deletion is in progress, peer cannot be created`. For example, refer to the Peer Creation Error During Deletion (page 1380) section.

To create a peer group, use the `neighbor WORD peer-group (page 1411)` command, and then use this command to add neighbors to the group.

Use the no parameter with this command to remove a neighbor from a named peer group.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X) peer-group WORD
no neighbor (A.B.C.D|X:X::X:X) peer-group WORD
```

For BGP unnumbered mode:

```
neighbor WORD peer-group WORD
no neighbor WORD peer-group WORD
```

Parameters

A.B.C.D
Address of the BGP neighbor in IPv4 format

X:X::X:X
Address of the BGP neighbor in IPv6 format

WORD
Peer group name

Default

No default value is specified

Command Mode

Router mode and BGP unnumbered mode

Applicability

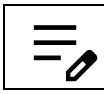
This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.



Note: For unnumbered peer we use peergroup key word to bind the unnumbered peer in group.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 peergroup ipi
```

Peer Creation Error During Deletion

Attempting to re-create a BGP peer immediately after removing it from a peer-group within the same commit:

```
OcNOS#show running-config router bgp
!
router bgp 65000
 neighbor RR peer-group
 neighbor RR remote-as 65000
 neighbor RR update-source loopback200
 neighbor 223.223.223.2 peer-group RR
 neighbor 223.223.223.3 peer-group RR
 !
 address-family vpnv4 unicast
 neighbor RR activate
 exit-address-family
 !
 exit
!

OcNOS#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
OcNOS(config)#router bgp 65000
OcNOS(config-router)#no neighbor 223.223.223.2 peer-group RR
OcNOS(config-router)#neighbor 223.223.223.2 remote-as 65000
OcNOS(config-router)#neighbor 223.223.223.2 update-source loopback200
OcNOS(config-router)#address-family vpnv4 unicast
OcNOS(config-router-af)#neighbor 223.223.223.2 activate
OcNOS(config-router-af)#commit
%% Peer deletion is in progress, peer cannot be created -  /bgp/bgp-instances/bgp-instance[bgp-
as='65000']/peers/peer[peer-address='223.223.223.2']/config/peer-as
%% bgpd config validation failed
Error
 %% Delete not supported at the Peer Address-family. Delete at the global address-family
% Failed to commit .. As error(s) encountered during commit operation...
  Uncommitted configurations are retained in the current transaction session, check 'show transaction
current'.
  Correct the reason for the failure and re-issue the commit.
  Use 'abort transaction' to terminate current transaction session and discard all uncommitted
changes.
%% Peer deletion is in progress, peer cannot be created
OcNOS(config-router-af)#
```

Usage

When a *peer group* and a *peer* (neighbor) have conflicting attribute configurations the following rules apply:

- Outbound attribute configurations of a peer group *replace* peer member configurations of the same attributes when a peer becomes member of that peer group. Outbound attribute modifications to group members are not allowed.
- A peer group member's inbound attribute configurations take precedence over the peer group configuration.

These commands control outbound attribute updates:

- neighbor activate (page 1338)
- neighbor advertisement-interval (page 1339)
- neighbor as-origination-interval (page 1342)
- neighbor attribute-unchanged (page 1343)
- neighbor capability orf prefix-list (page 1348)
- neighbor distribute-list (page 1359) with an access-list number and the `out` parameter
- neighbor dont-capability-negotiate
- neighbor filter-list (page 1366) with the `out` parameter
- neighbor next-hop-self (page 1375)
- neighbor prefix-list (page 1385) with an access-list name and the `out` parameter
- neighbor remove-private-AS (page 1389)
- neighbor route-map (page 1391) with the `out` parameter
- neighbor route-reflector-client (page 1393)
- neighbor route-server-client (page 1395)
- neighbor send-community (page 1396)
- neighbor unsuppress-map (page 1404)

These commands control inbound attribute updates:

- neighbor allowas-in (page 1340)
- neighbor collide-established (page 1350)
- neighbor description (page 1356)
- neighbor distribute-list (page 1359) with an access-list number and the `in` parameter
- neighbor ebgp-multihop (page 1361)
- neighbor enforce-multihop (page 1363)
- neighbor filter-list (page 1366) with the `in` parameter
- neighbor g-shut (page 1368)
- neighbor g-shut-timer (page 1369)
- neighbor local-as (page 1371)
- neighbor maximum-prefix (page 1373)
- neighbor override-capability (page 1377)
- neighbor passive (page 1378)
- neighbor authentication-key (page 1345)
- neighbor port (page 1384)

© 2026 IP Infusion Inc. Proprietary

- neighbor prefix-list (page 1385) with an access-list name and the `in` parameter
- neighbor remote-as (page 1387)
- neighbor restart-time (page 1390)
- neighbor route-map (page 1391) with the `in` parameter
- neighbor shutdown (page 1399)
- neighbor strict-capability-match (page 1401)
- neighbor update-source (page 1406)
- neighbor weight (page 1409)

BGP Peer Group Activation and Binding Guidelines

A BGP peer group can contain peer group members, including BGP IPv4, BGP IPv6, or BGP unnumbered peers. A peer group can consist of peer group members of different types; however, a restriction arises when the user attempts to activate the peer group across multiple address-families. Specifically, the user can only activate a BGP peer in a supported address family. This limitation can lead to functional issues and discrepancies in the show-running configuration.

To address this issue, limitations are implemented regarding the activation of the BGP peer group and the binding of peer group members.

- An error will occur if no peer group member is bound to the peer group during the activation attempt.
- A peer group that includes an IPv4 peer group member cannot also contain an IPv6 peer group member.
- Similarly, a peer group that includes an IPv6 peer group member cannot also contain an IPv4 peer group member.
- Additionally, a peer group that includes either an IPv4 or an IPv6 peer group member cannot contain an unnumbered peer.
- The BGP peer group type must remain unnumbered and cannot have IPv4 or IPv6 peers.
- Users cannot bind a peer to a peer group if it is already activated in address-family mode. Therefore, it is necessary to deactivate the peer first.

Applicability: OcNOS version 6.6.0

Note: Users must manually correct configurations after an upgrade or downgrade, as no scripts are available to facilitate this process.

neighbor WORD peer-group range

Use this command to create a dynamic peer group.

Use the no parameter with this command to remove a peer group.

Command Syntax

```
neighbor WORD peer-group range (A.B.C.D/M|X:X::X:X/M)
no neighbor WORD peer-group range (A.B.C.D/M|X:X::X:X/M)
```

Parameters

A.B.C.D/M
IP Prefix

X:X::X:X/M
IPv6 Prefix

WORD
Peer group name

Default

No default value is specified

Command Mode

Router mode and Address Family VRF mode.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group range 10.10.10.0/24
```

© 2026 IP Infusion Inc. Proprietary

neighbor port

Use this command to set the BGP port number of a neighbor.

Use the `no` parameter with this command to remove a port number from a BGP neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) port <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) port
no neighbor (A.B.C.D|X:X::X:X|WORD) port <0-65535>
```

For BGP unnumbered mode:

```
neighbor WORD port <0-65535>
no neighbor WORD port
no neighbor WORD port <0-65535>
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<0-65535>
Port number

Default

By default, neighbor port is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 port 643
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 port 500
```

© 2026 IP Infusion Inc. Proprietary

neighbor prefix-list

Use this command to specify a prefix list for filtering BGP advertisements.

Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access. When multiple entries of a prefix list match a prefix, the entry with the smallest sequence number is considered to be a real match.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top. The neighbor distribute-list (page 1359) command is an alternative to this command and only one of them can be used to filter the same neighbor in any direction.

Use the `no` parameter with this command to remove an entry.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) prefix-list WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) prefix-list WORD (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD prefix-list WORD (in|out)
no neighbor WORD prefix-list WORD (in|out)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

WORD
Name of an access list

in
Apply access list to incoming advertisements

out
Apply access list to outgoing advertisements

Default

By default, neighbor prefix list is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#ip prefix-list list1 deny 30.0.0.0/24
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.10 prefix-list list1 in
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 prefix-list list2 out
```

© 2026 IP Infusion Inc. Proprietary

neighbor remote-as

Use this command to establish a BGP peering relationship with a customer edge router.

The specified neighbor only exchanges unicast address prefixes, unless the neighbor is also activated using the neighbor activate (page 1338) command, which allows the exchange of other routing information.

Use the `no` parameter with this command to delete this peering.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) remote-as (<1-4294967295>|internal|external)
no neighbor (A.B.C.D|X:X::X:X|WORD) remote-as (<1-4294967295>|internal|external)
```

For BGP unnumbered mode:

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

For an unnumbered interface (RFC 5549), specify an interface name configured with neighbor discovery or an IPv4 address with /31 or /30.

<1-4294967295>
Neighbor's autonomous system number (ASN) when extended capabilities are configured. If the specified ASN matches the ASN number specified in the router BGP global configuration, the neighbor is identified as internal. If the ASN does no match, the neighbor is identified as external to the local AS.

internal
iBGP peer.

external
eBGP peer.

Default

By default, neighbor remote is disabled.

Command Mode

Router mode, Address Family-vrf mode, and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.6.

© 2026 IP Infusion Inc. Proprietary

Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor 10.10.0.73 remote-as 345
(config-router)#neighbor 11.11.0.74 remote-as 23456
```

Note: The last command in the example above should be used when the local speaker is OBGP and the neighbor is NBGP with a 4-octet ASN.

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 remote-as 65000

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 65000

(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 remote-as internal
(config-router-unnum)#show running bgp

router bgp 100
    !
    bgp unnumbered-mode
    neighbor eth1 remote-as internal
    neighbor eth2 remote-as external
    exit-unnumbered-mode
    !
```

© 2026 IP Infusion Inc. Proprietary

neighbor remove-private-AS

Use this command to remove the private autonomous system number (ASN) from outbound updates. Private ASNs are not advertised to the Internet. This command is used with external BGP peers only. The router removes the ASNs only if the update includes private ASNs. If the update includes both private and public ASNs, the system treats it as an error.

Use the `no` parameter with this command to revert to default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) remove-private-AS
no neighbor (A.B.C.D|X:X::X:X|WORD) remove-private-AS
```

For v4-unnumbered mode:

```
neighbor WORD remove-private-AS
no neighbor WORD remove-private-AS
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor remove private AS is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.63 remove-private-AS
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 remove-private-AS
```

© 2026 IP Infusion Inc. Proprietary

neighbor restart-time

Use this command to set a different restart-time than the global restart-time configured using the bgp graceful-restart (page 1603) command.

Use the `no` parameter with this command to restore the router to its default state.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
no neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-3600>
The maximum time that a graceful-restart neighbor waits to come back up after a restart. Make sure that this value does not exceed the stalepath-time specified in router mode.

Default

By default, restart time is 90 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 3.3.3.3 restart-time 45
```

© 2026 IP Infusion Inc. Proprietary

neighbor route-map

Use this command to apply a route map to incoming or outgoing routes. This command filters updates and modifies attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Use the `no` parameter with this command to a route map.

Note: Route maps enable filtering and modification of BGP routes using 'match' and 'set' clauses. They can be applied to a BGP peer or peer-group in either the inbound or outbound direction to influence received or advertised routes. However, for route-map updates to take effect, a manual command such as clear ip bgp A.B.C.D (page 1309) `<neighbor> soft` must be executed for each BGP peer or peer-group address-family. This manual step is required in all software releases except for release 6.6.x and later, provided that the 'bgp auto-policy-soft-reset enable' feature is configured.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-map WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) route-map WORD (in|out)
```

For v4-unnumbered mode:

```
neighbor WORD route-map WORD (in|out)
no neighbor WORD route-map WORD (in|out)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

WORD
Name of the route map

in
Apply access list to incoming advertisements

out
Apply access list to outgoing advertisements

Default

No default value is specified

Command Mode

Address Family mode and v4-unnumbered mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the configuration of the route map named `rmap2` and then the use of this map name in the `neighbor route-map` command.

```
#configure terminal
(config)#route-map rmap2 permit 6
(config-route-map)#match origin incomplete
(config-route-map)#set metric 100
(config-route-map)#exit
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.10 route-map rmap2 in
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 route-map rmap1 in
```

© 2026 IP Infusion Inc. Proprietary

neighbor route-reflector-client

Use this command to make the router a BGP route reflector and set a specified neighbor as its client.

Using route reflectors reduces the number of iBGP peers within an AS. An AS can have more than one route reflector. A route reflector treats other route reflectors as other iBGP speakers.

Use the `no` parameter with this command to indicate that the neighbor is not a client.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-reflector-client
no neighbor (A.B.C.D|X:X::X:X|WORD) route-reflector-client
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

No default value is specified

Command Mode

This command is supported in all Address Family modes.

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following configuration, Router1 is the route reflector for clients 3.3.3.3 and 2.2.2.2; it also has a non-client peer 6.6.6.6.

```
#configure terminal
(config)#router bgp 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 200
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 3.3.3.3 route-reflector-client
(config-router-af)#neighbor 2.2.2.2 route-reflector-client
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 route-reflector-client
```

© 2026 IP Infusion Inc. Proprietary

For unnumbered peer, configs in L2vpn EVPN mode are configured under l2vpn-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family l2vpn evpn
(config-router-af)#neighbor eth1 route-reflector-client
```

neighbor route-server-client

Use this command to make a neighbor a route server client.

Use the `no` parameter with this command to remove the configuration of a neighbor as route server client.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-server-client
no neighbor (A.B.C.D|X:X::X:X|WORD) route-server-client
```

For v4-unnumbered mode:

```
neighbor WORD route-server-client
no neighbor WORD route-server-client
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

No default value is specified

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.72 route-server-client

#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#no neighbor 10.10.0.72 route-server-client
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 route-server-client
```

© 2026 IP Infusion Inc. Proprietary

neighbor send-community

Use this command to send that a community attribute to a BGP neighbor.

The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes, the router reannounces them to the neighbor.

By default, both `standard` and `extended` community attributes are sent to a neighbor. To explicitly send only the `standard` or `extended` community attribute, run the bgp dampening (page 1268) command with the `standard` parameter before running this command.

Use the `no` parameter with this command to not announce community attributes to the neighbor. Use the `extended` and `no` parameters to remove extended communities. Specifying no other parameter with `no` removes standard communities only.

See also neighbor send-community (page 1499) in BGP Virtual Private Network Commands.

Command Syntax

```
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
neighbor (A.B.C.D|X:X::X:X|WORD) send-community
neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

both
Send Standard and Extended Community attributes

extended
Send Extended Community attributes

standard
Send Standard Community attributes

Default

By default, both communities (standard and extended) are sent to every BGP neighbor.

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.10.1 remote-as 200
(config-router-af)#no neighbor 10.10.0.1 send-community extended
```

© 2026 IP Infusion Inc. Proprietary

neighbor send-community large

Use this command to send that a community attribute to a BGP neighbor.

Use the `no` parameter with this command to not announce community attributes to the neighbor.

Command Syntax

```
neighbor A.B.C.D send-community large
no neighbor A.B.C.D send-community large
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

Default

By default send-community large is enabled for peer

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 1.1.1.1 activate
(config-router-af)#neighbor 1.1.1.1 send-community large
```

© 2026 IP Infusion Inc. Proprietary

neighbor shutdown

Use this command to terminate active sessions for a specified neighbor and clear all related routing information.

If a peer group is specified, a large number of peering sessions might be terminated. The show ip bgp summary command displays a summary of BGP neighbors and their connections.

Use `description` option for operators to transmit a short free-form message to describe why a BGP session was shut down.

Use the `no` parameter with this command to re-enable a neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) shutdown  (description LINE|)
no neighbor (A.B.C.D|X:X::X:X|WORD) shutdown
```

Foe BGP unnumbered mode:

```
neighbor WORD shutdown (description LINE|)
no neighbor WORD shutdown
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

description
Administratively shutdown communication msg to neighbor.

Default

By default, neighbor shutdown is disabled.

Command Mode

Router mode and Address Family-vrf mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3. The new version of the command with “description” option is introduced in OcNOS version 6.0.0.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 shutdown

(config)#router bgp 100
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 shutdown description software upgrade; back in 2
hours
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 shutdown
```

© 2026 IP Infusion Inc. Proprietary

neighbor strict-capability-match

Use this command to close the BGP connection if a capability value does not match the remote peer.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) strict-capability-match
no neighbor (A.B.C.D|X:X::X:X|WORD) strict-capability-match
```

For BGP unnumbered mode:

```
neighbor WORD strict-capability-match
no neighbor WORD strict-capability-match
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, strict capability match is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 strict-capability-match
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 strict-capability-match
```

© 2026 IP Infusion Inc. Proprietary

neighbor timers

Use this command to set the timers for a specific BGP neighbor.

Use the `no` parameter with this command to clear the timers for a BGP neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) timers <0-65535> <0-65535>
neighbor (A.B.C.D|X:X::X:X|WORD) timers connect <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) timers
no neighbor (A.B.C.D|X:X::X:X|WORD) timers connect
```

For BGP unnumbered mode:

```
neighbor WORD timers <0-65535> <0-65535>
neighbor WORD timers connect <1-65535>
no neighbor WORD timers
no neighbor WORD timers connect
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<0-65535>
Keepalive interval. Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router.

<0-65535>
Holdtime interval which is the time the router waits to receive a keepalive message. If the router does not receive a message in this period, the router declares the neighbor dead. The holdtime value should be at least 3 times the keepalive time.

connect
BGP connect timer

<1-65535>
Connect timer

Defaults

By default, keepalive timer value is 30 seconds.

Command Mode

Router mode and BGP unnumbered mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 timers 60 230
(config-router)#neighbor 10.10.10.10 timers connect 10

(config-router)#no neighbor 10.10.10.10 timers
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 timers 40 120
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 timers connect 50
```

© 2026 IP Infusion Inc. Proprietary

neighbor unsuppress-map

Use this command to selectively leak more-specific routes to a particular neighbor.

When the aggregate-address (page 1250) command is used with the `summary-only` option, the more-specific routes of the aggregate are suppressed to all neighbors. Use the `neighbor unsuppress-map` command to selectively leak more-specific routes to a particular neighbor.

Use the `no` parameter with this command to restore the setting to the default level.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) unsuppress-map WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) unsuppress-map WORD
```

For v4-unnumbered mode:

```
neighbor WORD unsuppress-map WORD
no neighbor WORD unsuppress-map WORD
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

WORD
Name of the route map used to select routes to unsuppress

Default

By default, neighbor unsuppress map is disabled

Command Mode

Address Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.70 unsuppress-map mymap
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 unsuppress-map map2
```

neighbor update-source

Use this command to allow internal BGP sessions to use any operating interface for TCP connections.

A loopback interface is most commonly used with this command. The use of loopback interface eliminates a dependency and BGP does not have to rely on the availability of a particular interface for making TCP connections.

Use the `no` parameter with this command to restore the interface assignment to the closest interface.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) update-source WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) update-source
```

For BGP unnumbered mode:

```
neighbor WORD update-source WORD
no neighbor WORD update-source
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

WORD
Interface name

Default

By default, neighbor update source is disabled

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 update-source myif
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 update-source myif
```

© 2026 IP Infusion Inc. Proprietary

neighbor version

Use this command to accept only a particular BGP version.

By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

Use the `no` parameter with this command to use the default version level of a neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) version 4
no neighbor (A.B.C.D|X:X::X:X|WORD) version
```

For BGP unnumbered mode:

```
neighbor WORD version 4
no neighbor WORD version
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

4
BGP version number

Default

By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2.

Command Mode

Router mode and BGP unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 version 4

(config)#router bgp 12
(config-router)#no neighbor 10.10.10.10 version
```

For unnumbered peer below configuration is given in BGP unnumbered-mode.

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 100
(config-router)#bgp unnumbered-mode
(config-router-unnum)#neighbor eth1 version 4
```

© 2026 IP Infusion Inc. Proprietary

neighbor weight

Use this command to specify a weight value, per address-family, for all routes learned from a neighbor.

The route with the highest weight gets preference when the same prefix is learned from more than one peer. Unlike the local-preference attribute, the weight attribute is relevant only to the local router. The weights assigned using the `set weight` command override the weights assigned using this command.

Use this command in router mode to specify a weight value for all address families. Use this command in address family mode to specify a weight value per IPv4/IPv6/VPNv4/6PE address family,

When the weight is set for a peer group, all members of the peer group get the same weight. This command can also be used to assign a different weight to an individual peer-group member. When an individually-configured weight of a peer-group member is removed, its weight is reset to its peer group's weight.

Use the `no` parameter with this command to remove a weight assignment.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) weight <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) weight
no neighbor (A.B.C.D|X:X::X:X|WORD) weight <0-65535>
```

For v4-unnumbered mode:

```
neighbor WORD weight <0-65535>
no neighbor WORD weight
no neighbor WORD weight <0-65535>
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<0-65535>
Weight value

Default

By default, neighbor weight value is 0

Command Mode

Router Address-Family mode and v4-unnumbered mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.10 weight 60

(config-router-af)#no neighbor 10.10.10.10 weight 60
```

For unnumbered peer, IPv4 unicast mode commands are configured under v4-unnumbered-mode.

```
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#neighbor eth1 weight 44
```

© 2026 IP Infusion Inc. Proprietary

neighbor WORD peer-group

Use this command to create a peer group.

Use the `no` parameter with this command to remove a peer group.

Command Syntax

```
neighbor WORD peer-group
no neighbor WORD peer-group
```

Parameters

WORD
Name of BGP peer group

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to create a peer group named `group1`.

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group
```

network

Use this command to specify the networks to be advertised by the BGP routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Use the backdoor parameter to specify a backdoor route to a BGP border router that will provide better information about the network. For data to be advertised by BGP, its routing table must include a route to the specified network. This command specifies the networks to be advertised. The network command works if the network being advertised is known to the router.

The backdoor parameter enables a route to be the preferred route even if it has a greater distance. A network that is specified as a backdoor network is dynamically assigned an administrative distance of 200 ensuring that IGP learned routes are preferred. If a backdoor network is not sourced by the local router, the network is learned from the external routers. If the route is learned from eBGP for a backdoor network, the distance is set to 20 or 200.

Use the no form of this command to remove a network route entry.

Command Syntax

```
network A.B.C.D (backdoor|)
network A.B.C.D/M (backdoor|)
network A.B.C.D mask A.B.C.D (backdoor|)
network A.B.C.D mask A.B.C.D route-map WORD (backdoor|)
network A.B.C.D route-map WORD (backdoor|)
network A.B.C.D/M route-map WORD (backdoor|)
no network A.B.C.D
no network A.B.C.D/M
```

Parameters

A.B.C.D
IP prefix <network>, for example, 35.0.0.0

A.B.C.D/M
IP prefix <network>/<length>, for example., 35.0.0.0/8

backdoor
BGP backdoor route

routemap
Route map used to modify the attributes

WORD
Name of the route map

mask
Network mask, for example, 255.255.0.0

A.B.C.D
Network mask, e.g., 255.255.0.0

Default

No default value is specified

© 2026 IP Infusion Inc. Proprietary

Command Mode

Router Address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 is internally derived, that is, 2.0.0.0/8.

```
(config)#router bgp 1
(config-router)#address-family ipv4 unicast
(config-router-af)#network 2.0.0.0
```

© 2026 IP Infusion Inc. Proprietary

network synchronization

Use this command to enable IGP synchronization for BGP static network routes.

Use this no parameter with this command to disable synchronization of BGP static routes.

Command Syntax

```
network synchronization
no network synchronization
```

Parameters

None

Default

By default, network synchronization is disabled.

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables IGP synchronization of BGP static network routes in the router configuration mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv6 unicast address-family mode.

```
#configure terminal
(config)#router bgp 11
(config)#address-family ipv6 unicast
(config-router-af)#network synchronization
```

© 2026 IP Infusion Inc. Proprietary

redistribute

Use this command to inject routes from one routing process into another. Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Use the no parameter with this command to disable this function.

Command Syntax

```
redistribute [connected|isis|connected-host-routes|ospf|rip|static]
redistribute [connected|isis|connected-host-routes|ospf|rip|static] route-map WORD
no redistribute [connected|isis|connected-host-routes|ospf|rip|static]
no redistribute [connected|isis|connected-host-routes|ospf|rip|static] route-map WORD
```

Parameters

connected
Redistribute connected routes

isis
Redistribute connected ISO IS-IS routes

connected-host-routes
Redistribute connected host to routes

ospf
Redistribute OSPFv2 routes

rip
Redistribute RIP routes

static
Redistribute static routes

route-map
Route map reference

WORD
Route map entires

Default

Disabled

Command Mode

Address Family mode and Address Family-vrf mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

The following example shows the configuration of the route-map name rmap1 and then the use of this map name in the redistribute route-map command.

```
#configure terminal
(config)#route-map rmap1 permit 1
(config-route-map)#match origin incomplete
(config-route-map)#set metric 100
(config-route-map)#exit
(config)#router bgp 12
(config-router)#address-family ipv4 unicast
(config-router-af)#redistribute ospf route-map rmap1

(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#redistribute static

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#redistribute static
```

© 2026 IP Infusion Inc. Proprietary

restart bgp graceful

Use this command to enable a BGP-speaker router for graceful restart. This command stops the whole BGP process and makes OcNOS retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all address families received in the Graceful Restart Capability exchange.

Command Syntax

```
restart bgp graceful
```

Parameters

None

Default

Disabled

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#restart bgp graceful
% Warning : BGP process will stop and needs to restart manually,
You may loose ospf configuration, if not saved
 Proceed for graceful restart? (y/n):y
```

© 2026 IP Infusion Inc. Proprietary

router bgp

Use this command to start a BGP process.

Use the `no` parameter with this command to disable an existing routing process.

Command Syntax

```
router bgp <1-4294967295>
no router bgp <1-4294967295>
```

Parameters

<1-4294967295>
Associate the routing process with this autonomous system number

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

snmp restart bgp

Use this command to restart SNMP in Border Gateway Protocol (BGP)

Command Syntax

```
snmp restart bgp
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart bgp
```

© 2026 IP Infusion Inc. Proprietary

synchronization

Use this command to enable IGP synchronization of Internal BGP (iBGP) learned routes with the Internal Gateway Protocol (IGP) system in the router configuration mode or in the address-family configuration mode.

Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

The no synchronization command is used when BGP router can advertise routes learned from its iBGP neighbors without waiting for the IGP reachability to be present.

Command Syntax

```
synchronization
no synchronization
```

Parameters

None

Default

No default value is specified

Command Mode

Address Family modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables IGP synchronization of iBGP routes in Router mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv4 unicast
(config-router-af)#synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6-Unicast address family.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv6 unicast
(config-router-af)#synchronization
```

© 2026 IP Infusion Inc. Proprietary

timers bgp

Use this command to globally set or reset the keepalive and holdtime values for all the neighbors.

Use the `no` parameter with this command to reset timers to default value.

Command Syntax

```
timers bgp <0-65535> <0-65535>
no timers bgp
```

Parameters

<0-65535>
Frequency with which keepalive messages are sent to the neighbors

<0-65535>
Interval after which a neighbor is considered dead if keepalive messages are not received

Default

By default, keepalive timer value is 30 seconds

By default, holdtime value is 90 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#timers bgp 40 120
```

© 2026 IP Infusion Inc. Proprietary

v4-unnumbered-mode

Use this command to configure the unnumbered peer with all the neighbor configs applicable in IPv4 unicast address family.

Use the `exit` parameter with this command to leave IPv4 BGP unnumbered mode.

Command Syntax

```
bgp v4-unnumbered-mode
exit-v4-unnumbered-mode
```

Parameters

None

Applicability

No default value is specified.

Command Mode

Address-family IPv4 Unicast Mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp v4-unnumbered-mode
(config-router-v4-unnum)#
```

BGP4+ Commands

BGP4+ extends BGP Commands (page 1244) to support IPv6 and other network layer protocols using address-family configuration mode. IPv6-specific commands are encapsulated within the address-family ipv6 context. It includes the following commands:

address-family ipv6 1424
aggregate-address X:X::X:X/M 1426
clear bgp * ipv6 1428
clear bgp ipv6 (A.B.C.D|X:X::X:X) 1430
clear bgp ipv6 <1-4294967295> 1431
clear bgp ipv6 external 1432
clear bgp ipv6 peer-group 1433
clear bgp ipv6 unicast flap-statistics 1434
clear ipv6 bgp * vrf 1435
clear ipv6 bgp X:X::X:X vrf 1436
clear ip bpg ipv6 unicast table-map 1437
network X:X::X:X 1438

© 2026 IP Infusion Inc. Proprietary

address-family ipv6

Use the address family command to enter the IPv6 or VPNv6 address family mode allowing configuration of address-family specific parameters. To leave the address family mode and return to the Configure mode use the `exit-address-family` command.

This command configures the routing exchange between Provider Edge (PE) and Customer Edge (CE) devices. The BGP sessions between PE routers can carry different types of routes (VPN-IPv6 and IPv6 routes). Address families are used to control the type of BGP session. Configure a BGP address family for each VRF configured on the PE router and a separate address family to carry VPN-IPv6 routes between PE routers. All non VPN BGP neighbors are defined using router mode. All VPN BGP neighbors are defined under its associated address family mode. The BGP process with no address-family specified is the default address-family, where any sessions are configured that either are not associated with a VRF or are used to carry IPv6 routes.

Use the `no` parameter with this command to disable the address-family configurations.

Command Syntax

```
address-family ipv6 (unicast|)
address-family ipv6 vrf NAME
address-family vpn6
address-family vpn6 unicast
no address-family ipv6 vrf NAME
no address-family ipv6 (unicast|)
no address-family vpnv6
no address-family vpnv6 unicast
```

Parameters

ipv6
Specifies the IPv6 address family.

unicast
Specifies the unicast address prefixes.

vrf NAME
Specifies the Virtual Private Network (VPN) routing/forwarding instance name.

vpnv6
Specifies the VPN version 6 (v6) address family.

vpnv6 unicast
Specifies the VPNv6 unicast address prefixes.

Applicability

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 unicast
(config-router-af)#exit-address-family

(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 allowas-in 3
(config-router-af)#exit-address-family
```

© 2026 IP Infusion Inc. Proprietary

aggregate-address X:X::X:X/M

Use this command to configure BGP aggregate entries.

Aggregates are used to minimize the size of routing tables. Aggregation combines the characteristics of several different routes and advertises a single route. This command creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available in the specified range. Using the `summary-only` parameter advertises the prefix only, suppressing more-specific routes to neighbors.

The `as-set` parameter creates an aggregate entry advertising the path for this route, consisting of all elements contained in all paths being summarized. Use the `as-set` parameter to reduce the size of path information by listing the AS number only once, even if it was included in multiple paths that were aggregated. The `as-set` parameter is useful when aggregation of information results in an incomplete path information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
aggregate-address X:X::X:X/M
aggregate-address X:X::X:X/M as-set
aggregate-address X:X::X:X/M as-set summary-only
aggregate-address X:X::X:X/M summary-only
aggregate-address X:X::X:X/M summary-only as-set
no aggregate-address X:X::X:X/M
no aggregate-address X:X::X:X/M as-set
no aggregate-address X:X::X:X/M as-set summary-only
no aggregate-address X:X::X:X/M summary-only
no aggregate-address X:X::X:X/M summary-only as-set
```

Parameters

X:X::X:X/M
Aggregate IPv6 prefix

as-set
Generate AS set path information

summary-only
Filter more specific routes from updates

Command Mode

Address Family mode

Default

By default, aggregate address is disabled

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#neighbor 2.2.2.2 remote-as 100
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#address-family ipv6
(config-router-af)#aggregate-address 3ffe::/32 as-set summary-only
```

clear bgp * ipv6

Use this command to reset the BGP IPv6 connection for all peers.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp ipv6 *
clear bgp ipv6 * in
clear bgp ipv6 * in prefix-filter
clear bgp ipv6 * out
clear bgp ipv6 * soft
clear bgp ipv6 * soft in
clear bgp ipv6 * soft out
clear ip bgp * ipv6 unicast in
clear ip bgp * ipv6 unicast out
clear ip bgp * ipv6 unicast soft
clear ip bgp * ipv6 unicast soft in
clear ip bgp * ipv6 unicast soft out
```

Parameters

in
Clear incoming advertised routes.

prefix-filter

Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear all incoming and outgoing IPv6 routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

unicast
Unicast prefixes

in
Clear incoming advertised routes.

out
Soft reconfig outbound update

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Clear outgoing advertised routes

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp * ipv6 unicast soft out
```

© 2026 IP Infusion Inc. Proprietary

clear bgp ipv6 (A.B.C.D|X:X::X:X)

Use this command to reset the BGP neighbor addresses (IPv4 or IPv6) for IPv6 peers.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp ipv6 (A.B.C.D|X:X::X:X)
clear bgp ipv6 (A.B.C.D|X:X::X:X) in
clear bgp ipv6 (A.B.C.D|X:X::X:X) in prefix-filter
clear bgp ipv6 (A.B.C.D|X:X::X:X) out
clear bgp ipv6 (A.B.C.D|X:X::X:X) soft
clear bgp ipv6 (A.B.C.D|X:X::X:X) soft in
clear bgp ipv6 (A.B.C.D|X:X::X:X) soft out
```

Parameters

in
Clear incoming advertised routes
prefix-filter

Push out prefix-list ORF and do inbound soft reconfig

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes
in
Soft reconfig inbound update
out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp ipv6 10.5.2.7
```

© 2026 IP Infusion Inc. Proprietary

clear bgp ipv6 <1-4294967295>

Use this command to reset the BGP connection with a specified AS (Autonomous System) number for IPv6 peers.

Command Syntax

```
clear bgp ipv6 <1-4294967295>
clear bgp ipv6 <1-4294967295> in
clear bgp ipv6 <1-4294967295> in prefix-filter
clear bgp ipv6 <1-4294967295> out
clear bgp ipv6 <1-4294967295> soft
clear bgp ipv6 <1-4294967295> soft in
clear bgp ipv6 <1-4294967295> soft out
```

Parameters

in
Clear incoming advertised routes.

prefix-filter

Push out prefix-list ORF and do inbound soft reconfig.

out
Clear outgoing advertised routes.

soft
Clear both incoming and outgoing routes.

in
Soft reconfig inbound update.

out
Soft reconfig outbound update.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp ipv6 12345
```

© 2026 IP Infusion Inc. Proprietary

clear bgp ipv6 external

Use this command to reset the BGP connection for all external IPv6 peers or for a specified external IPv6 peer.

Command Syntax

```
clear bgp ipv6 external
clear bgp ipv6 external in prefix-filter
clear bgp ipv6 external soft
clear bgp ipv6 external soft in
clear bgp ipv6 external soft out
clear bgp ipv6 external WORD in
clear bgp ipv6 external WORD out
```

Parameters

in

Clear incoming advertised routes

prefix-filter

Push out prefix-list ORF and do inbound soft reconfig

soft

Clear both incoming and outgoing routes

in

Soft reconfig inbound update

out

Soft reconfig outbound update

WORD

Name of external IPv6 peer

in

Soft reconfig inbound update

out

Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp ipv6 external soft in
```

© 2026 IP Infusion Inc. Proprietary

clear bgp ipv6 peer-group

Use this command to reset the BGP connection for all members of a peer group.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp ipv6 peer-group WORD
clear bgp ipv6 peer-group WORD in
clear bgp ipv6 peer-group WORD in prefix-filter
clear bgp ipv6 peer-group WORD out
clear bgp ipv6 peer-group WORD soft
clear bgp ipv6 peer-group WORD soft in
clear bgp ipv6 peer-group WORD soft out
```

Parameters

in
Clear incoming advertised routes

prefix-filter

Push out prefix-list ORF and do inbound soft reconfig

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

WORD
BGP peer-group name

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp peer-group P1
```

clear bgp ipv6 unicast flap-statistics

Use this command to reset IPv6 BGP route flap statistics.

Command Syntax

```
clear bgp ipv6 unicast flap-statistics
clear bgp ipv6 unicast flap-statistics X:X::X:X
clear bgp ipv6 unicast flap-statistics X:X::X:X/M
clear ip bgp ipv6 unicast flap-statistics
clear ip bgp ipv6 unicast flap-statistics X:X::X:X
clear ip bgp ipv6 unicast flap-statistics X:X::X:X/M
```

Parameters

X:X::X:X
IP prefix (network) for example, 35.0.0.0

X:X::X:X/M
IP prefix (network and length) for example, 35.0.0.0/8

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp ipv6 unicast flap-statistics 1:2::3:4/7
```

© 2026 IP Infusion Inc. Proprietary

clear ipv6 bgp * vrf

Use this command to reset an IPv6 BGP connection for all virtual routing forwarding addresses.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ipv6 bgp * vrf WORD
clear ipv6 bgp * vrf WORD in
clear ipv6 bgp * vrf WORD out
clear ipv6 bgp * vrf WORD soft
clear ipv6 bgp * vrf WORD soft in
clear ipv6 bgp * vrf WORD soft out
```

Parameters

in
Clear incoming advertised routes

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

WORD
BGP peer-group name

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 bgp * vrf BGPpeer7
```

© 2026 IP Infusion Inc. Proprietary

clear ipv6 bgp X:X::X:X vrf

Use this command to reset the specified VPNv6 Routing/Forwarding (VRF) instance for BGP connections. If the neighbor address is specified with this command, it clears the specified connection. If no address is specified, this command clears all the BGP routes.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ipv6 bgp (X:X::X:X) vrf WORD
clear ipv6 bgp X:X::X:X vrf WORD in
clear ipv6 bgp X:X::X:X vrf WORD out
clear ipv6 bgp X:X::X:X vrf WORD soft in
clear ipv6 bgp X:X::X:X vrf WORD soft out
```

Parameters

vrf
Specify a VPN routing/forwarding instance for IPv6

WORD
VPN routing/forwarding instance name

in
Clear incoming advertised routes

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 bgp vrf 10:10::0:12 vrf vrfname
```

clear ip bpg ipv6 unicast table-map

Use this command to apply the modified table map or route map rules to the BGP routes in the existing IP routing table.

Command Syntax

```
clear ip bpg ipv6 unicast table-map (vrf (VRFNAME|all|default))
```

Parameters

vrf
Select a VPN Routing/Forwarding Instance.

VRFNAME
Specify a VPN Routing/Forwarding instance name.

all
Select all VRFs.

default
Select default VRFs.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp ipv6 unicast table-map vrf all
```

network X:X::X:X

Use this command to specify the networks to be advertised by the BGP routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Use the `backdoor` parameter to specify a backdoor route to a BGP border router that will provide better information about the network. For data to be advertised by BGP, its routing table must include a route to the specified network. This command specifies the networks to be advertised. The network command works if the network being advertised is known to the router.

The `backdoor` parameter enables a route to be the preferred route even if it has a greater distance. A network that is specified as a backdoor network is dynamically assigned an administrative distance of 200 ensuring that IGP learned routes are preferred. If a backdoor network is not sourced by the local router, the network is learned from the external routers. If the route is learned from eBGP for a backdoor network, the distance is set to 20 or 200.

Use the `no` parameter with this command to remove an entry.

Command Syntax

```
network X:X::X:X/M
network X:X::X:X/M backdoor
network X:X::X:X/M route-map WORD (backdoor|)
no network X:X::X:X/M
no network X:X::X:X/M backdoor
no network X:X::X:X/M route-map WORD (backdoor|)
```

Parameters

X:X::X:X
IPv6 prefix <network>, for example, 3ffe::

backdoor
Specify a BGP backdoor route

WORD
Name of the route map

Default

None

Command Mode

IPv6 Address Family mode, IPv6 VRF Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 10
(config-router)#network 172.26.0.0/16
```

If Router1 receives updates from 172.10.0.0 via two routing protocols RIP (distance 120) and eBGP (distance 20), router1 chooses the shorter route. Use the `backdoor` parameter to allow Router1 to learn about 172.10.0.0 via RIP.

```
(config)# router rip
(config)#network 172.10.0.0
(config)#router bgp 65001
(config)#neighbor 5ffe:507::2 remote-as 65001
(config-af)#address-family ipv6 unicast
(config-af)#network 8ffe:507::/64
(config-af)#neighbor 5ffe:507::2 activate
(config-af)#exit-address-family
```

address-family

Specify address-family type to attach a policy to a specific address-family. This command enters address family configuration mode.

Note: IPv6 address-family is not supported.

Command Syntax

```
address-family ipv4
no address-family
```

Parameters

None

Default

None

Command Mode

Flowspec mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#flowspec
(config-flowspec)#address-family ipv4
```

© 2026 IP Infusion Inc. Proprietary

address-family ipv4 flowspec vrf

Use this command to enter address-family IPv4 Flowspec VRF mode to configure IPv4 BGP Flowspec specific parameters in a VRF.

Command Syntax

```
address-family ipv4 flowspec vrf VRFNAME
no address-famlily ipv4 flowspec vrf VRFNAME
```

Parameters

VRFNAME
VRF name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config-router)#address-family ipv4 flowspec vrf VRF1
```

© 2026 IP Infusion Inc. Proprietary

class-map type traffic match-all

Use this command to define a traffic class and associate rules by using match sub-commands, after the class-map type traffic command is typed in. The created c class-map can be removed with No form of this command. Only match-all criteria (match all match items configured in a class-map) is supported in BGP Flowspec.

Command Syntax

```
class-map type traffic match-all NAME
no class-map type traffic NAME
```

Parameters

NAME
A class-map-name to define.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
```

drop

When an attached class-map is matched, the matched packet drops.

Command Syntax

```
drop
no drop
```

Parameters

None

Default

None

Command Mode

policy-map class mode.

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config-pmap-pbr-c)#drop
```

© 2026 IP Infusion Inc. Proprietary

flowspec

Use this command to enable flowspec in the global configuration mode.

Command Syntax

```
flowspec
no flowspec
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#flowspec
(config-flowspec)#
```

© 2026 IP Infusion Inc. Proprietary

hardware filter ipv4-bgp-flowspec

Use this command to enable ipv4 BGP flowspec feature in hardware. Unless it is enabled, the all flowspec routes are not set to hardware, while the all BGP operations are done not related to this command.

Command Syntax

```
hardware filter ipv4-bgp-flowspec enable
hardware filter ipv4-bgp-flowspec disable
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#hardware-profile filter ipv4-bgp-flowspec enable
```

© 2026 IP Infusion Inc. Proprietary

ipv4 flowspec-disable

Use this command to disable BGP FlowSpec on a per-port basis. This is achieved by installing a high-priority FlowSpec rule that matches a specific FIB ID and Layer 3 (L3) interface, but with no action defined. This rule takes precedence over regular FlowSpec rules, ensuring that packets received on the specified L3 interface do not match any other FlowSpec rules. As a result, the FlowSpec functionality is effectively disabled for those specific ports. This feature is useful for environments where certain ports need to be excluded from BGP FlowSpec rule enforcement while maintaining regular network operations.

Notes:

This feature can be applied to any L3 interfaces, specifically on the following types:

- Physical interfaces: Direct physical network interfaces.
- Link Aggregation Group (LAG) interfaces: Bundled multiple network connections to act as a single interface.
- Virtual Local Area Network (VLAN) interfaces: Logical interfaces representing VLANs.
- Sub-interfaces: Logical interfaces created on a physical or VLAN interface for managing traffic separately.

Use no form of this command to enable BGP FlowSpec on a per-port basis.

Command Syntax

```
ipv4 flowspec-disable
no ipv4 flowspec-disable
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Examples

In the following scenario, define traffic classes and policy maps to handle traffic flows. Enable FlowSpec and apply the policy maps to control traffic behavior. When disabling FlowSpec on VLAN and Port-Channel interfaces (`vlan1.100` and `po1`), the system installs disabling rules with higher priority for the interfaces `vlan1.100` and `po1`. This ensures that regular FlowSpec rules do not apply to `vlan1.100` and `po1`.

© 2026 IP Infusion Inc. Proprietary

Disabling FlowSpec on VLAN and Port-Channel Interfaces

```
OcNOS(config)#interface po1
OcNOS(config-if)#ip address 100.1.1.4/24
OcNOS(config-if)#ipv4 flowspec-disable
OcNOS(config-if)#commit
OcNOS(config-if)#exit

OcNOS(config)#interface vlan1.100
OcNOS(config-if)#ip address 200.1.1.4/24
OcNOS(config-if)#ipv4 flowspec-disable
OcNOS(config-if)#commit
OcNOS(config-if)#end
```

Validation

To verify the installation of FlowSpec rules, use the `show hsl bgp-flowspec-rules fib-id all detail` command.

1. When traffic arrives at `vlan1.100` or `po1`, the system first matches the high-priority disabling rules (rules 1 and 2). These rules prevent further FlowSpec rules from being applied to traffic on the VLAN and Port-Channel interfaces.
2. For other interfaces, the system applies the regular FlowSpec rules. If the traffic matches the criteria defined in the class-map type `clas1` or `clas2` (rules 3 and 4), it will be dropped.

The prioritization of the disabling rules for `vlan1.100` and `po1` ensures these interfaces are effectively excluded from FlowSpec processing.

```
OcNOS#show hsl bgp-flowspec-rules fib-id all detail

<<< HSL BGP Flowspec information >>>
 rule processing type: all rules install
 Table Full: FALSE

<<< fib ID: 0 >>>
  Total number of rules installed: 4
  Rules installed to hw: 4
  Ruules not installed to hw: 0
  Table Full: FALSE

  <<< rule number: 1 >>>
    priority: 1
    disabled_interface: vlan1.100 (ifindex:10205)

    <<< Traffic Filters >>>

    <<< Actions >>>

  <<< rule number: 2 >>>
    priority: 2
    disabled_interface: po1 (ifindex:100001)

    <<< Traffic Filters >>>

    <<< Actions >>>

  <<< rule number: 3 >>>
    priority: 3

    <<< Traffic Filters >>>
    destination ip address: 100.1.1.0/24
    name: clas1

    <<< Actions >>>
    traffic_rate: 0 pps

  <<< rule number: 4 >>>
    priority: 4

    <<< Traffic Filters >>>

local-install

Specify whether or not, the attached service policy is installed to a local node. By default, not installed. This command can be taken effect for all address-families by specifying it before entering address-family configuration mode, or for a specific address-family when the mode is address-family configuration.

Command Syntax

```
local-install interface-all
no local-install
```

Parameters

None

Default

None

Command Mode

Flowspec, Flowspec address family and Flowspec-VRF mode.

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#flowspec
(config-flowspec)#local-install interface-all
(config-flowspec)#address-family ipv4
(config-flowspec-af)#local-install interface-all
(config-flowspec-af)#exit
(config-flowspec)#vrf VRF1
(config-flowspec-vrf)#local-install interface-all
```

© 2026 IP Infusion Inc. Proprietary

match destination-address

IP destination address to match. It can be specified with prefix and netmask bits.

Command Syntax

```
match destination-address ipv4 A.B.C.D/M
no match destination-address
```

Parameters

A.B.C.D/M
A.B.C.D is prefix and M is netmask bits.

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match destination-address ipv4 1.1.1.1/32
```

© 2026 IP Infusion Inc. Proprietary

match destination-port

Use this command to match TCP or UDP destination port number(s).

Command Syntax

```
match destination-port WORD
no match destination-port
```

Parameters

WORD

A port number in 1-65535. A range in a form of range: MIN_VALUE-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match destination-port 10-100
```

© 2026 IP Infusion Inc. Proprietary

match dscp

Use this command to match DSCP value.

Command Syntax

```
match dscp WORD
no match dscp
```

Parameters

WORD

A class-map-name to define DSCP code value. A range in a form of range: MIN_VALU-MAX_VALUE. e.g. 10-3e

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match dscp 21
```

match fragment-type

Use this command to match fragment type.

Command Syntax

```
match fragment-type (df|isf|ff|lf|lf-ff-isf)
no match fragment-type
```

Parameters

df
Don't fragment

isf
Is s fragment other than the first

ff
First fragment

lf
Last fragment

lf-ff-isf
When one of lf, ff, and isf is true to match, it matches.

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match fragment-type lf
```

© 2026 IP Infusion Inc. Proprietary

match icmp-code

Use this command to match the ICMP code.

Command Syntax

```
match ipv4 icmp-code WORD
no match ipv4 icmp-code
```

Parameters

WORD

ICMP code number in 0-255. A range in a form of range: MIN_VALU-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match ipv4 icmp-type 10
(config-cmap-tr)#match ipv4 icmp-code 20
```

© 2026 IP Infusion Inc. Proprietary

match icmp-type

Use this command to match TCP/UDP destination port number(s).

Command Syntax

```
match ipv4 icmp-type WORD
no match ipv4 icmp-type
```

Parameters

WORD
ICMP code number in 0-255. A range in a form of range: MIN_VALU-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match ipv4 icmp-type 10
```

match packet-length

Use this command to match packet length.

Command Syntax

```
match packet-length WORD
no match packet-length
```

Parameters

WORD

ICMP code number in 0-255 (packet length value). A range in a form of range: MIN_VALU-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match packet-length 70-100
```

match port

Use this command to match TCP/UDP port number(s).

Command Syntax

```
match port WORD
no match port
```

Parameters

WORD

A port number in 1-65535. A range in a form of range: MIN_VALUE-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match port 1000-2000
```

match protocol

Use this command to match Protocol number(s).

Command Syntax

```
match protocol WORD
no match protocol
```

Parameters

WORD

IP protocol number in 0-255. A range in a form of range: MIN_VALUE-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match protocol 122
```

match source-address

IP source address to match. It can be specified with prefix and netmask bits.

Command Syntax

```
match source-address ipv4 A.B.C.D/M
no match source-address
```

Parameters

A.B.C.D/M
A.B.C.D is prefix and M is netmask bits.

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match source-address ipv4 2.2.2.2/32
```

match source-port

Use the command to match TCP/UDP source port number(s).

Command Syntax

```
match source-port WORD
no match source-port
```

Parameters

WORD

A port number in 1-65535. A range in a form of range: MIN_VALU-MAX_VALUE. e.g. 10-100

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match source-port 10-100
```

match tcp-flag

Use this command to match TCP flag.

Command Syntax

```
match tcp-flag WORD bit-mask WORD
no match tcp-flag bitmask
```

Parameters

tcp-flag WORD
TCP flag value in hexadecimal (0-fff)

bit-mask WORD
TCP flag bitmask in hexadecimal (0-fff)

Default

None

Command Mode

Class-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#class-map type traffic match-all test1
(config-cmap-tr)#match tcp-flag 2e bit-mask 3f
```

neighbor flowspec-vaildation-disable

The following parameters can be configured with neighbor command in address-family for BGP Flowspec. The flowspec-vaildation-disable is a parameter for BGP Flowspec. When it is specified, BGP Flowspec validation is disabled. By default, this parameter is enabled.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X) flowspec-validation-disable
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

Default

Enabled

Command Mode

Router Address Family mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config-router)#address-family ipv4 flowspec
(config-router-af)#neighbor 1.1.1.1 flowspec-validation-disable
```

© 2026 IP Infusion Inc. Proprietary

police rate

Use this command to set a rate applied for matched packets.

Command Syntax

```
police rate <1-1000000000> (bps|pps)
no police rate
```

Parameters

police rate <1-1000000000>
Rate value specified in 1-1000000000.

pps
A unit for rate value, packets per second (pps).

bps
A unit for rate value, bit per second (bps).

Default

None

Command Mode

Policy-map class mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
OcNOS(config-pmap-pbr-c)#police rate
OcNOS(config-pmap-pbr-c)#police rate 100000000 bps
```

© 2026 IP Infusion Inc. Proprietary

policy-map

Create or modify a policy map with a pbr type that can be attached as a service policy, and proceed to a mode to enter class command after this command is typed in. Multiple class-map can be linked to a created policy-map. To delete a policy-map, use the no form of this command.

Command Syntax

```
policy-map type (pbr) NAME
no policy-map type pbr NAME
```

Parameters

pbr NAME
A name for a creating modifying policy-map.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#policy-map type pbr
(config)#policy-map type pbr test2
```

policy-map class type traffic

Use this command to attach a class to a policy-map created by policy-map command. This command enters policy-map mode.

Command Syntax

```
class type (traffic) NAME
no class type traffic NAME
```

Parameters

traffic NAME

A name for class-map already created with class-map command.

Default

None

Command Mode

Policy-map mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#policy-map type pbr test2
(config-pmap-pbr)#class type traffic test1
```

© 2026 IP Infusion Inc. Proprietary

redirect

Use this command to set a VRF redirected to for matched packets.

Command Syntax

```
redirect ipv4 extcommunity rt ASN:nn_or_IP-address:nn
no redirect ipv4 extcommunity rt
```

Parameters

ASN:nn_or_IP-address:nn

Specify a route target, Two formats can be used:

- AS number: index, e.g. 100:10
- IPv4 address: index, e.g. 2.2.2.2:10.

Default

None

Command Mode

Policy-map class mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config-pmap-pbr-c)#redirect ipv4 extcommunity rt 100:10
```

© 2026 IP Infusion Inc. Proprietary

service-policy type pbr

Use this command to attach or detach a service policy to BGP component. The attached policy is locally installed optionally by typing local-install command, as well as a BGP Flowspec route is injected to a BGP component.

Command Syntax

```
service-policy type (pbr) NAME
no service-policy type pbr NAME
```

Parameters

pbr NAME
Name of the policy map.

Default

None

Command Mode

Flowspec address family mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config)#flowspec
(config-flowspec)#local-install interface-all
(config-flowspec)#address-family ipv4
(config-flowspec-af)#service-policy type pbr test1
```

© 2026 IP Infusion Inc. Proprietary

set dscp

Use this command to set a DSCP value to a matched packet to mark with it.

Command Syntax

```
set dscp DSCP_VALUE
no set dscp
```

Parameters

DSCP_VALUE

DSCP value in hexadecimal (0-3f) -
(00|01|02|03|04|05|06|07|08|09|0a|0b|0c|0d|0e|0f|10|11|12|13|14|15|16|17|18|19|1a|1b|1c|1d|1e|1f|
20|21|22|23|24|25|26|27|28|29|2a|2b|2c|2d|2e|2f|30|31|32|33|34|35|36|37|38|39|3a|3b|3c|3d|3e|3f)

Default

None

Command Mode

Policy-map class mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
(config-pmap-pbr-c)#set dscp 3f
```

set ip next-hop

Use this command to configure ipv4 nexthop as tracked object to verify its availability.

Note: Depends on “IP-SLA” configurations.

Command Syntax

```
set ip next-hop A.B.C.D verify-availability track <1-500>
no set ip next-hop A.B.C.D
```

Parameters

A.B.C.D
Specifies the IP address of the next-hop router.

verify-availability
Enables availability tracking for the specified next-hop IP.

track <1-500>
Associates the route with a tracking object ID (in the range 1 to 500), which monitors the reachability or status of the next-hop. If the tracked object goes down, the next-hop is considered unavailable and the route is withdrawn or deprioritized.

Command Mode

policy-map class mode.

Applicability

This command was introduced in OcNOS version 6.6.1.

Examples

```
(config-pmap-pbr-c)#set ip next-hop 10.10.0.67 verify-availability track 7
```

set ipv6 next-hop

Use this command to configure IPv6 nexthop as tracked object to verify its availability.

Note: Depends on “IP-SLA” configurations.

Command Syntax

```
set ipv6 next-hop X:X::X:X verify-availability track <1-500>
no set ipv6 next-hop X:X::X:X
```

Parameters

X:X::X:X
Specifies the IPv6 address of the next-hop router.

verify-availability
Enables availability tracking for the specified next-hop IP.

track <1-500>
Associates the route with a tracking object ID (in the range 1 to 500), which monitors the reachability or status of the next-hop. If the tracked object goes down, the next-hop is considered unavailable and the route is withdrawn or deprioritized.

Command Mode

Policy-map class mode.

Applicability

This command was introduced in OcNOS version 6.6.1.

Examples

```
(config-pmap-pbr-c)#set ipv6 next-hop 1311::2 verify-availability track 8
```

show hsl bgp-flowspec-rules fib-id

Use these commands to display the BGP FlowSpec rules for FIB IDs.

Command Syntax

```
show hsl bgp-flowspec-rules fib-id (<0-255>|all) (detail|)
```

Parameters

fib-id <0-255>
Specifies the FIB ID range.

fib-id all
Displays rule for all the FIB IDs.

fib-id detail
(Optional) Displays the detailed information of the FlowSpec rules.

Default

None

Command Mode

Execution mode

Applicability

Introduced in OcNOS version 6.3.0.

Examples

```
OcNOS#show hsl bgp-flowspec-rules fib-id all detail

<<< HSL BGP Flowspec information >>>
rule processing type: all rules install
Table Full: FALSE

<<< fib ID: 0 >>>
  Total number of rules installed: 6
  Rules installed to hw: 6
  Ruules not installed to hw: 0
  Table Full: FALSE

  <<< rule number: 1 >>>

  <<< rule number: 4 >>>
    priority: 4

    <<< Traffic Filters >>>
    destination ip address: 200.1.1.0/24
    name: clas2

    <<< Actions >>>
    traffic_rate: 0 pps

  <<< rule number: 5 >>>
    priority: 5
    <<< Traffic Filters >>>
    destination ip address: 200.2.1.0/24
    name: clas3

    <<< Actions >>>
    traffic_rate: 0 pps
  <<< rule number: 6 >>>
    priority: 6
    <<< Traffic Filters >>>
    destination ip address: 200.3.1.0/24
    name: clas4
    <<< Actions >>>
    traffic_rate: 0
```

show ip bgp flowspec

Use these commands to display the BGP Flowspec summary details.

Command Syntax

```
show ip bgp flowspec
show ip bgp flowspec summary (vrf (VRFNAME|all|default))
show ip bgp (ipv4|vpnv4) flowspec (detail|)
show ip bgp (ipv4|vpnv4) flowspec (vrf (VRFNAME|all|default)) (detail|)
show ip bgp vpnv4 flowspec rd WORD (detail|)
```

Parameters

vrf VRFNAME
Display the Flowspec specific VRF details

all
Display the Flowspec all VRF details

default
Display the Flowspec default VRF details

detail
Display all Flowspec details

Default

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#show ip bgp flowspec

vrf

Use this command to specify a VRF to configure service policies. This command is executed in the default VRF mode, and enter VRF mode. address-family, local-install and service-policy commands can be executed in the same way (stated in `address-family, locall-install,` and `service-policy type pbr`) executed in the default VRF mode.

Command Syntax

```
vrf VRF_NAME
no vrf VRF_NAME
```

Parameters

VRF_NAME
Specify a VRF name already created

Default

None

Command Mode

Flowspec mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
OcNOS(config)#flowspec
OcNOS(config-flowspec)#vrf VRF1
```

BGP Virtual Private Network Commands

This section describes the BGP Virtual Private Network (VPN) configuration commands.

Notes: For the following commands refer to the BGP Commands (page 1244) and BGP4+ Commands (page 1423) sections

- address-family ipv4 (page 1248)
- address-family ipv6 (page 1424)
- exit-address-family (page 1319)
- neighbor activate (page 1338)
- neighbor allowas-in (page 1340)
- neighbor as-origination-interval (page 1342)
- neighbor description (page 1356)
- neighbor remote-as (page 1387)
- neighbor send-community (page 1396)
- neighbor shutdown (page 1399)
- redistribute (page 1415)

bgp external-route-leak

Use this command to control the external route leaking. An external imported route (those received from VPN neighbor and imported to an IP-VRF) is further leaked to another IP-VRF. The route-target exports the source VRF, matches the route-target, and imports the destination VRF.

Use the no parameter with this command to disable external route leaking.
External route leaking is only supported for BGP EVPN routes. It is not support for other types of VPN routes.

Command Syntax

```
bgp external-route-leak
no bgp external-route-leak
```

Parameters

None

Default

Enable

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.4

Examples

```
OcNOS#configure terminal
(config)#router bgp 100
(config-router)#no bgp external-route-leak
```

bgp inbound-route-filter

Use this command to control the filtering of received VPN routes with route-target extended community attributes. The inbound route filtering is applicable for both bgp inbound-route-filter and route-target import commands.

When a router is configured as EVPN Route-Reflector, it exchanges VRF routing information with a route distinguisher and route-target extended communities.

By default, OcNOS discards the received routes that does not match the local IP/MAC VRF's route-target import value. We can use command `no bgp inbound-route-filter` to override this behavior.

When the local box is acting as a EVPN route-reflector and not in the forwarding path, it may not be configured with an IP/MAC VRF terminations. In such case, `no bgp inbound-route-filter` is required to be configured to keep all the routes into RD (route-distinguisher) table.

Command Syntax

```
bgp inbound-route-filter
no bgp inbound-route-filter
```

Parameter

None

Default

By default, OcNOS does not import routing information that does not match the local IP or MAC VRF's route-target import value.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3. Inbound-route-filter support for L2VPN EVPN introduced from OcNOS version 6.3.0 .

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp inbound-route-filter
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp <1-4294967295> vpnv4

Use this command to reset a BGP connection for all VPN peers in a specified Autonomous System.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp <1-4294967295> vpnv4 unicast in
clear ip bgp <1-4294967295> vpnv4 unicast out
clear ip bgp <1-4294967295> vpnv4 unicast soft
clear ip bgp <1-4294967295> vpnv4 unicast soft in
clear ip bgp <1-4294967295> vpnv4 unicast soft out
```

Parameters

<1-4294967295>
Clear peers with this AS number

in
Clear incoming advertised routes

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 500 vpnv4 unicast soft out
```

clear ip bgp A.B.C.D vpnv4

Use this command to reset an VPNv4 BGP connection for a specific IPv4 address.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp A.B.C.D vpnv4 unicast in
clear ip bgp A.B.C.D vpnv4 unicast out
clear ip bgp A.B.C.D vpnv4 unicast soft
clear ip bgp A.B.C.D vpnv4 unicast soft in
clear ip bgp A.B.C.D vpnv4 unicast soft out
```

Parameters

in
Clear incoming advertised routes

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 10.10.0.12 vpnv4 unicast soft
#clear ip bgp 10.10.0.10 vpnv4 unicast out
```

© 2026 IP Infusion Inc. Proprietary

clear bgp <1-4294967295> l2vpn vpls

Use this command to reset the session for the neighbors with a specific ASN number for L2VPN VPLS.

Command Syntax

```
Clear bgp <1-4294967295> l2vpn vpls
```

Parameters

<1-4294967295>
Autonomous System number of the BGP neighbor.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp 100 l2vpn vpls
```

© 2026 IP Infusion Inc. Proprietary

clear bgp A.B.C.D l2vpn vpls

Use this command to reset the session for neighbor with address A.B.C.D.

Command Syntax

```
clear bgp A.B.C.D l2vpn vpls
```

Parameters

A.B.C.D
BGP neighbor address.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp 192.168.0.3 l2vpn vpls
```

clear bgp * l2vpn vpls

Use this command to reset the session with all neighbors for VPLS address family

Command Syntax

```
clear bgp * l2vpn vpls
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp * l2vpn vpls
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp * vpnv4

Use this command to reset a VPNv4 BGP connection for all peers. This command clears the BGP connection and dynamically resets the outbound routing table. This frees up additional memory required for storing updates to generate new updates.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp * vpnv4 unicast in
clear ip bgp * vpnv4 unicast out
clear ip bgp * vpnv4 unicast soft
clear ip bgp * vpnv4 unicast soft in
clear ip bgp * vpnv4 unicast soft out
```

Parameters

in
Clear incoming advertised routes

out
Clear outgoing advertised routes

soft
Clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp *
#clear ip bgp * vpnv4 unicast out
```

© 2026 IP Infusion Inc. Proprietary

debug bgp mpls

Use this command to enable the display of MPLS related information.

Use the `no` parameter with this command to disable this function.

Note: This command is available only when `vrf` option is enabled.

Command Syntax

```
debug bgp mpls
no debug bgp mpls
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
debug bgp mpls
```

export map

Use this command in VRF configuration mode to apply a route-map that controls which routes are exported from the VRF into the global routing table or into other VRFs. The route-map can filter routes using match clauses and modify BGP attributes using set clauses, enabling granular control over inter-VRF route export policies.

Notes:

- An export-map with a `permit route-map` that contains `no match` or `set clauses` functions as a **permit-all**.
- An export-map with a `deny route-map` that contains `no match` or `set clauses` functions as a **deny-all**.

Use the `no` parameter of this command to remove the applied route-map.

Command Syntax

```
export map WORD
no export map
```

Parameters

WORD

Specifies the name of the route-map to apply as the VRF export-map.

- `match` clauses filter the routes to export (for example, using prefix lists, community values, or AS path).
- `set` clauses adjust BGP attributes for exported routes (for example, route targets, local preference, AS path, MED).

Default

If no export-map is configured, all eligible VRF routes are exported unmodified.

Command Mode

VRF mode

Applicability

Introduced in OcNOS version 4.1. OcNOS version 7.0.0 adds support for VRF-level BGP export-maps with route-map match and set clauses, enabling granular control of exported routes and attributes.

Examples

This example shows how to configure an export-map with a route-map that filters specific prefixes and modifies their BGP attributes before exporting them from the VRF.

- The VRF `vrf1` is created, with route-distinguisher 1:1 and route-target 100:1.
- The `export map export-r1` is applied to control which routes `vrf1` exports.
- The prefix-list `p1_ipv4` permits only `121.1.1.1/32`.

© 2026 IP Infusion Inc. Proprietary

- The `route-map export-r1` matches the permitted prefix and modifies its attributes by:
  - Setting local preference to `1000`
  - Setting BGP community to `650:650`
  - Adding extended communities (route-targets) `110:1 and 220:1`

As a result, only the permitted prefix (`121.1.1.1/32`) is exported from `vrf1` with the modified BGP attributes.

```
OcNOS(config)#ip vrf vrf1
OcNOS(config-vrf)#export map export-r1
OcNOS(config-vrf)#
```

import map

Use this command to assign a route-map to the VRF. This route-map is applied to routing information imported from another PE or VRF.

Also, apply this command when finer control is required over the routes imported into a VRF than what is provided by the standard import and export extended communities.

The route-map can be used to filter specific routes that are eligible for import into the VRF. Routes that match a deny clause in the route-map are excluded, while those that match a permit clause are imported.

Note: Only match rules (permit or deny) in the route-map are applied for imported routes. Any set rules defined in the route-map are ignored.

Use the `no` parameter of this command to remove the assigned route-map.

Command Syntax

```
import map WORD
no import map
```

Parameters

WORD

Specifies the name of the route-map to be applied for import control.

Default

None

Command Mode

VRF mode

Applicability

Introduced in OcNOS version 4.1.

Examples

Applies the route-map `set-pref` to control which routes are imported into the VRF `myVRF`.

```
(config)#ip vrf myVRF
(config-vrf)#import map set-pref
(config-vrf)#
```

ip vrf

Use this command to assign a VPN Routing Forwarding (VRF) instance.

Use the `no` option with this command to remove the VRF from the instance.

Command Syntax

```
ip vrf WORD
no ip vrf WORD
```

Parameter

WORD
Name of the VRF instance

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Command Example

```
(config)#ip vrf myVRF
(config-vrf)#
```

neighbor allow-ebgp-vpn

Use this command to allow an eBGP neighbor to be a VPN peer. By default, BGP VPN functionality is allowed only for iBGP peers.

Use the `no` parameter with this command to remove the configuration.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) allow-ebgp-vpn
no neighbor (A.B.C.D|X:X::X:X|WORD) allow-ebgp-vpn
```

Parameters

A.B.C.D
Address of the BGP neighbor in IPv4 format

X:X::X:X
Address of the BGP neighbor in IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, BGP VPN functionality is allowed only for iBGP peers

Command Mode

Address Family-vpnv4 mode and Address Family-vpnv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 200
(config-router)#neighbor 66.66.66.66 remote-as 100
(config-router)#neighbor 66.66.66.66 update-source lo
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 66.66.66.66  allow-ebgp-vpn
(config-router-af)#neighbor 66.66.66.66 activate
(config-router-af)#exit-address-family
```

© 2026 IP Infusion Inc. Proprietary

neighbor as-override

Use this command to configure a provider edge (PE) router to override the autonomous system number (ASN) of a site with the ASN of a provider. BGP normally ignores routes from the same autonomous system. However, this command is used so that the Customer Edge (CE) routers router accepts and installs routes from the same autonomous system.

Typically, this command is used when CE routers have the same ASN in some or all sites. As per BGP requirement, a BGP speaker rejects a route that has the same ASN as itself in the `AS_PATH` attribute. Thus the CE routers having the same ASN do not accept routes from each other. Giving this command on the PE router removes the CE neighbor's ASN from the `AS_PATH` attribute allowing CE routers with the same ASN to accept routes from each other.

Use the `no` parameter with this command to remove VPN IPv4 prefixes from a specified router.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) as-override
no neighbor (A.B.C.D|X:X::X:X|WORD) as-override
```

Parameters

A.B.C.D
Address of the BGP neighbor in IPv4 format

X:X::X:X
Address of the BGP neighbor in IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor as override is disabled

Command Mode

Address Family-vrf mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 as-override

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 as-override
```

© 2026 IP Infusion Inc. Proprietary

neighbor send-community

Use this command to send the extended-community attribute to a customer edge router. In VPN, the route-distinguisher and route-target are encoded in BGP extended-community.

see also neighbor send-community in BGP Commands.

Command Syntax

```
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
neighbor (A.B.C.D|X:X::X:X|WORD) send-community
neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

both
Send Standard and Extended Community attributes

extended
Send Extended Community attributes

standard
Send Standard Community attributes

Default

By default, both communities (standard and extended) are sent to every BGP neighbor.

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.10.1 remote-as 200
(config-router-af)#no neighbor 10.10.0.1 send-community extended
```

© 2026 IP Infusion Inc. Proprietary

neighbor soo

Use this command to enable the site-of-origin (SOO) feature. If the customer AS is multi-homed to the ISP, this command ensures that the PE does not advertise the routes back to the same AS.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) soo AS:nn_or_IP:nn
no neighbor (A.B.C.D|X:X::X:X|WORD) soo
```

Parameters

A.B.C.D
Address of the BGP neighbor in IPv4 format

X:X::X:X
Address of the BGP neighbor in IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

ASN:nn_or_IP-address:nn
An AS number and an arbitrary number (for example, 100:1), or a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

By default, the site-of-origin (SOO) feature is disabled.

Command Mode

Address Family VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 1.1.1.1 remote-as 200
(config-router-af)#neighbor 10.10.0.1 soo 100:1
```

© 2026 IP Infusion Inc. Proprietary

rd (route distinguisher)

Use this command to assign a route distinguisher (RD) for the VRF. The route distinguisher value must be a unique value on the router.

This command creates routing and forwarding tables and specifies the default RD for a VPN. The RD is added to the customer's IPv4 prefixes, changing them into globally unique VPN-IPv4 prefixes.

Use `no` form command to remove the RD configuration.

Note: RD configuration cannot be changed, it needs to be removed and added back with new value. When RD configuration is removed the RT configuration is also lost and needs to be reconfigured.

Command Syntax

```
rd ASN:nn_or_IP-address:nn
no rd ASN:nn_or_IP-address:nn
```

Parameters

ASN:nn_or_IP-address:nn

AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

No default value is specified

Command Mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#ip vrf VRF_A
(config-vrf)#rd 100:1
```

route-target

Use this command to add a list of import and export route-target extended communities to the VRF.

This command creates lists of import and export route-target extended communities for the VRF. It specifies a target VPN extended community. Execute the command once for each community. All routes with the specific route-target extended community are imported into all VRFs with the same extended community as an import route-target.

Use the `no` parameter with this command to delete a route target.

Route-target values on a MAC-VRF can be manually configured or auto derived from BGP.

Command Syntax

```
route-target (import|export|both) (ASN:nn_or_IP-address:nn|evpn-auto-rt)
no route-target (import|export|both) (ASN:nn_or_IP-address:nn|evpn-auto-rt)
```

Parameters

import
Import routing information

export
Export routing information

Note: Users can configure up to 128 export route-targets under "IP VRF mode”.

both
Import and export routing information

ASN:nn_or_IP-address:nn
AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

evpn-auto-rt
route-target auto-derived from BGP

Default

No default value is specified

Command Mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3 and `evpn-auto-rt` option for mac-vrf is introduced from in OcNOS version 6.0.0.

Examples

```
(config)#ip vrf VRF_A
```

```
(config-vrf)#route-target both 100:10

(config)#ip vrf VRF_A
(config-vrf)#route-target import 100:20

(config)#mac vrf l2vrf1
(config-vrf)#route-target both evpn-auto-rt
```

BGP Show Commands

show bgp

Use this command to display the status of BGP routes.

Command Syntax

```
show bgp ipv4
show bgp (ipv6)
show bgp (ipv4|ipv6) (unicast|multicast)
show ip bgp
show ip bgp ipv4 (unicast|multicast)
show bgp (vrf (VRFNAME|all|default))
show ip bgp (vrf (VRFNAME|all|default))
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip bgp
BGP table version is 1, local router ID is 12.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network         Next Hop      Metric    LocPrf   Weight   Path
*> 1.1.1.1/32   0.0.0.0          0         100      32768      i

Total number of prefixes 1
```

show bgp A.B.C.D

Use this command to display BGP route information for a network.

Command Syntax

```
show bgp (ipv4) (unicast|multicast) A.B.C.D
show ip bgp A.B.C.D
show ip bgp ipv4 (unicast|multicast) A.B.C.D
```

Parameters

ipv4
IPv4 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

A.B.C.D
IP prefix (network), for example, 35.0.0.0

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip bgp 80.80.80.0

BGP routing table entry for 80.80.80.0/24
Paths: (1 available, no best path)
Not advertised to any peer
300
15.15.15.1 (inaccessible) from 11.11.11.2 (15.15.15.2)
Origin incomplete, metric 0, localpref 100, valid, internal
rx path_id: 0      tx path_id: -1
Last update: Wed May 11 15:22:36 2016
```

Table 17 explains the output fields.

Table 17. show ip bgp output details

Field	Description
Paths	The paths listed in the routing table, along with path information, and whether the path are being advertised.
Metric	If shown, the value of the inter-autonomous system metric.
LocalPref	Local preference value as set with the set local-preference route-map configuration

© 2026 IP Infusion Inc. Proprietary

Table 17. show ip bgp output details (continued)

Field	Description
	command.
rx path_id	Autonomous system receive path to the source network. There can be one entry in this field for each autonomous system in the path.
tx path_id	Autonomous system transmit path to the destination network. There can be one entry in this field for each autonomous system in the path.
Last update	Last time since the neighbor transitioned to or from the established state.

show bgp A.B.C.D/M

Use this command to display BGP route information for a network prefix.

Command Syntax

```
show bgp ipv4 (unicast|multicast) A.B.C.D/M
show ip bgp A.B.C.D/M
show ip bgp ipv4 (unicast|multicast) A.B.C.D/M
show ip bgp A.B.C.D/M (vrf (VRFNAME|all|default))
show ip bgp A.B.C.D/M longer-prefixes
show ip bgp ipv4 (unicast|multicast) A.B.C.D/M longer-prefixes
show ip bgp A.B.C.D/M longer-prefixes (vrf (VRFNAME|all|default))
```

Parameters

ipv4
IPv4 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

A.B.C.D/M
IP prefix (network/length), for example, 35.0.0.0/8

longer-prefixes
Display route and more specific routes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp ipv4 unicast 22.22.22.22/32
BGP routing table entry for 22.22.22.22/32
Paths: (2 available, best #1, table Default-IP-Routing)
  Not advertised to any peer
  Local
    11.11.11.2 from 11.11.11.2 (2.2.2.2)
      Origin IGP, metric 0, localpref 100, valid, internal, best
      Last update: Fri Feb 16 09:46:54 2001
```

© 2026 IP Infusion Inc. Proprietary

```
Local
  11.11.12.2 from 11.11.12.2 (2.2.2.2)
    Origin IGP, metric 0, localpref 100, valid, internal
    Last update: Fri Feb 16 09:46:52 2001
```

show bgp client

Use this command to display BGP client information.

Command Syntax

```
show bgp client
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
R1#sh bgp client
BGP client ID: 11
 PIM, socket 10
  Service: AS number service, Route Service
  Messsage received 1, sent 1
  Connection time: Tue May 14 03:11:01 2019
  Last message read: Service Request
  Last message write: Service Reply
R1#
```

© 2026 IP Infusion Inc. Proprietary

show bgp community

Use this command to display BGP routes that match a community.

Command Syntax

```
show bgp ip (unicast|multicast) community
show bgp ip (unicast|multicast) community (vrf (VRFNAME|all|default))
show bgp ip (unicast|multicast) community [AA:NN|local-AS|no-advertise|no-export] (exact-match|)
show ip bgp community
show ip bgp community [AA:NN|local-AS|no-advertise|no-export|internet] (exact-match|)
show ip bgp community (vrf (VRFNAME|all|default))
show ip bgp community [AA:NN|local-AS|no-advertise|no-export|internet] (exact-match|)
show ip bgp community-list WORD (exact-match|) (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) community
show ip bgp ipv4 (unicast|multicast) community (vrf (VRFNAME|all|default))
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

AA:NN
Community number

local-AS
Do not send outside local AS (well-known community)

no-advertise
Do not advertise to any peer (well-known community)

no-export
Do not export to next AS (well-known community)

internet
Internet community (well-known community)

exact-match
Exact match of the communities

Command Mode

Execution modePrivilege mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp community
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network                Next H     Metric    LocPrf     Weight    Path
*> 2001:43f8:bb1::/64   ::          0        100       32768     ?

Total number of prefixes 1
```

show bgp community-list

Use this command to display BGP routes that match a community list.

Command Syntax

```
show bgp community-list WORD (exact-match|)show bgp ip (unicast|multicast) community-list WORD
(exact-match|)
show bgp ip (unicast|multicast) community-list WORD (exact-match|)
show bgp (ipv4|ipv6) (unicast|multicast) community-list WORD (exact-match|)
show bgp (ipv6) community-list WORD (exact-match|)
show ip bgp community-list WORD (exact-match|)
show ip bgp ipv4 (unicast|multicast) community-list WORD (exact-match|)
```

Parameters

WORD
Community list name

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

exact-match
Only routes that exactly match the community

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp community-list Originate
Named Community expanded list Originate
    permit 37721:1[0-2]0[05]$
    permit 37721:1[0-2]0[05]
```

© 2026 IP Infusion Inc. Proprietary

show bgp dampening dampened-paths

Use this command to display detailed information about paths suppressed due to dampening.

Command Syntax

```
show bgp dampening dampened-paths
show bgp (ipv4|ipv6) (unicast|multicast) dampening dampened-paths
show bgp (ipv6) dampening dampened-paths
show ip bgp dampening dampened-paths
show ip bgp dampening dampened-paths (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) dampening dampened-paths
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp dampening dampened-paths
BGP table version is 32, local router ID is 3.3.3.3
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network           From                Reuse    Path
 d   11.11.11.0/24    90.90.90.1           00:27:20 200 i
```

Table 18 shows the status codes displayed at the start of a route entry.

Table 18. Status details

Status Code	Description	Comments
s	suppressed	Whether the route is suppressed and is not advertised to neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale.
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The selected route to be installed in the kernel routing table.
i	internal	The prefix was learned from an iBGP peer.

Table 19 shows the codes at the end of each route entry that indicate where the route originated.

Table 19. Origin details

Origin Code	Description	Comments
i	IGP	The route is from an Interior Gateway Protocol.
e	EGP	The route is from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an IGP.

Table 20 explains the output fields.

Table 20. show bgp dampening dampened-paths output details

Field	Description
Network	Internet address of a network.
From	IP address of the advertising peer.
Reuse	The amount of time remaining until this route will be un-suppressed and can be used again.
Path	Autonomous system path to the destination network.

© 2026 IP Infusion Inc. Proprietary

show bgp dampening flap-statistics

Use this command to display BGP dampening flap statistics.

Command Syntax

```
show bgp dampening flap-statistics
show bgp (ipv4|ipv6) (unicast|multicast) dampening flap-statistics
show bgp (ipv6) dampening flap-statistics
show ip bgp dampening flap-statistics
show ip bgp dampening flap-statistics (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) dampening flap-statistics
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This sample output shows that the internal route (`i`), has flapped 3 times and is now categorized as history (`h`).

```
#show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network            From               Flaps  Duration  Reuse   Path
```

hi1.1.1.0/24 10.100.0.62 3 00:01:20 i

Table 21 shows the status codes displayed at the start of a route entry.

Table 21. status details

Status Code	Description	Comments
s	suppressed	Whether the route is suppressed and is not advertised to neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale.
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The selected route to be installed in the kernel routing table.
i	internal	The prefix was learned from an iBGP peer.

Table 22 shows the codes at the end of each route entry that indicate where the route originated.

Table 22. origin details

Origin Code	Description	Comments
i	IGP	The route is from an Interior Gateway Protocol.
e	EGP	The route is from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an IGP.

Table 23 explains the output fields.

Table 23. show bgp dampening flap-statistics output details

Field	Description
Network	Internet address of a network.
From	IP address of the advertising peer.
Flaps	Number of times this route has failed and returned (flapped).
Duration	Elapsed time since the first penalty points were assessed.
Reuse	The amount of time remaining until this route will be un-suppressed and can be used again.
Path	Autonomous system path to the destination network.

© 2026 IP Infusion Inc. Proprietary

show bgp dampening parameters

Use this command to display the BGP dampening parameters.

Command Syntax

```
show bgp dampening parameters
show bgp (ipv4|ipv6) (unicast|multicast) dampening parameters
show bgp (ipv6) dampening parameters
show ip bgp dampening parameters
show ip bgp ipv4 (unicast|multicast) dampening parameters (vrf (VRFNAME|all|default))
show ip bgp dampening parameters (vrf (VRFNAME|all|default))
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip bgp dampening parameters
 dampening 5 750 2000 60 15
 Dampening Control Block(s):
  Reachability Half-Life time    : 5 min
  Reuse penalty                  : 750
  Suppress penalty               : 2000
  Max suppress time              : 60 min
  Un-reachability Half-Life time : 15 min
  Max penalty (ceil)             : 11999
  Min penalty (floor)            : 375
#
```

Table 24explains the output fields.

Table 24. show ip bgp dampening parameters output details

Field	Description
Dampening Control Block(s)	Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route.
Reachability Half-Life time	Number of minutes after which an arbitrary value is halved if a route stays stable.
Reuse penalty	Reuse threshold—Arbitrary value below which a suppressed route can be used again.
Suppress penalty	Cutoff (suppression) threshold—Arbitrary value above which a route can no longer be used or included in advertisements.
Max suppress time	Maximum hold-down time for a route, in minutes.
Un-reachability Half-Life time	Number of minutes after which an arbitrary value is not halved if a route stays stable.
Max penalty (ceil)	Maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level (ceil).
Min penalty (floor)	Maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level (floor).

show bgp filter-list

Use this command to display routes that match a regular expression filter list.

Command Syntax

```
show bgp filter-list WORD
show bgp (ipv4|ipv6) (unicast|multicast) filter-list WORD
show bgp (ipv6) filter-list WORD
show ip bgp filter-list WORD
show ip bgp ipv4 (unicast|multicast) filter-list WORD
show ip bgp filter-list WORD (exact-match)
show ip bgp filter-list WORD (exact-match) (vrf (VRFNAME|all|default))
show ip bgp filter-list WORD (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) filter-list WORD (exact-match)(vrf (VRFNAME|all|default))
```

Parameters

WORD
Regular-expression filter list

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

exact-match
Exact match of the filter list

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

vrf
VPN Routing/Forwarding instance name

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Example

```
#show bgp filter-list bgp-local-onlyBGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network                Next Hop        Metric    LocPrf      Weight   Path
*> 2001:43f8:bb1::/6     ::              0        100         32768     ?

Total number of prefixes 1
```

show bgp inconsistent-as

Use this command to display routes with inconsistent AS paths.

Command Syntax

```
show bgp inconsistent-asshow bgp (ipv4|ipv6) (unicast|multicast) inconsistent-as
show bgp (ipv6) inconsistent-as
show ip bgp inconsistent-as
show ip bgp ipv4 inconsistent-as
show ip bgp ipv4 (unicast|multicast) inconsistent-as
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp inconsistent-as
BGP table version is 3, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

Network        Next Hop              Metric         LocPrf   Weight   Path
*> 10.1.0.0   172.29.232.55            0             0         100      ?
```

© 2026 IP Infusion Inc. Proprietary

show bgp ipv6

Use this command to display the BGP routing table.

Command Syntax

```
show bgp ipv6 (unicast|multicast|labeled|)
show bgp ipv6 (unicast|multicast|labeled|) X:X::X:X/M
```

Parameters

multicast
IPv6 multicast address prefixes

unicast
IPv6 unicast address prefixes

labeled
Labeled IPv6 routes

X:X::X:X/M
IPv6 prefix network/length, such as 3ffe:a::/64

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example: iBGP and eBGP Routes

This example shows routes learned from both iBGP and eBGP.

```
#show bgp ipv6
BGP table version is 0, local router ID is 10.100.0.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal S stale,
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network                                Metric LocPrf Weight  Path
*> 2001:58::/32                                              0  20 ?
     fe80::202:b3ff:fec8:9fdb
*> 2002:58::/32                                              0  20 i
     fe80::202:b3ff:fec8:9fdb
*>i2003:58::/32                                    100       0  i
     fe80::208:a1ff:fe16:797d
```

Header

```
BGP table version is 0, local router ID is 10.100.0.77
```

- BGP table version
- BGP router ID is 10.100.0.77

```
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i - internal
```

Table 25 shows the status codes displayed at the start of a route entry.

Table 25. status details

Status Code	Description	Comments
s	suppressed	Whether the route is suppressed and is not advertised to neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale.
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The selected route to be installed in the kernel routing table.
i	internal	The prefix was learned from an iBGP peer.

Origin codes: i - IGP, e - EGP, ? - incomplete

Table 26 shows the codes at the end of each route entry that indicate where the route originated.

Table 26. origin codes

Origin Code	Description	Comments
i	IGP	The route is from an Interior Gateway Protocol.
e	EGP	The route is from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an IGP.

Route Entry Examples

```
*> 2002:58::/32    fe80::202:b3ff:fec8:9fdb                          0 20 i
```

- This route entry shows that this route is learned from eBGP.
- The origin code “i” means that the prefix is added by the network statement at originating AS.
- The path 20 indicates that the prefix advertisement originated from AS20.
- The administrative weight parameter applies only to routes within an individual router.
- Since this route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.

```
*> 2001:58::/32     fe80::202:b3ff:fec8:9fdb                          0 20 ?
```

- This route entry shows that the prefix is learnt from eBGP.The origin code i indicates that the prefix is added by network statement at originating AS.The path attribute 20 indicates that the route advertisement originated from AS20.The administrative weight parameter applies only to routes within an individual router. Since this route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.The origin code “?” means the route was learned through redistribution.

```
*>i2003:58::/32 fe80::208:a1ff:fe16:797d 100 0 i
```

- The status code “i” means that the route was learned through iBGP. The Local Preference attribute of the route, which is used only with the local AS, is set to 100 (the default value).

Example: IPv6 Prefix Routes

This example shows labeled routes for a given IPv6 prefix:

```
#show bgp ipv6 labeled 3ffe:a::/64
           BGP routing table entry for 3ffe:a::/64
           Paths: (1 available, best #1, table Default-IP-Routing-Table)
           Not advertised to any peer
           Local
           ::ffff:114:1414 from 20.20.20.1 (92.92.92.92)
           Origin incomplete metric 0, localpref 100, label    5420,
           valid, internal, best
           Last update: Mon May 26 17:48:18 2008
```

Table 27 explains the output fields.

Table 27. show bgp ipv6 output details

Field	Description
Paths	The paths listed in the routing table, along with path information, and whether the path are being advertised.
Metric	If shown, the value of the inter-autonomous system metric.
LocalPref	Local preference value as set with the set local-preference route-map configuration command.
rx path_id	Autonomous system receive path to the source network. There can be one entry in this field for each autonomous system in the path.
tx path_id	Autonomous system transmit path to the destination network. There can be one entry in this field for each autonomous system in the path.
Last update	Last time since the neighbor transitioned to or from the established state.

show bgp ipv6 peer-group

Use this command to list the BGP peer group information in ipv6 unicast.

Command Syntax

```
show bgp ipv6 peer-group (WORD|)
```

Parameters

WORD
Name of the peer group

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced in OcNOS version 4.2.

Example

```
#show bgp ipv6 peer-group p2
BGP dynamic peer-group is p2, IBGP, remote AS 42949672
  BGP dynamic peer-group p2 listen range group members:
  5ffe:3::/64
  BGP version 4
Minimum time between advertisement runs is 5 seconds
For address family: IPv6 Unicast
  Peer-group member:
  *5ffe:3::1
  Index 2, Offset 0, Mask 0x4
  0 accepted prefixes, 0 announced prefixes
#
```

show bgp l2vpn vpls

Command Syntax

```
show bgp l2vpn vpls (rr|) (detail|)
```

Parameters

rr

Display the information of auto-discovered peers at Route reflector node.

detail

Display the detailed information of auto-discovered peers.

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced in version OcNOS version 1.3.

Example

```
#show bgp l2vpn vpls
VPLS-ID   VE-ID    Discovered-Peers   Route-Target
10        3        1                   10:100

#show bgp l2vpn vpls  detail

VPLS ID: 10
VE-ID: 3
Discovered Peers: 1
Route-Target: 10:100
Local RD: 10:100
 Mesh Peers:
  Address:3.3.3.3, RD:10:100, VE-ID:4
  VC Details: VC-ID:34
  Remote (LB:52480,VBO:1,VBS:64)  Local (LB:52480,VBO:1,VBS:64)
  LB sent on known VEID:Yes
  In Label:52483, Out Label:52482
  PW Status:Established
```

Table 28 explains the output fields.

Table 28. show bgp l2vpn vpls output details

Field	Description
VPLS-ID	L2VPN address family database information for the Virtual Private LAN Service (VPLS).
VE-ID	L2VPN address family database information for the Virtual Expansion.
Discovered Peers	Peer discovery is used to find peers that are available for data using LLDP.

© 2026 IP Infusion Inc. Proprietary

Table 28. show bgp l2vpn vpls output details (continued)

Field	Description
Route-Target	An identifier prepended to IP addresses to assure the uniqueness of the address.
Local RD	The Local Route Descriptor – the first two numbers of the Route-Target.
Mesh Peers	Internal BGP peers – devices that do not re-advertise routes to other IBGP devices.
Address	Mesh session information for the peer specified with the ip-address argument.
RD	Mesh peer's Route-Descriptor.
VC Details	The virtual circuit session information with the ip-address for the Provider Edge (PE) routers.
Remote	LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router. VBS (VE Block Size) – the size of the label block.
Local	LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router. VBS (VE Block Size) – the size of the label block.
LB sent on known VEID	Whether the Label Base came on a known Virtual Expansion Identifier – yes or no.
In Label	The ingress (incoming interface) label for this segment.
Out Label	Label received from downstream neighbor for route.
PW Status	The status of the VPLS Pseudo-Wire. Values can be: Idle, Active, Open, or Established.

```
#show bgp l2vpn vpls rr
RD        RR-Clients     Non-Clients           Route-Target
10:100     2                  0                  10:100
10:100     2                  0                  10:100

#show bgp l2vpn vpls rr detail

Route-Target: 10:100
  Peer:1.1.1.1
    RR Client  : Yes
    VE-ID:3  LB:52480  VBO:1  VBS:64

Route-Target: 10:100
  Peer:3.3.3.3
    RR Client  : Yes
    VE-ID:4  LB:52480  VBO:1  VBS:64
```

Table 29 explains the output fields.

Table 29. show bgp l2vpn vpls rr output details

Field	Description
Route-Target	An identifier prepended to IP addresses to assure the uniqueness of the address.
Peer	Internal BGP peers – devices that do not re-advertise routes to other IBGP devices.
RR Client	Device is a client of the Route Reflector – yes or no.
VE-ID	L2VPN address family database information for the Virtual Expansion.
LB	LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain.
VBO	VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router.
VBS	VBS (VE Block Size) – the size of the label block.

© 2026 IP Infusion Inc. Proprietary

show bgp label-pool

Use this command to display the label management in BGP protocol.

Command Syntax

```
show bgp label-pool (block-id <0-1638>|)
```

Parameters

block-id
Block identifier of a block that is allocated to the protocol.

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced in version OcNOS version 6.5.4.

Example

```
#show bgp label-pool
Module: BGP, Label range: 16-1048575, Current block: 78
+----------+----------+----------+---------------+---------------+---------------+
block_id label_min label_max usable_labels free_labels first_free_label
+----------+----------+----------+---------------+---------------+---------------+
78 49920 50559 640 96 50464
Total - blocks: 1, used-labels: 544, free-labels: 96
```

show bgp neighbors

Use this command to display information about BGP neighbor connections.

Command Syntax

```
show bgp neighbors
show bgp ipv6 neighbors
show ip bgp ipv4 (unicast|multicast) neighbors
show ip bgp neighbors
show ip bgp neighbors (A.B.C.D|X:X::X:X)(advertise-routes|)
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X)
show ip bgp neighbors (A.B.C.D|X:X::X:X) (hold-time|keepalive-interval|connection-retrytime)
show ip bgp neighbors (A.B.C.D|X:X::X:X) (sent-msgs|rcvd-msgs|notification|update|open|keepalive
```

Parameters

ipv4
IPv4 neighbors

ipv6
IPv6 neighbors

unicast
Unicast prefixes

multicast
Multicast prefixes

A.B.C.D
IPv4 neighbor

X:X::X:X
IPv6 neighbor

advertised-routes

Routes advertised to a BGP neighbor

hold-time
Hold time

keepalive-interval

Keepalive interval

connection-retrytime

Connection retry time

sent-msgs
Sent packets

rcvd-msgs
Received packets

notification
Notification messages

© 2026 IP Infusion Inc. Proprietary

update
Update messages

open
Open messages

keepalive
Keepalive messages

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp neighbors
BGP neighbor is 2.2.2.2, remote AS 200, local AS 200, internal link
 Member of peer-group myPeer for session parameters
  BGP version 4, remote router ID 10.12.7.155
  BGP state = Established, up for 00:04:55
  Last read 00:04:55, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 11 messages, 0 notifications, 0 in queue
  Sent 11 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 IPv4
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  myPeer peer-group member
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 Connections established 1; dropped 0
Local host: 2.2.2.1, Local port: 33865
Foreign host: 2.2.2.2, Foreign port: 179
TCP MSS: (800), Advertise TCP MSS: (800), Send TCP MSS: (800),  Receive TCP MSS:
 (536)
Nexthop: 2.2.2.1
Nexthop global: 1111::1
Nexthop local: fe80::a00:27ff:fecc:47a6
BGP connection: non shared network
Last Reset: 00:32:48, due to BGP Notification sent
Notification Error Message: (OPEN Message Error/Bad Peer AS.)
```

BGP Neighbor Fields

Table 30 explains the output fields.

Table 30. show bgp neighbor output details

Field	Description
BGP neighbor	BGP session information for the neighbor with the ip-address argument.

Table 30. show bgp neighbor output details (continued)

Field	Description
remote AS	Remote Autonomous system used to exchange exterior routing information between neighboring ASs.
local AS	Local Autonomous system used to exchange internal routing information within AS.
internal link external link	Internal link is used to forward route advertisements received from an external BGP router through the internal network (in the same AS). External link is used for exchanging routing information between Autonomous Systems (AS) and routing traffic across the Internet (eBGP neighbor).
member of peer-group	Peer group information for the peer group specified with the peer-group argument.
BGP version	Negotiated BGP version for this session.
remote router ID	IP address of the neighbor. BGP uses the highest loopback address as the Router ID. If no loopback interface is configured, BGP uses the highest configured IP address on a system.
BGP state	Session state as explained in Table 35. The exchange of routing information begins between peers only after the neighbor session is in an Established state.
up for	Time that the underlying TCP connection has been up.
last read	Time since BGP last received a message from this neighbor.
hold time	Time, in seconds, that BGP will maintain the session with this neighbor without receiving messages. The maximum time that can elapse between successive messages from this neighbor is 180 seconds. If no message is received for 180 seconds, this neighbor will be declared dead.
last write	Time since BGP last sent a message to this neighbor.
keepalive interval	Time interval, in seconds, at which keepalive messages are transmitted to this neighbor. The time interval between successive keepalive messages is 60 seconds. Typically, the hold time value is set to three times the keepalive interval.
neighbor capabilities	BGP capabilities advertised and received from this neighbor. “Advertised and received” is displayed when a capability is successfully exchanged between two routers.
received	Total number of received messages. notifications: Number of notification (error) messages received. in queue: Number of messages in the input queue
sent	Total number of sent messages. notifications: Number of notification (error) messages sent. in queue: Number of messages in the output queue
route refresh request	Number of route refresh request messages sent and received.
minimum time between advertisement runs.	The minimum time gap, in seconds, between successive route updates sent to the neighbor. Generally, a jitter (of 25%) is applied to this time interval, which means that if the time

Table 30. show bgp neighbor output details (continued)

Field	Description
	between advertisements is configured as 30, successive advertisements can have a time gap of as low as 22.5 (after applying a 25% jitter to the 30 seconds, which is 7.5 seconds).
for address family	The peers have exchanged address family capability.
BGP table version	For each of the address families agreed upon, BGP maintains a separate table.
neighbor version	Tracks prefixes that have been sent and those that need to be sent.
connections established	The number of times the router has established a TCP connection and the two peers have agreed to speak BGP with each other. “Dropped” means the number of time the connection has failed or gone down.
local host foreign host	Local host is the IP address and the port number of the local system used for the peering session. Foreign host is the IP address and the port of the neighbor. BGP always uses the TCP port number 179 for the peer originating the session.
TCP MSS	This value indicates the configured TCP MSS value using the `neighbor A.B.C.D tcp-mss <40-1440>` command. If the TCP MSS value is not configured explicitly, the system shows a value of 0.
Advertise TCP MSS	The host communicates this value during the TCP connection establishment phase, specifically during the TCP handshake. It is based on the network path's Maximum Transmission Unit (MTU) and any TCP options set on the host.
Send TCP MSS	This value represents the MSS for the connection, typically the lesser of the two MSS values exchanged.
Receive TCP MSS	This value reflects the MSS that the Kernel believes the client TCP stack uses for receiving data, indicating the largest TCP segment size the client can handle for incoming packets.
nexthop	The IP address of the next hop used to reach the neighbor. eBGP or iBGP peers do not need to be directly connected. Peering sessions can be set up across multiple hops. If the neighbors are directly connected, the IP address of the local system is listed as the next hop.
nexthop global	The global IPv6 address of the next hop
nexthop local	The link-local IPv6 address of the next hop
non shared network	The peering session is running on a non shared network.
last reset	Time since this peering session was last reset. The reason for the reset is displayed on this line.
notification error message	Last error message sent.

show bgp neighbors advertised-routes

Use this command to display the routes advertised to a BGP neighbor.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes (vrf (VRFNAME|all|default))
show ip bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) advertised-routes
```

Parameters

A.B.C.D
IPv4 neighbor

X:X::X:X
IPv6 neighbor

ipv4
IPv4 addresses

multicast
Multicast prefixes

unicast
Unicast prefixes

vrf
VPN Routing/Forwarding instance name

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp neighbors 11.11.11.2 advertised-routes
BGP table version is 3, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

Network              Next Hop            Metric    LocPrf       Weight   Path
*>i 33.33.33.33/32   11.11.11.1           0         100         32768     i

Total number of prefixes 1
```

show bgp neighbors received prefix-filter

Use this command to display the prefix list filter.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) received prefix-filter
show ip bgp neighbors (A.B.C.D|X:X::X:X) received prefix-filter
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) received prefix-filter
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

ipv4
IPv4 addresses

unicast
Unicast prefixes

multicast
Multicast prefixes

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp neighbors 100.1.1.1 received prefix-filter
Address family: IPv4 Unicast
ip prefix-list 100.1.1.1.1.1: 1 entries
   seq 5 permit 1.1.1.1/32
```

show bgp neighbors received-routes

Use this command to view all the received routes, including all AFI/SAFI routes, from a BGP neighbour. Executing this CLI displays the received routes from accessing:

- BGP local RIB or
- BGP ADJ_IN RIB only if the 'soft-reconfiguration inbound' feature is supported.

Command Syntax

```
show ip bgp neighbors (A.B.C.D|X:X::X:X) received-routes (vrf (VRFNAME|all|default)|)
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) received-routes
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

ipv4
IPv4 addresses

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN Routing/Forwarding instance name

all
All VRFs

deault
Default VRF (Global routing)

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3. and updated in OcNOS version 6.3.1.

Example

```
OcNOS#show bgp neighbors 77.242.226.32 received-routes
% Inbound soft reconfiguration is not supported, displaying the received routes from accessing BGP
local RIB
For address family: IPv4 Unicast
BGP table version is 610, local router ID is 14.14.14.14
Status codes: s suppressed, d damped, h history, a add-path, * valid, > best, i - internal,
l - labeled, S Stale
```

© 2026 IP Infusion Inc. Proprietary

```
Origin codes: i - IGP, e - EGP, ? - incomplete

Accepted routes count = 2
To view the received-routes of particular address-family, use below filter.
“sh bgp neighbors 10.10.40.133 received-routes | begin LINE”
LINE can be of { IPv4 Unicast or
IPv4 Labeled-Unicast or
VPNv4 Unicast or
IPv6 Unicast or
6PE Labeled Unicast or
VPNv6 Unicast
}
```

show bgp neighbors routes

Use this command to display all accepted routes learned from neighbors.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) routes
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

ipv4
IPv4 addresses

unicast
Unicast prefixes

multicast
Multicast prefixes

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following output displays detailed information about the neighbor.

```
#show bgp neighbors 10.10.10.2 routes
BGP neighbor is fe80::203:47ff:feb0:d72b, remote AS 10, local AS 10, internal link
  BGP version 4, remote router ID 10.10.10.50
  BGP state = Established, up for 00:02:01
  Last read 00:00:01, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 3 messages, 0 notifications, 0 in queue
  Sent 5 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 Unicast
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes
```

Table 31 explains the output fields.

Table 31. show bgp neighbors routes output details

Field	Description
BGP neighbor	Neighbor identifier along with the local and remote Autonomous System numbers.
BGP version	The version of BGP being used by the neighbor device, along with the remote router ID number.
BGP state	The current state of the neighbor connection and length of time within the current state. Possible states are: Idle, Connect, Active, and Established.
Last read	The amount of time in Hours : Minutes : Seconds since this device last checked the Hold Time parameters.
hold time	The amount of time this device waits for a Keepalive or Update message before the BGP connection is closed.
Keepalive interval	KEEPALIVE messages are sent periodically to ensure that the connection is live.
Neighbor capabilities	New or optional parameters called “Capabilities.” Provides a graceful way to advertise new or unique options without causing peering to terminate. The capabilities are communicated in TLV fields. (see RFC 3392). In the example output above, the following capabilities were advertised by the neighbor and were received and understood by this device: 1. Route refresh 2. Address family IPv4 Unicast 3. Address family IPv6 Unicast
Route refresh	This helps to identify that and synchronize the peers without a hard reset.
For address family	Address Family Identifier (AFI) IPv4 Unicast.
Received messages	Information received from the neighbors.
notifications	Passes information to a router about sessions.
in que	Number of messages currently residing in the queue awaiting action.
Route refresh request	Information received and sent.
Minimum time between advertisement runs	Interval between exchange of messages.
For address family: IPv4 Unicast	The following three values are subordinate to the IPv4 Unicast Address Family.
Community attributes sent to this neighbor	Both the standard and the extended community information has been sent to the neighbor.
accepted prefixes	Configure a limit to the number of prefixes that can be accepted in a BGP peer session.
announced prefixes	A prefix announced in BGP consists of the IPV4 or IPV6 address block being announced.

show bgp nexthop-tracking

Use this command to display BGP nexthop-tracking status.

Command Syntax

```
show bgp nexthop-tracking
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp nexthop-tracking

Configured NHT: ENABLED
NHT Delay time-interval : 6
BGP VRF: (Default) VRF_ID 0
BGP Instance: (Default), AS: 100, router-id 4.4.4.40
NHT is Enabled
Recvd Msg count from RIB: 0
NHT delay-timer remaining seconds: 0
BGP nexthop(s):
Total number of IPV4 nexthops : 0
Total number of IPV6 nexthops : 0

BGP VRF: VRF_A VRF_ID 2
BGP Instance: (Default), AS: 100, router-id 4.4.4.40
NHT is Enabled
Recvd Msg count from RIB: 0
NHT delay-timer remaining seconds: 0
BGP nexthop(s):
Total number of IPV4 nexthops : 0
Total number of IPV6 nexthops : 0
```

Table 32 explains the output fields.

Table 32. show bgp nexthop-tracking output details

Field	Description
Configured NHT	Whether Next Hop Tracking (NHT) is enabled or disabled.
NHT Delay time-interval	A delay timer that indicates how long this device waits before checking its RIB for changes.
BGP VRF	Name and ID number of this BGP VRF.

© 2026 IP Infusion Inc. Proprietary

Table 32. show bgp nexthop-tracking output details (continued)

Field	Description
BGP Instance	Autonomous System number and router ID.
NHT is Enabled	NHT Network enables the measurement and comparison of performance.
Recvd Msg count from RIB	Number of received change-messages from the RIB.
NHT delay-timer remaining seconds	Time remaining until the next decision cycle.
BGP nexthop(s)	Nexthop in the BGP to reach a certain destination.
Total number of IPV4 nexthops	Number of nexthops in the IPv4 Address Family.
Total number of IPV6 nexthops	Number of nexthops in the IPv6 Address Family.

© 2026 IP Infusion Inc. Proprietary

show bgp nexthop-tree-details

Use this command to display BGP nexthop-tree details.

Command Syntax

```
show bgp nexthop-tree-details
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp nexthop-tree-details
BGP Instance: (Default), AS: 65534, router-id 51.1.1.3
AFI_IP Nexthop count : 0
AFI_IP6 Nexthop count : 0

BGP Instance: (Default), AS: 0, router-id 51.1.1.3
AFI_IP Nexthop count : 0
AFI_IP6 Nexthop count : 0
```

Table 33 explains the output fields.

Table 33. show bgp nexthop-tree-details output details

Field	Description
Bgp Instance	The Autonomous System number and router ID.
AFI_IP Nexthop count	Nexthop count for the IPv4 Address Family
AFI_IP6 Nexthop count	Nexthop count for the IPv6 Address Family

© 2026 IP Infusion Inc. Proprietary

show bgp paths

Use this command to display BGP path information.

Command Syntax

```
show bgp paths
show bgp (ipv6) paths
show ip bgp paths
show ip bgp ipv4 (unicast|multicast) paths
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp paths

Address        Refcnt    Path
[0x1af8ee0:0]   (21)
[0x1b3ceb0:345] (14)     64602
[0x1c71d40:821] (12008)  64602 65500
[0x1d03fb0:822] (12008)  64602 65501
```

Table 34 explains the output fields.

Table 34. show bgp paths output details

Field	Description
Address	Hash and hash key separated by the colon character.
Refcnt	Number of routed using that path.
Path	Autonomous System Number (ASN) for the route.

© 2026 IP Infusion Inc. Proprietary

show bgp prefix-list

Use this command to display routes matching the prefix-list.

Command Syntax

```
show bgp prefix-list WORD
show bgp (ipv4|ipv6) (unicast|multicast|) prefix-list WORD (vrf (VRFNAME|all|default|))
show ip bgp prefix-list WORD
show ip bgp prefix-list WORD (exact-match)
show ip bgp prefix-list WORD (exact-match) (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) prefix-list WORD
show ip bgp ipv4 (unicast|multicast) prefix-list WORD (exact-match)
```

Parameters

WORD
Name of the IP prefix list

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

exact-match
Exact match of the prefix list

vrf
VPN Routing/Forwarding instance

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp prefix-list Route1
BGP table version is 1, local router ID is 12.0.0.1
```

© 2026 IP Infusion Inc. Proprietary

```
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network        Next Hop          Metric    LocPrf       Weight   Path
*>1.1.1.1/32   0.0.0.0            0         100         32768      i

Total number of prefixes 1
```

show bgp quote-regexp

Use this command to display route matching an AS path quoted regular expression.

Command Syntax

```
show bgp quote-regexp WORD
show bgp (ipv4|ipv6) (unicast|multicast|) quote-regexp WORD
show ip bgp quote-regexp WORD
show ip bgp ipv4 (unicast|multicast) quote-regexp WORD
```

Parameters

WORD
A regular expression to match the AS paths. Use quotes to enclose the regular expression.

ipv4
IPv4 route information

ipv6
IPv6 route information

unicast
Unicast prefixes

multicast
Multicast prefixes

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp quote-regexp ^$
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network                Next Hop     Metric    LocPrf       Weight    Path
*> 2001:43f8:bb1::/64    :            0        100         32768      ?

Total number of prefixes 1
```

show bgp regexp

Use this command to display routes matching the AS path regular expression.

Command Syntax

```
show bgp regexp LINE
show bgp (ipv4|ipv6) (unicast|multicast) regexp LINE
show bgp (ipv6) regexp LINE
show ip bgp regexp LINE
show ip bgp vrf (VRFNAME|all|default) regexp LINE
show ip bgp ipv4 (unicast|multicast) regexp LINE
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

LINE
A regular expression to match the AS paths

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp regexp ^$
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network                Next Hop   Metric    LocPrf       Weight   Path
*> 2001:43f8:bb1::/64     ::        0        100          32768     ?

Total number of prefixes 1
```

© 2026 IP Infusion Inc. Proprietary

show bgp route-map

Use this command to display routes that match the specified route map.

Command Syntax

```
show bgp route-map WORD
show bgp (ipv4|ipv6) (unicast|multicast) route-map WORD
show bgp (ipv6) route-map WORD
show ip bgp route-map WORD
show ip bgp route-map WORD (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) route-map WORD
```

Parameters

WORD
Routes matching the route-map

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

vrf
VPN routing/forwarding instance

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp prefix-list Route1
BGP table version is 1, local router ID is 12.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

show bgp summary

Use this command to display a summary of BGP neighbor status.

Command Syntax

```
show bgp summary
show bgp (ipv4|ipv6) (unicast|multicast|) summary
show ip bgp summary
show ip bgp summary (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) summary
```

Parameters

ipv4
IPv4 routes

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp summary

BGP router identifier 6.6.6.6, local AS number 64601

BGP table version is 1

1 BGP AS-PATH entries

0 BGP community entries

Neighbor V   AS   MsgRcv    MsgSen TblVer   InQ   OutQ    Up/Down   State/PfxRcd

*12.1.1.24 64902    7          7       1      0      0   00:02:54       0
```

```
* Dynamically created based on a listen range command

BGP dynamic peer-group: group1

listen range:  12.1.0.0/16
Total number of dynamically created neighbors/limit: 1/(200)
Total number of dynamically created neighbors: 1
Total number of activated dynamic peer-groups for IPv4 Unicast address-family:
Total number of neighbors 1
Total number of Established sessions 1

BGP dynamic peer-group: group2
listen range:  12.2.0.0/16
Total number of dynamically created neighbors/limit: 0/(200)
Total number of dynamically created neighbors: 0
Total number of activated dynamic peer-groups for IPv4 Unicast address-family: 1
```

Header

```
BGP router identifier 10.10.15.50, local AS number 65000
1 BGP AS-PATH entries
0 BGP community entries
```

- The BGP router identifier is 10.10.15.50 and the local router AS number is 65000.
- The BGP table version tracks the local BGP table version. Any time the BGP best path algorithm executes, the table version increments.
- There is one BGP AS-PATH entry and no community entries.

Neighbor Entry Fields

Table 35 explains the fields for each neighbor entry.

Table 35. neighbor entry fields

Field	Description
Neighbor	IP address of peer.
V	BGP version of peer.
AS	Autonomous system number of peer.
MsgRcvd	Messages received since the BGP connection was established.
MsgSent	Messages sent since the BGP connection was established.
TblVer	Last version of the local router's BGP database advertised to the peer.
InQ	Received messages waiting in the input queue for further processing.
OutQ	Messages waiting in the output queue to be sent.
Up/Down	Connection up time and down time.
State/PfxRcd	If the TCP session is up and the BGP peers have formed an adjacency, this field shows how many prefixes have been received from the remote neighbor. Other states:

Table 35. neighbor entry fields (continued)

Field	Description
	Idle: The local router has not allocated resources for the peer connection, so incoming connection requests are refused Idle (Admin): The peer has shut down Idle (PfxCt): Prefix overflow Idle (G-shut): Graceful shutdown Connect: BGP is waiting for the TCP connection to complete Active: the local router is trying to establish a TCP connection to the remote peer. You might see this if the local peer has been configured, but the remote peer is unreachable or has not been configured. OpenSent: BGP is waiting for an open message from its peer OpenConfirm: BGP received an open message from the peer and is now waiting for a keepalive or notification message. If BGP receives a keepalive message from the peer, the state changes to established. If the message is a notification, the state changes to idle. Established: BGP is ready to exchange update, notification, and keepalive messages with its peer Invalid: The session state is invalid

Neighbor Entry Example

```
10.10.14.51   4   100  93       120     0      0    0     00:42:16        0
```

- The neighbor has the IP address 10.10.14.51 and AS number 100.
- The neighbor uses BGP version 4.
- 93 messages have been received.
- 120 messages have been sent.
- The BGP routing table version is 0.
- There are no received messages waiting in the input queue for further processing.
- There are no messages waiting in the output queue to be sent.
- The connection has been up for 0 hours, 42 minutes and 53 seconds.
- The local router has received no prefixes from this neighbor.

show bgp X:X::X:X

Use this command to display BGP network information in an IPv6 environment.

Command Syntax

```
show bgp X:X::X:X
show bgp (ipv6) X:X::X:X
show bgp (ipv6) (unicast|multicast) X:X::X:X
```

Parameters

ipv6
IPv6 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

X:X::X:X
IPv6 prefix (network), for example, 2003::

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp ipv6 6666::/64
BGP routing table entry for 6666::/64
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Advertised to peer-groups:
  Book-v6
  Local
    :: from :: (102.67.98.95)
      Origin incomplete,metric 0, localpref 100, weight 32768      valid, sourced, best, source safi:
0
      Community: 37721:2000
      Last update: Thu Feb  4 09:00:50 2021
```

show bgp X:X::X:X/M longer prefixes

Use this command to display BGP network information along with mask information.

Command Syntax

```
show bgp X:X::X:X/M longer-prefixes
```

Parameters

X:X::X:X/M
IPv6 prefix (network/length), for example, 2003::/16

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp 2001:43f8:bb1::/64 longer-prefixes
BGP table version is 1, local router ID is 102.67.98.95
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network               Next Hop    Metric    LocPrf       Weight  Path
*>2001:43f8:bb1::/64    ::         0         100         32768     ?

Total number of prefixes 1
```

show debugging bgp

Use this command to display BGP debugging options.

Command Syntax

```
show debugging bgp
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the show debugging bgp command.

```
#show debugging bgp
BGP debugging status:
 BGP debugging is on
 BGP events debugging is on
 BGP updates debugging is on
 BGP fsm debugging is on
```

© 2026 IP Infusion Inc. Proprietary

show ip bgp

Use this command to display BGP routes.

Command Syntax

```
show ip bgp
show ip bgp ipv4 (unicast|multicast)(vrf (VRFNAME|all|default))
```

Parameters

ipv4
IPv4 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

VRFNAME
VPN routing/forwarding instance name

all
All VRFs

default
Default VRF

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows routes learned from both iBGP and eBGP peers.

```
#show ip bgp
BGP table version is 0, local router ID is 10.100.0.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S stale,
Origin codes: i - IGP, e - EGP,? - incomplete
          Network             Next Hop      Metric LocPrf   Weight   Path
   *> 172.16.1.0/24     10.10.10.78                          0       1 4 i
   *> 192.16.1.0        10.10.10.78       200                0       1 4 ?
   *                    10.100.0.62       100                0       3 4 ?
   *>i 192.17.1.0       10.100.0.62               100        0       i

Total number of prefixes 2
```

Header

```
BGP table version is 0, local router ID is 10.100.0.77
```

- The BGP table version tracks the local BGP table version. Any time the BGP best path algorithm executes, the table version increments.
- The Router ID of the local router is `10.100.0.77`.

```
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i - internal
```

Table 36 explains the status codes in the header.

Table 36. status codes

Status code	Description	Comments
s	suppressed	Whether the route is suppressed and will not be advertised to the neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale.
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The route selected as the best path and installed in the kernel routing table.
i	internal	Whether the route is learned from an iBGP peer. If this symbol is not present, the route was learned from an eBGP peer.

```
Origin codes: i - IGP, e - EGP, ? - incomplete
```

Table 37 explains the codes are at the end of each routing entry that show where the route originated.

Table 37. origin codes

Origin code	Description	Comments
i	IGP	The route originated from an Interior Gateway Protocol.
e	EGP	The route originated from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an Interior Gateway Protocol.

Route Entry Fields

Table 38 explains the fields shows for each route.

Table 38. route entry fields

Field	Description
Network	Network prefix installed in BGP. If multiple routes exist for the same prefix, only the first prefix is identified and others have blank spaces.

© 2026 IP Infusion Inc. Proprietary

Table 38. route entry fields (continued)

Field	Description
	The status codes are explained in Table 36.
Next Hop	IP address of the nexthop for this route.
Metric	Multiple-Exit Discriminator (MED). If there are multiple paths to the same destination from a single routing protocol, then the multiple paths have the same administrative distance and the best path is selected based on this metric. The path with the lowest metric is selected as the optimal path and installed in the routing table.
LocPrf	Local preference set with the `set local-preference` command. This value is used only with iBGP sessions within the local autonomous system to determine if a route towards a destination is the “best” one. The path with the highest local preference is preferred.
Weight	This field applies only to routes within an individual router. If a route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.
Path and origin	The autonomous systems through which the prefix advertisement passed. The origin codes are explained in Table 37

Route Entry Examples

```
*> 172.16.1.0/24    10.10.10.78                    0   1 4 i
```

- The absence of status code “i” means the route is external and was learned from an eBGP peer.
- The “>” means this route is selected to be installed in the kernel routing table. Its network address is 172.16.1.0/24.
- The IP address of the nexthop for this route is 10.10.10.78.
- This route was learned from a peer, so it has a default weight of 0.
- The path “1 4” means the prefix advertisement passed through AS1 and AS4.
- The origin code “i” means the prefix was added by a network statement at an originating AS.

```
*> 192.16.1.0       10.10.10.78           200           0   1 4 ?
*                   10.100.0.62           100           0   3 4 ?
```

- The same prefix was learned from two different ASs, AS1 and AS3.
- The route learned from AS1 is chosen as the best route because AS1 has a lower Router ID (10.10.10.78) than AS2 (10.100.0.62). Although the metric of the route learned from AS1 is higher (200) than the route learned from AS3 (100), this attribute is not used in the best path selection decision because the metrics are compared only if the first (neighboring) AS is the same in the two paths.
- The origin code “?” indicates that the routes were learned through redistribution.

```
*>i192.17.1.0       10.100.0.62                 100    0   i
```

- The route is learned through an iBGP peer as indicated by the status code “i”.
- The preference of the route, used only with the local AS, is 100 (the default value).

© 2026 IP Infusion Inc. Proprietary

show ip bgp cidr-only

Use this command to display routes with non-natural network masks.

Command Syntax

```
show ip bgp cidr-only
show ip bgp ipv4 (unicast|multicast) cidr-only
```

Parameters

ipv4
IPv4 routes

unicast
Unicast prefixes

multicast
Multicast prefixes

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the `show ip bgp cidr-only` command.

```
#show ip bgp cidr-only
BGP table version is 0, local router ID is 10.10.10.50
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network          Next Hop            Metric LocPrf Weight Path
*> 3.3.3.0/24       10.10.10.10                           0 11 i
Total number of prefixes 2
```

show ip bgp community-info

Use this command to list all BGP community information.

Command Syntax

```
show ip bgp community-info
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp community-info
Address Refcnt Community
[0x262a4c0] (1) 1:1
```

© 2026 IP Infusion Inc. Proprietary

show ip bgp peer-group

Use this command to list the BGP peer group information in ipv4 unicast.

Command Syntax

```
show ip bgp peer-group (WORD|)
```

Parameters

WORD
Name of the peer group

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp peer-group group1
BGP dynamic peer-group is group1, EBGP, remote AS 64902
  BGP dynamic peer-group group1 listen range group members:
  12.1.0.0/16
  BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
  Peer-group member:
  *12.1.1.2
  Index 0, Offset 0, Mask 0x1
  0 accepted prefixes, 0 announced prefixes
```

© 2026 IP Infusion Inc. Proprietary

show ip bgp peer-group vrf all

Use this command to list all BGP peer group VRF information.

Command Syntax

```
show ip bgp peer-group vrf all
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp peer-group vrf all
% VRF: VRF1

BGP dynamic peer-group is group2, EBGP, remote AS 64902
  BGP dynamic peer-group group2 listen range group members:
  12.2.0.0/16
  BGP version 4
Minimum time between advertisement runs is 30 seconds
% VRF: management
Peer-Group not found

% VRF: default

BGP dynamic peer-group is group1, EBGP, remote AS 64902
  BGP dynamic peer-group group1 listen range group members:
  12.1.0.0/16
  BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
  Peer-group member:
  *12.1.1.2
  Index 0, Offset 0, Mask 0x1
  0 accepted prefixes, 0 announced prefixes
```

© 2026 IP Infusion Inc. Proprietary

show ip bgp rtfilter all

Use this command to display Route Target Constraint (RTC) Network Layer Reachability Information (NLRI) entries received from and advertised to BGP peers.

Command Syntax

```
show ip bgp rtfilter (all | summary)
```

Parameters

None

Command Mode

Execution mode and Privilege mode

Applicability

Introduced before OcNOS version 1.3.

Example

show ip bgp rtfilter all

```
#show ip bgp rtfilter all
RTFilter's Received
******************
peer-ip 22.22.22.22
100:1:400/96

RTFilter's Sent
******************
peer-ip 22.22.22.22
100:1:400/96

RTFilter's rt_add_pending
******************

RTFilter's rt_del_pending
******************

RTFilter's rtfilter_receive_pending
******************

 Example: The format 100:1:400/96 is interpreted as ORIGIN_AS:Route-Target/Prefix-length
 Breakdown of 100:1:400/96:
         The first part (100) is the Global Administrator ASN represents Origin AS.
         1:400 -> Represents the Route Target (RT) Extended Community.
         /96 -> The prefix length, which in the case of RTC is always 96 bits.
```

show ip bgp rtfilter all summary

```
#show ip bgp rtfilter all summary
BGP router identifier 192.168.36.11, local AS number 4294967294
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries
```

```
Neighbor           V    AS     MsgRcv     MsgSen  TblVer    InQ   OutQ   Up/Down  State/PfxRcd   Desc
192.168.36.1       4 4294967294        907      22670       1      0      0  00:26:24            43
192.168.36.2       4 4294967294        356       6046       0      0      0  01:23:25          Idle
192.168.36.3       4 4294967294        706      24519       1      0      0  00:25:49             6
192.168.36.4       4 4294967294       1015      21917       1      0      0  00:28:10          Idle
192.168.36.12      4 4294967294      12928       8239       1      0      0  00:27:32             2

Total number of neighbors 5

Total number of Established sessions 3
```

Here is the explanation of the show output fields.

Table 39. Description of output field for the 'show ip bgp rtfilter all' command.

Field	Description
RTFilter's Received	Lists the RTC NLRIs received from the specified BGP peer. These entries indicate the Route Targets (RTs) that the peer is interested in receiving.
RTFilter's Sent	Lists the RTC NLRIs advertised to the specified BGP peer. These entries indicate the Route Targets (RTs) for which this router is requesting VPN routes from the peer.
Peer-IP	Displays the IP address of the BGP peer associated with the RTC entries. **Example:** `peer-ip 22.22.22.22`
RTC NLRI Entry	The notation `100:1:400/96` in the output indicates a RTC NLRI entry, which is used in the Route Target Filtering mechanism of MPLS Layer 3 VPNs (L3VPNs). This limits the advertisement of VPN routes to only those needed by the peer. **Example:** Here is the breakdown of `100:1:400/96`: • 100 – Global Administrator ASN represents origin AS. • 1:400 – Route Target (RT) Extended Community. • /96 – Prefix length. For RTC NLRIs, this value is always 96 bits.
RTFilter's rt_add_pending	Shows RT filter routes that are pending to be added but not yet installed.
RTFilter's rt_del_pending	Shows RT filter routes that are pending to be deleted but not yet removed.
RTFilter's rtfilter_receive_pending	Shows RT filter routes that are pending to be processed after being received from peers.

Table 40. Description of output field for the 'show ip bgp rtfilter all summary' command.

Field	Description
BGP router identifier	The Router ID of the local BGP instance.
local AS number	The Autonomous System (AS) number configured on the local router.
BGP table version	Version number of the local BGP routing table.
BGP AS-PATH entries	Number of unique AS-PATH entries stored in the BGP table.
BGP community entries	Number of BGP community entries stored in the table.
Neighbor	IP address of the BGP peer.
V	BGP version in use with the neighbor.
AS	Autonomous System number of the neighbor.
MsgRcv	Total number of BGP messages received from the neighbor.
MsgSen	Total number of BGP messages sent to the neighbor.
TblVer	BGP table version that the neighbor is synchronized with.
InQ	Number of BGP messages currently in the input queue from the neighbor.
OutQ	Number of BGP messages currently in the output queue to the neighbor.
Up/Down	Elapsed time since the BGP session went up or down.
State/PfxRcd	If the session is established: displays the number of prefixes received from the neighbor. If the session is not established: shows the current state (e.g., Idle, Active).
Desc	Optional neighbor description (if configured).
Total number of neighbors	Number of configured BGP neighbors.
Total number of Established sessions	Number of neighbors with active, established BGP sessions.

© 2026 IP Infusion Inc. Proprietary

show ip bgp rtfilter neighbors

Use this command to display the BGP Route-Target (RT) filter routes that the router either advertises to or receives from the specified BGP neighbor.

Command Syntax

```
show ip bgp rtfilter neighbors <PREFIX> advertised-routes
show ip bgp rtfilter neighbors <PREFIX> received-routes
```

Parameters

<PREFIX>
Specify the IPv4 address of the BGP neighbor. The command output is specific to this neighbor.

advertised-routes
Displays RT filter routes sent by the local router to the specified neighbor.

received-routes
Displays RT filter routes learned from the specified neighbor.

Command Mode

Execution mode and Privilege mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

Display Advertised-routes

```
OcNOS#show ip bgp rtfilter neighbors 12.1.1.1 advertised-routes
BGP RT-Filter table version is 1, local router ID is 20.1.1.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
              l - labeled, S Stale, x-EVPN
Origin codes: i - IGP, e - EGP, ? - incomplete

    Network            Next Hop            Metric    LocPrf   Weight Path
 *> 100:0:200:1        0.0.0.0                                  32768  i
 *> 100:0:65535:1      0.0.0.0                                  32768  i
 *> 100:1:1.1.1.1:100  0.0.0.0                                  32768  i
 *> 100:2:65551:1      0.0.0.0                                  32768  i

 Total number of route-targets 4

 Example: The format 100:2:1:1 is interpreted as ORIGIN_AS:type/subtype:Route Target
          <Origin-AS>     : Autonomous System Number.
          <Type>          : The type/subtype of the extended community attribute.
                            (0-> 2-byte ASN, 1-> IPv4-address, 2-> 4-byte ASN)
          <RT-Identifier> : Route Target itself.
```

Display Received-routes

```
OcNOS#show ip bgp rtfilter neighbors 12.1.1.1 received-routes
BGP RT-Filter table version is 1, local router ID is 20.1.1.2
Status codes: s suppressed, d damped, h history, a add-path, b back-up, * valid, > best, i -
internal,
```

```
              l - labeled, S Stale, x-EVPN
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network            Next Hop            Metric    LocPrf   Weight Path
*> 100:0:100:1        0.0.0.0                                 0      i

Total number of route-targets 1

Example: The format 100:2:1:1 is interpreted as ORIGIN_AS:type/subtype:Route Target
         <Origin-AS>     : Autonomous System Number.
         <Type>          : The type/subtype of the extended community attribute.
                           (0-> 2-byte ASN, 1-> IPv4-address, 2-> 4-byte ASN)
         <RT-Identifier> : Route Target itself.
```

Here is the explanation of the show output fields.

Table 41. Description of the output field for the `show ip bgp rtfilter neighbors` command.

Field	Description
BGP RT-Filter table version	Version number of the RT-Filter table. Increments when changes occur.
local router ID	Router ID of the local BGP process. **Example:** 20.1.1.2
Status codes	Symbols indicating route status: `s (suppressed), d (damped), h (history), a (add-path), b (back-up), * (valid), > (best), i (internal), l (labeled), S (stale), x (EVPN).`
Origin codes	Route origin information: `i (IGP), e (EGP), ? (incomplete).`
Network	RT filter in the extended community format `<Origin-AS>:<Type>:<RT-Identifier>`. **Example:** 100:2:1:1 - Origin-AS=100, Type=2 (4-byte ASN), RT-Identifier=1.
Next Hop	IP address of the next hop for the route. For locally originated routes, this is `0.0.0.0`.
Metric	BGP metric for the route (if applicable).
LocPrf	Local preference value applied to the route.
Weight	Local router-specific weight attribute.
Path	AS path associated with the route.
Total number of route-targets	Displays the total count of RT entries advertised or received.

show ip bgp scan

Use this command to display BGP scan status.

Command Syntax

```
show ip bgp scan
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

In OcNOS version 7.0.0, the `MPLS nexthop: nhlfe-ix` field is added to the `show ip bgp scan` output.

Example

```
#show ip bgp scan
BGP VRF: (Default) VRF_ID 0
BGP scan interval is 60 secs
scan remain-time: 3 secs
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

The `MPLS nexthop: nhlfe-ix` field in the `show ip bgp scan` output indicates that the BGP next-hop is resolved through an MPLS forwarding entry, reflecting integration with the MPLS-aware recursive next-hop resolution mechanism.

```
#show ip bgp scan
    BGP VRF: (Default) VRF_ID 0, AS 200, router-id 1.1.1.1 RIB SCAN FRESH
    BGP scan interval is 60 secs
    scan remain-time: 19 secs
    Current BGP nexthop cache:
     2.2.2.2 valid [IGP metric 2, IfIndex: 10005, LSP status : invalid, LSP Type : NONE, is_dep : No,
MPLS nexthop: nhlfe-ix 1]
```

show ip bgp vpnv4

Use this command to display information relating to VPNv4.

Command Syntax

```
show ip bgp vpnv4 all
show ip bgp vpnv4 all A.B.C.D
show ip bgp vpnv4 all neighbors
show ip bgp vpnv4 all neighbors A.B.C.D
show ip bgp vpnv4 all neighbors A.B.C.D routes
show ip bgp vpnv4 all summary
show ip bgp vpnv4 all tags
show ip bgp vpnv4 rd WORD
show ip bgp vpnv4 rd WORD A.B.C.D
show ip bgp vpnv4 rd WORD label
show ip bgp vpnv4 rd WORD neighbors
show ip bgp vpnv4 rd WORD neighbors A.B.C.D
show ip bgp vpnv4 rd WORD summary
show ip bgp vpnv4 view WORD all
show ip bgp vpnv4 vrf NAME
show ip bgp vpnv4 vrf NAME A.B.C.D
show ip bgp vpnv4 vrf NAME label
show ip bgp vpnv4 vrf NAME summary
```

Parameters

all
Displays information about all VPNv4 NLRIs

PE2#
```

Table 42 explains the fields shows for each route.

Table 42. show ip bgp vpnv4 all neighbors output details

Field	Description
BGP neighbor	Router ID of the BGP neighbor.
remote AS	Autonomous system number of the neighbor.
local AS	Autonomous system number of the local system.
internal link	internal link: iBGP neighbor (in the same AS).
BGP version	The version of BGP being used by the neighbor device.
BGP state	The current state of the neighbor connection and length of time within the current state.Possible states are: Idle, Connect, Active, and Established.
Last read	The amount of time in Hours : Minutes : Seconds since this device last checked the Hold Time parameters.

© 2026 IP Infusion Inc. Proprietary

Table 42. show ip bgp vpnv4 all neighbors output details (continued)

Field	Description
hold time	The amount of time this device waits for a Keepalive or Update message before the BGP connection is closed.
Keepalive interval	KEEPALIVE messages are sent periodically to ensure that the connection is live.
Neighbor capabilities	New or optional parameters called “Capabilities.” Provides a graceful way to advertise new or unique options without causing peering to terminate. The capabilities are communicated in TLV fields. (see RFC 3392). In the example output above, the following capabilities were advertised by the neighbor and were received and understood by this device: 1. Route refresh 2. Address family IPv4 Unicast 3. Address family IPv6 Unicast
Received	Message count, notification count, number of messages waiting in the queue.
Sent	Message count, notification count, number of messages waiting in the queue.
Route refresh request	Route requests sent and received.
For address family	As stated – in this case IPv4 Unicast.
BGP table version	For each of the address families agreed upon, BGP maintains a separate table.
neighbor version	Tracks prefixes that have been sent and those that need to be sent.
connections established	The number of times the router has established a TCP connection and the two peers have agreed to speak BGP with each other. “Dropped” means the number of time the connection has failed or gone down.
local host foreign host	Local host is the IP address and the port number of the local system used for the peering session. Foreign host is the IP address and the port of the neighbor. BGP always uses the TCP port number 179 for the peer originating the session.
nexthop	The IP address of the next hop used to reach the neighbor. eBGP or iBGP peers do not need to be directly connected. Peering sessions can be set up across multiple hops. If the neighbors are directly connected, the IP address of the local system is listed as the next hop.
nexthop global	The global IPv6 address of the next hop
nexthop local	The link-local IPv6 address of the next hop

© 2026 IP Infusion Inc. Proprietary

Table 42. show ip bgp vpnv4 all neighbors output details (continued)

Field	Description
non shared network	The peering session is running on a non shared network.
last reset	Time since this peering session was last reset. The reason for the reset is displayed on this line.
notification error message	Last error message sent.

show ip bgp vpnv6 all neighbors

Use this command to display VPNv6 NLRI information for all neighbors or for a given neighbor.

Command Syntax

```
show ip bgp vpnv6 all neighbors
show ip bgp vpnv6 all neighbors (A.B.C.D|X:X::X:X)
```

Parameters

A.B.C.D
IPv4 neighbor address

X:X::X:X
IPv6 neighbor address

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show ip bgp vpnv6 all neighbors
BGP neighbor is 10.32.0.3, remote AS 1, local AS 1, internal link
  BGP version 4, local router ID 10.32.0.2, remote router ID 10.32.0.3
  BGP state = Established, up for 00:37:31
  Last read 00:00:09, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family VPNv4 Unicast: advertised and received
    Address family VPNv6 Unicast: advertised and received
  Received 25711 messages, 0 notifications, 0 in queue
  Sent 25673 messages, 1 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  Update source is lo

Next connect timer due in 108 seconds

BGP neighbor is 101.105.1.2, vrf 5, remote AS 105, local AS 1, external link
  BGP version 4, local router ID 101.105.1.1, remote router ID 0.0.0.0
  BGP state = Idle
  Last read         , hold time is 90, keepalive interval is 30 seconds
  Received 511 messages, 0 notifications, 0 in queue
  Sent 454 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
 For address family: IPv4 Unicast
  BGP table version 26, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (standard)
  0 accepted prefixes
  0 announced prefixes

 Connections established 1; dropped 1
```

show ip bgp vpnv6 rd neighbors

Use this command to display VPNv6 NLRI information for a given route distinguisher and optionally for a given neighbor.

Command Syntax

```
show ip bgp vpnv6 rd WORD neighbors
show ip bgp vpnv6 rd WORD neighbors (A.B.C.D|X:X::X:X)
```

Parameters

WORD
Route distinguisher

A.B.C.D
IPv4 neighbor address

X:X::X:X
IPv6 neighbor address

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced in OcNOS version 3.0.

Example

```
#show ip bgp vpnv6 rd 1:1 neighbors
BGP neighbor is 10.32.0.3, remote AS 1, local AS 1, internal link
  BGP version 4, local router ID 10.32.0.2, remote router ID 10.32.0.3
  BGP state = Established, up for 00:43:57
  Last read 00:00:08, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family VPNv4 Unicast: advertised and received
    Address family VPNv6 Unicast: advertised and received
  Received 25726 messages, 0 notifications, 0 in queue
  Sent 25689 messages, 1 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  Update source is lo
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 For address family: VPNv4 Unicast
  BGP table version 837, neighbor version 837
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
```

```
 0 announced prefixes

For address family: VPNv6 Unicast
 BGP table version 302, neighbor version 302
 Index 1, Offset 0, Mask 0x2
 Community attribute sent to this neighbor (both)
 0 accepted prefixes
 0 announced prefixes

Connections established 2; dropped 1
```

show ip extcommunity-list

Use this command to display BGP routes that match an extended community list.

Command Syntax

```
show ip extcommunity-list (WORD | )
show ip extcommunity-list (<1-199>|WORD)
show ip bgp extcommunity-list WORD (exact-match|)(vrf VRFNAME|)
```

Parameters

WORD
Name of extended community list

<1-199>
Number of extended community list

VRFNAME
VPN routing/forwarding instance name

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip extcommunity-list test
Named extended community expanded list test
    permit rt 100:100
```

© 2026 IP Infusion Inc. Proprietary

show ip protocols

Use this command to display IP process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols isis
```

Parameters

None

Command Mode

Execution modePrivilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# show ip protocols
Routing Protocol is "isis 1 "
Redistributing:
Area Address(es): 52
Distance : (default is 115)
#
```

Table 43 explains the output fields.

Table 43. show ip protocols output

Field	Description
Routing Protocol	“isis” and the name that identifies the IS-IS area.
Redistributing	Protocols being redistributed (such as RIP, OSPF, or BGP), including metric, metric type (internal or external), and route map.
redistribute isis	Whether redistributing IS-IS level-1 into level-2 and vice versa.
Area Address	Network address of the areas into which the routing process is injecting routes.
Distance: (default is 115)	Administrative distance.

show ip vrf

Use this command to display VRF information. This command is supported in RIP (IPv4).

Command Syntax

```
show ip vrf
show ip vrf WORD
```

Parameters

WORD
Specify the name for the VRF instance.

Default

None

Command Mode

Execution modeand Privilege mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip vrf myVRF

VRF myVRF, FIB ID 1
Router ID: 1.1.1.2 (config)
Interfaces:
  eth1
  eth3
VRF myVRF; (id=1); RIP enabled Interfaces:
  eth1
```

© 2026 IP Infusion Inc. Proprietary

show running-config as-path access-list

Use this command to show the running system status and configuration details for access lists based on autonomous system paths.

Command Syntax

```
show running-config as-path access-list
```

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#show running-config as-path access-list
!
ip as-path access-list wer permit knsmk
!
(config)#
```

show running-config bgp

Use this command to show the running system configuration for BGP.

This command sorts address-families entries by VRF name in alphabetical order. The address-families type IPv4 have precedence to be displayed rather than address-families type IPv6 entries.

Command Syntax

```
show running-config bgp
```

Parameters

None

Command Mode

Privileged Exec mode, Configure mode, and Router mode.

Applicability

This command was introduced before OcNOS version 6.6.0.

Example

```
OcNOS#show running-config bgp
!
router bgp 100
 neighbor 10.1.1.2 remote-as 100
 !
 address-family ipv4 vrf red
 exit-address-family
 !
 address-family ipv4 vrf yellow
 exit-address-family
 !
 address-family ipv6 vrf amber
 exit-address-family
 !
 address-family ipv6 vrf green
 exit-address-family
 !
 exit
!
OcNOS#
```

© 2026 IP Infusion Inc. Proprietary

show running-config community-list

Use this command to show the running system status and configuration details for community lists.

Command Syntax

```
show running-config community-list
```

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
(config)#show running-config community-list
!
ip community-list standard aspd permit internet
ip community-list expanded cspd deny ljj
ip community-list expanded cspd permit dcv
ip community-list expanded wde permit njhd
ip community-list expanded wer deny sde
(config)#
```

© 2026 IP Infusion Inc. Proprietary

show running-config vrf

Use this command to show the running system configuration details for VRF instances.

This command sorts VRF entries by name in alphabetical order.

Command Syntax

```
show running-config vrf
```

Parameters

None

Command Mode

Privileged Exec mode, Configure mode, and Router mode.

Applicability

This command was introduced before OcNOS version 6.6.0.

Example

```
OcNOS#show running-config vrf
ip vrf management
!
ip vrf test2
!
ip vrf test5
!
mac vrf test1
!
mac vrf test3
!
mac vrf test4
!
!
end

OcNOS#
```

© 2026 IP Infusion Inc. Proprietary

show running-config ip vrf

Use this command to show the running system status and configuration details for IP VRF entries.

This command sorts VRF entries by name in alphabetical order.

Command Syntax

```
show running-config ip vrf
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

```
OcNOS#show running-config ip vrf
ip vrf management
!
ip vrf test2
!
ip vrf test5
!
!
end
OcNOS#
```

© 2026 IP Infusion Inc. Proprietary

show running-config mac vrf

Use this command to show the running system status and configuration details for VRF MAC entries.

This command sorts VRF entries by name in alphabetical order.

Command Syntax

```
show running-config mac vrf
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

```
OcNOS#show running-config mac vrf
mac vrf test1
!
mac vrf test3
!
mac vrf test4
!
!
end
OcNOS#
```

© 2026 IP Infusion Inc. Proprietary

show running-config vrf word

Use this command to show the running system status and configuration details for a specified VRF instance name. This command displays the VRF instance association to interfaces and protocols.

Command Syntax

```
show running-config vrf word
```

Parameters

word
Virtual Routing and Forwarding name

Command Mode

Privileged Exec mode, Configure mode and Router mode.

Applicability

This command was introduced in OcNOS version 6.6.0.

Example

```
OcNOS#show running-config vrf test2
ip vrf test2
!
interface eth2
 ip vrf forwarding test2
!
router bgp 100
 address-family ipv4 vrf test2
 exit-address-family
!
end

OcNOS#
```

BGP Additional Paths Commands

The section describes the BGP additional paths commands.

Notes:

- The following protocols support additional paths: VPNv4, VPNv6, 6PE, and IPv4 Unicast (without IPv4 Labeled Unicast).
- Additional path advertisement is only supported for Internal Border Gateway Protocol (IBGP) peers. Furthermore, the marking for additional paths is performed for internal paths.
- When the next-hop-self configuration is set for a BGP peer, the device will only advertise the best path to add-path neighbors where the next-hop-self is enabled.
- A maximum of 64 paths can be advertised for the same prefix using the additional path.
- The system assigns a permanent, immutable tx path_id to every route upon creation (supporting Unicast, Labeled Unicast, and VPN SAFIs), replacing previous default values (e.g., 65 or -1) with stable 32-bit integer tracking.

bgp additional-paths 1595
bgp additional-paths install 1596
neighbor additional-paths 1597
neighbor advertise additional-paths 1598

© 2026 IP Infusion Inc. Proprietary

bgp additional-paths

Use this command to enable BGP additional paths.

Use the `no` parameter with this command to disable BGP add-path.

Command Syntax

```
bgp additional-paths (send|receive|send-receive|select (all | best<2-3>))
no bgp additional-paths (send|receive|send-receive|select (all | best))
```

Parameters

send
Send additional paths to neighbors

receive
Receive additional paths from neighbors

send-receive
Send and receive additional paths from neighbors

select
Selection criteria to pick the paths

all
Select all available paths

best
Select best N paths

<2-3>
Number of best paths in additional paths to be selected

Default

Disabled

Command Mode

address-family vpnv4 unicast

address-family vpnv6 unicast

address-family ipv6 labeled-unicast

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router-af)#bgp additional-paths send
(config-router-af)#no bgp additional-paths send
```

© 2026 IP Infusion Inc. Proprietary

bgp additional-paths install

Use this command to install the back-up path. BGP selects only one best path in the multiple next-hop network, the additional-path install (or) bgp prefix independent convergence enables BGP to select and install the back-up path.

Use the no parameter with this command to delete the installed back-up paths.

Command Syntax

```
bgp additional-paths install
no bgp additional-paths install
```

Parameters

None

Default

Disabled

Command Mode

address-family vpnv4 unicast

address-family vpnv6 unicast

address-family ipv6 labeled-unicast

Applicability

This command was introduced before OcNOS version 4.1 and new modes were introduced before OcNOS version 6.2.0

Examples

```
OCNOS(config)#router bgp 100
OCNOS(config-router)#address-family vpnv4 unicast
OCNOS(config-router)#bgp additional-paths install
OCNOS(config-router-af)#exit-address-family

OCNOS(config-router)#address-family vpnv6 unicast
OCNOS(config-router)#bgp additional-paths install
OCNOS(config-router-af)#exit-address-family

OCNOS(config-router)#address-family ipv6 labeled-unicast
OCNOS(config-router)#bgp additional-paths install
OCNOS(config-router-af)#exit-address-family
```

CLI ”bgp additional-paths select best” requires to be configured.

© 2026 IP Infusion Inc. Proprietary

neighbor additional-paths

Use this command to enable neighbour BGP add-path.

Use the `no` parameter with this command to disable neighbour BGP add-path.

Command Syntax

```
neighbor A.B.C.D additional-paths (send|receive|send-receive|disable)
no neighbor A.B.C.D additional-paths (send|receive|send-receive|disable)
```

Parameters

send
Send additional paths to neighbors

receive
Receive additional paths from neighbors

send-receive
Send and Receive additional paths from neighbors

disable
Disable additional paths

Default

Disabled

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 1.1.1.2 additional-paths send
(config-router-af)#no neighbor 1.1.1.2 additional-paths send
```

© 2026 IP Infusion Inc. Proprietary

neighbor advertise additional-paths

Use this command to enable BGP add-path at neighbor level.

Use the `no` parameter with this command to disable BGP add-path at neighbor level.

Command Syntax

```
neighbor A.B.C.D advertise additional-paths (all|best <2-3>)
no neighbor A.B.C.D advertise additional-paths (all|best <2-3>)
```

Parameters

all

Select all available paths

best

Select best N paths

<2-3>

Number of best paths in additional paths to be selected

Default

Disabled

Command Mode

Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 1.1.1.2 advertise additional-paths all
(config-router-af)#no neighbor 1.1.1.2 advertise additional-paths all
```

© 2026 IP Infusion Inc. Proprietary

BGP Graceful Restart Commands

This section describes the BGP graceful restart commands.

bgp g-shut 1600
bgp g-shut-capable 1601
bgp g-shut-local-preference 1602
bgp graceful-restart 1603
bgp update-delay 1605
neighbor capability graceful-restart 1606
neighbor g-shut 1608
neighbor g-shut-timer 1609
neighbor restart-time 1610

© 2026 IP Infusion Inc. Proprietary

bgp g-shut

Use this command to gracefully shut down all BGP IPv4 sessions under this router. The BGP graceful shutdown feature reduces packet loss during maintenance activity.

Use the `no` parameter with this command to bring up all the sessions under this router after completion of the maintenance activity using the `bgp g-shut` command.

Note: The graceful shutdown is not supported on iBGP sessions.

Command Syntax

```
bgp g-shut
no bgp g-shut
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut

#configure terminal
(config)#router bgp 100
(config-router)#no bgp g-shut
```

© 2026 IP Infusion Inc. Proprietary

bgp g-shut-capable

Use this command to enable the graceful shutdown capability at the router level and make available the graceful-shutdown related commands at the router and BGP neighbor levels.

Use the `no` parameter with this command to disable the graceful shutdown capability on a router.

Notes:

- The graceful shutdown capability cannot be disabled on a router that is in a graceful shutdown state until it comes out this state, after the graceful shutdown has been initiated and the impacted BGP sessions are up again.
- The graceful shutdown capability is not supported on iBGP sessions.

Command Syntax

```
bgp g-shut-capable
no bgp g-shut-capable
```

Parameters

None

Default

Disabled at the router level

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut-capable

#configure terminal
(config)#router bgp 100
(config-router)#no bgp g-shut-capable
```

bgp g-shut-local-preference

Use this command to sets the local preference of the router to use during graceful shutdown. The local preference value indicates the preferred path when there are multiple paths to the same destination in a single routing database. The path with a higher preference value is the preferred one. The preferred path is sent to all routers and access servers in the local autonomous system.

Use the `no` parameter with this command to revert to the default setting.

Note: The bgp g-shut-local-preference (page 1602) command relies on the bgp g-shut-capable (page 1601) configuration. When user remove the bgp g-shut-capable (page 1601) command from the configuration, it automatically deletes the bgp g-shut-local-preference (page 1602) setting as well. This dependency means that the bgp g-shut-local-preference (page 1602) cannot function or remain configured without the presence of the bgp g-shut-capable (page 1601) command.

Command Syntax

```
bgp g-shut-local-preference <0-4294967295>
no bgp g-shut-local-preference
```

Parameters

<0-4294967295>
Local preference value

Default

Zero

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut-local-preference 22
```

bgp graceful-restart

Use this command to enable BGP graceful-restart capabilities. The restart-time parameter is used for setting the maximum time that a graceful-restart neighbor waits to come back up after a restart. This value is applied to all neighbors unless you explicitly override it by configuring the corresponding value on the neighbor. The stalepath-time parameter is used to set the maximum time to preserve stale paths from a gracefully restarted neighbor. All stalepaths, unless reinstated by the neighbor after a re-establishment, will be deleted at the expiration of this timer.

Use the `no` parameter with this command to restore the router to its default state.

Command Syntax

```
bgp graceful-restart
bgp graceful-restart graceful-reset
bgp graceful-restart restart-time <1-3600>
bgp graceful-restart stalepath-time <1-3600>
no bgp graceful-restart
no bgp graceful-restart graceful-reset
no bgp graceful-restart restart-time
no bgp graceful-restart stalepath-time
```

Parameters

graceful-reset
The BGP daemon is not restarted, so that any changes in network configurations that cause BGP reset do not affect packet forwarding.

restart-time
Maximum time needed for neighbors to restart. Default is 90 seconds.

<1-3600>
sDelay value in seconds.

stalepath-time
Maximum time to retain stale paths from restarting neighbors. Default is 360 seconds.

<1-3600>
Delay value in seconds.

Default

The maximum time for neighbors to restart is 90 seconds.

The maximum time to retain stale paths from restarting neighbors is 360 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#router bgp 10
(config-router)#bgp graceful-restart

#configure terminal
(config)#router bgp 10
(config-router)#no bgp graceful-restart
```

bgp update-delay

Use this command to set the update delay for a graceful-restart capable router. The update-delay value is the maximum time a graceful-restart capable router, which is restarting, will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-RIB markers are received from all its graceful-restart capable neighbors.

Use the `no` form of this command to set to the update delay to its default value.

Command Syntax

```
bgp update-delay <1-3600>
no bgp update-delay
no bgp update-delay <1-3600>
```

Parameters

<1-3600>
Delay interval in seconds

Default

120 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#bgp update-delay 345
```

© 2026 IP Infusion Inc. Proprietary

neighbor capability graceful-restart

Use this command to advertise the graceful restart capability to its neighbor. This configuration indicates that the BGP speaker has the ability to preserve its forwarding state for the address family when BGP restarts.

You must first specify a neighbor's `remote-as` identification number assigned by the neighbor router.

Note: The graceful restart capability is advertised only when the graceful restart capability has been enabled using the bgp graceful-restart (page 1603) command.

Use the `no` parameter with this command to not advertise the graceful restart capability to its neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
no neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

Default

Disabled

Command Mode

Address Family mode Applicable for ipv4, ipv6 and vpnv4.

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.10.50 capability graceful-restart
```

```
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 2.2.2.2 activate
(config-router-af)#neighbor 2.2.2.2 capability graceful-restart
(config-router-af)#neighbor 3.3.3.3 activate
(config-router-af)#neighbor 3.3.3.3 capability graceful-restart
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router-af)#exit-address-family
```

neighbor g-shut

Use this command to start a graceful shutdown for the BGP session of the specified BGP neighbor. The BGP session for this neighbor is shut down after the graceful shutdown timer expires.

If there is no alternate path available for traffic to flow prior the actual shutdown of the BGP session, this path is made available for 60 seconds or for configured time after which the path is no longer available and traffic is dropped.

Use the `no` parameter with this command to bring up the session again for the specified BGP neighbor whose BGP session had been shut down using the `neighbor g-shut` command.

Note: The graceful shutdown capability is not supported on iBGP sessions .

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
```

Parameters

A.B.C.D
Neighbor IPv4 address

X:X::X:X|
Neighbor IPv6 address

WORD
Neighbor tag

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut

#configure terminal
(config)#router bgp 100
(config-router)#no neighbor 1.1.1.2 g-shut
```

© 2026 IP Infusion Inc. Proprietary

neighbor g-shut-timer

Use this command to configure the value of the graceful shutdown timer . After the timer expires, the BGP session initiated for graceful shutdown is shut down.

Use the `no` parameter with this command to revert to the default setting.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
```

Parameters

A.B.C.D
Neighbor IPv4 address

X:X::X:X
Neighbor IPv6 address

WORD
Neighbor tag

<10-65535>
Graceful shutdown timer in seconds

Default

60 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut-timer 120
```

© 2026 IP Infusion Inc. Proprietary

neighbor restart-time

Use this command to set a different restart-time than the global restart-time configured using the bgp graceful-restart (page 1603) command.

Use the `no` parameter with this command to restore the router to its default state.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
no neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
```

Parameters

A.B.C.D
Address of the BGP neighbor in an IPv4 format

X:X::X:X
Address of the BGP neighbor in an IPv6 format

WORD
Name of a BGP peer group created with the neighbor WORD peer-group (page 1411) command. When you specify this parameter, the command applies to all peers in the group.

<1-3600>
The maximum time that a graceful-restart neighbor waits to come back up after a restart. Make sure that this value does not exceed the stalepath-time specified in router mode.

Default

90 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 3.3.3.3 restart-time 45
```

© 2026 IP Infusion Inc. Proprietary

BGP Labeled Unicast Commands

This section describes the BGP labeled unicast commands.

address-family labeled-unicast 1612
allocate-label 1614
clear ip bgp * ipv4 labeled-unicast 1615
clear ip bgp A.B.C.D ipv4 labeled-unicast 1616
clear ip bgp peer-group WORD ipv4 labeled-unicast 1617

© 2026 IP Infusion Inc. Proprietary

address-family labeled-unicast

Use the address family command to enter the IPv4 or VPNv4 address family mode allowing configuration of address-family specific parameters. To leave address family mode and return to configure mode, give the exit-address-family (page 1319) command.

This command configures the routing exchange between Provider Edge (PE) and Customer Edge (CE) devices. The BGP sessions between PE routers can carry different types of routes (VPN-IPv4 and IPv4 routes). Address families are used to control the type of BGP session.

Use the `no` parameter with this command to disable the address-family configurations.

As in OcNOS, IPv4 Unicast and IPv4 Labeled-Unicast share the same BGP RIB [AFI=1][SAFI=1].

Paths learned from IPv4 unicast capable peer and routes learned from IPv4 labeled-unicast capable peer both the paths will be imported to IPv4 Unicast RIB. For a BGP route A.B.C.D, paths learned via IPv4 Labeled-Unicast are preferred over paths learned via IPv4 Unicast.

When max-paths ECMP is enabled for IPv4 Unicast address-family routes:

For a BGP route having the paths learned via IPv4 Labeled-Unicast and also via IPv4 Unicast OcNOS will not select these paths as multipath candidates as load-balancing the traffic to ip path and mpls path is not achievable in OcNOS and paths from LU are preferred and are marked best path.

Note: Enabling the `address-family ipv4 labeled-unicast` mode, automatically adds bgp implicit-null CLI to the existing configuration. For more information, refer to .

Command Syntax

```
address-family ipv4 labeled-unicast
address-family ipv6 labeled-unicast
```

Parameters

ipv4

IPv4 address family

labeled-unicast

Enter IPv4 labeled-unicast address-family mode to advertise labeled unicast routes. When a neighbor activate (page 1338) command is given in this mode, the BGP speaker advertises the BGP-LU capability.

ipv6

IPv6 address family

labeled-unicast

Enter IPv6 labeled-unicast address-family mode to:

Activate an IPv4 neighbor to exchange labeled routes data among ISP PE devices. When a IPv4 neighbor activate (page 1338) command is given in this mode, the device becomes 6PE capable.

OR:

Activate an IPv6 neighbor to advertise labeled unicast routes. When a IPv6 neighbor activate (page 1338) command is given in this mode, the BGP speaker advertises the BGP-LU capability.

© 2026 IP Infusion Inc. Proprietary

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 3.0.

Example

```
(config)#router bgp 100
(config-router)#address-family ipv4 labeled unicast
(config-router-af)#neighbor 172.4.5.52 activate
(config-router-af)#exit-address-family
```

© 2026 IP Infusion Inc. Proprietary

allocate-label

Use this command to allocate MPLS labels to all/route-map permitted IPv4 prefixes present in the BGP RIB. This command enables the label allocation to IPv4 prefixes, where labeled unicast (LU) routes can be exchanged with IPv4 Peers having BGP labeled-unicast capability. This command allocates labels for all IPv4 unicast prefixes (afi:1, safi:1) and IPv4 labeled-unicast prefixes (afi:1, safi:4).

Once configured, BGP will allocate labels to IPv4 unicast prefixes after the expiry of current BGP RIB scan time (default: 60 seconds).

Use the `no` form of this command to release the labels and disable BGP from allocating label to IPv4 prefixes.

Command Syntax

```
allocate-label (all|route-map WORD)
no allocate-label (all|route-map)
```

Parameters

all
All the advertised routes

route-map
Only those routes that match route-map

WORD
Route-map name

Default

None

Command Mode

Router mode

Applicability

This command was introduced before updated in OcNOS version 3.0.

Example

To allocate an MPLS label to IPv4 unicast prefix 1.1.1.1/32

```
(config)#router bgp 100
(config-router)#neighbor 11.0.0.2 remote-as 100
(config-router)#allocate-label all
(config-router)#address-family ipv4 unicast
(config-router-af)#network 1.1.1.1/32
(config-router-af)#exit-address-family
(config-router)#address-family ipv4 labeled-unicast
(config-router-af)#network 11.0.0.2 activate
(config-router-af)#exit-address-family
```

```
(config-router)#no allocate-label all
(config-router)#allocate-label route-map bgp
(config-router)#no allocate-label route-map
(config-router)#
```

clear ip bgp * ipv4 labeled-unicast

Use this command to soft reset all IPv4 Labeled-unicast BGP neighbors.

Command Syntax

```
clear ip bgp * ipv4 labeled-unicast soft
clear ip bgp * ipv4 labeled-unicast soft in
clear ip bgp * ipv4 labeled-unicast soft out
```

Parameters

soft
Soft clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#clear ip bgp * ipv4 labeled-unicast soft in
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp A.B.C.D ipv4 labeled-unicast

Use this command to soft reset an IPv4 Labeled-unicast BGP neighbor.

Command Syntax

```
clear ip bgp A.B.C.D ipv4 labeled-unicast soft
clear ip bgp A.B.C.D ipv4 labeled-unicast soft in
clear ip bgp A.B.C.D ipv4 labeled-unicast soft out
```

Parameters

A.B.C.D
BGP neighbor address

soft
Soft clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#clear ip bgp A.B.C.D ipv4 labeled-unicast soft in
```

© 2026 IP Infusion Inc. Proprietary

clear ip bgp peer-group WORD ipv4 labeled-unicast

Use this command to soft reset an peer-group of ipv4 labeled-unicast peer members.

Command Syntax

```
clear ip bgp peer-group WORD ipv4 labeled-unicast soft
clear ip bgp peer-group WORD ipv4 labeled-unicast soft in
clear ip bgp peer-group WORD ipv4 labeled-unicast soft out
```

Parameters

WORD
Peer-group name

soft
Soft clear both incoming and outgoing routes

in
Soft reconfig inbound update

out
Soft reconfig outbound update

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 3.0.

Examples

```
#clear ip bgp peer-group LU_GROUP ipv4 labeled-unicast soft in
```

Regular Expressions

The table below shows the regular expression special characters used in BGP commands. Users can use these characters in combination to build complex regular expressions.

Table 44. Regular expression characters

Symbol	Character	Meaning
^	Caret	Matches the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Matches the end of the input string.
.	Period	Matches a single character (including white spaces).
*	Asterisk	Matches none or more sequences of a pattern.
+	Plus sign	Matches one or more sequences of a pattern.
?	Question mark	Matches none or one occurrence of a pattern.
_	Underscore	Matches spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	A range of single-characters.
-	Hyphen	Separates the end points of a range.

BFD Authentication

This section provides BFD authentication configuration examples.

Overview

Bidirectional Forwarding Detection (BFD) is a protocol intended to detect faults in the bidirectional path between two forwarding engines, including physical interfaces, sub-interfaces, and data link. It operates independently of media, data protocols, and routing protocols. A session will be created between links. When BFD links is hacked, the link may be falsely declared to be down, or falsely declared to be up. To overcome this type of situations, need to use authentication on BFD. Using this we can mitigate threats from attackers.

OcNOS supports the following authentication types:

- Simple password
- Meticulous-Keyed-SHA1
- Keyed-SHA1

Among these types, Meticulous-Keyed-SHA1 is the strongest one.

Authentication is optionally enabled on BFD sessions. By default, it is disabled and is configurable via CLI. When authentication is enabled, BFD packets will exchange with authentication section (based on the configured auth type). Receiving system will examine the authentication section of the packet; if it is successful then it will accept. Otherwise, it will discard.

Enabling BFD Authentication for Multihop for IPv4, Using Key-ID

In this example, the BFD Multihop session is configured between R1 and R3 using single key (using key-ID). Once the BFD session is up, the authentication is enabled on both the routers, with the authentication type as Keyed-SHA1. We can enable the authentication on BFD session using any one of the above mentioned authentication type, with the Identical authentication type on both side.

Note: BFD authentication is not supported for Single hop BFD session.

Configuration

R1 Configuration

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface lo`	Enter the Loopback Interface configuration mode.
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assign IP address for interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#interface xe9`	Enter Interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 20.1.1.2 multihop`	Enabling BFD Multihop session
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#router ospf 1`	Enter router OSPF mode
`R1(config-router)#redistribute connected`	
`R1(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exit router OSPF mode
`R1(config)#bfd multihop-peer 20.1.1.2 auth type keyed-sha1 key-id 2 0 key ocnos`	Enabling Authentication for Multihop session

R2 Configuration

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface lo`	Enter the Loopback Interface configuration mode.
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP address for interface
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#interface xe9`	Enter Interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#interface xe2`	Enter Interface Mode.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP address for interface

© 2026 IP Infusion Inc. Proprietary

`R2(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#router ospf 1`	Enter router OSPF mode
`R2(config-router)#redistribute connected`	
`R2(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#commit`	Commit the candidate configuration to the running configuration.
`R2(config-router)#exit`	Exit router OSPF mode

R3 Configuration

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#interface lo`	Enter the Loopback Interface configuration mode.
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Assign IP address for interface
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exit from interface mode.
`R3(config)#interface xe2`	Enter Interface Mode.
`R3(config-if)#ip address 20.1.1.2/24`	Assign IP address for interface
`R3(config-if)#bfd session 20.1.1.2 10.1.1.1 multihop`	Enabling BFD Multihop session
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exit from interface mode.
`R3(config)#router ospf 1`	Enter router OSPF mode
`R3(config-router)#redistribute connected`	
`R3(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R3(config-router)#exit`	Exit router OSPF mode
`R3(config)#bfd multihop-peer 10.1.1.1 auth type keyed-sha1 key-id 2 0 key ocnos`	Enabling Authentication for Multihop session
`R3(config)#commit`	Commit the candidate configuration to the running configuration.

Validation

Check Multihop session is up between R1 and R3 with authentication type configured.

Base BFD Configuration

This section provides the steps for configuring the base Bidirectional Forwarding Detection (BFD) setup.

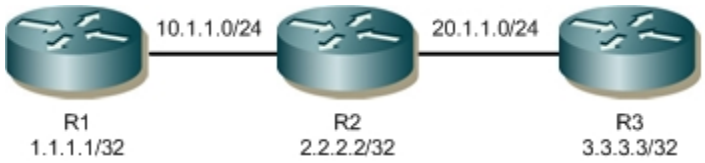
Overview

This section provides an overview of Bidirectional Forwarding Detection (BFD). BFD is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols like BGP, EIGRP, IS-IS, and OSPF. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators.The configuration and command reference for BFD is given in the following sections in this section.

Note: Software BFD is enabled by default on IRB interfaces, as hardware BFD is not supported.

Topology

Figure 102. Basic Topology of Three Routers



BFD Echo Function

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 10.1.1.2`	Configure BFD session on interface.
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#bfd echo`	Enable BFD echo mode.
`R1(config)#commit`	Commit the candidate configuration to the running configuration.
`R1(config)#exit`	Exit from interface mode.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#bfd session 10.1.1.2 10.1.1.1`	Configure BFD session on interface.
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#bfd echo`	Enable BFD echo mode.
`R2(config)#commit`	Commit the candidate configuration to the running configuration.
`R2(config)#exit`	Exit from interface mode.

BFD Slow Timer

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 10.1.1.2`	Configure BFD session on interface.
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#bfd slow-timer 1000`	Configure BFD `slow-timer` in milliseconds.
`R2(config)#commit`	Commit the candidate configuration to the running configuration.
`R2(config)#exit`	Exit from interface mode.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#bfd session 10.1.1.2 10.1.1.1`	Configure BFD session on interface.
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#bfd slow-timer 1000`	Configure BFD `slow-timer` in milliseconds.

BFD Multihop Peer Timer

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#router ospf 1`	Enter router OSPF mode
`R1(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R1(config-router)#redistribute connected`	
`R1(config-router)#exit`	Exit router OSPF mode
`R1(config)#bfd multihop-peer 20.1.1.3 interval 100 minrx 100 multiplier 3`	Configure BFD `multihop-peer` timer and reception intervals in milliseconds and the Hello multiplier.
`R1(config)#commit`	Commit the candidate configuration to the running configuration.
`R1(config)#exit`	Exit router OSPF mode

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#interface eth2`	Enter interface Mode.
`R2(config-if)#ip address 20.1.1.2/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#router ospf 1`	Enter router OSPF mode
`R2(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#redistribute connected`	
`R2(config-router)#commit`	Commit the candidate configuration to the running configuration.
`R2(config-router)#exit`	Exit router OSPF mode

R3

`R1#configure terminal`	Enter the Configure mode.

`R1(config)#interface eth2`	Enter interface Mode.
`R1(config-if)#ip address 20.1.1.3/24`	Assign IP address for interface
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#router ospf 1`	Enter router OSPF mode
`R1(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R1(config-router)#redistribute connected`	
`R1(config-router)#exit`	Exit router OSPF mode
`R1(config)#bfd multihop-peer 10.1.1.1 interval 100 minrx 100 multiplier 3`	Configure BFD `multihop-peer` timer and reception intervals in milliseconds and the Hello multiplier.v
`R1(config)#commit`	Commit the candidate configuration to the running configuration.
`R1(config)#exit`	Exit router OSPF mode

BFD Protocol Configurations

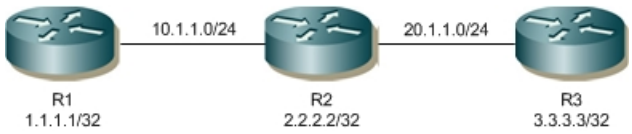
This section describes the BFD protocol configurations.

OSPF—BFD Single-Hop Session

This section provides the steps for configuring BFD for Single-Hop OSPF.

Topology

Figure 103. Single-Hop OSPF Topology



R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface lo`	Enter the Interface configuration mode for lo
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assign IP Address
`R1(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)#router ospf 100`	Enter the Router mode for OSPF.
`R1(config-router)#network 10.1.1.0/24 area 1`	Advertise network 10.1.1.0/24 in OSPF `area 1`.
`R1(config-router)#network 1.1.1.1/32 area 1`	Advertise loopback network 1.1.1.1/32 in OSPF `area1`.
`R1(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R1(config-router)#commit`	Commit the configuration on the node
`R1(config-router)#exit`	Exit the router mode

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP Address

© 2026 IP Infusion Inc. Proprietary

`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#router ospf 100`	Enter the Router mode for OSPF.
`R2(config-router)#network 10.1.1.0/24 area 1`	Advertise network 10.1.1.0/24 in OSPF `area 1`.
`R2(config-router)#network 20.1.1.0/24 area 1`	Advertise network 20.1.1.0/24 in OSPF `area 1`.
`R2(config-router)#network 2.2.2.2/32 area 1`	Advertise loopback network 2.2.2.2/32 in OSPF `area 1`.
`R2(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R2(config)#interface lo`	Enter the Interface configuration mode for lo
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP Address
`R2(config-router)#commit`	Commit the configuration on the node
`R2(config-router)#exit`	Exit the router mode.

R3

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#interface lo`	Enter the Interface configuration mode for lo
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Assign IP Address
`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 20.1.1.2/24`	Assign IP Address.
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#router ospf 100`	Enter the Router mode for OSPF.
`R3(config-router)#network 20.1.1.0/24 area 1`	Advertise network 20.1.1.0/24 in OSPF area 1.
`R3(config-router)#network 3.3.3.3/32 area 1`	Advertise loopback network 3.3.3.3/32 in OSPF area 1.
`R3(config-router)#bfd all-interfaces`	Enable BFD for all neighbors
`R3(config-router)#commit`	Commit the configuration on the node
`R3(config-router)#exit`	Exit the router mode.

Validation

R1

```
R1#show ip ospf n

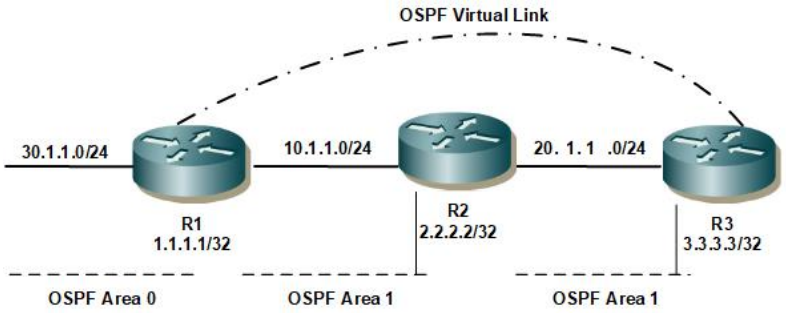
OSPF—BFD Multi-Hop Session

This section provides the steps for configuring BFD for OSPF multi-hop sessions.

Topology

Figure 104. Multi-hop OSPFv2 Topology



R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface lo`	Enter the Interface configuration mode for lo
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assign IP Address
`R1(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)#interface eth2`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 30.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)#router ospf 100`	Enter the Router mode for OSPF.
`R1(config-router)#ospf router-id 1.1.1.1`	
`R1(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R1(config-router)#network 10.1.1.0/24 area 1`	Advertise network 20.1.1.0/24 in OSPF area 1.
`R1(config-router)#network 1.1.1.1/32 area 1`	Advertise loopback network 1.1.1.1/32 in OSPF area 1.
`R1(config-router)#network 30.1.1.0/24 area 0`	Advertise network 30.1.1.0/24 in OSPF area 0.
`R1(config-router)#area 1 virtual-link 3.3.3.3 fall-over bfd`	Create a virtual link to R3 with BFD.
`R1(config-router)#commit`	Commit the configuration on the node

R2

`R2#configure terminal`	Enter the Configure mode
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.

`R2(config-if)#ip address 10.1.1.2/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#interface lo`	Enter the Interface configuration mode for lo
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#router ospf 100`	Enter the Router mode for OSPF.
`R2(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R2(config-router)#ospf router-id 2.2.2.2`	OSPF router ID in IPv4 format
`R2(config-router)#network 10.1.1.0/24 area 1`	Advertise network 10.1.1.0/24 in OSPF area 1.
`R2(config-router)#network 20.1.1.0/24 area 1`	Advertise network 20.1.1.0/24 in OSPF area 1.
`R2(config-router)#network 2.2.2.2/32 area 1`	Advertise loopback network 2.2.2.2/32 in OSPF area 1.
`R2(config-router)#commit`	Commit the configuration on the node
`R2(config-router)#exit`	Exit the router mode.

R3

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#interface lo`	Enter the Interface configuration mode for lo
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Assign IP Address
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 20.1.1.2/24`	Assign IP Address.
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#router ospf 100`	Enter the Router mode for OSPF.
`R3(config-router)#ospf router-id 3.3.3.3`	OSPF router ID in IPv4 format
`R3(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R3(config-router)#network 20.1.1.0/24 area 1`	Advertise network 20.1.1.0/24 in OSPF area 1.
`R3(config-router)#network 3.3.3.3/32 area 1`	Advertise loopback network 3.3.3.3/32 in OSPF area 1.
`R3(config-router)#area 1 virtual-link 1.1.1.1 fall-over bfd`	Create a virtual link to R1 with BFD.
`R3(config-router)#commit`	Commit the configuration on the node

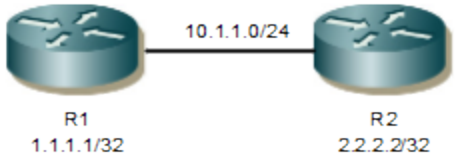
BFD Configuration in IS-IS

This section provides the steps for configuring BFD for the IS-IS protocol.

Topology

Figure 105. Basic Topology for BFD-ISIS



R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface mode.
`R1(config-if)#ip address 10.1.1.1/24`	Configure IP address.
`R2(config-if)#ip router isis 1`	Configure ISIS router
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#router isis 1`	Enter the Router mode for IS-IS.
`R1(config-router)#net 10.0000.0000.0001.00`	Advertise network 10.0000.0000.0001.00 in IS-IS.
`R1(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R1(config-router)#commit`	Commit the configuration on the node

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface mode.
`R2(config-if)#ip address 10.1.1.2/24`	Configure IP address.
`R2(config-if)#ip router isis 1`	Configure ISIS router
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#router isis 1`	Enter the Router mode for IS-IS.
`R2(config-router)#net 10.0000.0000.0002.00`	Advertise network 10.0000.0000.0002.00 in IS-IS.
`R2(config-router)#bfd all-interfaces`	Enable BFD for all neighbors .
`R2(config-router)#commit`	Commit the configuration on the node

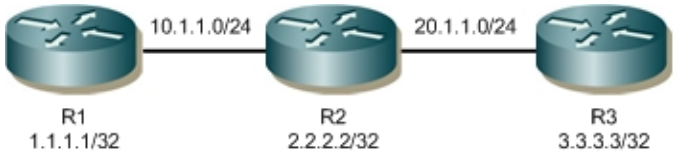
BFD Configuration in BGP

This section provides the steps for configuring BFD for the BGP protocol.

Topology

Figure 106. Basic Topology for BFD in BGP



R1

`R1#configure terminal`	Enter configure mode
`R1(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)# interface lo`	Enter interface mode
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Configure the IP address on loopback interface.
`R1(config-if)#bfd session 1.1.1.1 3.3.3.3 multihop`	Enable BFD multihop session
`R1(config)#router ospf 100`	Enter Router mode for OSPF
`R1(config-router)# ospf router-id 1.1.1.1`	Configure router-id in OSPF
`R1(config-router)# network 1.1.1.1/32 area 0.0.0.1`	Advertise network 1.1.1.1/32 in OSPF area 1.
`R1(config-router)# network 10.1.1.0/24 area 0.0.0.1`	Advertise network 10.1.1.0/24 in OSPF area 1.
`R1(config)#router bgp 100`	Enter Router mode for BGP
`R1(config-router)# neighbor 3.3.3.3 remote-as 100`	Add the neighbor 3.3.3.3 to remote-as 100.
`R1(config-router)# neighbor 3.3.3.3 fall-over bfd`	Enable BFD option for neighbor multihop
`R1(config-router)#neighbor 3.3.3.3 update-source lo`	Add neighbor 3.3.3.3 to update-source lo.
`R1(config-router)#neighbor 10.1.1.2 remote-as 100`	Add neighbor 10.1.1.2 to remote-as 100.
`R1(config-router)# neighbor 10.1.1.2 fall-over bfd`	Enable BFD option for neighbor
`R1(config-router)#commit`	Commit the configuration on the node
`R1(config-router)#end`	Exit from Router BGP mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP Address

© 2026 IP Infusion Inc. Proprietary

`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)# interface lo`	Enter interface mode
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Configure the IP address on loopback interface.
`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#router ospf 100`	Enter Router mode for OSPF
`R2(config-router)#ospf router-id 2.2.2.2`	Configure router-id in OSPF
`R2(config-router)# network 2.2.2.2/32 area 0.0.0.1`	Advertise network 1.1.1.1/32 in OSPF area 1.
`R2(config-router)#network 10.1.1.0/24 area 0.0.0.1`	Advertise network 10.1.1.0/24 in OSPF area 1.
`R2(config-router)# network 20.1.1.0/24 area 0.0.0.1`	Advertise network 20.1.1.0/24 in OSPF area 1.
`R3(config-router)#exit`	Exit from Router OSPF mode
`R2(config)#router bgp 100`	Enter Router mode for BGP
`R2(config-router)# neighbor 10.1.1.1 remote-as 100`	Add neighbor 10.1.1.1 to remote-as 100.
`R2(config-router)#neighbor 10.1.1.1 fall-over bfd`	Enable BFD option for neighbor
`R2(config-router)# neighbor 20.1.1.2 remote-as 100`	Add neighbor 20.1.1.2 to remote-as 100.
`R2(config-router)# neighbor 20.1.1.2 fall-over bfd`	Enable BFD option for neighbor
`R2(config-router)#commit`	Commit the configuration on the node
`R2(config-router)#end`	Exit from Router BGP mode

R3

`R3#configure terminal`	Enter configure mode
`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 20.1.1.2/24`	Assign IP Address.
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)# interface lo`	Enter interface mode
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address on loopback interface.
`R1(config-if)#bfd session 3.3.3.3 1.1.1.1 multihop`	Enable BFD multihop session
`R2(config-if)#exit`	Exit the Interface configuration mode
`R3(config)#router ospf 100`	Enter Router mode for OSPF
`R3(config-router)#ospf router-id 3.3.3.3`	Configure router-id in OSPF
`R3(config-router)# network 3.3.3.3/32 area 0.0.0.1`	Advertise network 3.3.3.3/32 in OSPF area 1.
`R3(config-router)# network 20.1.1.0/24 area 0.0.0.1`	Advertise network 20.1.1.0/24 in OSPF area 1.
`R3(config-router)#exit`	Exit from Router OSPF mode
`R3(config)#router bgp 100`	Enter Router mode for BGP
`R3(config-router)# neighbor 1.1.1.1 remote-as 100`	Add neighbor 1.1.1.1 to remote-as 100.
`R3(config-router)# neighbor 1.1.1.1 fall-over bfd multihop`	Enable BFD option for neighbor
`R3(config-router)#neighbor 1.1.1.1 update-source lo`	Add neighbor 1.1.1.1 to update-source lo.

© 2026 IP Infusion Inc. Proprietary

`R3(config-router)# neighbor 20.1.1.1 remote-as 100`	Add neighbor 20.1.1.1 to remote-as 100.
`R3(config-router)#neighbor 20.1.1.1 fall-over bfd`	Enable BFD option for neighbor
`R3(config-router)#commit`	Commit the configuration on the node
`R3(config-router)#end`	Exit from Router BGP mode

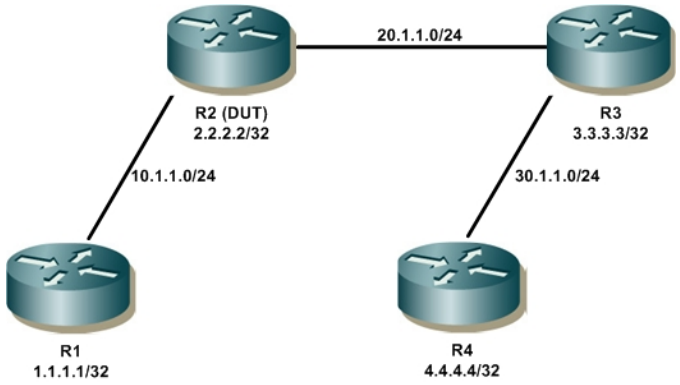
BFD Static Route Configuration

This section describes the configurations for BFD static routes.

In order to establish alternate paths to destinations that have the least possible delay it is important to quickly detect any changes to static route validity. BFD detects the liveliness of a static route's nexthop and then uses the nexthop's reachability information to determine whether routes are valid. Using BFD to reach a static route's nexthop also ensures that a static route is inserted in the forwarding database only when the nexthop neighbor is reachable.

Topology

Figure 107. BFD Static Route Basic Topology



R1

`R1(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address on interface.
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exit the Interface configuration mode.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#ip route 30.1.1.0/24 20.1.1.3`	Configure static route.
`R2(config)#ip bfd static all-interfaces`	Enable BFD for all static routes.
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R2(config-if)#ip static bfd enable`	Enable static BFD on the interface.
`R2(config-if)#ip address 20.1.1.2/24`	Assign IP address on interface.
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)# ip static 30.1.1.0/24 20.1.1.3 fall-over-bfd enable`	Enable static BFD at static route level.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address on interface.
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exit the Interface configuration mode.

R3

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#ip route 10.1.1.0/24 20.1.1.2`	Configure static route.
`R3(config)#ip bfd static all-interfaces`	Enable BFD for all static routes.
`R3(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R3(config-if)#ip address 20.1.1.3/24`	Assign IP address on interface.
`R3(config-if)#ip static bfd enable`	Enable static BFD at interface level.
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#ip static 10.1.1.0/24 20.1.1.2 fall-over-bfd enable`	Enable static BFD at static route level.
`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 30.1.1.2/24`	Assign IP address on interface.
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exit the Interface configuration mode.

R4

`R4(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R4(config-if)#ip address 30.1.1.1/24`	Assign IP address on interface.
`R4(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R4(config-if)#exit`	Exit the Interface configuration mode.

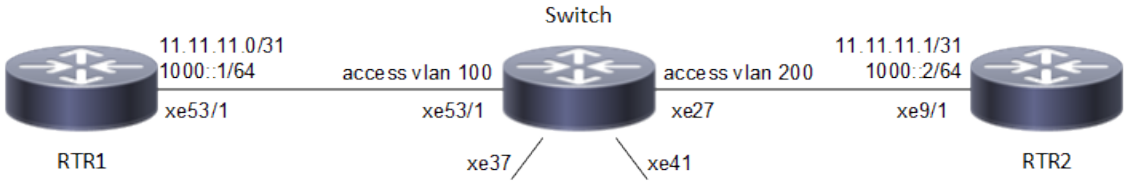
BFD with VRF Configuration

This chapter shows using BFD with user defined VRF for OSPFv2 and OSPFv3.

Topology

Figure 108. BFD user-defined VRF



RTR1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrf10`	Create VRF instance with VRF10 and enter into VRF mode
`(config-vrf)#exit`	Exit from VRF mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#interface xe53/1`	Enter interface mode
`(config-if)#ip vrf forwarding vrf10`	Enable VRF forwarding on interface
`(config-if)#ip address 11.11.11.0/31`	Assign IPv4 address in /31 mask.
`(config-if)#ipv6 address 1000::1/64`	Assign IPv6 address in /64 mask.
`(config-if)#ipv6 router ospf area 0 tag vrf10`	Tag OSPFv3 instance on interface with VRF10 for area 0
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 65535 vrf10`	Enter into OSPF VRF configuration mode
`(config-router)#router-id 1.1.1.1`	Assign router ID 1.1.1.1 for OSPF process 65535
`(config-router)#bfd all-interfaces`	Enable BFD for all-interface into OSPF
`(config-router)#network 11.11.11.0/31 area 0`	Enable routing for network 11.11.11.0/31 in area 0
`(config-router)#exit`	Exit from OSPF VRF configuration mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ipv6 vrf ospf vrf10`	Enter into IPv6 OSPF VRF configuration mode

© 2026 IP Infusion Inc. Proprietary

(config-router)#router-id 2.2.2.2	Assign router-id 2.2.2.2 for IPv6 OSPF process
(config-router)#bfd all-interfaces	Enable BFD for all-interface into OSPF
(config-router)#exit	Exit from IPv6 OSPF VRF configuration mode
(config)#commit	Commit the candidate configuration to the running configuration.

Switch Configuration

#configure terminal	Enter configure mode.
(config)#bridge 32 protocol rstp vlan-bridge	Create a RSTP VLAN aware bridge with bridge-id 32
(config)#vlan 100 bridge 32	Create VLAN 100 and map it to bridge 32
(config)#vlan 200 bridge 32	Create VLAN 200 and map it to bridge 32
(config)#interface xe53/1	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)#bridge-group 32	Configure bridge group to l2 interface
(config-if)#switchport mode trunk	Set the layer 2 interface as trunk interface
(config-if)#switchport trunk allowed vlan all	Allow all VLAN to trunk interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#interface xe27	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)#bridge-group 32	Configure bridge group to l2 interface
(config-if)#switchport mode trunk	Set the layer 2 interface as trunk interface
(config-if)#switchport trunk allowed vlan all	Allow all VLAN to trunk interface
(config-if)#exit	Exit interface mode.
(config)#interface xe37	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)#bridge-group 32	Configure bridge group to l2 interface
(config-if)#switchport mode trunk	Set the layer 2 interface as trunk interface
(config-if)#switchport trunk allowed vlan all	Allow all VLAN to trunk interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#interface xe41	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)# bridge-group 32 spanning-tree disable	Configure bridge group to l2 interface with spanning-tree disable

© 2026 IP Infusion Inc. Proprietary

(config-if)#switchport mode trunk	Allow all VLAN to trunk interface
(config-if)#switchport trunk allowed vlan all	Map the VLAN 200 to access interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.

RTR2 Configuration

#configure terminal	Enter configure mode.
(config)#ip vrf vrf10	Create VRF instance with VRF10 and enter into vrf mode
(config-vrf)#exit	Exit from VRF mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#interface xe9/1	Enter interface mode
(config-if)#ip vrf forwarding vrf10	Enable VRF forwarding on interface
(config-if)#ip address 11.11.11.1/31	Assign IPv4 address in /31 mask.
(config-if)#ipv6 address 1000::2/64	Assign IPv6 address in /64 mask.
(config-if)#ipv6 router ospf area 0 tag vrf10	Tag OSPFv3 instance on interface with VRF10 for area 0
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 65535 vrf10	Enter into OSPF VRF configuration mode
(config-router)#router-id 3.3.3.3	Assign router ID 3.3.3.3 for OSPF process 65535
(config-router)#bfd all-interfaces	Enable BFD for all-interface into OSPF
(config-router)#network 11.11.11.0/31 area 0	Enable routing for network 11.11.11.0/31 in area 0
(config-router)#exit	Exit from OSPF VRF configuration mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ipv6 vrf ospf vrf10	Enter into IPv6 OSPF VRF configuration mode
(config-router)#router-id 4.4.4.4	Assign router-id 4.4.4.4 for IPv6 OSPF process
(config-router)#bfd all-interfaces	Enable BFD for all-interface into OSPF
(config-router)#exit	Exit from IPv6 OSPF VRF configuration mode
(config)#commit	Commit the candidate configuration to the running configuration.

BFD Support on LAG Interface

Overview

The Bidirectional Forwarding Detection (BFD) protocol detects faults in the bidirectional path between two forwarding routers, including interfaces, data links, and beyond. It provides the fastest detection of communication failures on any data links, and the protocol runs over any media and at any protocol layer.

Establish a BFD session using the Link Aggregation Group (LAG) members to identify faults in the bidirectional pathway between two forwarding engines, including interfaces. A single Micro-BFD session operates on each member link of the LAG for every enabled address family; that is, each session established for every LAG member link under LAG. The Micro-BFD sessions on the member links are individual BFD sessions and operate independently. They use their own distinct local discriminator values, maintain separate sets of state variables, and operate with independent state machines. If a Micro-BFD session goes down, the corresponding member link MUST be removed from the LAG load-balancing table.

Single Hop BFD Option Over LAG

To interop with old/legacy routers, where micro-bfd support is not available, and to run regular Single HOP BFD sessions over LAG, a new CLI “ bfd session software” is being introduced. This software is operated by the control plane, which means the BFD packet TX/RX and the state machine run in the control plane. This session uses a unique discriminator for the whole LAG (not per member interface). BFD Single HOP packets are sent on each member links of LAG on a round-robin basis.

Notes:

- When setting up the session with LAG using the " bfd session software" command, the session type is single-hop.
- When setting up the session with LAG without using the command " bfd session software" command, the session type is Micro-BFD.

Feature Characteristics

BFD is used to control the load-balancing, this protocol minimizes the need for additional MAC addresses, thereby decreasing the resources needed on the Ethernet hardware of the receiving member link. Standard L3 protocols such as OSPF lack visibility into the LAG and perceive it as a single larger interface.

Benefits

BFD offers an efficient way to detect failures in the forwarding path between adjacent routers with low overhead. This encompasses identifying failures in interfaces, data links, and forwarding planes. Enable BFD at the routing protocol level. The BFD protocol identifies faults in the bidirectional path between two forwarding interfaces, encompassing interfaces and data link(s).

Prerequisites

LAG configurations must consist of a minimum of two ports:

- All ports within the LAG must inherit the port characteristics from the primary port.
- For ports within an LAG to ensure a specific port speed, auto-negotiation must be disabled or set to a limited mode.

Additionally, ports in a LAG must be configured for entire duplex operation.

Configuration

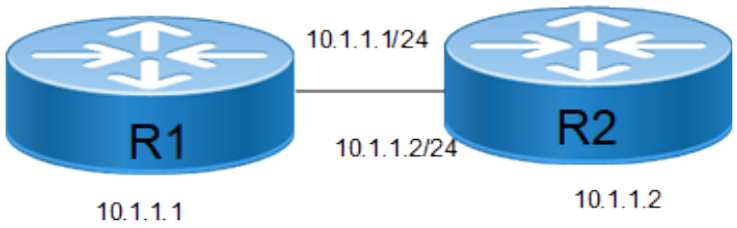
The following configuration enables the BFD support on LAG interfaces.

Note: The following configurations are applicable to protocols such as OSPF, BGP, and IS-IS, ensuring immediate notification in the event of session failure.

Topology

The following topology illustrates BFD support on the LAG interface configured between R1 and R2.

Figure 109. BFD support on LAG interface



Perform the following steps to configure the BFD on the LAG interface.

1. Configure the R1 interface with the IP address and with BFD interface.

```
R1#configure terminal
R1(config)#int po1
R1(config-if)#ip address 10.1.1.2/24
R1(config)#commit
R1(config)#interface eth1
R1(config-if)#channel-group 1 mode active
R1(config)#commit
R1#configure terminal
R1(config-if)#bfd session 10.1.1.2 10.1.1.1
R1(config-if)#bfd session ?
A.B.C.D   Source IPv4 address
X:X::X:X  Source IPv6 address
hardware  BFD Session offloaded to Forwarding Plane
software  BFD Session running at Control Plane (Host CPU)
R1(config-if)#bfd session software
R1(config)#commit
```

2. Configure the R2 interface with the IP address and with BFD interface.

```
R2#configure terminal
R2(config)#int po1
R2(config-if)#ip address 10.1.1.1/24
```

```
R2(config)#commit
R2(config)#interface eth1
R2(config-if)#channel-group 1 mode active
R2(config)#commit
R2#configure terminal
R2(config-if)#bfd session 10.1.1.1 10.1.1.2
R2(config-if)#bfd session ?
A.B.C.D   Source IPv4 address
X:X::X:X  Source IPv6 address
hardware  BFD Session offloaded to Forwarding Plane
software  BFD Session running at Control Plane (Host CPU)
R2(config-if)#bfd session software
R2(config)#commit
```

CLI Commands

bfd session software

Use this command to create a BFD session operated by control plane (This implies the BFD TX or RX is operated in the control plane).

Note: The scaling number of BFD sessions depends on the CPU performance of the target device since a Single Hop BFD session over LAG is handled in the control plane. Therefore, it is recommended to limit the number of sessions to a maximum of 8, with a minimum BFD interval of 100ms (Default BFD interval is 250ms). The lowest configurable interval for a software-based BFD session is 50ms.

Command Syntax

```
bfd session software
```

Parameters

None

Command Mode

Interface mode

Applicability

Introduced in OcNOS version 6.5.1.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bfd session software
(config-if)#
```

accept-lifetime

Use this command to specify the time period during which the authentication on a key chain is received as valid.

Use the `no` parameter with this command to disable it.

Command Syntax

```
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> HH:MM:SS MONTH <01-31> <1993-2035>
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> infinite
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> duration <1-2147483646>
no accept-lifetime
```

Parameters

HH:MM:SS
Specify the start time of accept-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to start. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to start as the first three letters of the month with first letter in upper case, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to start.

HH:MM:SS
Specify the end time of accept-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to end. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to end as the first three letters of the month with first letter in caps, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to expire.

duration
Specify the duration of the key in seconds

<1-2147483646>
Specify the actual end time duration of a key in seconds.

infinite
Specify the end time to never expire.

Default

By default, accept-lifetime command is disabled

Command Mode

Key-chain key mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of accept-lifetime for key-id 1 on the key chain named mychain.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#accept-lifetime 03:03:01 Dec 03 2004 04:04:02 Oct 06 2006
```

© 2026 IP Infusion Inc. Proprietary

bfd auth type

Use this command to enable BFD authentication on an interface that has either an IPv4 or an IPv6 BFD session.

Use the `no` form of the command to disable BFD authentication.

Note: BFD authentication is not supported for single hop IPv4 sessions.

Command Syntax

```
 bfd auth type (keyed-md5 | keyed-sha1 | meticulous-keyed-md5 | meticulous-keyed-sha1 | simple) key-
id <0-255> <0|1> key (WORD)
 no bfd auth
```

Parameters

auth type
Specify an authentication type.

keyed-md5
Specify a keyed message digest authentication type.

simple
Specify a simple authentication type.

keyed-sha1
Specify a keyed secure hashing algorithm authentication type.

meticulous-keyed-md5
Specify an authentication key meticulous keyed message digest authentication.

meticulous-keyed-sha1
Specify an authentication key meticulous keyed secure hashing algorithm authentication.

key-id
Indicate the key-id keyword.

<0-255>
Specify the key ID value.

<0|1>
0 Unencrypted password (key)

1 Encrypted password (key)

key
Indicate the key keyword.

WORD
Specify the authentication key name. Whitespaces is not allowed in key.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Example

Do the following to configure a single-key support:

Use value 0 before the key parameter for plain text key.

Use value 1 before the key parameter for already encrypted key.

```
(config)#interface eth1
(config-if)#bfd auth type keyed-md5 key-id 10 0 key test-key
(config-if)#bfd auth type keyed-sha1 key-id 20 1 key 0x4d8ea8d7e9ee090b
```

© 2026 IP Infusion Inc. Proprietary

bfd

Use this command to enable and disable all the BFD sessions on this interface.

Command Syntax

```
bfd (enable|disable)
```

Parameters

enable
Enable BFD

disable
Disable BFD

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bfd disable
```

© 2026 IP Infusion Inc. Proprietary

bfd echo

Use this command to set BFD sessions to echo mode.

Use the `no` form of the command to return a BFD session to its default mode off.

Note: BFD echo mode is supported for IPv4 BFD single hop sessions only.

Command Syntax

```
bfd echo
no bfd echo
```

Parameters

None

Default

By default, `bfd echo` is off.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd echo
```

bfd echo interval

Use this command to set the BFD echo interval.

Use the `no` form of this command to reset the echo interval to its default value.

Command Syntax

```
bfd echo interval <50-4294967>
no bfd echo interval
```

Parameter

<50-4294967>
Transmit interval in milliseconds.

Default

The default value is 1000 milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following command sets the BFD echo with no values.

```
#configure terminal
(config)#interface eth1
(config-if)#bfd echo interval 234
```

© 2026 IP Infusion Inc. Proprietary

bfd echo ipv4 source

Use this command to set the echo ipv4 source address.

Use the `no` form of this command to reset the value.

Command Syntax

```
bfd echo ipv4 source A.B.C.D
no bfd echo ipv4 source
```

Parameter

A.B.C.D
Source IPv4 address.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following command displays the ipv4 source address value.

```
#configure terminal
(config)#interface eth1
(config-if)#bfd echo interval 234
(config-if)#bfd echo ipv4 source A.B.C.D
```

© 2026 IP Infusion Inc. Proprietary

bfd interval

Use this command to configure BFD transmit and receive intervals, and the hello multiplier value.

Use the `no` form of the command to set the intervals and multiplier to their default values.

Notes: If “bfd session software” configured on any l3 interface then minimum tx/rx can be configured as 10 else minimum tx/rx can be configured as 3.

The scaling number of BFD sessions depends on the target device's CPU performance, as a Single-HOP BFD session over LAG is handled in the control plane. Therefore, it is recommended to limit the number of sessions to a maximum of 8, with a minimum interval of 100ms (default interval is 250ms). The lowest configurable interval for a software-based BFD session is 50ms.

Command Syntax

```
bfd interval <3-999> minrx <3-999> multiplier <3-50>
no bfd interval
```

Parameters

<3-999>
Transmit interval in milliseconds.

minrx <3-999>
Receive interval in milliseconds.

multiplier <3-50>
Hello multiplier value.

Defaults

The default for the transmit and receive intervals is 250 milliseconds.

The default hello multiplier value is 3.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bfd interval 100 minrx 100 multiplier 5
(config-if)#
```

© 2026 IP Infusion Inc. Proprietary

bfd multihop-peer

Use this command to enable authentication over either a multihop IPv4 or IPv6 session

Use the `no` form of the command to disable BFD authentication.

Command Syntax

```
bfd multihop-peer (A.B.C.D | X:X::X:X) auth type (keyed-md5 | keyed-sha1 | meticulous-keyed-md5 |
meticulous-keyed-sha1 | simple) key-id <0-255> <0|1> key (WORD)
no bfd multihop-peer (A.B.C.D) auth
```

Parameters

A.B.C.D
Specify an IPv4 address.

X:X::X:X
Specify an IPv6 address.

auth type
Specify an authentication type.

simple
Specify a simple authentication type.

keyed-md5
Specify a keyed message digest authentication type.

keyed-sha1
Specify a keyed secure hashing algorithm authentication type.

meticulous-keyed-sha1
Specify an authentication key Meticulous Keyed Secure hashing algorithm authentication type.

meticulous-keyed-md5
Specify an authentication key meticulous keyed message digest authentication.

key-id
Indicate the `key-id` keyword.

<0-255>
Specify the key ID value.

<0|1>
0 Unencrypted password (key)
1 Encrypted password (key)

key
Indicate the `key` keyword.

WORD
Specify the authentication key name. Whitespaces is not allowed in key.

Command Mode

Configure mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Example

Do the following to configure a single-key support:

Use value 0 before the key parameter for plain text key.

Use value 1 before the key parameter for already encrypted key.

```
#configure terminal
(config)#bfd multihop-peer 10.10.10.2 auth type keyed-md5 key-id 100 0 key test-key
(config)#bfd multihop-peer 20.20.20.2 auth type keyed-sha1 key-id 200 1 key 0x4d8ea8d7e9ee090b
```

© 2026 IP Infusion Inc. Proprietary

bfd multihop-peer A.B.C.D interval

Use this command to configure IPv4 BFD multihop peer timer values.

Use the `no` form of the command to reset the IPv4 multihop peer timer value.

Note: Multihop BFD operates at the control plane. When handling numerous services or traffic sessions, BFD session instability might occur. To address this, it is recommended to increase RX/TX interval to the maximum value of 999 milliseconds and refrain from selecting or configuring the default 250-millisecond option.

Command Syntax

```
bfd multihop-peer A.B.C.D interval <50-999> minrx <50-999> multiplier <3-50>
no bfd multihop-peer A.B.C.D interval
```

Parameters

interval

Indicate the interval parameter.

<50-999>

Specify the actual transmit interval in milliseconds.

minrx

Indicate the minrx parameter.

<50-999>

Specify the actual reception interval in milliseconds.

multiplier

Indicate the multiplier parameter.

<3-50>

Specify the actual hello multiplier value.

Command Mode

Configure mode

Default

Multiplier value is 3

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
bfd multihop-peer A.B.C.D interval <50-999> minrx <50-999> multiplier <3-50>
no bfd multihop-peer A.B.C.D interval
```

© 2026 IP Infusion Inc. Proprietary

bfd multihop-peer interval

Use this command for the global configuration of the timers for all multi-hop BFD sessions.

Use the `no` form of the command to reset the multihop peer timer value.

Note: Multihop BFD operates at the control plane. When handling numerous services or traffic sessions, BFD session instability might occur. To address this, the recommendation is to increase the RX/TX interval to the maximum value of 999 milliseconds and refrain from selecting or configuring the default 250-millisecond option.

Command Syntax

```
bfd multihop-peer interval <50-999> minrx <50-999> multiplier <3-50>
no bfd multihop-peer interval
```

Parameters

`interval <50-999>`	Specifies the actual transmit interval in this range of milliseconds. The default transmit interval is 250 milliseconds.
`minrx <50-999>`	Specify the actual reception interval in milliseconds. The default reception interval is 250 milliseconds.
`multiplier <3-50>`	Specify the actual hello multiplier value. The default multiplier value is 3.

Command Mode

Configure mode

Default

Disabled

Applicability

Introduced in OcNOS version 6.6.0.

Example

The following example shows how to configure timers for all multi-hop BFD sessions:

```
#configure terminal
(config)#bfd multihop-peer interval 100 minrx 100 multiplier 3
```

© 2026 IP Infusion Inc. Proprietary

bfd multihop-peer X:X::X:X interval

Use this command to configure an IPv6 BFD multihop peer timer values.

Use the `no` form of the command to reset the IPv6 multihop peer timer values.

Command Syntax

```
bfd multihop-peer X:X::X:X interval <50-999> minrx <50-999> multiplier <3-50>
no bfd multihop-peer X:X::X:X interval
```

Parameters

interval

Indicate the interval parameter.

<50-999>

Specify the actual transmit interval in milliseconds.

minrx

Indicate the minrx parameter.

<50-999>

Specify the actual reception interval in milliseconds.

multiplier

Indicate the multiplier parameter.

<3-50>

Specify the actual hello multiplier value.

Command Mode

Configure mode

Default

Default multiplier value is 3

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd multihop-peer 10.1.1.1 interval 100 minrx 100 multiplier 3
```

© 2026 IP Infusion Inc. Proprietary

bfd notification

Use this command to enable or disable BFD notification.

Command Syntax

```
bfd notification (enable | disable)
```

Parameters

disable
Disable BFD notification.

enable
Enable BFD notification.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bfd notification enable

(config)#bfd notification disable
```

© 2026 IP Infusion Inc. Proprietary

bfd session

Use this command to create a BFD IPv4 or IPv6 session on an interface.

Use the no form of the command to delete a BFD session from an interface.

Command Syntax

```
bfd session (hardware| Software)(A.B.C.D | X:X::X:X)
A.B.C.D | X:X::X:X) (multihop) (non-persistent | admin-down | demand-mode)
```

Parameters

A.B.C.D
Specifies the source IPv4 address for the BFD session.

X:X::X:X
Specifies the source IPv6 address for the BFD session.

hardware
Offloads the BFD session to the forwarding plane (hardware-based processing).

software
Runs the BFD session on the control plane (handled by the host CPU).

multihop
Enables BFD session support over multihop paths

admin-down
Brings the BFD session administratively down.

demand-mode
Enables demand mode for the BFD session, reducing control message exchanges.

non-persistent
Configures the BFD session as non-persistent; session state is not retained across restarts.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameters hardware and software in OcNOS version 6.6.1

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#bfd session 20.20.20.2 20.20.20.1 admin-down
(config-if)#do sh run bfd
!
interface eth2
bfd session  20.20.20.2  20.20.20.1 admin-down
!
(config-if)#no bfd session  20.20.20.2  20.20.20.1 admin-down
(config-if)#do sh run bfd
```

© 2026 IP Infusion Inc. Proprietary

```
!
interface eth2
bfd session  20.20.20.2  20.20.20.1
!
(config-if)#bfd session 20.20.20.2 20.20.20.1 admin-down
(config-if)#do sh run bfd
!
interface eth2
bfd session  20.20.20.2  20.20.20.1 admin-down
!
(config-if)#no bfd session 20.20.20.2 20.20.20.1
(config-if)#do sh run bfd
!
```

© 2026 IP Infusion Inc. Proprietary

bfd slow-timer

Use this command to set a BFD slow timer interval.

Use the `no` form of the command to reset the timer to default values.

Command Syntax

```
bfd slow-timer <1000-1703>
no bfd slow-timer
```

Parameter

<1000-1703>
Interval for the slow-timer in milliseconds.

Command Mode

Configure mode

Default

The default slow timer interval is 1703 milli-seconds.

The default slow timer interval is 2000 milli-seconds.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd slow-timer 1500
(config)#
```

© 2026 IP Infusion Inc. Proprietary

debug bfd

Use this command to enable debugging for BFD.

Use the `no` form of the command to disable all debugging for BFD.

Command Syntax

```
debug bfd (all|)
debug bfd (event|ipc-error|ipc-event|nsm|packet|session)
no debug bfd (all|)
no debug all
no debug bfd (event|ipc-error|ipc-event|nsm|packet|session)
```

Parameters

all
Enable all debugging.

event
Enable BFD event debugging.

ipc-error
Enable BFD IPC-error debugging

ipc-event
Enable BFD IPC-event debugging.

nsm
Enable BFD NSM debugging.

packet
Enable BFD packet debugging.

session
Enable BFD session debugging.

Command Mode

Configure mode, Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug bfd all
#debug bfd event
#debug bfd ipc-error
#debug bfd ipc-event
#debug bfd nsm
#debug bfd packet
#debug bfd session
```

© 2026 IP Infusion Inc. Proprietary

hardware-profile seamless-bfd

Use this command to enable the hardware-profile for seamless BFD to successfully activate seamless BFD in the hardware. Configure the `hardware-profile seamless-bfd` command before configuring the `s-bfd sr policy` or `s-bfd discriminator` commands. Before disabling the hardware-profile, unconfigure the **s-bfd sr policy** or `s-bfd discriminator` commands.

Use the `disable` form of this command to disable the configured hardware-profile.

Notes:

- After configuring `hardware-profile seamless-bfd` command, save the configuration and reboot the system.
- When downgrading to version 6.3.x from a higher-build version, configure the hardware-profile seamless-bfd disable.

Command Syntax

```
hardware-profile seamless-bfd enable
hardware-profile seamless-bfd disable
```

Parameter

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#hardware-profile seamless-bfd enable
(config)#hardware-profile seamless-bfd disable
```

© 2026 IP Infusion Inc. Proprietary

key-id

Use this command to manage, add or delete authentication keys in a key chain. This command allows you to enter the keychain-key mode to set a password for the key.

Command Syntax

```
key-id <0-2147483647>
no key-id <0-2147483647>
```

Parameters

<0-2147483647>
Specify a key identifier.

Default

By default, BFD uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Key-chain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures a key number 1 and shows the change to keychain-key command mode.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#
```

© 2026 IP Infusion Inc. Proprietary

key chain

Use this command to enter key chain mode to configure a key chain with a key chain name. This command allows you to enter the keychain mode to specify keys on this key chain.

Command Syntax

```
key chain WORD
no key chain WORD
```

Parameters

WORD
Specify the name of the key chain to manage.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the creation of a key chain named `mychain` and the change to keychain mode:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#
```

key-string

Use this command to define a password in plain-text to be used by a key.

The password is stored as encrypted, and is displayed in encrypted text when show running-config command is executed.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
key-string WORD
no key-string
```

Parameters

WORD

Specify a string of characters to be used as a password by the key. The length of the string should be between 1-80 characters.

Default

By default, password is not configured.

Command Mode

Key-chain mode and Key-chain key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, the password for `key-id 1` in the key chain named `mychain` is set to `prime`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string prime

(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

key-string encrypted

Use this command to define a password in its encrypted format to be used by a key.

Use the `no` parameter with this command to disable this feature

Command Syntax

```
key-string encrypted WORD
no key-string encrypted
```

Parameters

WORD

Specify the encrypted string of characters to be used as a passoword by the key. The length of this string should be between 18-162 characters.

Default

By default, password is not configured.

Command Mode

Key-chain mode and Key-chain key mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

In the following example, the encrypted password for key-id 1 in the key chain named mykeychain is set to 0xd6c50b442de47f70 (equivalent to "mychain" in plain-text):

```
#configure terminal
(config)#key chain mykeychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string encrypted 0xd6c50b442de47f70
(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Use the `no` parameter with this command to negate this command.

Command Syntax

```
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> HH:MM:SS MONTH <01-31> <1993-2035>
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> infinite
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> duration <1-2147483646>
no send-lifetime
```

Parameters

HH:MM:SS
Specify the start time of send-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to start. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to start as the first three letters of the month with first letter in upper case, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to start.

HH:MM:SS
Specify the end time of send-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to end.

MONTH
Specify the month of the year to end as the first three letters of the month with first letter in upper case, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to end.

duration
Indicate the duration parameter.

<1-2147483646>
Specify the actual end time duration of a key in seconds.

infinite
Specify the end time to never expire.

Command Mode

Key-chain key mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

The following example shows the setting of `send-lifetime` for `key-id 1` on the key chain named `mychain`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#send-lifetime 03:03:01 Jan 03 2004 04:04:02 Dec 06 2006
```

© 2026 IP Infusion Inc. Proprietary

show bfd

Use this command to display information about the BFD process.

Command Syntax

```
show bfd
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show bfd
BFD ID: 00      Start Time:Fri May 1 09:55:06 2009
Number of Sessions:     1
Slow Timer: 1000        Image type: MONOLITHIC
Echo Mode: Disabled     Next Session Discriminator:    2
```

Table 45. show BFD fields

Entry	Description
BFD ID	ID number of the BFD session.
Start Time	The date and time when the BFD session was started
BFD Admin State	State of the BFD session: Initializing: session is initializing Up: session is up. Down: session is down
Number of Sessions	Number of BFD sessions running on the device.
Slow Timer	Required minimum transmission time for the BFD session.
Image Type	Distributed or Monolithic.
Echo Mode	Either enabled or disabled.
Next Session Discriminator	An opaque discriminator value that identifies each session on the device that is used to demultiplex multiple BFD sessions between the same pair of devices.

© 2026 IP Infusion Inc. Proprietary

show bfd interface

Use this command to display details for an interface running BFD or for all interfaces configured for BFD.

Command Syntax

```
show bfd interface (ifindex <0-4294967295>|all|)
```

Parameters

all
Display all interfaces.

ifindex
Display an interface index.

<0-4294967295>
Display an ID of an interface in this range.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show bfd interface all
Interface:         lo ifindex: 1 state:   UP
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       eth0 ifindex: 2 state:   UP
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       eth1 ifindex: 3 state: DOWN
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       sit0 ifindex: 4 state: DOWN
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       gre0 ifindex: 5 state: DOWN
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5
```

Table 46 explains the output fields.

© 2026 IP Infusion Inc. Proprietary

Table 46. show BFD interface fields

Entry	Description
interface	Interface on which BFD is running
ifindex	Interface index number
state	State of the BFD session for the interface: UP: session is up. DOWN: session is down
Interface level configuration	State of interface-level properties: echo on or off slow-timer (timer dampening) on or off
Min Tx	The minimum interval that the local device would like to use when transmitting BFD control packets.
Min Rx	The minimum interval between received BFD control packets that this device is capable of supporting
Multiplier	The negotiated transmit interval, multiplied by this value, provides the detection time for the receiving device in asynchronous mode.

© 2026 IP Infusion Inc. Proprietary

show bfd session

Use this command to display BFD sessions.

Note: BFD Packet In and BFD Packet Out counters are not supported for Single Hop IPv4 BFD sessions on Qumran devices.

Command Syntax

```
show bfd session (detail|)
show bfd session vrf (WORD|all|default) (detail|)
```

Parameters

detail
Session details.

WORD
Sessions for this user-defined Virtual Routing and Forwarding instance name.

all
Show information for all Virtual Routing and Forwarding instances

default
Show information for only the default Virtual Routing and Forwarding instance

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bfd session detail
Session Interface Index : 3             Session Index : 1
Lower Layer : IPv4                      Version : 1
Session Type : Single Hop               Session State : Down
Local Discriminator : 1                 Local Address : 19.19.19.2/32
Remote Discriminator : 0                Remote Address : 19.19.19.1/32
Local Port : 49152                      Remote Port : 3784
Options :

Table 47 explains the output fields.

Table 47. show bfd session detail fields

Entry	Description
Session Interface Index	ID number of the interface.
Session Index Sess-Idx	ID number of this BFD session.
Lower Layer	The lower layer protocol on which BFD is carried: IPv4 IPv6 MPLS LSP MPLS VCCV MPLS-TP
Version	Session version number; generally 1.

Table 47. show bfd session detail fields (continued)

Entry	Description
Session Type Sess-Type	Single Hop Multihop Arbit Path Multihop OOB Signalled Multihop Unidirectional.
Session State Sess-State	The State of the session: Init: The session is initializing Up: The session is up. Down: The session is down AdminDown: The session has been administratively shutdown indefinitely.
Local Discriminator	A unique discriminator value generated by the transmitting device used to demultiplex multiple BFD sessions between the same pair of devices.
Local Address	Local address of the transmitting device.
Remote Discriminator Remote-Disc	The discriminator received from the corresponding remote device; zero if that value is unknown.
Remote Address Remote-Addr	Remote address of the receiving device.
Local Port	UDP port number of the transmitting device.
Remote Port	UDP port number of destination.
Options	Fate Shared Echo Enabled Demand Enabled Remote Demand Enbl Remote admin Down Poll seq Init.
Diagnostics	Performance diagnostics: None Control Detection Time Expired Echo Failed Neighbor Session Down Forwarding Plane Reset Path Down Concatenated Path Down Admin Down Reverse Concatenated Path Down

Table 47. show bfd session detail fields (continued)

Entry	Description
Min Tx	Minimum transmit interval.
Min Rx	Minimum receive interval.
Multiplier	The negotiated transmit interval, multiplied by this value, provides the detection time for the receiving system in asynchronous mode.
Neg Tx	Negotiated transmit interval.
Neg Rx	Negotiated receive interval in milliseconds.
Neg detect mult	Negotiated detection multiplier.
Min echo Tx	Minimum echo transmit interval in milliseconds.
Min echo Rx	Minimum echo receive interval in milliseconds.
Neg echo intrvl	Negotiated echo interval.
Storage type	SNMPv2 storage type (usually be set to 2): other(1) volatile(2) non-Volatile(3) permanent(4 read-Only(5)
Sess down time	Length of time this BFD session has been down.
Bfd GTSM	Whether the BFD session has enabled or disabled the Generalized TTL Security Mechanism (GTSM), which uses the time to live (TTL) or hop count to prevent off-link attackers from spoofing packets.
Bfd Authentication Enabled	When authentication is enabled.
Authentication type	Type of authentication: simple: Simple Password keyed-md5: Keyed message digest keyed-sha1: Keyed Secure hashing algorithm meticulous-keyed-md5: Meticulous Keyed message digest meticulous-keyed-sha1: Meticulous Keyed Secure hashing algorithm
Authentication Key-id	ID number of the authentication key.
Pkt In	Number of packets that have been received during this BFD session.
Pkt Out	Number of packets that have been transmitted during this BFD session.
Echo Out	Number of Echo-packets that have been transmitted during this BFD session.
IPv6 Pkt In	Number of IPv6 packets that have been received during this BFD session.
IPv6 Pkt Out	Number of IPv6 packets that have been transmitted during this BFD session.
UP Count	Number of times the BFD session has been up.

© 2026 IP Infusion Inc. Proprietary

Table 47. show bfd session detail fields (continued)

Entry	Description
UPTIME	Length of time this BFD session has been up.
BGP-> Client ID	Protocol and module ID number of this BFD session’s neighboring device.
Flags	Session state of the neighboring device.
Interface	The interface on which the VRF resides.
Down-Reason	The reason causing the VRF to be down.

show bfd session A.B.C.D

Use this command to display information about an IPv4 BFD session neighbor.

Command Syntax

```
show bfd session A.B.C.D A.B.C.D (detail|)
show bfd session vrf WORD A.B.C.D A.B.C.D (detail|)
show bfd session A.B.C.D A.B.C.D <0-4294967295> (detail|)
show bfd session vrf WORD A.B.C.D A.B.C.D <0-4294967295> (detail|)
```

Parameters

WORD
Name of a specific Virtual Routing and Forwarding instance

A.B.C.D
Display the local IPv4 address.

A.B.C.D
Display the neighbor IPv4 address.

<0-4294967295>
Display the interface index of the address.

detail
Display detailed information.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show bfd session 10.1.1.66 10.1.1.67 3

show bfd session ipv6

Use this command to display information about an IPv6 BFD session neighbor.

Command Syntax

```
show bfd session ipv6 X:X::X:X X:X::X:X (detail|)
show bfd session ipv6 vrf WORD X:X::X:X X:X::X:X (detail|)
show bfd session ipv6 X:X::X:X X:X::X:X <0-4294967295> (detail|)
show bfd session ipv6 vrf WORD X:X::X:X X:X::X:X <0-4294967295> (detail|)
```

Parameters

WORD
Name of a specific Virtual Routing and Forwarding instance

X:X::X:X
Display the local IPv6 address.

X:X::X:X
Display the neighbor IPv6 address.

<0-4294967295>
Display the interface index of the address.

detail
Display detailed information.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

show debugging bfd

Use this command to display debugging information for BFD processes.

Command Syntax

```
show debugging bfd
```

Parameters

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show debugging bfd
BFD debugging status:
BFD events debugging is on
BFD packet debugging is on
BFD ipc-error debugging is on
BFD ipc-event debugging is on
BFD session debugging is on
BFD nsm debugging is on
#
```

© 2026 IP Infusion Inc. Proprietary

snmp restart bfd

Use this command to restart SNMP in Bidirectional Forwarding (BFD).

Command Syntax

```
snmp restart bfd
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#snmp restart bfd
```

© 2026 IP Infusion Inc. Proprietary

Protocol Commands for BFD

The section describes the commands used to manage BFD functionality for OSPF, IS-IS and BGP.

area virtual-link 1722
bfd all-interfaces 1723
debug bgp bfd 1724
debug isis bfd 1725
debug ospf bfd 1726
ip ospf bfd 1727
isis bfd 1728

© 2026 IP Infusion Inc. Proprietary

area virtual-link

Use this command to enable the BFD option for a specified virtual-link neighbor.

Use the `no` form of the command to disable BFD on a virtual-link neighbor.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
```

Parameters

A.B.C.D
Indicate an area IP address

<0-429467295>
Indicate an area ID in integer format

virtual-link
Indicate a virtual link and its parameters

A.B.C.D
Indicate the IP address of the virtual link

fall-over
Indicate fall-over detection

bfd
Specify the Bidirectional Forwarding Detection (BFD)

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ospf
(config-router)#area 1 virtual-link 192.168.0.1 fall-over bfd
```

© 2026 IP Infusion Inc. Proprietary

bfd all-interfaces

Use this command to enable BFD for all neighbors maintained by an OSPF process or an ISIS instance.

Use the `no` form of the command to disable BFD.

Note: This command does not apply BFD to virtual-link neighbors.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

By default, bfd all interface is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ospf
(config-router)#bfd all-interfaces

#configure terminal
(config)#router isis
(config-router)# bfd all-interfaces
```

© 2026 IP Infusion Inc. Proprietary

debug bgp bfd

Use this command to debug BFD processes in BGP.

Use the `no` form of the command to stop debugging.

Command Syntax

```
debug bgp bfd
no debug bgp bfd
```

Parameters

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug bgp bfd
```

© 2026 IP Infusion Inc. Proprietary

debug isis bfd

Use this command to debug BFD processes in IS-IS.

Use the `no` form of the command to stop debugging.

Command Syntax

```
debug isis bfd
no debug isis bfd
```

Parameters

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug isis bfd
```

© 2026 IP Infusion Inc. Proprietary

debug ospf bfd

Use this command to debug BFD processes in OSPF.

Use the `no` form of the command to stop debugging.

Command Syntax

```
debug ospf bfd
no debug ospf bfd
```

Parameters

None

Command Mode

Execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ospf bfd
```

© 2026 IP Infusion Inc. Proprietary

ip ospf bfd

Use this command to enable the BFD option for OSPF neighbors on an interface. Use the no form of the command to disable the BFD option for OSPF neighbors on an interface.

Note: When BFD monitoring is enabled for ospf session, protocol admin events like clear/ shutdown will cause BFD session to go to admin down.Due to this, neigbourship/adjacency down detection on peer will be according to the protocol configured dead interval and is not based on BFD interval.

Command Syntax

```
ip ospf bfd (disable|)
no ip ospf bfd (disable|)
```

Parameter

disable
Disable the BFD option for neighbors on an interface

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip ospf bfd
```

© 2026 IP Infusion Inc. Proprietary

isis bfd

Use this command to enable the BFD option for IS-IS neighbors on an interface. Use the `no` form of the command to disable the BFD option for neighbors on an interface.

Note: When BFD monitoring is enabled for ISIS session, protocol admin events like clear/ shutdown will cause BFD session to go to admin down.

Command Syntax

```
isis bfd (disable|)
no isis bfd (disable|)
```

Parameter

disable
Used to disable the BFD option for neighbors on an interface

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis bfd disable
```

© 2026 IP Infusion Inc. Proprietary

BFD Static Route Commands

Bidirectional Forwarding Detection (BFD) support for static routes can be configured on a static route basis, interface basis, or on a global level:

- When BFD is configured for an IPv4 or IPv6 static route, BFD provides the next-hop reachability detection for the given static route.
- When BFD is configured for an interface, BFD provides the data plane next-hop reachability information for any IPv4 or IPv6 static route configured through the given interface.
- When BFD is configured globally, BFD is applied on all interfaces with a single command. In all these cases, the BFD session update for NSM governs the state of the static routes.

This section includes the following commands:

ip bfd static all-interfaces 1730
ip static fall-over-bfd 1731
ip static bfd 1732
ipv6 bfd static all-interfaces 1733
ipv6 static fall-over-bfd 1734
ipv6 static bfd 1735

© 2026 IP Infusion Inc. Proprietary

ip bfd static all-interfaces

Use this command to enable BFD support for IPv4 static routes configured on all interfaces.

Use the `no` option with this command to disable BFD support for IPv4 static routes configured on all interfaces.

Command Syntax

```
ip bfd static all-interfaces
ip bfd vrf NAME static all-interfaces
no ip bfd static all-interfaces
no ip bfd vrf NAME static all-interfaces
```

Parameters

NAME

Enable/disable IPv4 static BFD on all interfaces bound to this user-defined Virtual Routing and Forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Example

```
#configure terminal
(config)#ip bfd static all-interfaces

#configure terminal
(config)#ip  bfd  vrf vrf1 static all-interfaces
```

© 2026 IP Infusion Inc. Proprietary

ip static fall-over-bfd

Use this command to enable BFD support for a specific IPv4 static route.

Use the `no` form of the command to disable the BFD support for a specific IPv4 static route.

Note: Configuring static BFD with an invalid next-hop requires recursive resolution to form a session. However, the system does not support multi-hop static BFD.

Command Syntax

```
ip static A.B.C.D/M A.B.C.D fall-over-bfd (disable|enable)
no ip static A.B.C.D/M A.B.C.D
ip static vrf NAME A.B.C.D/M A.B.C.D fall-over-bfd (disable|enable)
no ip static vrf NAME A.B.C.D/M A.B.C.D
```

Parameters

A.B.C.D/M
The IPv4 destination prefix and mask length.

A.B.C.D
The IPv4 gateway address.

fall-over-bfd disable
Disable BFD.

fall-over-bfd enable
Enable BFD.

vrf NAME
Enable/disable BFD for the IPv4 routes for this user-defined Virtual Routing and Forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5. Added a note in OcNOS version 6.6.1.

Example

```
#configure terminal
(config)#ip static  A.B.C.D/M A.B.C.D fall-over-bfd disable

#configure terminal
(config)# ip static vrf vrf1  A.B.C.D/M A.B.C.D fall-over-bfd enable
```

© 2026 IP Infusion Inc. Proprietary

ip static bfd

Use this command to enable or disable BFD support for IPv4 static route(s) configured on an interface.

Use the `no` option with this command to reset BFD support for IPv4 static route(s) configured on an interface.

Note: When static bfd is enabled on the interface (`ip static bfd enable`) and if the bfd session is not up, then the related static route to that interface will fall into inactive state.

Command Syntax

```
ip static bfd (disable|enable)
no ip static bfd
```

Parameters

disable
Disable BFD

enable
Enable BFD

Command Mode

Interface mode

Default

By default, BFD static route support is disabled at all levels.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip static bfd disable

(config)#interface eth1
(config-if)#ip static bfd enable
```

© 2026 IP Infusion Inc. Proprietary

ipv6 bfd static all-interfaces

Use this command to enable BFD support for IPv6 static routes on all interfaces.

Use the `no` option with this command to disable BFD support for IPv6 static routes on all interfaces.

Command Syntax

```
ipv6 bfd static all-interfaces
ipv6 bfd vrf NAME static all-interfaces
no ipv6 bfd static all-interfaces
no ipv6 bfd vrf NAME static all-interfaces
```

Parameters

NAME

Enable/disable IPv6 static BFD on all interfaces bound to this user-defined Virtual Routing and Forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Example

```
#configure terminal
(config)#ipv6 bfd static all-interfaces

#configure terminal
(config)#ipv6 bfd vrf vrf1 static all-interfaces
```

© 2026 IP Infusion Inc. Proprietary

ipv6 static fall-over-bfd

Use this command to enable BFD support for a specific IPv6 static route.

Use the `no` option with this command to disable BFD support for a specific IPv6 static route.

Command Syntax

```
ipv6 static X:X::X:X/M X:X::X:X fall-over-bfd (disable|enable)
no ipv6 static X:X::X:X/M X:X::X:X
ipv6 static vrf NAME X:X::X:X/M X:X::X:X fall-over-bfd (disable|enable)
no ipv6 static vrf NAME X:X::X:X/M X:X::X:X
```

Parameters

X:X::X:X/M
The IPv6 destination prefix and mask length.

X:X::X:X
The IPv6 gateway address.

NAME
Enable/disable BFD for the IPv6 routes for this user-defined Virtual Routing and Forwarding instance name.

disable
Disable BFD.

enable
Enable BFD.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Examples

```
#configure terminal
(config)# ipv6 static X:X::X:X/M X:X::X:X fall-over-bfd disable

#configure terminal
(config)#ipv6 static  X:X::X:X/M X:X::X:X fall-over-bfd enable

#configure terminal
(config)#ipv6 static vrf vrf1  X:X::X:X/M X:X::X:X fall-over-bfd disable
```

© 2026 IP Infusion Inc. Proprietary

ipv6 static bfd

Use this command to disable BFD support for IPv6 static route(s) configured on an interface.

Use the `no` option with this command to reset BFD support for IPv6 static route(s) configured on an interface.

Command Syntax

```
ipv6 static bfd (disable|enable)
no ipv6 static bfd
```

Parameters

disable
Disable BFD

enable
Enable BFD

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 static bfd disable
```

IS-IS IPv4

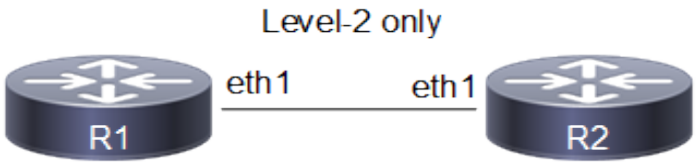
This section contains basic Intermediate System to Intermediate System (IS-IS) configuration examples.

Enable IS-IS on an Interface Configuration

This example shows the minimum configuration required for enabling IS-IS on an interface. R1 and R2 are two routers in the `ABC` instance connecting to the network 10.10.10.0/24. After enabling IS-IS on an interface, create a routing instance, and specify the Network Entity Title (NET). IS-IS explicitly specifies a NET to begin routing. NET is comprised of the area address and the system ID of the router.

Topology

Figure 110. Basic IS-IS Topology



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC).`
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (`ABC`).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

R2 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC).`

© 2026 IP Infusion Inc. Proprietary

`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49(ABC)`.
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

```

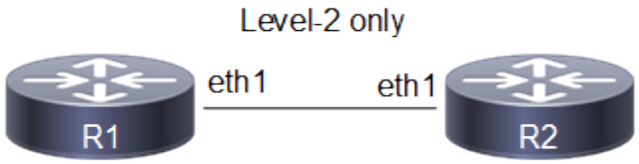
Set Priority

This example describes how to set the priority for an interface. Set a high priority for a router to make it the Designated IS (DIS). Router R2 is configured to have a priority of 125, this is higher than the default priority (64) of R1. This makes R2 the DIS.

Topology

Figure 111. Set IS-IS Priority



R1 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49` (`ABC`).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

R2 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#isis priority 125`	Specify the router priority to a higher priority (125) to make R2 the designated IS (DIS).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49` (`ABC`).

© 2026 IP Infusion Inc. Proprietary

`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Next IS-IS LAN Level-2 Hello in 737 milliseconds
```

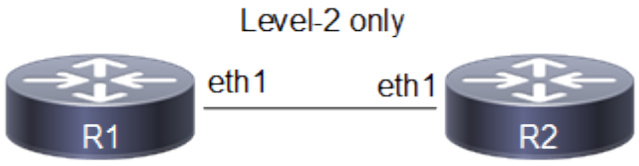
Dynamic Hostname

This example shows how to configure Dynamic Hostname for an ISIS instance. Dynamic hostname is the method of mapping name-to-systemID. It allows the routing protocol to advertise symbolic names in the IS-IS PDUs. This is done by the addition of a new TLV which allows the IS-IS routers to include the name-to-systemID mapping data in their LSPs. This allows for simple and reliable transport of name mapping across IS-IS networks. Dynamic hostname can be either the hostname of the node or the tag of the configured ISIS instance.

Note: Dynamic-hostname has to be configured on all nodes for it to take effect.

Topology

Figure 112. Basic dynamic hostname topology



R1 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

R2 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#commit`	Commit candidate configuration to the running configuration

Redistribute Routes into IS-IS

In this example, the configuration causes OSPF routes to be imported into the IS-IS routing table, and advertised into the `ABC` instance.

Topology

Figure 113. Redistribute Routes Into IS-IS

R1 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).

© 2026 IP Infusion Inc. Proprietary

`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#commit`	Commit candidate configuration to the running configuration

R2 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 31.31.31.1/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#redistribute ospf`	Specify redistributing routes from other routing protocol (OSPF) into IS-IS.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit interface mode.
`(config)#interface lo`	Configure interface lo
`(config-if)#ip address 2.2.2.2/32 secondary`	Configure secondary IP address to loopback interface
`(config-if)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure OSPF routing process and specify the tag (100) which uniquely identifies the routing process
`(config-router)#ospf router-id 2.2.2.2`	Specify a Router ID (2.2.2.2) for the OSPF routing process.
`(config-router)#network 2.2.2.2/32 area 0.0.0.0`	Advertising 2.2.2.2 network
`(config-router)#network 31.31.31.0/24 area 0.0.0.0`	Advertising 31 network
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.

R3 Configuration

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 31.31.31.2/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Configure interface lo
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure secondary IP address to loopback interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure OSPF routing process and specify the tag (100) which uniquely identifies the routing process
`(config-router)#ospf router-id 3.3.3.3`	Specify a Router ID (3.3.3.3) for the OSPF routing process.
`(config-router)#network 3.3.3.3/32 area 0.0.0.0`	Advertising 3.3.3.3 network
`(config-router)#network 31.31.31.0/24 area 0.0.0.0`	Advertising 31 network
`(config-if)#commit`	Commit candidate configuration to the running configuration

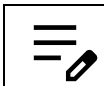
Metric

Users can make a route the preferred route by changing its metric. In this example, the cost has been configured to make R3 the next hop for R1.

The default metric for each interface is 10. Interface eth3 on R2 has a metric of 20, and Interface eth2 on R3 has a metric of 30. The total cost to reach `10.10.14.0/24 (R4)` through R2 and R3 is computed as follows:

- R2: 10+20 = 30
- R3: 10+30 = 40

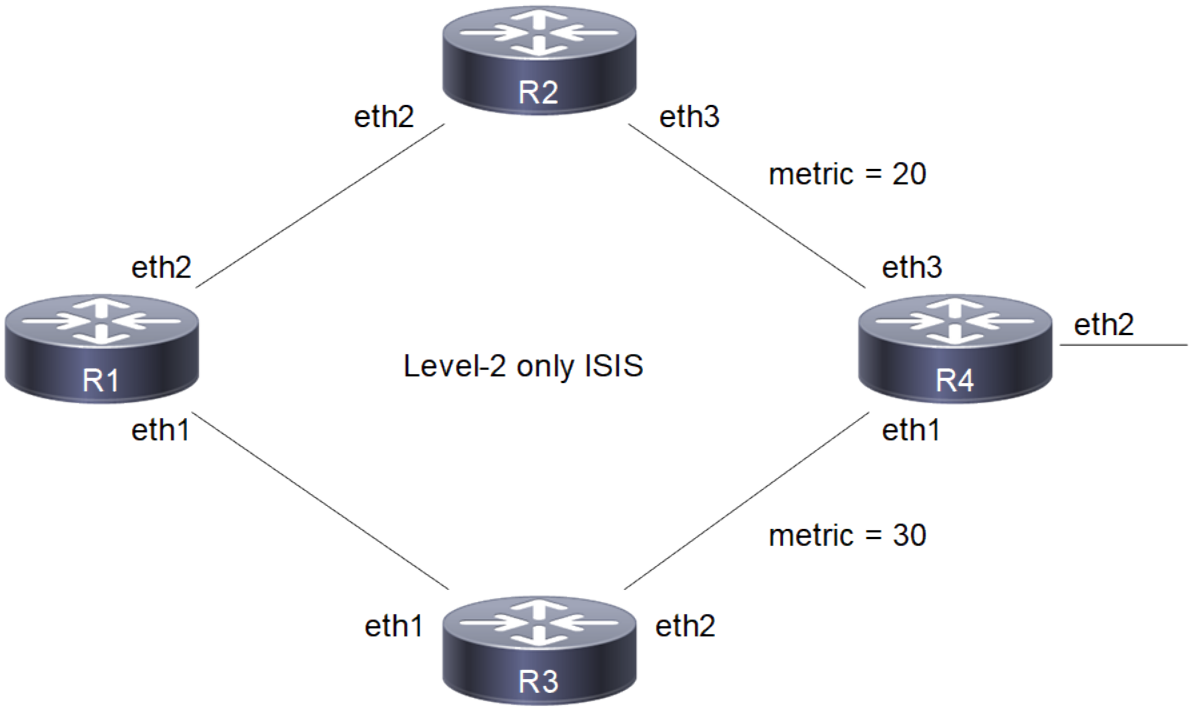
In this topology, R1 chooses R2 as its next hop for destination `10.10.14.0/24`.



Note: Below configuration is applicable for narrow (non-wide) metric-style. Wide metric can be configured by using the CLI's "`metric-style wide`" under isis instance and "`isis wide-metric < 1-16777214>`" under interface mode.

Topology

Figure 114. Metric Topology



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS

	instance.
(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#commit	Commit candidate configuration to the running configuration

R2 Configuration

(config)#interface eth2	Enter interface mode.
(config-if)#ip address 30.30.30.2/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ip address 40.40.40.1/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#isis metric 20	Set the value of IS-IS metric (on eth3) to 20.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.
(config-router)#net 49.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#commit	Commit candidate configuration to the running configuration

R3 Configuration

(config)#interface eth1	Enter interface mode.
(config-if)#ip address 20.20.20.2/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#commit	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#ip address 50.50.50.1/24`	Configure IP address on interface.
`(config-if)#isis metric 30`	Set the value of IS-IS metric (on `eth2`) to `30`.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49` (`ABC`).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#net 49.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

R4 Configuration

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#ip address 50.50.50.2/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#ip address 40.40.40.2/24`	Configure IP address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49` (`ABC`).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#net 49.0000.0000.0004.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

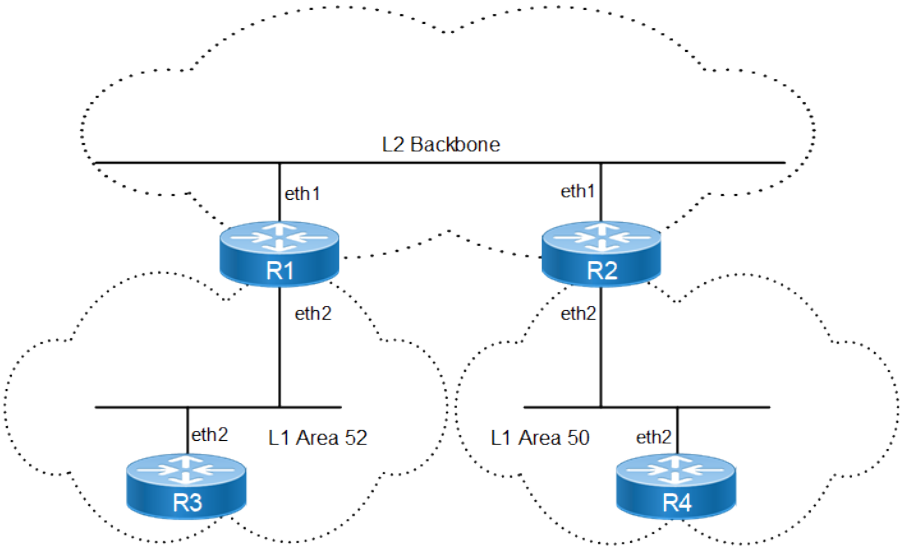
L1-L2 Area Routing with a Single Instance

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the single-instance version of the Level-1-2 router.

Topology

Figure 115. Single-Instance L1-L2 Area Routing



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on the interface eth1 for area ABC.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type for the interface eth1.
`(config-if)#exit`	Exit interface mode.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on the interface eth2 for area ABC.
`(config-if)#isis circuit-type level-1`	Set the circuit type for interface eth2 to level 1.

© 2026 IP Infusion Inc. Proprietary

(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area ABC.
(config-router)#net 52.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#commit	Commit candidate configuration to the running configuration

R2 Configuration

(config)#interface eth1	Enter interface mode.
(config-if)#ip router isis bb	Enable IS-IS routing on the interface eth1 for area bb.
(config-if)#ip address 20.20.20.2/24	Configure IP address on interface.
(config-if)#isis circuit-type level-2-only	Set the circuit type for the interface eth1 to level-2 only.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 40.40.40.1/24	Configure IP address on interface.
(config-if)#ip router isis bb	Enable IS-IS routing on interface eth2 for area bb.
(config-if)#isis circuit-type level-1	Set the circuit type for interface eth2 to level 1.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis bb	Create an IS-IS routing instance for area bb.
(config-router)#net 50.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-if)#commit	Commit candidate configuration to the running configuration

R3 Configuration

(config)#interface eth2	Enter interface mode.
(config-if)#ip address 30.30.30.2/24	Configure IP address on interface.
(config-if)#ip router isis xyz	Enable IS-IS routing on the interface eth2 for area xyz.
(config-if)#commit	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#router isis xyz`	Create an IS-IS routing instance for area `xyz`.
`(config-router)#is-type level-1`	Set the IS level for this area (`xyz`) as `level-1`.
`(config-router)#net 52.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-if)#commit`	Commit candidate configuration to the running configuration

R4 Configuration

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.2/24`	Configure IP address on interface.
`(config-if)#ip router isis aa`	Enable IS-IS routing on the interface `eth2` for area `aa`.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis aa`	Create an IS-IS routing instance for area `aa`.
`(config-router)#is-type level-1`	Set the IS level for this area (`aa`) as `level-1`.
`(config-router)#net 50.0000.0000.0004.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-if)#commit`	Commit candidate configuration to the running configuration

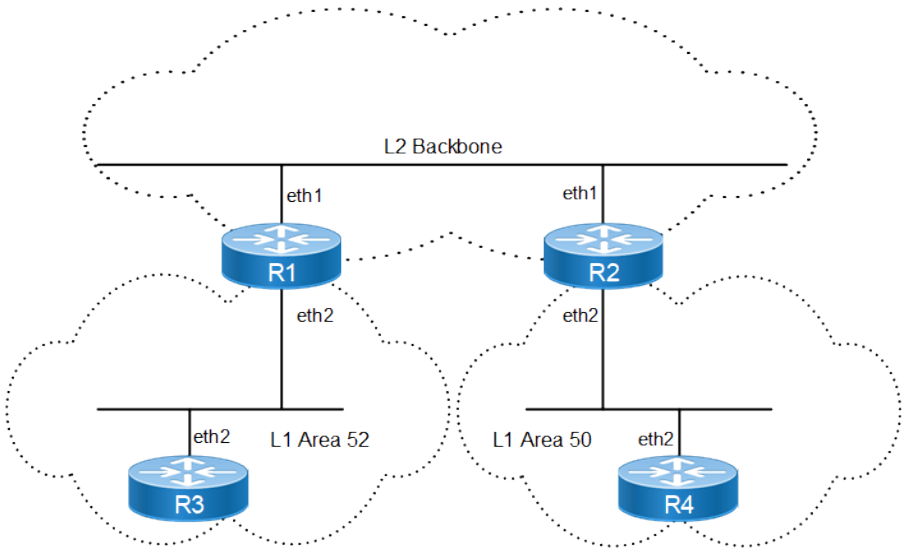
L1-L2 Area Routing with Multiple Instances

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the multiple-instance version of the Level-1-2 router.

Topology

Figure 116. Multiple-Instance L1-L2 Area Routing



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis aaa`	Enable IS-IS routing on interface `eth1` for area

	aaa.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis aaa	Create an IS-IS routing instance for area aaa.
(config-router)#is-type level-2-only	Set the IS level for this area (aaa) as level-2-only.
(config-router)#net bb.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 30.30.30.1/24	Configure IP address on interface.
(config-if)#ip router isis ccc	Enable IS-IS routing on interface eth2 for area ccc.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ccc	Create an IS-IS routing instance for area ccc.
(config-router)#is-type level-1	Set the IS level for this area (ccc) as level-1.
(config-router)#net cc.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-if)#commit	Commit candidate configuration to the running configuration

R2 Configuration

(config)#interface eth1	Enter interface mode.
(config-if)#ip address 20.20.20.2/24	Configure IP address on interface.
(config-if)#ip router isis bb	Enable IS-IS routing on interface eth1 for area bb.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis bb	Create an IS-IS routing instance for area bb.
(config-router)#is-type level-2-only	Set the IS level for this area (bb) as level-2-only.
(config-router)#net bb.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-if)#commit	Commit candidate configuration to the running

	configuration
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on interface `eth2` for area `ABC`.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `ABC`.
`(config-router)#is-type level-1`	Set the IS level for this area (`ABC`) as `level-1`.
`(config-router)#net cc.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-if)#commit`	Commit candidate configuration to the running configuration

R3 Configuration

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IP address on interface.
`(config-if)#ip router isis xyz`	Enable IS-IS routing on interface `eth2` for area `xyz`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis xyz`	Create an IS-IS routing instance for area `xyz`.
`(config-router)#is-type level-1`	Set the IS level for this area (`xyz`) as `level-1`.
`(config-router)#net 52.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4 Configuration

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.2/24`	Configure IP address on interface.
`(config-if)#ip router isis aa`	Enable IS-IS routing on interface `eth2` for area `aa`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis aa`	Create an IS-IS routing instance for area `aa`.
`(config-router)#is-type level-1`	Set the IS level for this area (`aa`) as `level-1`.
`(config-router)#net 52.0000.0000.0004.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

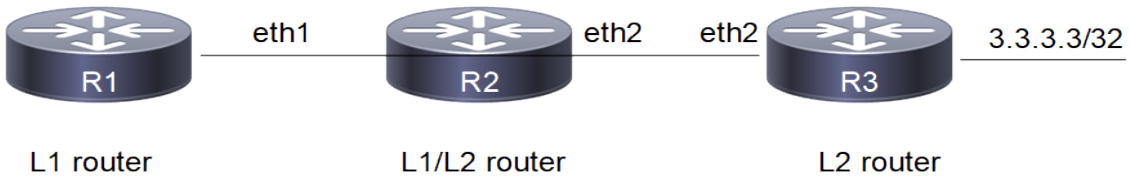
Route Leaking

Route leaking is defined in RFC 2966. For Level-1 (L1) routers, only level-1 routes are populated in the routing table. The L1 router has a default route to the nearest Level-1/Level-2 (L1/L2) router: This could result in sub-optimal routing in certain scenarios. Route leaking causes an L1/L2 router to advertise the level-2 routes in its database to the L1 router, thus allowing the L1 router to acknowledge the prefixes advertised by the Level-2 (L2) router. In this way, the L1 router has the ability to learn the true cost to reach other areas.

In the following example, R1 is the L1 router, R2 is the L1/L2 router doing the route leaking, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacency with R1 and R3 are already up, and the route tables with appropriate routes are already populated.

Topology

Figure 117. Route Leaking Topology



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#is-type level-1`	Configure instance as level-1.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).
`(config-if)#commit`	Commit candidate configuration to the running configuration

R2 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R1).
`(config-if)#isis circuit-type level-1`	Configure instance as level-1-only routing.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth2 (connected to R3).
`(config-if)#isis circuit-type level-2-only`	Configure instance as level-2-only routing.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0002.00`	Define the NET address.
`(config-router-af)#redistribute isis level-2 into level-1`	Enable redistribution of isis routes from level-2 into level-1
`(config-if)#commit`	Commit candidate configuration to the running configuration

R3 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface (lo)to configure and enter Interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address on loopback interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface lo
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0001.0000.0000.0003.00`	Define the NET address.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type as level-2-only for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).
`(config-if)#commit`	Commit candidate configuration to the running configuration

In the example, route, `i ia 3.3.3.3/32 [115/30] via 20.20.20.2, eth1, 00:12:29`, is the L2 route leaked by the L1/L2 router into the L1 router.

Route Summarization

Route summarization makes the routing table smaller, but still allows complete IP connectivity, if everything is configured properly.

The following example consists of a three-router topology, in which R2 is doing the summarization. In this example, R1 is the L1 router, R2 is the L1/L2 router doing the summarization, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacencies with R1 and R3 are already up, and the route tables with the appropriate routes are already populated.

Topology

Figure 118. Route Summarization Topology

R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#is-type level-1`	Configure instance as level-1.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).
`(config-if)#commit`	Commit candidate configuration to the running configuration

R2 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R1).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.

© 2026 IP Infusion Inc. Proprietary

(config-if)#isis circuit-type level-2-only	Set the circuit type as level-2-only for the interface
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2 (connected to R3).
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode and return to Configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0002.00	Define the NET address.
(config-router-af)#redistribute isis level-2 into level-1	Enable redistribution of isis routes from level-2 into level-1
(config-router-af)#summary-address 66.66.66.0/24 level-1 metric 50	Configure the summary address to summarize IP reachability information.
(config-if)#commit	Commit candidate configuration to the running configuration

R3 Configuration

#configure terminal	Enter configure mode.
(config)#ip route 66.66.66.1/32 eth2	Configure ip static route.
(config)#ip route 66.66.66.2/32 eth2	Configure ip static route.
(config)#ip route 66.66.66.3/32 eth2	Configure ip static route.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0001.0000.0000.0003.00	Define the NET address.
(config-router)#redistribute static	Enable redistribution of static routes into ISIS instance.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-router)#exit	Exit router mode.
(config)#interface eth2	Specify the interface (eth2)to configure and enter Interface mode.
(config-if)#ip address 30.30.30.2/24	Configure IP address on interface.
(config-if)#isis circuit-type level-2-only	Set the circuit type as level-2-only for the interface
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R2).
(config-if)#commit	Commit candidate configuration to the running configuration

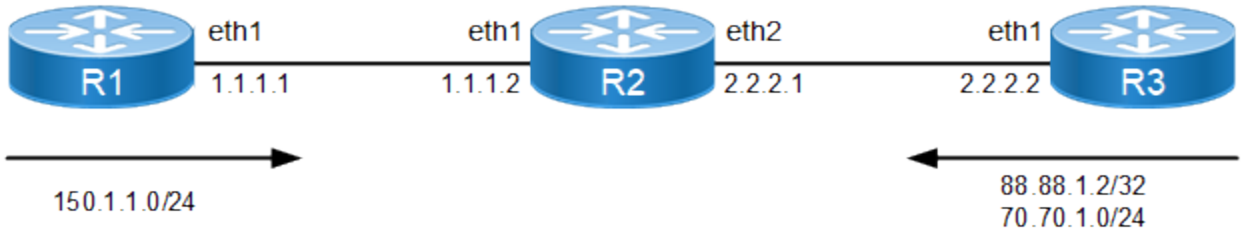
IS-IS Distance

Administrative distance in IS-IS can be configured for a specified source ID or for all routes. This example shows configuring the IS-IS administrative distance for the IPv4 address family.

Topology

Figure 119. IS-IS Distance Topology



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/24`	Assign the IP address on this interface (eth1).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	
`(config)#ip route 150.1.1.0/24 eth1`	Configure static routes.
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).

© 2026 IP Infusion Inc. Proprietary

(config-router)#net 49.0001.0000.0001.00	Set a Network Entity Title (NET) for this instance, specifying the address and the system ID.
(config-router)#redistribute static	Redistribute the static routes.
(config-if)#commit	Commit candidate configuration to the running configuration

R2 Configuration

#configure terminal	Enter configure mode
(config)#ip access-list DIST	Enter access list mode
(config-ip-acl)#permit ipip 88.88.1.2/32 any	Create an access list to permit the 88.88.1.2/32 route from R3.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-ip-acl)#exit	Exit access list mode
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 1.1.1.2/24	Assign the IP address on this interface (eth1).
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 2.2.2.1/24	Assign the IP address on this interface (eth2).
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0002.00	Specify the NET address.
(config-router)#distance 100	Configure the administrative distance for all routes received from R1 and R2.
(config-router)#distance 20 0001.0000.0001	Configure the administrative distance for all routes received from R1. This command overwrites the applied distance, 100, and will apply distance 20 for all routes received from R1.
(config-router)#distance 30 0001.0000.0003 DIST	Configure the distance, 30, to the route, 88.88.1.2/32, received from R3. All other routes from R3 (for example, 70.70.1.0/24) will have the distance applied as 100. If the distance, 100, is not configured, all other routes will have a default distance of 115.
(config-if)#commit	Commit candidate configuration to the running configuration

R3 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/24`	Assign the IP address on this interface (eth1).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#ip route 88.88.1.2/32 eth2`	Configure static routes
`(config)#ip route 70.70.1.0/24 eth2`	Configure static routes
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0003.00`	Specify the NET address.
`(config-router)#redistribute static`	Redistribute the static routes.
`(config-if)#commit`	Commit candidate configuration to the running configuration

Overload Bit

This section provides examples of configuring the IS-IS overload bit. For detailed information about the commands used in these examples, refer to the IS-IS Commands (page 1929) section.

Overview

The expanded use of the overload bit in IS-IS proves beneficial for Internet Service Providers (ISPs) operating both BGP and IS-IS, helping them avoid specific routing anomalies. With the overload bit feature, a router can automatically disable the overload bit when BGP achieves convergence.

IS-IS will deactivate the overload bit if BGP fails to converge within ten minutes and the `wait-for-bgp` option is set in the configuration.

On-Startup Wait-for-BGP

When configure the `set overload-bit wait-for-bgp` after a restart (e.g., using commands like `set-overload-bit on-startup wait-for-bgp` or `set-overload-bit on-startup <5-86400>`), the IS-IS router broadcasts the overload bit status to all its neighbors. This informs them not to route traffic through this router, except for traffic destined for networks directly connected to it.

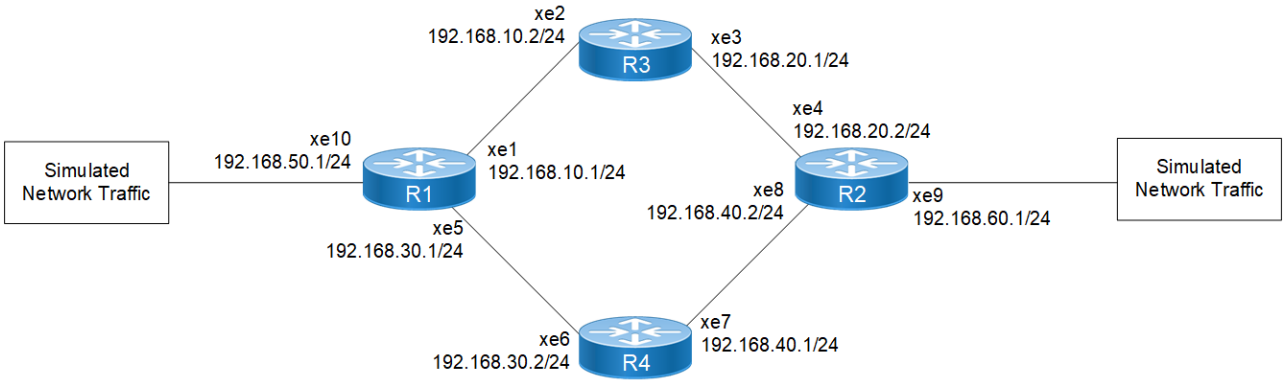
If an interface is configured with the `no set-overload-bit` command, the router will not advertise or set the overload bit during startup.

Topology

The illustration below shows a sample topology with four routers (R1, R2, R3, and R4) connected in a linear sequence.

In this network configuration scenario, these routers collaborate to create a dynamic and resilient routing environment. Through the implementation of both BGP and IS-IS routing protocols, these routers establish connections, exchange routing information, and optimize network performance. Each router plays a unique role in this network, with specific configurations tailored to ensure smooth communication and fault tolerance.

Figure 120. Configure Overload Bit Wait-for-BGP



The key element in these configurations is on R3 and R4, where the `set-overload-bit on-startup wait-for-bgp` commands are used. By configuring R3 and R4 with these commands, IS-IS on R3 and R4 will advertise the overload bit to its neighbors, effectively informing them not to route traffic through R3 and R4 until BGP has converged. This behavior helps prevent routing anomalies during network restarts and enhances network stability.

R1 Configuration

The following are the step-by-step configurations on the R1 router.

Step 1: Assign IP Addresses to the Interfaces

`R1#configure terminal`	Enters configure mode.
`R1(config)#interface xe1`	Configures interface `xe1` and enters interface mode.
`R1(config-if)#ip address 192.168.10.1/24`	Assigns the IP address `192.168.10.1/24`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R1(config)#interface xe5`	Configures interface `xe5` and enters interface mode.
`R1(config-if)#ip address 192.168.30.1/24`	Assigns the IP address `192.168.30.1/24`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R1(config)#interface xe10`	Configures interface `xe10` and enters interface mode.
`R1(config-if)#ip address 192.168.50.1/24`	Assigns the IP address `192.168.50.1/24`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and return to the configure mode.

Step 2: Configure IS-IS Operations

`R1(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.
`R1(config-router)#is-type level-2-only`	Specifies IS-IS to operate as Level-2.
`R1(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R1(config-router)#net 49.0000.0000.0001.00`	Configures IS-IS network entity title.
`R1(config-router)#redistribute connected`	Redistributes connected routes into IS-IS.
`R1(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

© 2026 IP Infusion Inc. Proprietary

Step 3: Configure Interfaces to Participate in IS-IS Process

`R1(config)#interface xe1`	Configures interface `xe1` and enters interface mode.
`R1(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe1`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R1(config)#interface xe5`	Configures interface `xe5` and enters interface mode.
`R1(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe5`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 4: Configure Route-map and Set Weight

Configure a route map and set the weight within the route map

`R1(config)#route-map rmap1 permit 10`	Configures a route map named `rmap1` with a permit statement and enters route-map mode.
`R1(config-route-map)#set weight 4000`	Sets the weight to 4000 in the route map.
`R1(config-route-map)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-route-map)#exit`	Exits route-map mode and returns to the configure mode.

Step 5: Configure and Activate BGP Neighbors

Configure and activate BGP neighbors, and apply the route map to BGP neighbors for both inbound and outbound traffic.

`R1(config)#router bgp 100`	Enters BGP router mode with AS number `100`.
`R1(config-router)#neighbor 192.168.10.2 remote-as 300`	Configures BGP neighbors with remote AS number `300`.
`R1(config-router)#neighbor 192.168.30.2 remote-as 400`	Configures BGP neighbors with remote AS number `400`.
`R1(config-router)#neighbor 192.168.50.2 remote-as 500`	Configures BGP neighbors with remote AS number `500`.
`R1(config-router)#address-family ipv4 unicast`	Enters BGP address family mode for IPv4 unicast.
`R1(config-router-af)#redistribute connected`	Redistributes connected routes into BGP.

© 2026 IP Infusion Inc. Proprietary

`R1(config-router-af)#neighbor 192.168.10.2 activate`	Activates BGP neighbors.
`R1(config-router-af)#neighbor 192.168.10.2 route-map rmap1 in`	Applies the route-map `rmap1` to BGP neighbors for inbound traffic.
`R1(config-router-af)#neighbor 192.168.10.2 route-map rmap1 out`	Applies the route-map `rmap1` to BGP neighbors for outbound traffic.
`R1(config-router-af)#neighbor 192.168.30.2 activate`	Activates BGP neighbors.
`R1(config-router-af)#neighbor 192.168.50.2 activate`	Activates BGP neighbors.
`R1(config-router-af)#exit-address-family`	Exits BGP address family mode.
`R1(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exits BGP router mode and returns to the configure mode.

R2 Configuration

The following are the step-by-step configurations on the R2 router.

Step 1: Assign IP Addresses to the Interfaces

`R2#configure terminal`	Enters configure mode.
`R2(config)#interface xe4`	Configures interface `xe4` and enters interface mode.
`R2(config-if)#ip address 192.168.20.2/24`	Assigns the IP address `192.168.20.2/24`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R2(config)#interface xe8`	Configures interface `xe8` and enters interface mode.
`R2(config-if)#ip address 192.168.40.2/24`	Assigns the IP address `192.168.40.2/24`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R2(config)#interface xe9`	Configures interface `xe9` and enters interface mode.
`R2(config-if)#ip address 192.168.60.1/24`	Assigns the IP address `192.168.60.1/24`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

`R2(config-if)#exit`	Exits interface mode and return to the configure mode.

Step 2: Configure IS-IS IPv4 Routing

`R2(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.
`R2(config-router)#is-type level-2-only`	Specifies IS-IS to operate as Level-2.
`R2(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R2(config-router)#net 50.0000.0000.0002.00`	Configures IS-IS network entity title.
`R2(config-router)#redistribute connected`	Redistributes connected routes into IS-IS.
`R2(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

Step 3: Enable IS-IS IPv4 Routing on the Interfaces

`R2(config)#interface xe4`	Configures interface `xe4` and enters interface mode.
`R2(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe4`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R2(config)#interface xe8`	Configures interface `xe8` and enters interface mode.
`R2(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe8`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 4: Configure Route-map and Set Weight

Configure a route map and set the weight within the route map.

`R2(config)#route-map rmap1 permit 10`	Configures a route map named `rmap1` with a permit statement and enters route-map mode.
`R2(config-route-map)#set weight 4000`	Sets the weight to `4000` in the route map.
`R2(config-route-map)#commit`	Commits the candidate configuration to the running configuration.

`R2(config-route-map)#exit`	Exits route-map mode and returns to the configure mode.

Step 5: Configure and Activate BGP Neighbors

Configure and activate BGP neighbors, and apply the route map to BGP neighbors for both inbound and outbound traffic.

`R2(config)#router bgp 200`	Enters BGP router mode with AS number `200`.
`R2(config-router)#neighbor 192.168.20.1 remote-as 300`	Configures BGP neighbors with remote AS number `300`.
`R2(config-router)#neighbor 192.168.40.1 remote-as 400`	Configures BGP neighbors with remote AS number `400`.
`R2(config-router)#neighbor 192.168.60.2 remote-as 600`	Configures BGP neighbors with remote AS number `600`.
`R2(config-router)#address-family ipv4 unicast`	Enters BGP address family mode for IPv4 unicast.
`R2(config-router-af)#redistribute connected`	Redistributes connected routes into BGP.
`R2(config-router-af)#neighbor 192.168.20.1 activate`	Activates BGP neighbors.
`R2(config-router-af)#neighbor 192.168.20.1 route-map rmap1 in`	Applies the route-map `rmap1` to BGP neighbors for inbound traffic.
`R2(config-router-af)#neighbor 192.168.20.1 route-map rmap1 out`	Applies the route-map `rmap1` to BGP neighbors for outbound traffic.
`R2(config-router-af)#neighbor 192.168.40.1 activate`	Activates BGP neighbors.
`R2(config-router-af)#neighbor 192.168.60.2 activate`	Activates BGP neighbors.
`R2(config-router-af)#exit-address-family`	Exits BGP address family mode.
`R2(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-router)#exit`	Exits BGP router mode and returns to the configure mode.

R3 Configuration

The following are the step-by-step configurations on the R3 router.

Step 1: Assign IP Addresses to the Interfaces

`R3#configure terminal`	Enters configure mode.
`R3(config)#interface xe2`	Configures interface `xe2` and enters interface mode.
`R3(config-if)#ip address 192.168.10.2/24`	Assigns the IP address `192.168.10.2/24`.

`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R3(config)#interface xe3`	Configures interface `xe3` and enters interface mode.
`R3(config-if)#ip address 192.168.20.1/24`	Assigns the IP address `192.168.20.1/24`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 2: Set the Overload Bit

Configure IS-IS IPv4 routing, setting the overload bit on startup and waiting for BGP convergence.

`R3(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.
`R3(config-router)#is-type level-2-only`	Specifies IS-IS to operate as Level-2.
`R3(config-router)#set-overload-bit on-startup wait-for-bgp`	Configures the overload bit to be set on startup and wait for BGP convergence.
`R3(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R3(config-router)#net 51.0000.0000.0003.00`	Configures IS-IS network entity title.
`R3(config-router)#redistribute connected`	Redistributes connected routes into IS-IS.
`R3(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

Step 3: Enable IS-IS IPv4 Routing on the Interfaces

`R3(config)#interface xe2`	Configures interface `xe2` and enters interface mode.
`R3(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe2`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R3(config)#interface xe3`	Configures interface `xe3` and enters interface mode.
`R3(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe3`.

© 2026 IP Infusion Inc. Proprietary

`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 4: Configure and Activate BGP Neighbors

`R3(config)#router bgp 300`	Enters BGP router mode with AS number `300`.
`R3(config-router)#neighbor 192.168.10.1 remote-as 100`	Configures BGP neighbors with remote AS number `100`.
`R3(config-router)#neighbor 192.168.20.2 remote-as 200`	Configures BGP neighbors with remote AS number `200`.
`R3(config-router)#address-family ipv4 unicast`	Enters BGP address family mode for IPv4 unicast.
`R3(config-router-af)#redistribute connected`	Redistributes connected routes into BGP.
`R3(config-router-af)#neighbor 192.168.10.1 activate`	Activates BGP neighbors.
`R3(config-router-af)#neighbor 192.168.20.2 activate`	Activates BGP neighbors.
`R3(config-router-af)#exit-address-family`	Exits BGP address family mode.
`R3(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-router)#exit`	Exits BGP router mode and returns to the configure mode.

R4 Configuration

The following are the step-by-step configurations on the R4 router.

Step 1: Assign IP Addresses to the Interfaces

`R4#configure terminal`	Enters configure mode.
`R4(config)#interface xe6`	Configures interface `xe6` and enters interface mode.
`R4(config-if)#ip address 192.168.30.2/24`	Assigns the IP address `192.168.30.2/24`.
`R4(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R4(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R4(config)#interface xe7`	Configures interface `xe7` and enters interface mode.
`R4(config-if)#ip address 192.168.40.1/24`	Assigns the IP address `192.168.40.1/24`.
`R4(config-if)#commit`	Commits the candidate configuration to the

© 2026 IP Infusion Inc. Proprietary

	running configuration.
`R4(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 2: Configure IS-IS IPv4 Routing

`R4(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.
`R4(config-router)#is-type level-2-only`	Specifies IS-IS to operate as Level-2.
`R4(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R4(config-router)#net 52.0000.0000.0004.00`	Configures IS-IS network entity title.
`R4(config-router)#redistribute connected`	Redistributes connected routes into IS-IS.
`R4(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R4(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

Step 3: Enable IS-IS IPv4 Routing on the Interfaces

`R4(config)#interface xe6`	Configures interface `xe6` and enters interface mode.
`R4(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe6`.
`R4(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R4(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R4(config)#interface xe7`	Configures interface `xe7` and enters interface mode.
`R4(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe7`.
`R4(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R4(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 4: Configure and Activate BGP Neighbors

`R4(config)#router bgp 400`	Enters BGP router mode with AS number `400`.
`R4(config-router)#neighbor 192.168.30.1 remote-as 100`	Configures BGP neighbors with remote AS number `100`.
`R4(config-router)#neighbor 192.168.40.2 remote-as 200`	Configures BGP neighbors with remote AS number `200`.

`R4(config-router)#address-family ipv4 unicast`	Enters BGP address family mode for IPv4 unicast.
`R4(config-router-af)#redistribute connected`	Redistributes connected routes into BGP.
`R4(config-router-af)#neighbor 192.168.30.1 activate`	Activates BGP neighbors.
`R4(config-router-af)#neighbor 192.168.40.2 activate`	Activates BGP neighbors.
`R4(config-router-af)#exit-address-family`	Exits BGP address family mode.
`R4(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R4(config-router)#exit`	Exits BGP router mode and returns to the configure mode.

Validation

1. Verify the ISIS and BGP sessions are coming up.
2. Send traffic from one network simulator to another and verify traffic flow via R1-R3-R2 router's without loss.
3. Reload R3 router.
4. Verify traffic switchover to the R1-R4-R2 routers path.
5. Unconfigure the BGP neighbor between R2 and R3 routers during R2 routers reload.
6. After reloading, check the overload-bit is set to `1 (0/0/1)` on the R3 router using the `show isis database` command.
7. Now configure the BGP neighbor between R2 and R3 routers and verify the BGP session comes up.
8. After some time, verify the overload-bit is set to `0 (0/0/0)` using the `show isis database` command on the R3 router.
9. Verify traffic switchover to the R1-R3-R2 router's path.

Before Reload

```
R3#show interface counters rate mbps
+-------------------+--------------+-------------+--------------+-------------+
|     Interface     |    Rx mbps   |    Rx pps   |    Tx mbps   |    Tx pps   |
+-------------------+--------------+-------------+--------------+-------------+
 xe4                  680.47         664526        0.01           4
 xe5                  0.00           4             680.48         664525
```

After Reload

```
R3#reload
Are you sure you would like to reset the system? (y/n): y
 Device rebooted by ocnos user from cmlsh at time:Thu Dec  7 11:45:40 2023

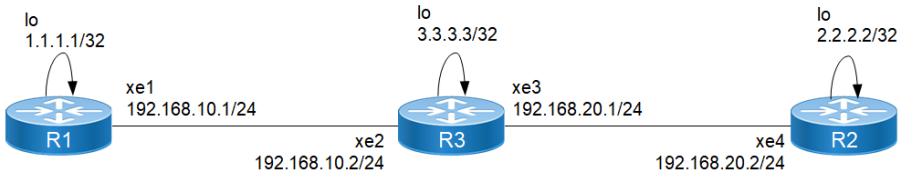
Suppress External and Inter-level Reachability

The control mechanism of suppressing the redistribution of external, inter-level, or both external and inter-level reachabilities is useful for managing the advertisement of these specific reachability data during overload states, providing flexibility in network configurations.

Topology

The illustration below shows a sample topology with three routers (R1, R2, and R3) interconnected in a linear sequence.

Figure 121. Configure Overload Bit Suppress



The key element in the below configurations is on R3 router, where the `set-overload-bit suppress external` and `set-overload-bit suppress interlevel` commands are used.

Configuring the R3 router with the `set-overload-bit suppress external` or `set-overload-bit suppress interlevel` commands in IS-IS prevents the advertisement of external routes learned from BGP to its IS-IS neighbors or prevents the advertisement of inter-level routes to its IS-IS neighbors. The options `suppress external` or `suppress interlevel` contribute to the controlled management of routing information during network overload states.

R1 Configuration

The following are the step-by-step configurations on the R1 router.

Step 1: Assign IP Addresses to the Interfaces

`R1#configure terminal`	Enters configure mode.
`R1(config)#interface xe1`	Configures interface `xe1` and enters interface mode.
`R1(config-if)#ip address 192.168.10.1/24`	Assigns the IP address `192.168.10.1/24`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.

© 2026 IP Infusion Inc. Proprietary

Step 2: Configure IS-IS Operations

`R1(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.
`R1(config-router)#is-type level-1`	Specifies IS-IS to operate as Level-1.
`R1(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R1(config-router)#net 49.0000.0000.0001.00`	Configures IS-IS network entity title.
`R1(config-router)#redistribute connected`	Redistributes connected routes into IS-IS.
`R1(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

Step 3: Configure Interfaces to Participate in IS-IS Process

`R1(config)#interface xe1`	Configures interface `xe1` and enters interface mode.
`R1(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe1`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R1(config)#interface lo`	Configures a loopback interface `lo` and enters interface mode.
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assigns the secondary IP address `1.1.1.1/32`.
`R1(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the loopback interface `lo`.
`R1(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 4: Configure and Activate BGP Neighbors

Note: Configure BGP only for Suppress External reachability using the `set-overload-bit suppress external` command, excluding inter-level reachability.

`R1(config)#router bgp 100`	Enters BGP router mode with AS number `100`.
`R1(config-router)#neighbor 192.168.10.2 remote-as 300`	Configures BGP neighbors with remote AS number `300`.

© 2026 IP Infusion Inc. Proprietary

`R1(config-router)#address-family ipv4 unicast`	Enters BGP address family mode for IPv4 unicast.
`R1(config-router-af)#redistribute connected`	Redistributes connected routes into BGP.
`R1(config-router-af)#neighbor 192.168.10.2 activate`	Activates BGP neighbors.
`R1(config-router-af)#exit-address-family`	Exits BGP address family mode.
`R1(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exits BGP router mode and returns to the configure mode.

R2 Configuration

The following are the step-by-step configurations on the R2 router.

Step 1: Assign IP Addresses to the Interfaces

`R2#configure terminal`	Enters configure mode.
`R2(config)#interface xe4`	Configures interface `xe4` and enters interface mode.
`R2(config-if)#ip address 192.168.20.2/24`	Assigns the IP address `192.168.20.2/24`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 2: Configure IS-IS IPv4 Routing

`R2(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.
`R2(config-router)#is-type level-1`	Specifies IS-IS to operate as Level-1.
`R2(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R2(config-router)#net 49.0000.0000.0002.00`	Configures IS-IS network entity title.
`R2(config-router)#redistribute connected`	Redistributes connected routes into IS-IS.
`R2(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

Step 3: Enable IS-IS IPv4 Routing on the Interfaces

`R2(config)#interface xe4`	Configures interface `xe4` and enters interface mode.

`R2(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe4`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R2(config)#interface lo`	Configures a loopback interface `lo` and enters interface mode.
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Assigns the secondary IP address `2.2.2.2/32`.
`R2(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the loopback interface `lo`.
`R2(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R2(config-if)#exit`	Exits interface mode and returns to the configure mode.

R3 Configuration

The following are the step-by-step configurations on the R3 router.

Step 1: Assign IP Addresses to the Interfaces

`R3#configure terminal`	Enters configure mode.
`R3(config)#interface xe2`	Configures interface `xe2` and enters interface mode.
`R3(config-if)#ip address 192.168.10.2/24`	Assigns the IP address `192.168.10.2/24`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R3(config)#interface xe3`	Configures interface `xe3` and enters interface mode.
`R3(config-if)#ip address 192.168.20.1/24`	Assigns the IP address `192.168.20.1/24`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.

Step 2: Set Overload Bit Options

Configure IS-IS IPv4 routing, setting the overload bit suppress external or inter-level options.

`R3(config)#router isis test`	Enters IS-IS router mode for IS-IS process named `test`.

`R3(config-router)#is-type level-2-only`	Specifies IS-IS to operate as Level-2.

`R3(config-router)#set-overload-bit suppress external`
OR
`R3(config-router)#set-overload-bit suppress interlevel`
	Suppresses the redistribution of external reachability during overload states.
	OR
	Suppresses the redistribution of inter-level reachability during overload states.

`R3(config-router)#bfd all-interfaces`	Enables BFD on all interfaces.
`R3(config-router)#net 49.0000.0000.0003.00`	Configures the IS-IS network entity title.
`R3(config-router)#redistribute bgp`	Redistributes BGP routes into IS-IS.
`R3(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-router)#exit`	Exits IS-IS router mode and returns to the configure mode.

Step 3: Enable IS-IS IPv4 Routing on the Interfaces

`R3(config)#interface xe2`	Configures interface `xe2` and enters interface mode.
`R3(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe2`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R3(config)#interface xe3`	Configures interface `xe3` and enters interface mode.
`R3(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the interface `xe3`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.
`R3(config)#interface lo`	Configures a loopback interface `lo` and enters interface mode.
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Assigns the secondary IP address `3.3.3.3/32`.
`R3(config-if)#ip router isis test`	Enables IS-IS IPv4 routing on the loopback interface `lo`.
`R3(config-if)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exits interface mode and returns to the configure mode.

© 2026 IP Infusion Inc. Proprietary

Step 4: Configure and Activate BGP Neighbors

> **Note:** Configure BGP only for Suppress External reachability using the `set-overload-bit suppress external` command, excluding inter-level reachability.

`R3(config)#router bgp 300`	Enters BGP router mode with AS number `300`.
`R3(config-router)#neighbor 192.168.10.1 remote-as 100`	Configures BGP neighbors with remote AS number `100`.
`R3(config-router)#address-family ipv4 unicast`	Enters BGP address family mode for IPv4 unicast.
`R3(config-router-af)#redistribute connected`	Redistributes connected routes into BGP.
`R3(config-router-af)#neighbor 192.168.10.1 activate`	Activates BGP neighbors.
`R3(config-router-af)#exit-address-family`	Exits BGP address family mode.
`R3(config-router)#commit`	Commits the candidate configuration to the running configuration.
`R3(config-router)#exit`	Exits BGP router mode and returns to the configure mode.

Validation

Verify all IS-IS sessions are up.

Pre-Configuration Check: IS-IS Session Status

Before configuring `set-overload-bit suppress external` command, verify the IS-IS session status on R1, R2, and R3 routers.

Passive Interface

In ISP and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the Default Passive-Interface feature, there were two possibilities for obtaining routing information from all of these interfaces:

- Configure a routing protocol on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive, which was time consuming.

The solution to this problem was to configure the routing protocol on all interfaces and manually set the passive-interface command on the interfaces where adjacency was not desired. In certain networks, this meant coding 200 or more passive-interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single passive-interface default command, then configuring individual interfaces in which adjacencies are desired using the `passive-interface <interface-name> disable` command.

Usage

1. When a specific interface is configured as passive using the `passive-interface <interface-name>` command:
    a. The interface loses its adjacency on that interface, for example, `eth1`.
    b. The interface `(eth1)` is still advertised by other IS-IS speaking interfaces to their neighbors.
2. When a specific interface is configured as passive using `passive-interface <interface-name>` command followed by removing the configuration using `no passive-interface <interface-name>` command:
    a. The interface is IS-IS disabled and must be enabled using the `ip router isis` command (for example, `ip router isis 1`).
    b. If IS-IS is not configured, the interface (for example, eth1) will not be advertised by other IS-IS speaking interfaces to their neighbors.

© 2026 IP Infusion Inc. Proprietary

3. When an interface is configured with the `passive interface` command:
    a. All IS-IS enabled interfaces lose their adjacency.
    b. All IS-IS enabled interfaces in the system will be made passive.
    c. To establish adjacency on a particular interface, the `passive interface <interface-name> disable` command must be enabled.
    d. All interfaces which were made passive are advertised by the active IS-IS speaking interface to its neighbors.
4. When an interface is configured with the `no passive interface` command:
    a. All interfaces which are currently passive, will become active.
    b. If IS-IS is configured on those interface, it will start sending out IS-IS packets and attempt to form adjacency.
    c. If IS-IS is not configured on those interfaces, it will not be advertised by the active IS-IS speaking interface to its neighbors.

Topology

The illustration below shows a passive-interface configuration example.

Figure 122. IS-IS Passive Interface

R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance `(1)`.
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1` (connected to R2).
`(config-if)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

R2 Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R1).
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth2 (connected to R3).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0002.00`	Define the NET address.
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#passive-interface eth1`	Configure the eth1 interface as passive.

R3 Configuration

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0001.0000.0000.0003.00`	Define the NET address.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).
`(config-if)#commit`	Commit candidate configuration to the running configuration

IS-IS IPv4 Loop-Free Alternate Fast Reroute

This section contains Intermediate System to Intermediate System (IS-IS) Loop-Free Alternate Fast Reroute (LFA-FRR) configuration examples.

For details about the commands used in these examples, see the Intermediate System to Intermediate System Command Reference (page 1925) section.

Overview

When a primary next-hop fails, LFA-FRR reduces the failure reaction time to tens of milliseconds using a pre-computed alternate next-hop, so that the alternate can be rapidly used when the failure is detected. A network with this feature experiences less traffic loss and less micro-loo ping of packets than a net work without LFA-FRR.

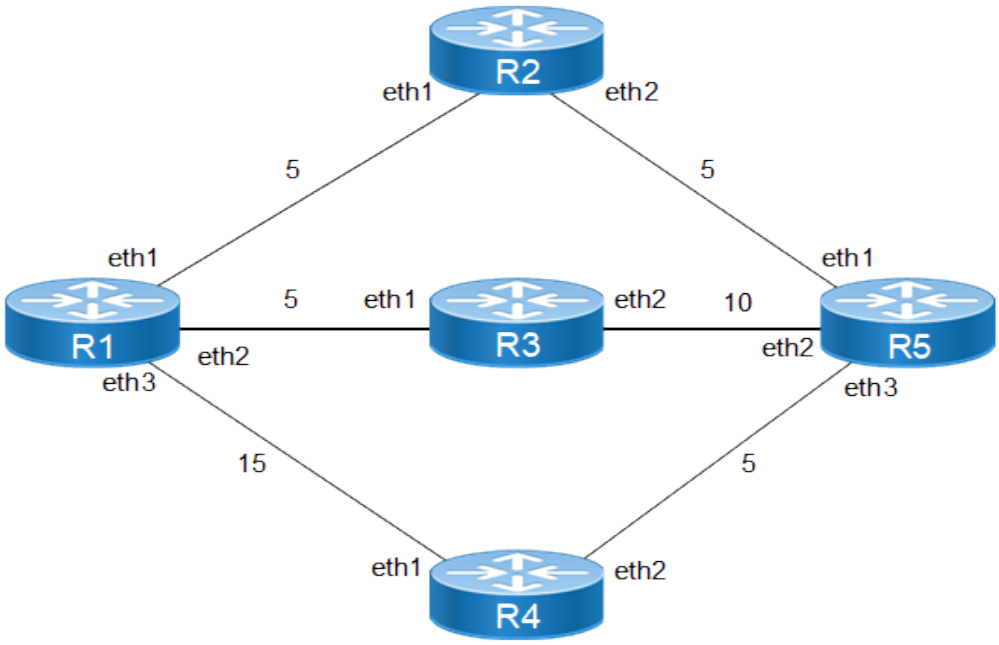
After you enable LFA-FRR, routers calculate a backup path for each primary path to reach the destination. The backup path is calculated based on the attributes such as node protecting, link protecting, and broadcast link protecting. If there is an ECMP path to reach prefixes, the backup is selected from the same primary set by default; if a secondary tie-breaker is enabled, and if a secondary path is available, the backup will be selected from the secondary path.

Basic Configuration

Topology

The illustration below shows the configuration to enable the basic IS-IS LFA feature.

Figure 123. IS-IS LFA-FRR



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10 .10.10.142/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 20.20. 20.142/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.

`(config-if)#ip address 30.30. 30.142/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 15`	Configure IS-IS metric value for interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0000.000 0.0001.00`	Establish a network entity title, for instance, specifying the area address and the system ID.
`(config-router)#bfd all-interfaces`	Enable BFD for IS-IS on all interfaces
`(config-rou ter)#fast-reroute per-prefix level-1 proto ipv4 all`	Configure LFA-FRR to calculate the available back up path for all L1 IPv4 prefixes learnt
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-rou ter)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

R2 Configuration

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10 .10.10.141/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.141/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0000.000 0.0002.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#bfd all-interfaces`	Enable BFD for IS-IS on all interfaces
`(config-if)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

R3 Configuration

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.143/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)# ip address 50.50.50.143/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for the area 49 with instance 1
`(config-router)#net 49.0000.000 0.0003.00`	Establish a network entity title, for instance, specifying the area address and the system ID.
`(config-router)#bfd all-interfaces`	Enable BFD for IS-IS on all interfaces
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-rou ter)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

R4 Configuration

`#configure t erminal`	Enter config ure m ode.
`(config)#int eth1`	Enter interface mode.
`(config-if)# ip address 30.30.30.144/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 15`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

`(config)#int eth2`	Enter interface mode.
`(config-if)# ip address 60.60.60.144/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for the area 49 with instance 1
`(config-router)#net 49.0000.000 0.0004.00`	Establish a network entity title, for instance, specifying the area address and the system ID.
`(config-router)#bfd all-interfaces`	Enable BFD for IS-IS on all interfaces
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-rou ter)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

R5 Configuration

`#configure t erminal`	Enter config ure m ode.
`(config)#int eth1`	Enter interface mode.
`(config-if)# ip address 40.40.40.145/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)# ip address 50.50.50.145/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)# ip address 60.60.60.145/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface for area 49 with instance 1
`(config-if)#isis metric 5`	Configure IS-IS metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface

© 2026 IP Infusion Inc. Proprietary

(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)# exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for the area 49 with instance 1
(config-router)#net 49.0000.000 0.0005.00	Establish a network entity title, for instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable BFD for IS-IS on all interfaces
(config-if)#commit	Commit candidate configuration to the running configuration
(config-rou ter)#exit	Exit router mode.
(config)#exit	Exit config mode.

```

It is not mandatory that for all primary paths, there exists an LFA back up path only if inequality equation satisfies according to attributes configured on routers, backup path will be calculated.

To prohibit an interface from being used as a repair path, disable fast reroute calculation on the interface:

`R1(config-if)#interface eth1`	Enter interface.
`(config-if)#isis fast-reroute per-prefix candidate disable level-1`	Disable fast reroute calculation on the interface.
`(config-if)#end`	Exit.

Verify that the `eth1` interface is not used for backup path calculation.

Backup Path Based on Route-Map Prefixes

R1 Configuration

Route-map and Access-list Configuration

`(config)#ip access-list 1`	Create an access-list
`(config-ip-acl)#permit any 40.40.40.0 0.0.0.255 any`	Configuring rule to permit only one prefix
`(config)#route-map rmap1 permit 1`	Create a route-map
`(config-route-map)#match ip address 1`	Apply above created access-list in route-map
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config)#exit`	Exit config mode.

Apply the Created Route-map with Fast-reroute

`(config)#rou ter isis 1`	Cr eate an IS-IS r out ing instance for area 49 with instance 1
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 route-map rmap1`	Configure LFA-FRR to calculate the available backup path for routes allowed through route-map
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

```
R1#show ip route
```

```

```

LFA Tie-Breaker

Based on the index values configured, if inequalities are satisfied, protections will be provided:

- Lower the index will have the highest priority, The path which provides protection with highest priority will be selected. If there are multiple paths providing the highest priority protection then we will check which of the path provides the protection which has 2nd highest priority and so on.
- If all the paths provide same priority, then the LFA route is chosen on the basis of path cost.
- If none of the paths provides the protection with highest priority, then we will see which path provides the 2nd highest priority and so on.

The show command below displays default values for tie-breaker, by default maximum protection (link, node, broadcast, if ecmp, ecmp backup path) will be provided.

After configuring tie-breaker with index, values will be changed accordingly.

```
R1#show ip isis lfa-config level-1

TIE-Breaker Preference values
-------------------------------------------------
 Primary Path                 : 20
 Link Protecting              : 60
 Node Protecting              : 30
 Broadcast Interface Disjoint : 70
 Secondary Path               : 255
 Downstream Path              : 90

 Termination Hold On Interval : 1000 ms
```

R1 Configuration

To change index values, below configurations should be used, with the lower the index highest the priority.

`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 all`	Configure LFA-FRR to calculate the available back up path for all L1 IPv4 prefixes learned
`(config-router)#fast-reroute tie-break level-1 proto ipv4 interface-disjoint index 1`	Configure index value to change priority for link protection
`(config-router)#fast-reroute tie-break level-1 proto ipv4 node-protecting index 2`	Configure index value to change priority for node protection
`(config-router)#fast-reroute tie-break level-1 proto ipv4 broadcast-interface-disjoint index 3`	Configure index value to change priority for broadcast link protection
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

```
R1#show ip isis lfa-config level-1

```

LFA Termination

A router MUST limit the amount of time an alternate next-hop is used after the primary next-hop has become unavailable. This ensures that the router will start using the new primary next-hops.

LFA termination avoids a micro looping in topology, when particular network goes down, LFA backup path will be installed and if termination interval is configured, LFA backup will be still used till the interval and it is used in order to verify new primary path is loop free.

R1 Configuration

Configure termination interval on R1 in router mode:

`(config)#rou ter isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#fast-reroute terminate-hold-on interval 100000`	Configure LFA termination interval
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

R1 Output Before Primary Next-hop Shutdown

```
R1#show ip isis lfa-config level-1

LFA For ECMP Paths

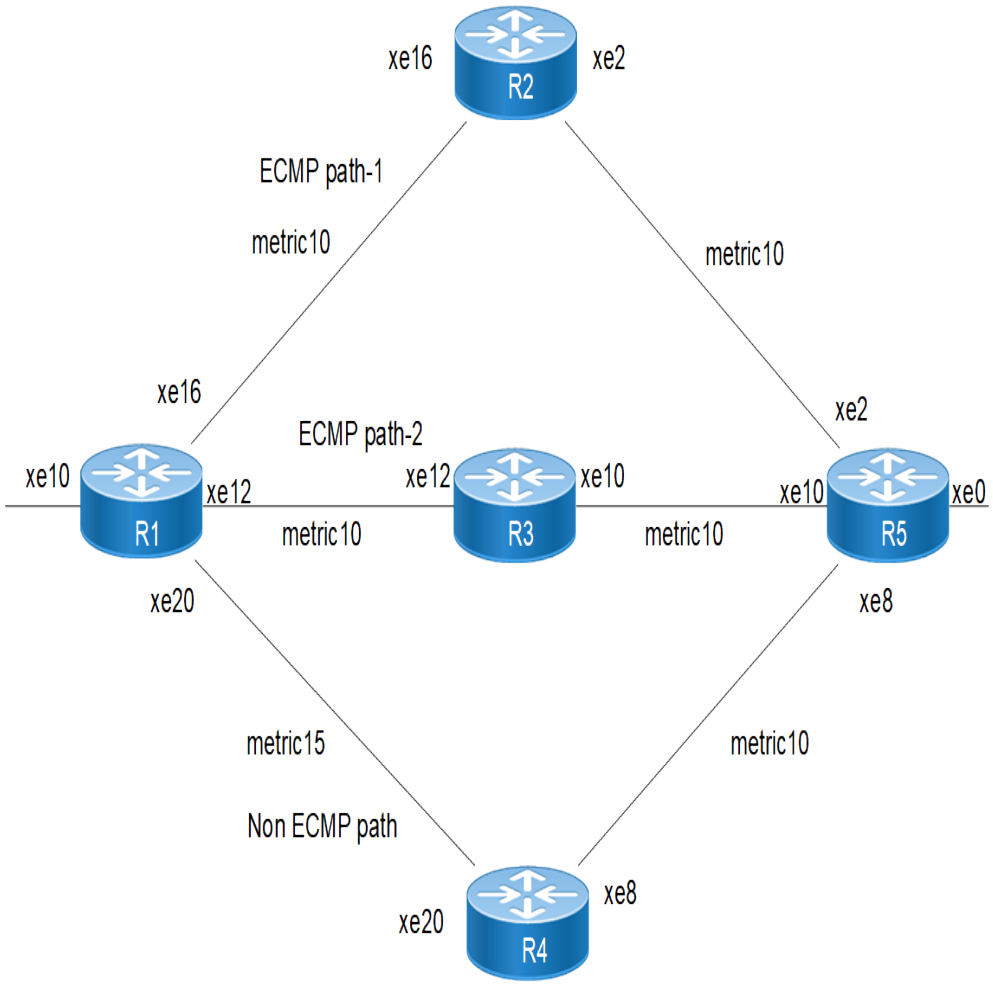
Equal-Cost Multi-Path Routing (ECMP) is a routing technique where next-hop packet forwarding to a single destination can occur over multiple “best-paths” that tie in routing metric calculations. Because it is a per-hop decision limited to a single router, it can increase bandwidth by load-balancing traffic over multiple paths.

Here, we provide configuration capabilities for Loop-Free Alternate (LFA) Fast Reroute (FRR) along with ECMP.

Topology

The illustration below shows the configuration to enable the ISIS LFA feature with ECMP.

Figure 124. ISIS LFA-FRR ECMP



R1 Configuration

`#configure terminal`	Enter configure mode.
`(config)#int xe16`	Enter interface mode.

`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int xe12`	Enter interface mode.
`(config-if)#ip address 20.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int xe20`	Enter interface mode.
`(config-if)#ip address 30.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 15`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int xe10`	Enter interface mode.
`(config-if)#ip address 31.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for the area 49 with instance 1
`(config-router)#net 49.0001.0000.0000.0001.00`	Establish a network entity title, for instance, specifying the area address and the system ID.
`(config-router)#bfd all-interfaces`	Enable BFD for ISIS on all interfaces
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 all`	C onf igure L FA-FRR to c alcul a te the av aila ble back up p ath for all L1 ipv4 prefixes learnt
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

© 2026 IP Infusion Inc. Proprietary

R2 Configuration

`#configure terminal`	Enter configure mode.
`(config)#int xe16`	Enter interface mode.
`(config-if)#ip address 10.1.1.2/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int xe2`	Enter interface mode.
`(config-if)#ip address 40.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for the area 49 with instance 1
`(config-router)#net 49.0001.0000.0000.0002.00`	Establish a network entity title, for instance, specifying the area address and the system ID.
`(config-rout er)#bfd all-interfaces`	Enable BFD for ISIS on all interfaces
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-rou ter)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

R3 Configuration

`#configure terminal`	Enter configure mode.
`(config)#int xe12`	Enter interface mode.
`(config-if)#ip address 20.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)# exit`	Exit interface mode.
`(config)#int xe10`	Enter interface mode.
`(config-if)#ip address 50.1.1.1/24`	Configure the IP address of the interface.

```

Backup Path for ECMP Path from Non-ECMP Path

To select Backup path from secondary/Non-ECMP path, configure the below command in R1 with lowest index value.

If no backup path available from non-ecmp set , then from primary set itself , backup path will be installed.

`(config)#router isis 1`	Create an IS-IS routing instance for the area 49 with instance 1
`(config-router)#net 49.0000.000 0.0001.00`	Establish a network entity title, for instance, specifying the area address and the system ID.
`(config-router)#fast-reroute tie-break level-1 proto ipv4 secondary-path index 1`	Configure secondary path tie-breaker to select backup path from Non-ECMP path
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

IS-IS IPv6 Configuration

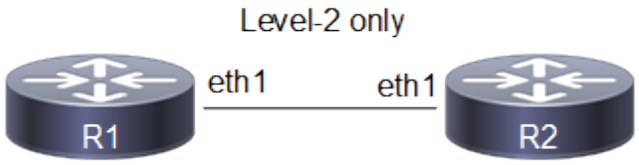
This section contains basic IS-IS (Intermediate System to Intermediate System) on IPv6 configuration examples.

Enable IS-ISv6 on an Interface

This example shows the minimum configuration required for enabling IS-IS on IPv6 on an interface. R1 and R2 are two routers in the ABC instance connecting to the network 1000::/64. After enabling IS-IS on an interface, create a routing instance, and specify the Network Entity Title (NET). IS-IS explicitly specifies a NET to begin routing. NET is comprised of the area address and the system ID of the router.

Note: ISISv6 session will come up even if IPv6 address is not configured, as it will use the link local address present on the interfaces.

Figure 125. Figure 4-46: Basic IS-IS v6 Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

```

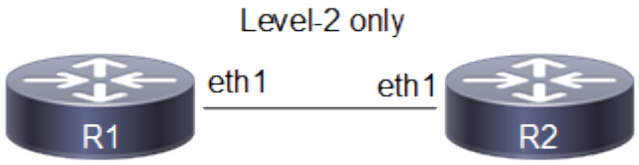
Set Priority

This example describes how to set the priority for an interface. Set a high priority for a router to make it the Designated IS (DIS). Router R3 is configured to have a priority of 70, this is higher than the default priority (64) of R1 and R2. This makes R3 the DIS.

Figure 126. Set IS-IS Priority



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#isis priority 125`	Specify the router priority to a higher priority (125) to make R2 the designated IS (DIS).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.

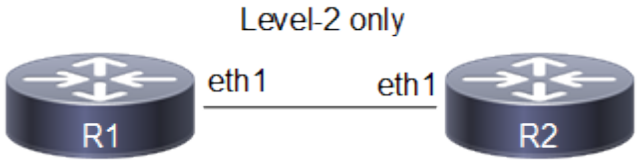
Dynamic hostname

This example shows how to configure Dynamic Hostname for an ISIS IPv6 instance. Dynamic hostname is the method of mapping name-to-systemID. It allows the routing protocol to advertise symbolic names in the IS-IS PDUs. This is done by the addition of a new TLV which allows the IS-IS routers to include the name-to-systemID mapping data in their LSPs. This allows for simple and reliable transport of name mapping across IS-IS networks.

Dynamic hostname can be either the hostname of the node or the tag of the configured ISISv6 instance.

Note: Dynamic-hostname has to be configured on all nodes for it to take effect.

Figure 127. Basic dynamic hostname topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#end`	Exit the current mode and enter privilege mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#end`	Exit the current mode and enter privilege mode.

Redistribute Routes into IS-IS

In this example, the configuration causes OSPFv3 routes to be imported into the IS-ISv6 routing table, and advertised into the ABC instance.

Topology

Figure 128. Redistribute Routes into IS-IS

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#commit`	Commit candidate configuration to the running configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface and assign the Area ID 0.
`(config-if)#ipv6 address 2000::1/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#address-family ipv6`	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration
`(config-router-af)#redistribute ospf`	Enable redistribution of routes from ospf into the ISIS routing table.
`(config-router-af)# exit-address-family`	Exit address family mode.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit router mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 2.2.2.2`	Specify a Router ID (2.2.2.2) for the OSPFv3 routing process .
`(config-router)#end`	Exit the current mode and enter privilege mode.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface and assign the Area ID 0.
`(config-if)#ipv6 address 2000::2/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 3.3.3.3`	Specify a Router ID (3.3.3.3) for the OSPFv3 routing process.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#end`	Exit the current mode and enter privilege mode.

Interface Metric

You can make a route the preferred route by changing its metric. In this example, the cost has been configured to make R3 the next hop for R1.

The default metric for each interface is 10. Interface eth2 on R2 has a metric of 20, and Interface eth2 on R3 has a metric of 30. The total cost to reach 9999::/64 (R4) through R2 and R3 is computed as follows: R2: 10+20 = 30 R3: 10+30 = 40

In this topology, R1 chooses R2 as its next hop for destination 9999::/64.

© 2026 IP Infusion Inc. Proprietary

Note: Below configuration is applicable for narrow (non-wide) metric-style. Wide metric can be configured by using the CLI's "metric-style wide" under isis instance and "isis wide-metric < 1-16777214>" under interface mode.

Topology

Route Summarization

Route summarization makes the routing table smaller, but still allows complete IP connectivity.

The following example consists of a three-router topology, in which R2 is doing the summarization. In this example, R1 is the L1 router, R2 is the L1/L2 router doing the summarization, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacencies with R1 and R3 are already up, and the route tables with the appropriate routes are already populated.

Topology

Figure 130. Route Summarization Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)# is-type level-1`	Configure instance as level-1 routing.
`(config-if)#commit`	Commit candidate configuration to the running

© 2026 IP Infusion Inc. Proprietary

	configuration
(config-router)#net 49.0001.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#commit	Commit candidate configuration to the running configuration

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49 (ABC).
(config-if)#ipv6 address 1000::2/64	Configure IPv6 address on interface.
(config-if)#isis circuit-type level-1	Set the circuit type as level-1 for the interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49 (ABC).
(config-if)#ipv6 address 2000::1/64	Configure IPv6 address on interface.
(config-if)#isis circuit-type level-2-only	Set the circuit type as level-2-only for the interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#net 49.0001.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#address-family ipv6	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration.
(config-router-af)#redistribute isis level-2 into level-1	Enable redistribution of isis routes from level-2 into level-1
(config-router-af)#summary-prefix 11:1:1:1::/64 level-1 metric 58	Configure the summary prefix to summarize IPv6 reachability information.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit router mode.

© 2026 IP Infusion Inc. Proprietary

R3

`#configure terminal`	Enter configure mode.
`(config)#ipv6 route 11:1:1:1:1:1::/96 eth2`	Configure ipv6 static route.
`(config)#ipv6 route 11:1:1:1:2:1::/96 eth2`	Configure ipv6 static route.
`(config)#ipv6 route 11:1:1:1:3:1::/96 eth2`	Configure ipv6 static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 2000::2/64`	Configure IPv6 address on interface.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type as level-2-only for the interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#net 49.0001.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)# is-type level-2-only`	Configure instance as level-2 -onlyrouting.
`(config-router)#address-family ipv6`	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration.
`(config-router-af)#redistribute static`	Enable redistribution of static routes into ISIS instance.
`(config-router-af)#commit`	Commit candidate configuration to the running configuration
`(config-router-af)#end`	Exit the current mode and enter privilege mode.

Passive Interface

In ISP and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the Default Passive-Interface feature, there were two possibilities for obtaining routing information from tall of these interfaces:

- Configure a routing protocol on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive, which was time consuming.

The solution to this problem was to configure the routing protocol on all interfaces and manually set the passive interface command on the interfaces where adjacency was not desired. In certain networks, this meant coding 200 or more passive-interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single passive-interface default command, then configuring individual interfaces in which adjacencies are desired using the no passive-interface command.

Usage

1. When a specific interface is configured as passive using the passive-interface command:
    - The interface loses its adjacency on that interface, for example, eth1.
    - The interface (eth1) is still advertised by other IS-IS speaking interfaces to their neighbors.
2. When a specific interface is configured as passive using passive-interface command followed by removing the configuration using no passive-interface command:
    - The interface is IS-IS disabled and must be enabled using the ipv6 router isis command (for example, ipv6 router isis 1).
    - The interface (for example, eth1) is not advertised by other IS-IS speaking interfaces to their neighbors.
3. When an interface is configured with the passive interface command:
    - All interfaces lose their adjacency, except the interface with the higher index number. (For example: If eth1, eth2, eth3, and eth4 are the router interfaces, eth4 has the highest index number.)

© 2026 IP Infusion Inc. Proprietary

- All interfaces are advertised by the active IS-IS speaking interface to its neighbors.

4. When an interface is configured with the no passive interface command:
   - All interfaces are IS-IS disabled, except the interface that was active, and all interfaces must enable IS-IS on these interfaces using the ipv6 router isis command (for example, ipv6 router isis 1).
   - All interfaces are not advertised by the active IS-IS speaking interface to its neighbors.

Topology

Figure 131. IS-ISv6 Passive Interface

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-router)#end`	Exit the current mode and enter privilege mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#commit`	Commit candidate configuration to the running

	configuration
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)# ipv6 router isis ABC	Enable OSPFv3 routing on an interface and assign the Area ID 0.
(config-if)#ipv6 address 2000::1/64	Configure IPv6 address on interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#passive-interface eth1	Configure interface eth1 as a passive-interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit the current mode and enter privilege mode.

R3

#configure terminal	Enter configure mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49 (ABC).
(config-if)#ipv6 address 2000::2/64	Configure IPv6 address on interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit the current mode and enter privilege mode.

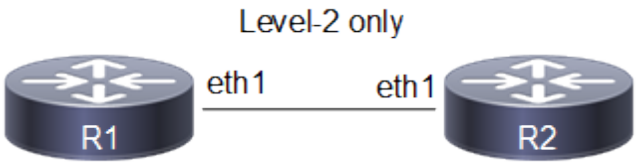
Enable BFD over IS-ISv6

This example shows how to configure Bidirectional Forwarding Detection with ISISv6 instance

Topology

Figure 132. Basic BFD over IS-ISv6 Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49 (ABC).
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying

© 2026 IP Infusion Inc. Proprietary

	the area address and the system ID.
(config-router)#bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit current mode and enter privilege mode.

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49 (ABC).
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit current mode and enter privilege mode.

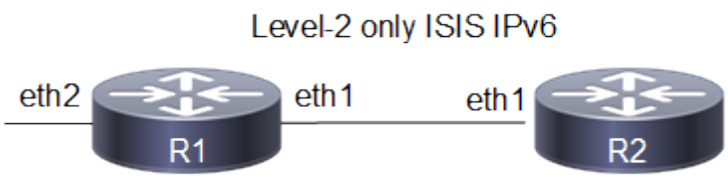
Originate Default Route to ISISv6 Neighbors

This example shows how to originate default route present to ISISv6 neighbors.

> **Note:** To get a default route in ISIS, we should have it (said default route) in the routing table first otherwise we can use the CLI "default information originate always" which advertises default route.

Topology

Figure 133. Basic IS-ISv6 Topology



Configuration

R1

#configure terminal	Enter configure mode.
(config)#ipv6 route ::/0 2345::2	Configure default route.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49 (ABC).
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 address 2345::1/64	Configure IPv6 address on interface.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0001.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# address-family ipv6	Enter ipv6 address family.
(config-router-af)#default-information originate	Originate reachability information to Default destination into LSP.
(config-router-af)#commit	Commit candidate configuration to the running configuration
(config-router-af)#end	Exit all modes and enter privilege mode.

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49 (ABC).
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit current mode and enter privilege mode

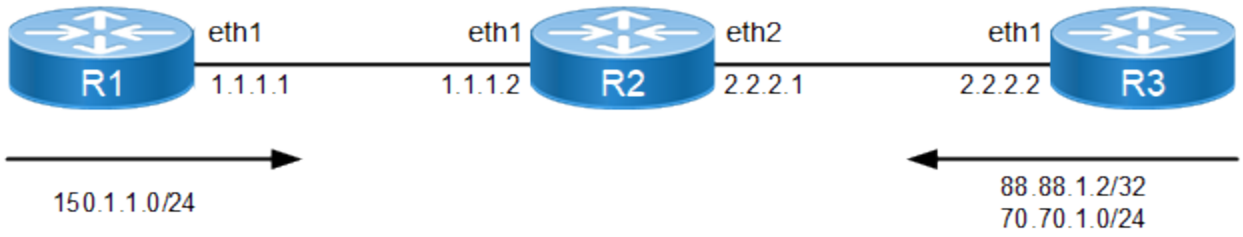
IS-IS Distance

Administrative distance in IS-IS can be configured for a specified source ID or for all routes.

This example shows configuring the IS-IS administrative distance for the IPv6 address family.

Topology

Figure 134. IS-IS Distance Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/24`	Assign the IP address on this interface (eth1).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface eth1.
`(config)#ip router isis 1`	Create an IS-IS routing instance on interface eth1.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	
`(config)#ip route 150.1.1.0/24 eth1`	Configure static routes.
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0001.00`	Set a Network Entity Title (NET) for this instance, specifying the address and the system ID.
`(config-router)#redistribute static`	Redistribute the static routes.
`(config-if)#commit`	Commit candidate configuration to the running configuration

R2

`#configure terminal`	Enter configure mode
`(config)#ipv6 access-list DIST`	Enter access list mode
`(config-ip-acl)#permit ipipv6 6000::/64 any any`	Create an access list to permit the 88.88.1.2/32 route from R3.
`(config-if)#commit`	Commit candidate configuration to the running

© 2026 IP Infusion Inc. Proprietary

	configuration
(config-ip-acl)#exit	Exit access list mode
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 1.1.1.2/24	Assign the IP address on this interface (eth1).
(config-if)#ipv6 address 1000::2/64	Configure IPv6 address on interface.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 2.2.2.1/24	Assign the IP address on this interface (eth2).
(config-if)#ipv6 address 4000::1/64	Configure IPv6 address on interface.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface mode
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0002.00	Specify the NET address.
(config-router)#address-family ipv6	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration
(config-router-af)#distance 100	Configure the administrative distance for all routes received from R1 and R2.
(config-router-af)#distance 20 0001.0000.0001	Configure the administrative distance for all routes received from R1. This command overwrites the applied distance, 100, and will apply distance 20 for all routes received from R1.
(config-router-af)#distance 30 0001.0000.0003 DIST	Configure the distance, 30, to the route, 88.88.1.2/32, received from R3. All other routes from R3 (for example, 70.70.1.0/24) will have the distance applied as 100. If the distance, 100, is not configured, all other routes will have a default distance of 115.
(config-if)#commit	Commit candidate configuration to the running configuration

R3

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 2.2.2.2/24	Assign the IP address on this interface (eth1).
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1.
(config-if)#commit	Commit candidate configuration to the running

	configuration
`(config-if)#exit`	Exit interface mode.
`(config)#ipv6 route 5000::/64 eth2`	Configure static routes
`(config)#ipv6 route 6000::/64 eth2`	Configure static routes
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0003.00`	Specify the NET address.
`(config-router)#redistribute static`	Redistribute the static routes.
`(config-router)#address-family ipv6`	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration
`(config-router-af)#redistribute static`	Redistribute the static routes
`(config-if)#commit`	Commit candidate configuration to the running configuration

IS-IS IPv4 TE-Metric Extension

Overview

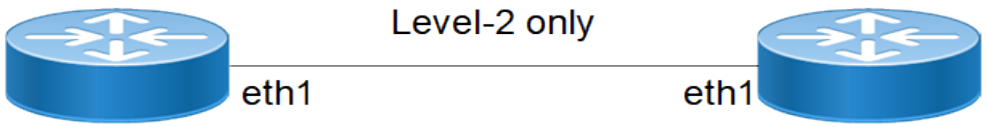
This section contains basic IS-IS TE-Metric Extension configuration examples.

A TE link represents an IS-IS/OSPF link state advertisement and a link state database of certain physical resources and their properties between two nodes. Typically, a TE link is advertised as an adjunct to a "regular" OSPF or IS-IS link. That is, an adjacency is brought up on the link. When the link is up, both the regular IGP properties of the link (for example, the SPF metric) and the TE properties of the link are then advertised.

Note: Bandwidth-measurement values should be less than maximum link bandwidth configuration.

Topology

Figure 135. Basic IS-IS Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#isis te-metric 40 level-2`	Configure ISIS te-metric
`(config-if)#bandwidth-measurement static uni-available-bandwidth 8g`	Configure Bandwidth-measurement uni-available-bandwidth
`(config-if)#delay-measurement static uni-delay-variation 12`	Configure delay-measurement uni-delay-variation static
`(config-if)#delay-measurement static uni-link-delay 12`	Configure delay-measurement uni-link-delay static
`(config-if)#loss-measurement static uni-link-loss 12.3`	Configure loss-measurement uni-link-loss static
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#commit`	Commit candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng level-2	Enable MPLS-TE in is-type Level-2
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#commit	Commit candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config)#ip address 21.21.21.1/24	Configure IP address on interface.
(config-if)#isis circuit-type level-2	Configure ISIS circuit-type as Level-2.
(config-if)#isis te-metric 40 level-2	Configure ISIS Te-metric
(config-if)#delay-measurement static uni-delay-variation 12	Configure delay-measurement uni-delay-variation static

IS-IS Graceful Restart Configuration

Overview

The Intermediate System to Intermediate System (IS-IS) routing protocol is a link state intra-domain routing protocol. Normally, when an IS-IS router is restarted, temporary disruption of routing occurs due to events in both the restarting router and the neighbors of the restarting router.

ISIS provides graceful restart, in which the adjacency and routes are maintained in the routing table for the grace period. In this way, the data flow is not affected, and there is no packet loss during the restart phase.

With ISIS GR, the ISIS router is capable to restart gracefully with non-stop forwarding during the recovery. And the Helper ISIS router is able to help restarting router by maintaining the adjacency.

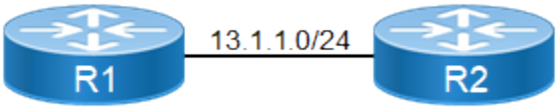
ISIS Grace Restart Functionality applies to:

- ISIS broadcast network
- ISIS point-to-point network
- IPv4 domain
- IPv6 domain

Topology

In this example, R1 is the L1/L2 router, and R2 is the L1/L2 restart-helper router.

Figure 136. IS-IS Graceful Restart



Configuration

The following configuration assumes that the adjacency with R1 is already up and the route tables with the appropriate routes are already populated.

R1

`#configure terminal`	Enter configure mode.
`(config)#isis restart grace-period 300`	Set the grace period to 300 seconds. The restarting router should come up before 300 seconds, otherwise, the adjacency and routes will be deleted.
`(config)#commit`	Commit candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

R2

`#configure terminal`	Enter configure mode.
`(config)#isis restart helper`	Configure this router as a restart helper.
`(config)#commit`	Commit candidate configuration to the running configuration

Notes:

- The IS-IS daemon in the restarting router must be manually restarted using the restart IS-IS graceful command; it does not restart automatically.
- Execute `restart isis graceful grace-period <1-65535>` CLI in privilege mode directly to view the graceful restart warning message.
- The IS-IS daemon in the restarting router must be manually restarted using the restart IS-IS graceful command; it does not restart automatically.
- The unplanned GR is not supported.
- In the restarting node,
  - restart the IS-IS daemon before it's LSP's remaining lifetime expires in Helper nodes.
  - the restarting node might take higher graceful restart time interval than what it advertised (before GR) as 'Remaning Lifetime' in its LSP.
  - in such cases, the LSP's received from the restarting node are not refreshed in helper nodes. These timed-out LSP's are deleted from Helper nodes and disrupt the traffic, though IS-IS adjacency is unaffected. To avoid this, the administrator has to ensure that GR time window is always lesser than the 'Remaning Lifetime' in Helper nodes.

Validation

IS-IS-TE IPv4

This section contains basic IS-IS TE configuration examples.

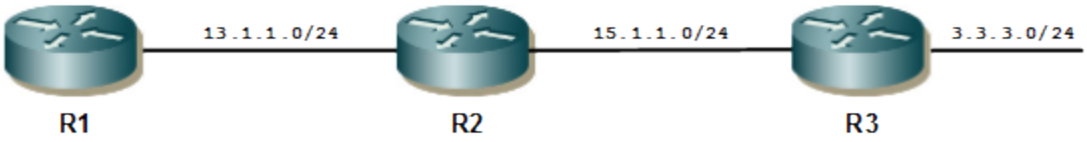
A TE link represents an IS-IS/OSPF link state advertisement and a link state database of certain physical resources and their properties between two nodes. Typically, a TE link is advertised as an adjunct to a “regular” OSPF or IS-IS link. That is, an adjacency is brought up on the link. When the link is up, both the regular IGP properties of the link (for example, the SPF metric) and the TE properties of the link are then advertised.

Enable MPLS-TE in Level-1 and Level-2 on L1-L2 IS

In the following example, R1 is the L1 router, R2 is the L1/L2 router enabling MPLS-TE for both Level-1 and Level-2 IS, and R3 is the L2 router. The following configuration is given for R1, R2 and R3.

Toplogy

Figure 137. MPLS-TE Topology



Configuration

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#interface eth2`	Enter Interface eth2 configure mode.
`(config-if)#ip address 15.1.1.2/24`	Configure ip address to the interface eth2.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth2.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).

© 2026 IP Infusion Inc. Proprietary

(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng router-id 2.2.2.2	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)#mpls traffic-eng level-2	Enable MPLS-TE in is-type Level-2.
(config-router)#net 49.0001.0000.0000.0002.00	Configure the ISIS net address with area id as: 49.0001 and system id as: 0000.0000.0002.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit Router mode.

R1

#configure terminal	Enter Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip address 13.1.1.1/24	Configure ip address to the interface eth1.
(config-if)#ip router isis 1	Enable ISIS on interface eth1.
(config-if)#isis circuit-type level-1	Configure ISIS circuit-type as Level-1
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit from interface configuration mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 (1).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#is-type level-1	Configure IS-Type as Level-1 router.
(config-router)#mpls traffic-eng router-id 1.1.1.1	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)#net 49.0001.0000.0000.0001.00	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0001.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit Router mode.

R3

#configure terminal	Enter Configure mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip address 15.1.1.3/24	Configure ip address to the interface eth1.
(config-if)#ip router isis 1	Enable ISIS on interface eth1.
(config-if)#isis circuit-type level-2	Configure ISIS circuit-type as Level-2

© 2026 IP Infusion Inc. Proprietary

(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit from interface configuration mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 (1).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#is-type level-2	Configure IS-Type as Level-1 router.
(config-router)#mpls traffic-eng router-id 3.3.3.3	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-2	Enable MPLS-TE in is-type Level-2.
(config-router)#net 49.0001.0000.0000.0003.00	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0003.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#end	Exit Router mode.

Validation

R2

Check the output of show clns neighbors (page 2034) to verify that ISIS adjacency is up.

```
#show clns neighbors
Area 1:
System Id      Interface   SNPA            State  Holdtime  Type Protocol
0000.0000.0001 eth1        5254.00bb.5e85      Up     24        L1   IS-IS
0000.0000.0003 eth2        5254.00ac.f960      Up     9         L2   IS-IS
#
```

Check the output of **show isis database (page 2056)level-1 verbose** to verify that LSP does have correct router-id.

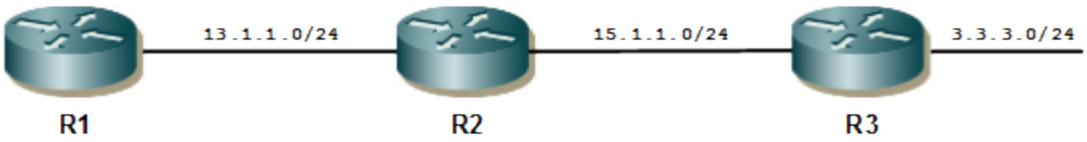
Maximum Link Bandwidth and Reservable Bandwidth

In the following example, R1 is the L1 router, R2 is the L1/L2 router enabling MPLS-TE for both Level-1 and Level-2 IS, and R3 is the L2 router. The following configuration is given for R1, R2 and R3.

Topology

Figure 138. MPLS-TE Topology



Configuration

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface configuration mode.
`(config-if)#interface eth2`	Enter Interface eth2 configure mode.
`(config-if)#ip address 15.1.1.2/24`	Configure ip address to the interface eth2.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth2.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng router-id 2.2.2.2`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.
`(config-router)#net 49.0001.0000.0000.0002.00`	Configure the ISIS net address with area id as: 49.0001 and system id as: 0000.0000.0002.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth2`	Enter the interface configure mode.
`(config-if)#bandwidth 1g`	Configure Maximum link Bandwidth as 1g bits per second.
`(config-if)#reservable-bandwidth 100m`	Specify the maximum reservable bandwidth per interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface configure mode.
`(config)#interface eth1`	Enter the interface configure mode.
`(config-if)#bandwidth 500m`	Configure Maximum link Bandwidth as 500m bits per second.
`(config-if)#reservable-bandwidth 200m`	Specify the maximum reservable bandwidth per interface.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface configure mode.

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.1/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-1`	Configure IS-Type as Level-1 router.
`(config-router)#mpls traffic-eng router-id 1.1.1.1`	
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#net 49.0001.0000.0000.0001.00`	Configure the ISIS net address with area id as:

	49.0001 and system-id as: 0000.0000.0001.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#exit	Exit Router mode.
(config)#interface eth1	Enter the interface configure mode.
(config-if)#bandwidth 1g	Configure Maximum link Bandwidth as 1g bits per second.
(config-if)#reservable-bandwidth 100m	Specify the maximum reservable bandwidth per interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface configure mode.

R3

#configure terminal	Enter Configure mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip address 15.1.1.3/24	Configure ip address to the interface eth1.
(config-if)#ip router isis 1	Enable ISIS on interface eth1.
(config-if)#isis circuit-type level-2	Configure ISIS circuit-type as Level-1
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit from interface configuration mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 (1).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#is-type level-2	Configure IS-Type as Level-2 router.
(config-router)#mpls traffic-eng router-id 3.3.3.3	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-2	Enable MPLS-TE in is-type Level-2.
(config-router)#net 49.0001.0000.0000.0003.00	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0003.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#exit	Exit Router mode.
(config)#interface eth2	Enter the interface configure mode.
(config-if)#bandwidth 1g	Configure Maximum link Bandwidth as 1g bits per second.
(config-if)#reservable-bandwidth 100m	Specify the maximum reservable bandwidth per interface.
(config-if)#commit	Commit candidate configuration to the running

© 2026 IP Infusion Inc. Proprietary

	configuration
(config-if)#exit	Exit interface configure mode.

Validation

R2

Check the output of show clns neighbors (page 2034) to verify that ISIS adjacency is up.

```
#show clns neighbors
Total number of L1 adjacencies: 2
Total number of L2 adjacencies: 1
Total number of adjacencies: 3
Tag 1:  VRF : default
System Id      Interface   SNPA            State  Holdtime  Type Protocol
0000.0000.0001 eth1        5254.003d.2123  Up     6         L1   IS-IS
0000.0000.0003 eth2        5254.00fa.54d5  Up     6         L1   IS-IS
                                           Up     6         L2   IS-IS
```

Check the output of **show isis database (page 2056)** **level-1 verbose** to verify that LSP does have configured Max Link Bandwidth and Reservable Bandwidth.

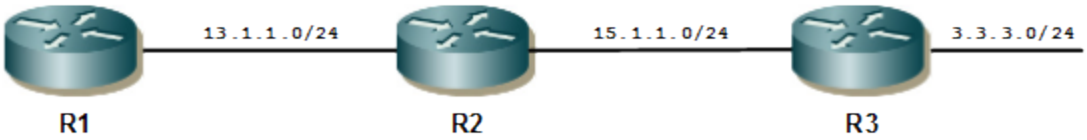
Administrative Group Constraints

To configure administrative group constraints (also known as color constraints) in Level-1 and Level-2 on L1-L2 IS:

- Configure support for required admin groups in NSM on all participating routers
- Configure required administrative groups on all participating interfaces

The configuration in this example forces the primary LSP to be setup through links that belong either to admin group A or C. A link that does not belong to either of these admin groups will not be used for setting up the LSP.

Figure 139. MPLS-TE Topology



Configuration

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config)#interface eth2`	Enter Interface eth2 configure mode.
`(config-if)#ip address 15.1.1.2/24`	Configure ip address to the interface eth2.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth2.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#admin-group a 0`	Add new administrative groups and specify their names and assign bit values to them.
`(config)#admin-group b 1`	
`(config)#admin-group c 2`	
`(config)#admin-group d 3`	
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng router-id 2.2.2.2`	Configure MPLS-TE unique router-id TLV.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.
`(config-router)#net 49.0001.0000.0000.0002.00`	Configure the ISIS net address with area id as: 49.0001 and system id as: 0000.0000.0002.
`(config-router)#commit`	Commit candidate configuration to the running configuration
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth1`	Enter the interface configure mode.
`(config-if)#admin-group a`	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group Previously configured. You can have multiple groups per Interface.
`(config-if)#admin-group c`	
`(config-if)#exit`	Exit interface configure mode.
`(config)#interface eth2`	Enter the interface configure mode.
`(config-if)#admin-group b`	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group previously configured. You can have multiple groups per Interface.
`(config-if)#admin-group d`	
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#end`	Exit interface configure mode.

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.1/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#commit`	Commit candidate configuration to the running configuration
`(config-if)#exit`	Exit interface configure mode.
`(config)#admin-group a 0`	Add new administrative groups and specify their names and assign bit values to them.
`(config)#admin-group c 2`	
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-1`	Configure IS-Type as Level-1 router.

© 2026 IP Infusion Inc. Proprietary

(config-router)#mpls traffic-eng router-id 1.1.1.1	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)#net 49.0001.0000.0000.0001.00	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0001.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#exit	Exit Router mode.
(config)#interface eth1	Enter the interface configure mode.
(config-if)#admin-group a	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group Previously configured. You can have multiple groups per Interface.
(config-if)#admin-group c	
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#end	Exit interface configure mode.

R3

#configure terminal	Enter Configure mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip address 15.1.1.3/24	Configure ip address to the interface eth1.
(config-if)#ip router isis 1	Enable ISIS on interface eth1.
(config-if)#isis circuit-type level-2	Configure ISIS circuit-type as Level-1
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#exit	Exit interface configure mode.
(config)#admin-group b 1	Add new administrative groups and specify their names and assign bit values to them.
(config)#admin-group d 3	
(config)#router isis 1	Create an IS-IS routing instance for area 49 (1).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#is-type level-2	Configure IS-Type as Level-2 router.
(config-router)#mpls traffic-eng router-id 3.3.3.3	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-2	Enable MPLS-TE in is-type Level-2.
(config-router)#net 49.0001.0000.0000.0003.00	Configure the ISIS net address with area id as:

	49.0001 and system-id as: 0000.0000.0003.
(config-router)#commit	Commit candidate configuration to the running configuration
(config-router)#exit	Exit Router mode.
(config)#interface eth2	Enter the interface configure mode.
(config-if)#admin-group b	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group
(config-if)#admin-group d	Previously configured. You can have multiple groups per Interface.
(config-if)#commit	Commit candidate configuration to the running configuration
(config-if)#end	Exit interface configure mode.

Validation

R2

Check the output of show clns neighbors (page 2034) to verify that ISIS adjacency is up.

```
#show clns neighbors

Area 1:
System Id      Interface   SNPA            State  Holdtime  Type Protocol

ISIS Multi Topology

Overview

Intermediate System to Intermediate System (ISIS) is a link-state routing protocol commonly used in large-scale service provider networks and enterprise networks. By default, ISIS is in a single topology with no separate Shortest Path First (SPF) process to differentiate between IPv4 and IPv6 topologies. If the topology in IPv6 is different from IPv4, the routing calculation encounters a problem as the routes are evaluated and chosen based on the common topology.

Multi Topology (MT) is a mechanism to run a set of independent IP topologies within a single ISIS domain. This means, both IPv4 and IPv6 have different topologies in the network and two SPF processes are run to find the route to each IPv4 and IPv6 destination independently.

Feature Characteristics

The main characteristics of ISIS Multi Topology are as follows:

- Enables ISIS to maintain separate topologies for IPv4 and IPv6 within the same ISIS area or domain.
- Allows routers in the ISIS area (for Level 1 routing) or domain (for Level 2 routing) to support both IPv4 and IPv6 address families.
- Performs multiple SPF calculations for each configured topology.
- Defines new Type-Length-Value (TLV) encodings called Multi Topology TLV (MT TLV). It is used to advertise the multiple topologies supported by the routers and contains information about the topology, including the ID (MTID), flags, and MT metric.
  - MT TLV (229): Capability TLV advertised in Hello packets.
  - MT intermediate system TLV (222): Extended TLV that describes the adjacency between nodes once the adjacency is formed.
  - MT IPV6 reachability TLV (237): Reachability TLV that gives information on IPv6 routing.

Benefits

The key benefits of ISIS Multi Topology are as follows:

- Enables the ability to make changes to the IPv6 topology without affecting the IPv4 topology, and vice-versa.
- Leverages common adjacency and database tables.
- Provides an independent SPF process for IPv4 and IPv6.

Prerequisites

- To enable ISIS Multi Topology on OcNOS devices, wide metric configuration is mandatory.
- Follow the below configuration steps to prepare the interface for implementation of Multi Topology by enabling single topology on the routers:

© 2026 IP Infusion Inc. Proprietary

Note: In each of the commands, modify the relevant router as R1, R2, R3, R4 or R5, depending on the router being configured.

1. Enter configure mode followed by interface mode on loopback interface.

```
#configure terminal
R1(config)#int lo
```

2. Configure the IP address for the interface.

```
R1(config -if)# ip add 1.1.1.1/32 secondary
R1(config -if)# ipv6 address 1111::11/128
```

3. Include the interface in the router's ISIS 1 instance and exit the interface mode.

```
R1(config -if)# ip router isis 1
R1(config -if)# ipv6 router isis 1
R1(config -if)# exit
```

4. Enter the interface configuration mode and configure the IP address for the interface.

```
R1(config)#int xe22
R1(config -if)# ip address 10.1.1.1/24
R1(config -if)# ipv6 address 1001::1/64
```

5. Include the interface in the router's ISIS 1 instance and exit the interface mode.

```
R1(config -if)# ip router isis 1
R1(config -if)# ipv6 router isis 1
R1(config -if)# exit
```

For Routers R1 and R5, continue the configuration steps as follows:

6. Set the routing process ID as 1 and configure the IS type as level-1.

```
R1(config)# router isis 1
R1(config-router)# is-type level-1
```

7. Configure wide metric-style.

```
R1(config-router)# metric-style wide
```

8. Enable dynamic host name under ISIS process.

```
R1(config-router)# dynamic-hostname
```

9. Enable BFD in all the interfaces.

```
R1(config-router)# bfd all-interfaces
```

10. Configure Network Entity Title (NET).

```
R1(config-router)# net 49.0000.0000.0001.00
```

11. Commit the candidate configuration to the running configuration.

```
R1(config-router)# commit
```

For Routers R2 and R4, use the following configuration steps after you exit the interface mode (step 5 shown above):

1. Enter the interface configuration mode and configure the IP address for the interface.

```
R2(config)#int xe24
R2(config  -if)#  ip address 20.1.1.1/24
R2(config -if)# ipv6 address 2001::1/64
```

2. Include the interface in the router's ISIS 1 instance and exit the interface mode.

```
R2(config -if)# ipv6 router isis 1
R2(config -if)# exit
```

3. Enter the interface configuration mode and configure the IP address for the interface.

```
R2(config)#int xe23
R2(config -if)# ip address 40.1.1.1/24
R2(config -if)# ipv6 address 4001::1/64
```

4. Include the interface in the router's ISIS 1 instance and exit the interface mode.

```
R2(config  -if)#  ip router isis 1
R2(config  -if)#  ipv6 router isis 1
R2(config  -if)#  exit
```

5. Set the routing process ID as 1 and configure IS type as level 1.

```
R2(config)# router isis 1
R2(config-router)# is-type level-1
```

6. Configure wide metric style.

```
R2(config-router)# metric-style wide
```

7. Enable dynamic host name under ISIS process.

```
R2(config-router)# dynamic-hostname
```

8. Enable BFD in all the interfaces.

```
R2(config-router)# bfd all-interfaces
```

9. Configure Network Entity Title (NET).

```
R2(config-router)# net 49.0000.0000.0002.00
```

10. Commit the candidate configuration to the running configuration.

```
R2(config-router)# commit
```

For Router R3, follow these configuration steps after you exit the interface mode (step 5 shown above):

1. Enter Interface configuration mode and configure the IP address of the interface.

```
R3(config)#int xe31/1
R3(config -if)# ip address 50.1.1.1/24
R3(config -if)# ipv6 address 5001::1/64
```

2. Include the interface in the router's ISIS 1 instance and exit the interface mode.

```
R3(config -if)# ip router isis 1
R3(config -if)# ipv6 router isis 1
R3(config -if)# exit
```

3. Set the routing process ID as 1 and configure IS type as level-1.

```
R3(config)# router isis 1
R3(config-router)# is-type level-1
```

4. Configure wide metric-style.

```
R3(config-router)# metric-style wide
```

5. Enable dynamic host name under ISIS process.

```
R3(config-router)# dynamic-hostname
```

6. Enable BFD on all the interfaces.

© 2026 IP Infusion Inc. Proprietary

```
R3(config-router)# bfd all-interfaces
```

7. Configure Network Entity Title (NET).

```
R3(config-router)# net 49.0000.0000.0003.00
```

8. Commit the candidate configuration to the running configuration.

```
R3(config-router)# commit
```

Configuration

To set up Multi Topology in ISIS, the configuration is as shown below:

Topology

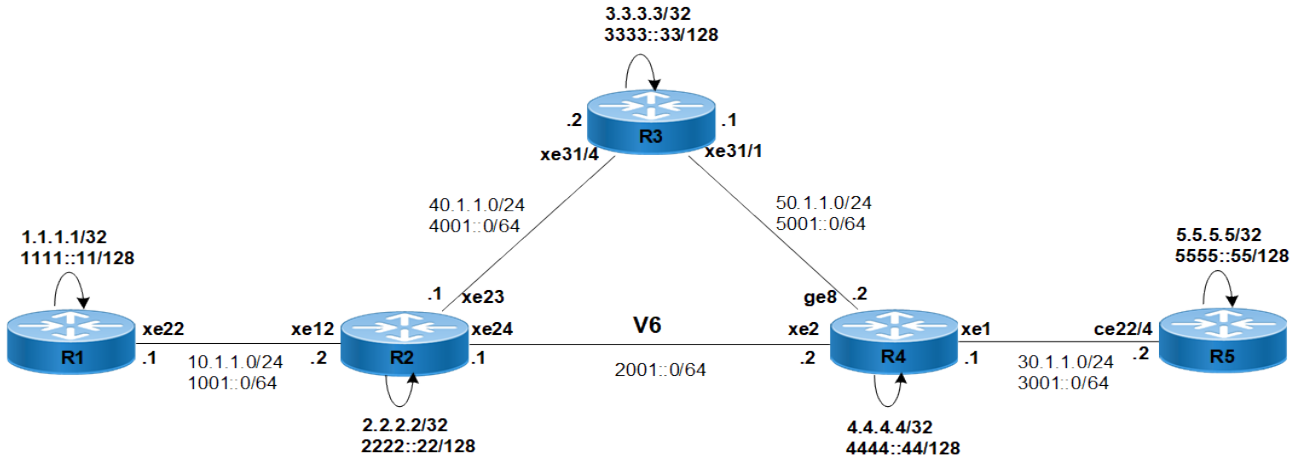
This topology diagram consists of five routers (R1, R2,R3,R4 and R5).

It has both ISIS IPv4 and IPv6 routing enabled, except the link between R2 and R4 which has only IPv6 enabled.

In Single Topology, router R1 receives the information and calculates a SPF tree. To reach 5.5.5.5 (R5 IPv4), it takes the path R1-> R2 -> R4 ->R5. However, it fails since R2 to R4 is solely an IPv6 path. Since the same SPF tree is used for both IPv4 and IPv6 in R1, it considers the link between R2 -> R4 as the shortest path instead of R2 -> R3 -> R4.

On enabling Multi Topology on all the routers, SPF trees are calculated separately for IPv4 and IPv6 routing. This means, to reach from R1 to R5, IPv4 takes the R1 -> R2 -> R3 -> R4 -> R5 path and IPv6 takes the R1 -> R2 -> R4 -> R5 path.

Figure 140. ISIS Multi Topology



To configure multi topology on the routers R1, R2, R3, R4 and R5, follow the steps mentioned below:

Notes:

- Ensure that the Prerequisites (page 1895) are met for all the routers.
- Modify the commands for the relevant routers being configured (R1, R2, R3, R4 or R5).

1. Set the routing process ID as 1.

```
R1(config)# router isis 1
```

2. Configure metric-style wide.

```
R1(config-router)# metric-style wide
```

3. Configure address family IPv6.

```
R1(config-router)#address-family ipv6
```

4. Enable multi topology with level 1.

```
R1(config-router-af)#multi-topology level-1
```

5. Commit the candidate configuration to the running configuration.

```
R1(config-router-af)#commit
```

Validation for Multi Topology

```

CLI Commands

The ISIS Multi-topology feature introduces the `multi-topology` configuration command.

multi topology

Use this command to configure the ISIS topology type.

Use `no` parameter of this command to set the topology back to single.

Command Syntax

```
multi-topology (level-1|level-1-2|level-2)
no multi-topology
```

Parameters

level-1
Specify to enable multi-topology for level 1.

level-2
Specify to enable multi-topology for level 2.

level-1-2
Specify to enable multi-topology for both the levels.

Default

ISIS topology type applies to levels 1 and 2.

© 2026 IP Infusion Inc. Proprietary

Command Mode

Address-family IPv6 mode.

Applicability

Introduced the `multi-topology` parameter in OcNOS version 6.5.2.

Example

The following sequence of commands is used to configure ISIS `multi-topology` type as transition for levels 1 and 2.

```
(config)#router isis 1
(config-router)#address-family ipv6 unicast
(config-router-af)#multi-topology level-1-2
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
ISIS	Intermediate System to Intermediate System is a link-state routing protocol.
Multi Topology (MT)	In ISIS, Multi Topology (MT) is a mechanism to run a set of independent IP topologies within a single ISIS domain.
Type Length Value (TLV)	A data structure used to encode optional information in a data communications protocol: Type: the kind of field that this part of the message represents Length: the size of the value field, usually in bytes Value: a variable-sized set of bytes that contains the data of the message
Shortest Path First (SPF)	Algorithm used by ISIS to make routing decisions based on the state of network links.
Loopback	A troubleshooting test in which a signal is transmitted from a source to a destination and then back to the source again so that the signal can be measured and evaluated.
Wide metric configuration	Allows ISIS to support larger networks by configuring high value metric in the interface.
Hello Packets	Information packets used to discover ISIS neighbors and maintain adjacencies.
Link State Packets (LSP)	Unidirectional, point-to-point, half-duplex connection used to exchange link state information.

IS-IS Commands

This section describes the IS-IS commands:

accept-lifetime 1932
address-family ipv6 1934
adjacency-check 1935
area-password 1936
authentication key-chain 1937
authentication mode 1938
authentication send-only 1939
bfd all-interfaces 1940
capability cspf 1941
clear clns is-neighbors 1942
clear clns neighbors 1943
clear ip isis route 1944
clear isis adjacency 1945
clear isis counter 1946
clear isis interface counter 1947
clear isis process 1948
debug isis 1949
default-information originate 1951
distance (IPv4) 1952
distance (IPv6) 1954
domain password 1956
dynamic-hostname 1958
fast-reroute per-prefix 1959
fast-reroute per-prefix remote-lfa 1960
fast-reroute terminate-hold-on interval 1961
fast-reroute tie-break 1962
ignore-lsp-errors 1964
ip route high-priority tag 1965
ip router isis 1966
ipv6 router isis 1967
is-type 1968
isis authentication key-chain 1969
isis authentication mode md5 1970
isis authentication send-only 1971
isis bfd 1972
isis circuit-type 1973

accept-lifetime

Use this command to specify the time period during which the authentication on a key chain is received as valid.

Use the `no` parameter with this command to disable it.

Command Syntax

```
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> HH:MM:SS MONTH <01-31> <1993-2035>
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> infinite
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> duration <1-2147483646>
no accept-lifetime
```

Parameters

HH:MM:SS
Specify the start time of accept-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to start. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to start as the first three letters of the month with first letter in upper case, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to start.

HH:MM:SS
Specify the end time of accept-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to end. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to end as the first three letters of the month with first letter in caps, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to expire.

duration
Specify the duration of the key in seconds

<1-2147483646>
Specify the actual end time duration of a key in seconds.

infinite
Specify the end time to never expire.

Default

By default, accept-lifetime command is disabled

Command Mode

Key-chain key mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of accept-lifetime for key-id 1 on the key chain named mychain.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#accept-lifetime 03:03:01 Dec 03 2004 04:04:02 Oct 06 2006
```

© 2026 IP Infusion Inc. Proprietary

address-family ipv6

Use this command to enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration.

Use the no parameter with this command to remove all configuration under 'address-family ipv6'.

Command Syntax

```
address-family ipv6 (unicast|)
no address-family ipv6 (unicast|)
```

Parameters

unicast
Specify unicast routing for IPv6.

Default

Unicast routing is not configured

Command Mode

Router mode

Example

```
#configure terminal
(config)#router isis bb
(config-router)#address-family ipv6 unicast
```

© 2026 IP Infusion Inc. Proprietary

adjacency-check

Use this command to check ISIS neighbor protocol support.

Use the `no` parameter with this command to uncheck ISIS neighbor protocol support.

Command Syntax

```
adjacency-check
no adjacency-check
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis bb
(config-router)#adjacency-check

(config-router)#no adjacency-check
```

© 2026 IP Infusion Inc. Proprietary

area-password

Use this command to set the authentication password for the Level-1 area and to set authentication on Level-1 sequence number PDUs. This command enables authentication when receiving and sending link-state and sequence number PDUs in Level-1 areas. The password must be the same for all the ISIS routers in the same area.

Use the `no` parameter with this command to clear the area password.

Command Syntax

```
area-password WORD
area-password WORD authenticate snp (send-only|validate)
no area-password
```

Parameters

WORD
Password string.

authenticate
Insert the password into Level-1 SNP PDUs.

snp
Sequence number PDUs.

send-only
Only insert the password into the Level-1 sequence number PDUs, but not check the password in sequence number PDUs that it receives. Use this keyword during a software upgrade to ease the transition.

validate
Insert the password into Level-1 sequence number PDUs and check the password in sequence number PDUs that it receives.

Default

Not configured

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis bb
(config-router)#area-password mypasswd

(config)#router isis bb
(config-router)#area-password myPass authenticate snp send-only

(config)#router isis bb
(config-router)#no area-password
```

© 2026 IP Infusion Inc. Proprietary

authentication key-chain

Use this command to set the key chain to be used for authentication at the instance level. Authentication mode must be set to md5 to configure the key chain. If no key chain is configured with the key-chain command, no key-chain authentication is performed.

Only one authentication key-chain is applied to an ISIS interface at a time. That is, issuing a second isis authentication key-chain command overrides the first isis authentication key-chain command. If neither the level-1 nor the level-2 keyword is configured, the chain applies to both levels. Authentication can be specified for an individual ISIS interface using the isis authentication key-chain command.

Use the `no` parameter with this command to unset the key chain used for authentication.

Command Syntax

```
authentication key-chain WORD (level-1|level-2|)
no authentication key-chain (level-1|level-2|)
```

Parameters

WORD
Specify the chain name (valid authentication keys).

level-1
Specify an authentication key-chain for level-1 PDUs.

level-2
Specify an authentication key-chain for level-2 PDUs.

Default

The key chain applies to the level(s) on which authentication mode is configured as MD5 if no level is specified.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis 1
(config-router)#authentication key-chain myKey level-1
```

© 2026 IP Infusion Inc. Proprietary

authentication mode

Use this command to set the authentication mode at the instance level.

If clear-text authentication was configured using the `area-password` or `domain password` commands, the `authentication mode` command overrides both of those commands (based on the level at which MD5 is configured). If the `authentication mode` command was used first, and subsequently an attempt is made to use the `area-password` or `domain password` commands, the attempt fails. To configure clear-text authentication using the `area-password` or `domain password` commands, first use the `no authentication mode` command.

The type of authentication and the level to which it applies can be specified for a single ISIS interface, rather than per ISIS instance, using the `isis authentication mode` command.

Use the `no` parameter with this command to unset the authentication mode.

Command Syntax

```
authentication mode {md5|text} (level-1|level-2|)
no authentication mode {md5|text} (level-1|level-2|)
```

Parameters

md5
Keyed message digest

text
Text mode

level-1
Specify an authentication key-chain for level-1 PDUs.

level-2
Specify an authentication key-chain for level-2 PDUs.

Default

The authentication mode is set to MD5 for both levels if no level is specified.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#authentication mode md5 level-1

(config-router)#no authentication mode md5 level-1
```

© 2026 IP Infusion Inc. Proprietary

authentication send-only

Use this command to set the send-only option at the instance level.

Use this command before configuring the authentication mode and authentication key-chain, so that the implementation of authentication goes smoothly. That is, the routers will have more time for the keys to be configured on each router if authentication is inserted only on the packets being sent, not checked on packets being received. After all routers that must communicate are configured with this command, enable the authentication mode and key chain on each router. Then, specify the no authentication send-only command to disable the send-only feature.

If the level-1-2 keyword is configured, the send-only feature applies to both levels.

Use the `no` parameter with this command to unset the send-only option.

Command Syntax

```
authentication send-only (level-1-only|level-2-only|level-1-2)
no authentication send-only
```

Parameters

level-1-only
Set send-only option for level-1 only.

level-2-only
Set send-only option for level-2 only.

level-1-2
Set send-only option for level-1-2 only.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#authentication send-only level-1-only

(config-router)#no authentication send-only
```

© 2026 IP Infusion Inc. Proprietary

bfd all-interfaces

Use this command to enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.

This command sets BFD fall-over check for all the neighbors under specified process . To disable BFD checking on particular interface use `isis bfd disable` command at interface mode.

Use the no parameter with this command to disable BFD functionality for an ISIS instance.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

Disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis aa
(config-router)# bfd all-interfaces

(config-router)#no  bfd all-interfaces
```

© 2026 IP Infusion Inc. Proprietary

capability cspf

Use this command to enable the constrained shortest path first (CSPF) feature in the ISIS module. CSPF calculates optimum explicit route (ER), using Traffic Engineering Database and (TED) and pre-existing Label Switched Path (LSP). The resulting ER is used by a signaling protocol (RSVP-TE) to set up LSPs.

Use the `no` parameter with this command to disable CSPF functionality for an ISIS instance.

Command Syntax

```
capability cspf
no capability cspf
```

Parameters

None

Default

If this command is not used, the CSPF feature is disabled.

Command Mode

Router mode

Example

```
(config)#router isis aa
(config-router)#capability cspf
```

© 2026 IP Infusion Inc. Proprietary

clear clns is-neighbors

Use this command to clear IS neighbor adjacencies.

Command Syntax

```
clear clns is-neighbors System-ID
```

Parameters

System-ID
Neighbor system ID in XXXX.XXXX.XXXX format.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#clear clns is-neighbors 1111.1111.1111.1111
```

© 2026 IP Infusion Inc. Proprietary

clear clns neighbors

Use this command to clear CLNS neighbor adjacencies.

Command Syntax

```
clear clns neighbors
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>ena
#clear clns neighbors
```

© 2026 IP Infusion Inc. Proprietary

clear ip isis route

Use this command to clear IPv4 routes.

Command Syntax

```
clear ip isis (WORD|) route (redistribution|all)
```

Parameters

WORD
Name that identifies the IS-IS area.

redistribution
Clear IS-IS local redistribution routes.

all
Clear all of the IS-IS routing tables.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>ena
#clear ip isis route redistribution
```

© 2026 IP Infusion Inc. Proprietary

clear isis adjacency

This command is used to remove the entries from the IS-IS adjacency database. Clears all adjacencies for the specified routing instance or specified interface or particular system ID.

Command Syntax

```
clear isis adjacency (*|IFNAME|system-id XXXX.XXXX.XXXX|) (vrf VRFNAME|)
```

Parameters

*****
Clear all neighbors.

IFNAME
Interface name.

XXXX.XXXX.XXXX

Neighbor System-ID.

VRFNAME
VRF name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis adjacency *
```

© 2026 IP Infusion Inc. Proprietary

clear isis counter

Use this command to clear system-wide IS-IS counters (IsisSystemCounterEntry in RFC 4444).

Command Syntax

```
clear isis counter
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis counter
```

© 2026 IP Infusion Inc. Proprietary

clear isis interface counter

Use this command to clear interface counters. If you do not specify a parameter, then counters for all interfaces are cleared.

Command Syntax

```
clear isis interface counter (IFNAME|)
```

Parameters

IFNAME
Interface name.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis interface counter
```

© 2026 IP Infusion Inc. Proprietary

clear isis process

Use this command to restart ISIS processes. If you do not specify a parameter, then all ISIS processes are restarted.

Command Syntax

```
clear isis (WORD|) process
```

Parameters

WORD
Name that identifies the IS-IS area.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis process
```

© 2026 IP Infusion Inc. Proprietary

debug isis

Use this command to turn on debugging for specified criteria. Debug commands enable to show some debugging information about specified criteria into file or terminal.

Use the `no` parameter to turn off debugging for specified criteria.

Command syntax

```
debug isis (all|)
debug isis (ifsm|nfsm|events|pdu|lsp|ofib|sr-micro-loop-
avoidance|spf|nsm|rib|checksum|authentication|protocol-errors|local-
updates|bfd|mpls|sr|lfa|tilfa|asla|flexalgo|dist-ls)
no debug isis (all|)
no debug all
no debug all isis
no debug isis (ifsm|nfsm|events|pdu|lsp|ofib|sr-micro-loop-
avoidance|spf|nsm|rib|checksum|authentication|protocol-errors|local-
updates|bfd|mpls|sr|lfa|tilfa|asla|flexalgo|dist-ls)
```

Parameters

all
Enables all debugging.

authentication
Debugging for authentication.

checksum
Debugging for checksums.

bfd
Debugging for bidirectional forwarding detection.

events
Debugging for internal events.

hello
Debugging for hello processing.

mpls
Debugging for MPLS.

IFNAME
Interface name.

System-ID
System identifier.

cspf
Debugging for CSPF.

events
Events

hexdump
Hexdump.

ifsm
Debugging for interface finite state machine.

local-updates
Debugging for local updates.

© 2026 IP Infusion Inc. Proprietary

lsp
Debugging for link-state packet.

nfsm
Debugging for neighbor finite state machine.

nsm
Debugging for NSM messages.

pdu
Debugging for protocol data unit.

protocol-errors
Debugging for protocol errors.

rib
Debugging for RIB information.

spf
Debugging for shortest path first route calculation.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug isis pdu

#configure terminal
(config)#debug isis nsm
```

© 2026 IP Infusion Inc. Proprietary

default-information originate

Use this command to originate reachability information to a default route into link-state packets.

There is no default information in a Level-2 domain by default, while a Level-1 router calculates a default to L1L2 route during SPF calculation. This command originates a default route into a Level-2 domain.

Use the no parameter with this command to withdraw reachability information to a default route from link-state packets.

Command Syntax

```
default-information originate (always| level-1|) (route-map WORD|)
no default-information originate (always| level-1|)
```

Parameters

originate
Specify to distribute a default route

always
The default route is advertised even if there is no default route in the router's routing table.

level-1
Distribute in level-1.

route-map
Identifies other filtering options via a route map.

Default

There is no default information in Level-2 domain by default, while Level-1 router calculates default to L1L2 route during SPF calculation. This command enables to originate default route into Level-2 domain. As an added option, if the user wants to originate the default route in L1 LSP, the "level-1" parameter can be used as follows:

```
default-information originate level-1
```

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#default-information originate
(config-router)#exit
(config)#exit
```

© 2026 IP Infusion Inc. Proprietary

distance (IPv4)

Use the distance command in router mode to configure the administrative distance for:

- All IPv4 routes received from a specific source System-ID
- Optionally, routes that match a specified access list

Use the `no` form:

- To remove a previously configured administrative distance, use the no distance command.
- To remove distance settings configured with a specific System-ID or access-list use no distance along with system-id only.

Command Syntax

```
distance <1-255> (System-ID (WORD|)|)
no distance
no distance (System-ID|)
```

Parameters

<1-255>
Distance range.

System-ID
Source ID in XXXX.XXXX.XXXX format.

WORD
Access-list name.

Default

Turned off.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the administrative distance for all routes.

```
#configure terminal
(config)#router isis
(config-router)#distance 10
```

The following example shows setting the administrative distance to 40, only for routes learned from the router with System-ID 0000.0000.0001

```
#configure terminal
(config)#router isis
(config-router)#distance 40 0000.0000.0001
```

© 2026 IP Infusion Inc. Proprietary

The following example shows setting the administrative distance to 40, only for routes from the system with System-id that match access list DIST.

```
#configure terminal
(config)#router isis
(config-router)#distance 40 0000.0000.0001 DIST
```

© 2026 IP Infusion Inc. Proprietary

distance (IPv6)

Use the distance command in router mode to configure the administrative distance for:

- All IPv6 routes received from a specific source System-ID
- Optionally, routes that match a specified access list

Use the `no` form:

- To remove a previously configured administrative distance,
- To remove distance settings configured with a specific System-ID or access-list use no distance along with system-id only.

Command Syntax

```
distance <1-255>
no distance
```

Parameters

<1-255>
Distance range.

Default

Turned off

Command Mode

Address-family ipv6 mode

Applicability

This command was introduced before OcNOS version 1.3. T

Examples

The following example shows setting the administrative distance for all ipv6 routes.

```
#configure terminal
(config)#router isis
(config-router)address-family ipv6
(config-router-af)#distance 10
```

The following example shows setting the administrative distance to 40 but only for routes learned from the router with System-ID 0000.0000.0001

```
#configure terminal
(config)#router isis
(config-router)address-family ipv6
(config-router-af)distance 40 0000.0000.0001
```

The following example shows setting the administrative distance to 40 but only for routes from the system with System-id that match access list DIST

© 2026 IP Infusion Inc. Proprietary

```
#configure terminal
(config)#router isis
(config-router)address-family ipv6
(config-router-af)distance 40 0000.0000.0001 DIST
```

© 2026 IP Infusion Inc. Proprietary

domain password

Use this command to set the authentication password for the Level-2 domain, and optionally, the authentication password on Level-2 sequence number PDUs.

Configuring this command to enable authentication when receiving and sending link state and sequence number PDUs in Level-2 domain. The domain password must be the same in the Level-2 domain.

Use the `no` parameter with this command to clear the domain password.

Command Syntax

```
domain password WORD
domain password WORD authenticate snp (send-only|validate)
no domain password
```

Parameters

WORD
Password string.

authenticate
Inserts th password into Level-1 sequence number PDUs.

snp
sequence number PDUs.

send-only
Only inserts the password into the Level-1 sequence number PDUs, but does not check the password in sequence number PDUs that it receives. Use this keyword during a software upgrade to ease the transition.

validate
Inserts the password into the Level-1 sequence number PDUs and checks the password in sequence number PDUs received.

Default

No domain password

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#domain password mypasswd

(config)#router isis bb
(config-router)#domain password myPass authenticate snp send-only
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#router isis bb
(config-router)#no domain password
```

dynamic-hostname

Use this command to configure the hostname to advertise for an ISIS instance using the dynamic hostname exchange mechanism (RFC 2763) and system-ID-to-hostname translation. This command configures a hostname to use for the Dynamic Hostname Exchange Mechanism and System-ID to hostname translation. This is required to get accurate results when using the show isis database and a few other commands.

Use the `no` parameter to disable the Hostname configured.

Command Syntax

```
dynamic-hostname
hostname dynamic
dynamic-hostname area-tag
no dynamic-hostname
no hostname dynamic
```

Parameters

area-tag

Use the routing area tag as the hostname, not the router's global hostname.

Default

Disabled

Command Mode

Router mode

Example

```
#configure terminal
(config)#router isis bb
(config-router)#dynamic-hostname area-tag
```

fast-reroute per-prefix

Use this command to enable Loop Free Alternate Fast Reroute (LFA FRR) for all prefixes or only those prefixes in a route map.

Use the no form of this command to disable LFA FRR.

Command Syntax

```
fast-reroute per-prefix (level-1|level-2) proto (ipv4) (all|route-map WORD)
 no fast-reroute per-prefix (level-1|level-2) proto (ipv4)
```

Parameters

level-1
Level 1 only.

level-2
Level 2 only.

ipv4
IPv4 address family only.

all
All prefixes.

route-map
Prefixes from a route map.

WORD
Route map name.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#fast-reroute per-prefix level-2 proto ipv4 all
(config-router)#fast-reroute per-prefix level-1 proto ipv4 route-map rmap1 (config-router)#no fast-
reroute per-prefix level-2 proto ipv4
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute per-prefix remote-lfa

Use this command to configure remote loop-free alternate fast reroute configuration for a particular level of an IS-IS instance.

Use the `no` parameter to remove remote loop-free alternate fast reroute configuration.

Command Syntax

```
fast-reroute per-prefix remote-lfa (level-1|level-2) proto ipv4 tunnel mpls-ldp
no fast-reroute per-prefix remote-lfa (level-1|level-2) proto ipv4
```

Parameters

level-1
Level 1 only.

level-2
Level 2 only.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 5.1.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#fast-reroute per-prefix remote-lfa level-1 proto ipv4 tunnel mpls-ldp
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute terminate-hold-on interval

Use this command to set the Loop Free Alternate Fast Reroute (LFA FRR) termination hold-on timer.

Use the no form of this command to set the termination hold-on timer to its default value (1000 milliseconds).

Command Syntax

```
fast-reroute terminate-hold-on interval <100-100000>
no fast-reroute terminate-hold-on interval
```

Parameters

<100-100000>

LFA FRR termination hold-on timer interval in milliseconds.

Default

1000 milliseconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#fast-reroute terminate-hold-on interval 7000
(config-router)#no fast-reroute terminate-hold-on interval
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute tie-break

Use this command to set the tie-breaking policy for selecting a fast reroute repair path. You assign a priority to each type of repair path. The tie-breaker value is used to select an LFA FRR route when multiple LFA FRR routes are available for the same primary route.

Use the no form of this command to set the tie-break preference value for a protection type to its default value.

To set all types of repair paths to their default priorities, do not specify a repair path with the no form of this command.

Command Syntax

```
fast-reroute tie-break (level-1|level-2) proto (ipv4) (primary-path|interface- disjoint|node-
protecting|broadcast-interface-disjoint|secondary-path|downstream- path) index <1-255>
no fast-reroute tie-break (level-1|level-2) proto (ipv4) (primary- path|interface-disjoint|node-
protecting|broadcast-interface-disjoint|secondary- path|downstream-path)
```

Parameters

level-1
Level 1 only.

level-2
Level 2 only.

ipv4
IPv4 address family only.

primary-path
Use a path from the Equal-Cost Multipath Path (ECMP) set. An ECMP found during the primary shortest path first (SPF) repair might not be desirable in networks where traffic exceeds the capacity of any single link.

interface-disjoint
Link protecting: prefer a backup path that uses a different interface than the interface used to reach destination via the primary path.

node-protecting
Bypass the primary-path gateway router which might not protect the router that is the next hop in the primary path. This ensures complete traffic protection even if the primary next-hop router fails.

broadcast-interface-disjoint
Do not use the interface if connected to a broadcast network. Repair paths protect links when a repair path and a protected primary path use *different* next-hop interfaces. However, on broadcast interfaces, if the repair path is computed via the same interface as the primary path, but their next-hop gateways are different, the router is protected but the link might not be.

secondary-path
Prefer a non-ECMP backup path.

downstream-path
Prefer a backup path to the destination which satisfies the downstream condition where the path cost to reach the destination from the LFA next hop is less than the path cost to the destination from the self node via primary next hop:

Distance_opt(N, D) < Distance_opt(S, D)

This might result in lost traffic, but prevents looping.

© 2026 IP Infusion Inc. Proprietary

index

Tie breaking index. A lower value has higher preference.

<1-255>

Tie breaking index value.

Defaults

primary-path	20
interface-disjoint	60
node-protecting	30
broadcast-interface-disjoint	70
secondary-path	255
downstream-path	90

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#fast-reroute tie-break level-2 proto ipv4 node-protecting index 127
(config-router)#no fast-reroute tie-break level-1 proto ipv4 broadcastinterface-disjoint
```

© 2026 IP Infusion Inc. Proprietary

ignore-lsp-errors

Use this command to ignore link-state packets (LSPs) with checksum errors. By default, ISIS validates the checksum for LSP and if the checksum has an error, the LSP is dropped. Giving this command says to ignore the LSP checksum error and treat it as if checksum is passed.

Use the `no` parameter to turn off this function.

Command Syntax

```
ignore-lsp-errors
no ignore-lsp-errors
```

Parameters

None

Default

Checked on receipt

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In this sample, rtr1 does not drop LSP packets with bad checksum.

```
#configure terminal
(config)#router isis bb
(config-router)#ignore-lsp-errors
```

© 2026 IP Infusion Inc. Proprietary

ip route high-priority tag

Use this command to set the tag value on ISIS LSP.

Command Syntax

```
ip route high-priority tag <1-4294967295>
```

Parameters

tag <1-4294967295>
Specify the high priority tag value.

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 6.0.0.

Example

```
OcNOS#configure terminal
OcNOS(config)#router isis 1
OcNOS(config-router)#ip route high-priority tag 10
```

© 2026 IP Infusion Inc. Proprietary

ip router isis

Use this command to enable ISIS IPv4 routing on the interface. This command is mandatory to ISIS configuration.

After giving this command, the router sends ISIS Hello with IP address TLV on this interface and IP reachability information TLV in link-state packets are updated.

Use the `no` parameter with this command to disable ISIS IPv4 routing on the interface. This action does not clear the ISIS database. To clear the database, unconfigure the ISIS routing instance.

Command Syntax

```
ip router isis WORD
no ip router isis WORD
```

Parameters

WORD
Name that identifies the IS-IS area. Specify an existing area name or a new area name.

Default

Disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip router isis bb
```

© 2026 IP Infusion Inc. Proprietary

ipv6 router isis

Use this command to enable ISIS IPv6 routing on the interface. This command is mandatory to IPv6 ISIS configuration. Match the ISIS instance tag to one of existing instance's tags, or a new instance with the tag name should be initiated, otherwise routing will not run on this interface.

Configuring this command, the router sends ISIS Hello with IPv6 address TLV on this interface, and IPv6 reachability information TLV in the LSP will be updated.

Use the no parameter with this command to disable ISIS IPv6 routing on the interface.

Command Syntax

```
ipv6 router isis WORD
no ipv6 router isis WORD
```

Parameters

WORD
ISIS instance name.

Default

Disabled

Command Mode

Interface mode

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 router isis bb
```

© 2026 IP Infusion Inc. Proprietary

is-type

Use this command to set the IS to the specified level of routing.

Changing `is-type` brings down, then brings up a particular level of routing. There is a limitation: Only one ISIS instance can run Level-2 routing (either Level-2 only IS, or Level-1-2 IS).

Use the `no` parameter to set the IS to the default.

Command Syntax

```
is-type (level-1|level-1-2|level-2-only)
no is-type
```

Parameters

level-1
Act as level-1 only IS.

level-1-2
Act as level-1-2 IS.

level-2-only
Act as level-2 only IS.

Default

By default, ISIS uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#is-type level-1

(config)#router isis bb
(config-router)#no is-type
```

© 2026 IP Infusion Inc. Proprietary

isis authentication key-chain

Use this command to set the key chain to be used for authentication on the interface-related packets.

Authentication mode must be set to md5 to configure the key chain. If no key chain is configured with the key-chain command, no key-chain authentication is performed. Only one authentication key-chain is applied to an ISIS interface at a time. That is, issuing a second isis authentication key-chain command overrides the first isis authentication key-chain command.

If neither the level-1 nor level-2 keyword is configured, the key chain applies to the level(s) on which the authentication mode is configured as md5. Authentication can be specified for an entire instance of ISIS, instead of at the interface level, by using the authentication key-chain command.

Use the `no` parameter with this command to unset the key chain used for authentication on the interface-related packets.

Command Syntax

```
isis authentication key-chain WORD (level-1|level-2|)
no isis authentication key-chain (level-1|level-2|)
```

Parameters

WORD
Chain name - valid authentication keys.

level-1
Specify an authentication key-chain for level-1 PDUs.

level-2
Specify an authentication key-chain for level-2 PDUs.

Default

Disabled. The key chain applies to the level(s) on which authentication mode is configured as MD5 if no level is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis authentication key-chain myKey level-1
```

© 2026 IP Infusion Inc. Proprietary

isis authentication mode md5

Use this command to set the MD5 authentication mode. If the `isis password` command was used, then subsequently an attempt is made to use the `isis authentication mode` command, the attempt fails. To configure `isis authentication mode` command, first use the `no isis password` command. If the isis authentication mode command was used, then subsequently an attempt is made to use the isis password command, the attempt fails.

To configure clear text authentication using the isis password command, first use the no isis authentication mode command. The type of authentication and the level to which it applies can be specified for the entire ISIS instance, rather than per interface, using the authentication mode command.

Use the `no` parameter with this command to unset the MD5 authentication mode.

Command Syntax

```
isis authentication mode {md5|text} (level-1|level-2|)
no isis authentication mode {md5|text} (level-1|level-2|)
```

Parameters

md5
Keyed message digest

text
Text mode

level-1
Specify an authentication key-chain for level-1 PDUs.

level-2
Specify an authentication key-chain for level-2 PDUs.

Default

Disabled. The authentication mode will be set to MD5 for both levels if no level is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis authentication mode md5 level-1
```

© 2026 IP Infusion Inc. Proprietary

isis authentication send-only

Use this command to set the send-only option to the interface-related packets.

Use this command before configuring the ISIS authentication mode and ISIS authentication key-chain, so that the implementation of authentication goes smoothly. That is, the routers will have more time for the keys to be configured on each router if authentication is inserted only on the packets being sent, not checked on packets being received. After all routers that must communicate are configured with this command, enable the authentication mode and key chain on each router.

Use the `no` parameter with this command to unset the send-only option to the interface-related packets.

Command Syntax

```
isis authentication send-only (level-1-only|level-2-only|level-1-2)
no isis authentication send-only
```

Parameters

level-1-only
Set send-only option for level-1 only.

level-2-only
Set send-only option for level-2 only.

level-1-2
Set send-only option for level-1-2 only.

Default

Disabled. The send-only option applies to both levels if no level is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis authentication send-only level-1-only
```

© 2026 IP Infusion Inc. Proprietary

isis bfd

Use this command to enable/disable the BFD check on interface.

The `isis bfd` command allows a user to enable BFD on an interface. The `isis bfd disable` command disables BFD checking on an interface. However, the `no isis bfd` and `no isis bfd disable` commands both remove the enable/disable configuration, but do not disable/enable BFD.

The `bfd all-interfaces` command enables BFD on all interfaces attached to an instance then configuring. This command disables BFD configuration on a particular interface.

Command Syntax

```
isis bfd (disable|)
no isis bfd (disable|)
```

Parameters

disable
Specify to disable BFD.

Default

Enable/disable is not configured.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis bfd disable
```

© 2026 IP Infusion Inc. Proprietary

isis circuit-type

Use this command to set the circuit type for the interface.

If level-1 or level-2-only is specified in this command, ISIS sends only the specified level of PDUs. On the point-to-point interface, there is only one type of Hello packet, so in this case ISIS Hello will be sent regardless of circuit-type. If is-type is configured as level-1 or level-2 only, routing for this instance is performed for only the specified level. In this manner, only the particular level of PDU is sent on the interface.

Use the `no` parameter to reset circuit type to the default.

Command Syntax

```
isis circuit-type (level-1|level-1-2|level-2-only)
no isis circuit-type
```

Parameters

level-1
Specify that only Level-1 adjacencies are formed.

level-1-2
Specify that Level-1-2 adjacencies are formed.

level-2-only
Specify that only Level-2 adjacencies are formed.

Default

level-1-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis circuit-type level-2-only
```

© 2026 IP Infusion Inc. Proprietary

isis csnp-interval

Use this command to set CSNP (Complete sequence number PDU) interval in seconds.

Configuring this command changes the interval between two consecutive CSNP transmission. By default, CSNP is sent every 10 seconds only by LAN DIS. This parameter is only valid on broadcast interface, since periodic CSNP is only sent on broadcast interface, while CSNP on Point-to-Point interface is sent only when adjacency is initiated.

Use the `no` parameter with this command to reset CSNP interval to the default value.

Command Syntax

```
isis csnp-interval <1-65535> (level-1|level-2|)
no isis csnp-interval (level-1|level-2|)
```

Parameters

<1-65535>
Specify the CSNP interval in seconds.

level-1
Specify Level-1 CSNP.

level-2
Specify Level-2 CSNP.

Default

ISIS uses 10 seconds for the interval and the interval is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis csnp-interval 20
```

© 2026 IP Infusion Inc. Proprietary

isis fast-reroute per-prefix candidate disable

Use this command to prevent an interface from becoming an Loop Free Alternate Fast Reroute (LFA FRR) for a primary route.

Use the no form of this command to enable an interface to become an LFA FRR for a primary route.

Command Syntax

```
isis fast-reroute per-prefix candidate disable (level-1|level-2)
no isis fast-reroute per-prefix candidate disable (level-1|level-2)
```

Parameters

level-1
Level-1 only

level-2
Level-2 only

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis fast-reroute per-prefix candidate disable level-2
(config-if)#no isis fast-reroute per-prefix candidate disable level-2
```

© 2026 IP Infusion Inc. Proprietary

isis hello-interval

Use this command to set the Hello interval in seconds. The Hello-interval is set with the hello-multiplier (see `isis hello-multiplier` command).

Configuring this command changes the time interval between two consecutive Hello transmissions. If a device receives its own LSP with a maximum sequence number, then it suspends ISIS for the hold interval. DIS sends Hello transmissions at three times the rate than non-DIS. If ISIS is elected as DIS on this interface, ISIS sends Hello every 3.3 seconds.

If `minimal` keyword is specified, Holding timer in Hello PDU is set to 1 second and Hello interval is calculated by dividing by the hello-multiplier. For example, if the hello-multiplier is configured as 4 and `hello-interval minimal` is the command used, an Hello PDU is sent every 250 milliseconds.

Use the `no` parameter to set the Hello interval to the default.

Command Syntax

```
isis hello-interval <1-65535> (level-1|level-2|)
isis hello-interval minimal (level-1-only|level-2-only|level-1-2)
no isis hello-interval (level-1|level-2|)
no isis hello-interval minimal
```

Parameters

<1-65535>
Specify the hello interval in seconds.

minimal
Specify the holding-time as 1 second.

level-1
Specify Level-1 CSNP.

level-2
Specify Level-2 CSNP.

level-1-only
Specify only Level-1 CSNP.

level-2-only
Specify only Level-2 CSNP.

level-1-2
Specify only Level-1-2 CSNP.

Default

ISIS uses 10 seconds for the interval and the interval is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#isis hello-interval 5 level-1

(config-if)#isis hello-interval minimal level-1-only
```

© 2026 IP Infusion Inc. Proprietary

isis hello-multiplier

Use this command to set multiplier for Hello holding time.

Changes Holding Timer in Hello PDU. Holding timer is calculated by “Hello-Interval” multiplied by this value. If `minimal` keyword is specified with the Hello-Interval, the holding timer is set to 1 second and the hello-interval is calculated by dividing 1 by this value.

Use the `no` parameter with this command to set multiplier to the default.

Command Syntax

```
isis hello-multiplier <2-100> (level-1|level-2|)
no isis hello-multiplier (level-1|level-2|)
```

Parameters

<2-100>
Specify a hello multiplier value.

level-1
Specify Level-1 hello.

level-2
Specify Level-2 hello.

Default

ISIS uses 3 seconds for the multiplier value and the multiplier is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis hello-multiplier 4
```

© 2026 IP Infusion Inc. Proprietary

isis hello padding

Use this command to enable IS-IS hello padding at the interface level.

Intermediate System-to-Intermediate System (IS-IS) hellos are padded to the full maximum transmission unit (MTU) size. The benefit of padding IS-IS hellos to the full MTU is that it allows for early detection of errors that result from transmission problems with large frames or errors that result from mismatched MTUs on adjacent interfaces.

Use the `no` parameter with this command to disable IS-IS hello padding.

Command Syntax

```
isis hello padding
no isis hello padding
```

Parameters

None

Default

Enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#isis hello padding

(config-if)#no isis hello padding
```

© 2026 IP Infusion Inc. Proprietary

isis lsp-interval

Use this command to set the link-state packet (LSP) transmission interval.

Giving this command changes the minimum interval between two consecutive LSP transmission. When flooding or some other event triggers LSP transmission, the LSP is put in the interface queue and scheduled to send according to this interval. Two consecutive LSP transmissions are scheduled to have at least this interval.

Use the `no` parameter with this command to set LSP transmission interval to the default.

Command Syntax

```
isis lsp-interval <1-4294967295>
no isis lsp-interval
```

Parameters

<1-4294967295>
LSP transmission interval in milliseconds.

Default

33 milliseconds for the interval.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#isis lsp-interval 100

(config-if)#no isis lsp-interval
```

© 2026 IP Infusion Inc. Proprietary

isis mesh-group

Use this command to set Mesh Group ID on the current interface.

Use the `no` parameter to unset mesh group on the current interface.

Command Syntax

```
isis mesh-group <1-4294967295>
no isis mesh-group
```

Parameters

<1-4294967295>
Specify a mesh group number

Default

Disabled

Command Mode

Interface mode

Examples

```
(config)#interface eth0
(config-if)#isis mesh-group 20

(config)#interface eth2
(config-if)#no isis mesh-group
```

© 2026 IP Infusion Inc. Proprietary

isis metric

Use this command to set the default metric for the interface. The interface default metric is put into IP reachability information TLVs and in IS reachability information TLVs in link-state packets. The value is used for SPF calculation, and is applied when the metric-style is configured as “narrow”.

Use the `no` parameter with this command to set default metric to the default.

Command Syntax

```
isis metric <1-63> (level-1|level-2|)
no isis metric (level-1|level-2|)
```

Parameters

<1-63>
Default metric.

level-1
Default metric for level-1 circuit.

level-2
Default metric for level-2 circuit.

Default

ISIS uses 10 for the metric value and the value is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis metric 20
```

© 2026 IP Infusion Inc. Proprietary

isis network

Use this command to change a broadcast interface network type to a point-to-point network type.

Use the `no` parameter with this command to revert to the default setting of a broadcast interface network type.

Command Syntax

```
isis network (broadcast|point-to-point)
no isis network
```

Parameters

broadcast
Specify ISIS a broadcast multi-access network.

point-to-point
Specify ISIS a point-to-point network.

Default

Set to a broadcast multi-access network type.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis network point-to-point
```

© 2026 IP Infusion Inc. Proprietary

isis password

Use this command to set the authentication password of Hello PDU on the interface.

If the `isis authentication mode` command was used, then subsequently an attempt is made to use the `isis password` command, the attempt fails. To configure clear text authentication using the `isis password` command, first use the `no isis authentication mode` command.

Use the `no` parameter to clear the password.

Command Syntax

```
isis password WORD (level-1|level-2|)
no isis password (level-1|level-2|)
```

Parameters

WORD
Specify a password string.

level-1
Specify a password for Level-1 hello PDUs.

level-2
Specify a password for Level-2 hello PDUs.

Default

No password is configured; this applies to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis password mypassword level-1
```

© 2026 IP Infusion Inc. Proprietary

isis priority

Use this command to set the priority for LAN DIS election. This command changes the priority value in LAN ISIS Hello PDUs. A lower priority value is less preferred in DIS election, and a higher priority value is more preferred.

Note: This command is not valid for Point-to-Point interface.

Use the `no` parameter to set priority to the default.

Command Syntax

```
isis priority <0-127> (level-1|level-2|)
no isis priority (level-1|level-2|)
```

Parameters

<0-127>
Priority value

level-1
Specify a password for Level-1 hello PDUs.

level-2
Specify a password for Level-2 hello PDUs.

Default

ISIS uses 64 for the priority value, and the priority is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis priority 127
```

© 2026 IP Infusion Inc. Proprietary

isis retransmit-interval

Use this command to set the link-state packet (LSP) retransmission interval.

Use the `no` parameter to set the interval to the default.

Command Syntax

```
isis retransmit-interval <1-65535>
no isis retransmit-interval
```

Parameters

<1-65535>
Interval for retransmission of the same LSP in seconds.

Default

5 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#isis retransmit-interval 10

(config-if)#no isis retransmit-interval
```

© 2026 IP Infusion Inc. Proprietary

isis tag

Use this command to sets the tag for link-state packets (LSPs) sent out advertising routes for networks directly connected to an interface.

If you do not specify a parameter, then the tag value is set for level-1-2 boundary.

Use the `no` parameter to unset the tag.

Command Syntax

```
isis tag <1-4294967295> (level-1|level-2|)
no isis tag (level-1|level-2|)
```

Parameters

<1-4294967295>
Tag value.

level-1
Specify the tag value for the level-1 boundary.

level-2
Specify the tag value for the level-2 boundary.

Command Mode

Interface mode

Examples

```
>ena
#con term
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#interface eth0
(config-if)#isis tag 500 level-1
```

© 2026 IP Infusion Inc. Proprietary

isis te-metric

Use this command to set TE metric for the interface. Interface te-metric is put into Extended IS reachability TLV. The value is used for CSPF calculation. The value is applied when metric-style is configured as wide.

Use the `no` parameter to unset the TE metric.

Command Syntax

```
isis te-metric <1-16777214> (level-1|level-2|)
no isis te-metric (level-1|level-2|)
```

Parameters

<1-16777214>
Specify a TE metric.

level-1
Specify the TE metric for level-1 circuit.

level-2
Specify the TE metric for level-2 circuit.

Default

ISIS wide metric value.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0

Examples

```
#configure terminal
(config)#interface eth1
(config-router)#isis te-metric 100
(config)#interface eth1
(config-router)#no isis te-metric
```

© 2026 IP Infusion Inc. Proprietary

isis wait-timer

Use the isis wait-timer seconds command to configure the number of seconds the router will wait for adjacency information

Use the `no` parameter to set the wait-timer to the default.

Command Syntax

```
isis wait-timer <1-65535> (level-1|level-2|)
no isis wait-timer (level-1|level-2|)
```

Parameters

level-1
Act as level-1 only IS.

level-2
Act as level-2 only IS.

Default

20 seconds (2 times the hello timer).

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#isis wait-timer 30

(config)#router isis bb
(config-router)#no isis wait-timer
```

© 2026 IP Infusion Inc. Proprietary

isis wide-metric

Use this command to set wide metric for the interface.

Interface wide-metric is put into Extended IP reachability TLVs. Extended IS reachability TLVs and IPv6 rechability TLVs in LSPs. The value is used for SPF calculation. The value is applied when metric-style is configured as 'wide'.

Use the `no` parameter to set wide metric to the default.

Command Syntax

```
isis wide-metric <1-16777214> (level-1|level-2|)
no isis wide-metric (level-1|level-2|)
```

Parameters

<1-16777214>
Specify a wide metric.

level-1
Specify the wide metric for Level-1 circuit.

level-2
Specify the wide metric for Level-2 circuit.

Default

ISIS uses 10 for the metric value and the metric is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

None.

Examples

```
#configure terminal
(config)#interface eth0
(config-router)#isis wide-metric 100

(config)#interface eth0
(config-router)#no isis wide-metric
```

© 2026 IP Infusion Inc. Proprietary

ispf

Use this command to enable incremental SPF for a routing process.

Use the `no` parameter to disable incremental SPF from a routing process.

Command Syntax

```
ispf (level-1|level-2-only|)
no ispf
```

Parameters

level-1
Act as level-1 only IS.

level-2-only
Act as level-2 only IS.

Default

By default, all levels are turned off.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#ispf level-1

(config)#router isis bb
(config-router)#no ispf
```

© 2026 IP Infusion Inc. Proprietary

key chain

Use this command to enter the key chain management mode and to configure a key chain with a key chain name. This command allows you to enter the keychain mode to specify keys on this key chain.

Command Syntax

```
key chain WORD
no key chain WORD
```

Parameters

WORD
Specify the name of the key chain to manage.

Default

Disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the creation of a key chain named `mychain` and the change to keychain mode:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#
```

© 2026 IP Infusion Inc. Proprietary

key-id

Use this command to manage, add or delete authentication keys in a key-chain. This command allows you to enter the keychain-key mode to set a password for the key.

Command Syntax

```
key-id <0-2147483647>
no key-id <0-2147483647>
```

Parameters

<0-2147483647>
Specify a key identifier.

Default

ISIS uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Key-chain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures a key number 1 and shows the change to keychain-key command mode.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#
```

© 2026 IP Infusion Inc. Proprietary

key-string

Use this command to define a password in plain-text to be used by a key.

The password is stored as encrypted, and is displayed in encrypted text when show running-config command is executed.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
key-string WORD
no key-string
```

Parameters

WORD

Specify a string of characters to be used as a password by the key. The length of the string should be between 1-80 characters.

Default

By default, password is not configured.

Command Mode

Key-chain mode and Key-chain key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, the password for `key-id 1` in the key chain named `mychain` is set to `prime`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string prime

(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

key-string encrypted

Use this command to define a password in its encrypted format to be used by a key.

Use the `no` parameter with this command to disable this feature

Command Syntax

```
key-string encrypted WORD
no key-string encrypted
```

Parameters

WORD

Specify the encrypted string of characters to be used as a passoword by the key. The length of this string should be between 18-162 characters.

Default

By default, password is not configured.

Command Mode

Key-chain mode and Key-chain key mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

In the following example, the encrypted password for key-id 1 in the key chain named mykeychain is set to 0xd6c50b442de47f70 (equivalent to "mychain" in plain-text):

```
#configure terminal
(config)#key chain mykeychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string encrypted 0xd6c50b442de47f70
(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

lsp-gen-interval

Use this command to set the minimum interval before regenerating the same link-state packet (LSP). The smaller the interval, the faster the convergence. However, this setting might cause more frequent flooding.

Use the `no` parameter with this command to set the interval to the default.

Command Syntax

```
lsp-gen-interval <1-120>
lsp-gen-interval (level-1|level-2) <1-120>
no lsp-gen-interval (level-1|level-2|)
```

Parameters

<1-120>
Minimum interval in seconds.

level-1
Interval for Level-1 IS.

level-2
Interval for Level-2 IS.

Default

ISIS uses 5 seconds for the interval and the interval is applied to both level-1 and level-2.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis bb
(config-router)#lsp-gen-interval 10
```

© 2026 IP Infusion Inc. Proprietary

lsp-mtu

Use this command to set maximum transfer unit for link-state packets (LSPs).

Use the `no` parameter with this command to set the interval to the default.

Command Syntax

```
lsp-mtu (level-1|level-2|) <512-4352>
no lsp-mtu (level-1|level-2|)
```

Parameters

<512-4352>
MTU size

level-1
Size for Level-1 IS.

level-2
Size for Level-2 IS.

Default

The MTU is 1492 bytes.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis bb
(config-router)#lsp-mtu 555
```

© 2026 IP Infusion Inc. Proprietary

lsp-refresh-interval

Use this command to set the link-state packet (LSP) refresh interval.

IP Infusion Inc. recommends making the `lsp-refresh-interval` smaller than the max-lsp-lifetime (page 2000) value.

Use the `no` parameter to set the interval to the default value.

Command Syntax

```
lsp-refresh-interval <1-65535>
no lsp-refresh-interval
```

Parameters

<1-65535>
Refresh interval in seconds.

Default

900 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#lsp-refresh-interval 600

(config)#router isis bb
(config-router)#no lsp-refresh-interval
```

© 2026 IP Infusion Inc. Proprietary

max-area-address

Use this command to set the maximum number of ISIS areas that can be configured on this router with the `net` command. By default, ISIS permits a maximum of three areas that can be defined on a router.

Use the `no` parameter with this command to set the maximum number of ISIS areas to its default (3).

Command Syntax

```
max-area-address <3-254>
no max-area-address
```

Parameters

<3-254>
The maximum number of areas in the network.

Default

The maximum number of areas is 3.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis net2
(config-router)# max-area-address 5
(config-router)#net 71.0001.0000.0000.0001.00
(config-router)#net 72.0001.0000.0000.0001.00
(config-router)#net 73.0001.0000.0000.0001.00
(config-router)#net 74.0001.0000.0000.0001.00
(config-router)#net 75.0001.0000.0000.0001.00
```

© 2026 IP Infusion Inc. Proprietary

max-lsp-lifetime

Use this command to set the maximum link-state packet (LSP) lifetime. You must set `max-lsp-lifetime` greater than the lsp-refresh-interval (page 1998) interval.

Use the `no` parameter to set the lifetime to the default.

Command Syntax

```
max-lsp-lifetime <350-65535>
no max-lsp-lifetime
```

Parameters

<350-65535>
Maximum LSP lifetime in seconds.

Default

1200 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#max-lsp-lifetime 1500

(config)#router isis bb
(config-router)#no max-lsp-lifetime
```

© 2026 IP Infusion Inc. Proprietary

metric-style

Use this command to configure the ISIS metric style. Use the following table when changing the method of how TLV encodes and SPF calculates a decision:

Metric-style Command	Wide SPF	Wide TLV	Narrow SPF	Narrow TLV
narrow (default)	OFF	OFF	ON	OFF
narrow transition	ON	OFF	ON	ON
wide	ON	ON	OFF	OFF
wide transition	ON	ON	ON	OFF
transition	ON	ON	ON	ON

Where:

- Wide SPF: Uses wide TLVs for SPF calculation.
- Wide TLV: Encodes wide TLVs in the LSP.
- Narrow SPF: Uses narrow TLVs for SPF calculation.
- Narrow TLV: Encodes narrow TLVs in the LSP.

Use the `no` parameter to set the style to the default style, narrow.

Command Syntax

```
metric-style (narrow|wide|transition) (level-1|level-2|)
metric-style (narrow|wide) transition (level-1|level-2|)
no metric-style
```

Parameters

narrow
Specify the old style of TLVs with narrow metric.

wide
Specify the new style of TLVs to carry wider metric.

transition
Specify to send and accept both styles of TLVs during transition.

level-1
Specify the level-1 metric style.

level-2
Specify the level-2 metric style.

transition
Accept both styles of TLVs during transition

Default

ISIS uses narrow metric style for level 1 and 2.

© 2026 IP Infusion Inc. Proprietary

Command Mode

Router mode

Examples

```
(config)#router isis bb
(config-router)#metric-style narrow transition
```

© 2026 IP Infusion Inc. Proprietary

mpls traffic-eng

Use this command to configure MPLS Traffic Engineering feature for ISIS.

Use the `no` parameter to turn off the feature.

Note: Metric-style wide must be enabled before using this CLI.

Command Syntax

```
mpls traffic-eng (level-1|level-2)
no mpls traffic-eng (level-1|level-2)
```

Parameters

level-1

Specify the level-1 MPLS Traffic Engineering feature.

level-2

Specify the level-2 MPLS Traffic Engineering feature.

Default

If this command is not used, ISIS does not encode traffic engineering TLVs and Sub-TLVs.

Command Mode

Router mode

Examples

```
(config)#router isis bb
(config-router)#metric-style wide
(config-router)#mpls traffic-eng level-1

(config)#router isis bb
(config-router)#no mpls traffic-eng level-1
```

© 2026 IP Infusion Inc. Proprietary

mpls traffic-eng router-id

Use this command to configure the traffic engineering stable IP address for a system.

Use the `no` parameter to turn off the feature.

Command Syntax

```
mpls traffic-eng router-id A.B.C.D
no mpls traffic-eng router-id
```

Parameters

A.B.C.D

Specify the ISIS router-ID in an IP address format.

Default

If this command is not used, and traffic engineering is enabled, ISIS will use global router-id..

Command Mode

Router mode

Examples

```
(config)#router isis bb
(config-router)#mpls traffic-eng router-id 10.10.0.23

(config)#router isis bb
(config-router)#no mpls traffic-eng router-id
```

© 2026 IP Infusion Inc. Proprietary

net

Use this command to add a Network Entity Title (NET) for the instance.

On a router running ISIS, a NET can be 8 to 20 bytes in length. The last byte is always the n-selector, and must be zero. The n-selector indicates no transport entity, and means that the packet is for the routing software of the system. The six bytes directly preceding the n-selector are the system ID. The system ID length is a fixed size and cannot be changed. The system ID must be unique throughout each area (Level 1) and throughout the backbone (Level 2).

The bytes preceding the system ID are the area ID, which can be from 1 - 13 bytes in length. By default, a maximum of three NETs per router are allowed with a different area ID but the system ID should be the same for all NETs. You can increase the number of area IDs per system ID with the `max-area-address` command.

Use the `no` parameter to remove the NET.

Command Syntax

```
net NET
no net NET
```

Parameters

NET

Specify a network entity title (NET) in 1 to 13 octets (that is, XX.XXXX. ... .XXXX.XX).

Default

ISIS does not configure a NET and routing is not enabled for the interface.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis bb
(config-router)#net 49.0000.0001.0002.0003.00
```

© 2026 IP Infusion Inc. Proprietary

passive-interface

Use this command to suppress routing updates on all interfaces or on a specified interface, which puts the interfaces into passive mode.

To advertise passive prefixes in LSP, an interface must be configured with ip router isis when using "passive-interface" command. If interface is not configured with isis instance "passive-interface IFNAME" command must be used to add that interface as passive. Enabling passive interface on an ISIS enabled interface disables ISIS routing updates on the interface and makes the interface passive.

Use the `no` parameter with this command to remove interfaces from passive mode.

Note: The command `passive-interface IFNAME disable` is used to make a particular interface active after the `passive-interface` command (with no parameters) has set all interfaces as passive.

Command Syntax

```
passive-interface
passive-interface IFNAME
passive-interface IFNAME disable

no passive-interface
no passive-interface IFNAME
no passive-interface IFNAME disable
```

Parameters

IFNAME
Interface name. If this parameter is omitted, then all interfaces become passive or active.

disable
Disable passive interface.

Command Mode

Router mode

Examples

The following suppresses routing updates on a specified interface.

```
#configure terminal
(config)#router isis 100
(config-router)#passive-interface
(config-router)#passive-interface eth0 disable
```

© 2026 IP Infusion Inc. Proprietary

prc-interval-exp

Use this command to configure exponential back-off delay between PRC calculations.

Use the `no` parameter to disable any set exponential back-off delay between PRC calculations.

Command Syntax

```
prc-interval-exp
prc-interval-exp <0-2147483647> <0-2147483647>
no prc-interval-exp
```

Parameters

<0-2147483647>
Set the minimum delay between receiving a change to PRC calculation in milliseconds.

<0-2147483647>
Set the maximum delay between receiving a change to PRC calculation in milliseconds.

Default

Minimum delay is 500 milliseconds and maximum delay is 50 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis
(config-router)#prc-interval-exp 100 10000

(config)#router isis
(config-router)#no prc-interval-exp
```

© 2026 IP Infusion Inc. Proprietary

redistribute

Use this command to redistribute routes from another protocol into the ISIS routing table.

Use the `no` form of this command to disable redistribution.

Command Syntax

```
redistribute (kernel|connected|static|rip|ospf|bgp) {metric <0-16777215>| metric-type
(internal|external)|level-1|level-2|level-1-2|route-map WORD}
no redistribute (kernel|connected|static|rip|ospf|bgp) {metric <0-16777215>| metric-type
(internal|external)|level-1|level-2|level-1-2|route-map WORD}
```

Parameters

connected
Redistribute connected routes.

static
Redistribute static routes.

rip
Redistribute RIP routes.

ospf
Redistribute OSPF routes.

bgp
Redistribute BGP routes.

metric
Metric for redistributed routes.

<0-16777215>
IS-IS default metric.

metric-type
IS-IS exterior metric type for redistributed routes:

internal
IS-IS internal metric type.

external
IS-IS external metric type.

level-1
Redistribute routes into level 1 only.

level-2
Redistribute routes into level 2 only (default).

level-1-2
Redistribute routes into both levels.

route-map
Route map reference.

WORD
Route map name.

© 2026 IP Infusion Inc. Proprietary

Default

Disabled

If no level parameter is specified, by default redistributed routes will be added in level-2 LSP. If is-type of an IS-IS instance is level-1, the level parameter must be set to level-1 for redistribute command to take effect and redistribute routes in L1 LSP.

Command Mode

For IPv4: Router mode

For IPv6: address-family ipv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis A
(config-router)#redistribute bgp metric 12
```

© 2026 IP Infusion Inc. Proprietary

redistribute isis

Use this command to redistribute reachability information from one level to the other level. If an distribute-list name is given with this command for an access list that does not exist, the routes are still redistributed.

Use the `no` form of this command to disable redistribution.

Command Syntax

```
redistribute isis level-1 into level-2
redistribute isis level-2 into level-1
redistribute isis level-1 into level-2 distribute-list WORD
redistribute isis level-2 into level-1 distribute-list WORD
no redistribute isis level-1 into level-2
no redistribute isis level-2 into level-1
```

Parameters

level-1
Specify an inter-area route from level-1.

level-2
Specify an inter-area routes from level-2.

into
Specify a level from level-n into level-m.

level-1
Specify an inter-area route into level-1.

level-2
Specify an inter-area routes into level-2.

distribute-list
Indicate the distributed-list parameter.

WORD
Specify the actual selected route.

Default

ISIS redistributes selected L1 routes into L2.

Command Mode

For Ipv4: Router mode

For Ipv6: address-family ipv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#redistribute isis level-2 into level-1

(config)#router isis bb
(config-router)#redistribute isis level-2 into level-1 distribute-list new

(config)#router isis bb
(config-router)#no redistribute isis level-2 into level-1
```

© 2026 IP Infusion Inc. Proprietary

redistribute isis WORD

Use this command to redistribute reachability information from one isis instance into another instance. Only one isis instance can be redistributed.

Use the `no` parameter with this command to stop redistribution.

Note: This command is not supported for address family IPv6.

Command Syntax

```
redistribute isis WORD {metric <0-16777215>| metric-type (internal | external ) |level-1|level-
2|level-1-2|route-map WORD}
no redistribute isis WORD {metric <0-16777215>| metric-type (internal|external) |level-1|level-
2|level-1-2|route-map WORD}
```

Parameters

WORD
Specify an isis instance name or tag

metric
Specify the metric for redistributed routes.

<0-16777215>
Specify the IS-IS default metric.

metric-type
Specify the IS-IS exterior metric type for redistributed routes:

internal
Set IS-IS internal metric type.

external
Set IS-IS external metric type.

level-1
IS-IS Level-1 routes.

level-2
IS-IS Level-2 routes.

level-1-2
IS-IS Level-1 and Level-2 routes.

route-map
Specify a Route map reference.

WORD
Specify name of the route-map.

Default

Disabled

Command Mode

Router mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis A
(config-router)#redistribute isis B metric 12
```

© 2026 IP Infusion Inc. Proprietary

router isis

Use this command to initiate an ISIS routing instance. This command starts the ISIS routing instance and enters router configuration mode. Configure at least one NET to start routing. Also, enable a particular interface with the ip router isis (page 1966) command.

Use the `no` parameter with this command to remove an ISIS routing instance.

Command Syntax

```
router isis WORD
no router isis WORD
```

Parameters

WORD
Name that specifies an ISO routing instance tag.

Default

Not configured

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis New
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Use the `no` parameter with this command to negate this command.

Command Syntax

```
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> HH:MM:SS MONTH <01-31> <1993-2035>
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> infinite
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> duration <1-2147483646>
no send-lifetime
```

Parameters

HH:MM:SS
Specify the start time of send-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to start. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to start as the first three letters of the month with first letter in caps, for example, Jan. (case sensitive)

<1993-2035>
Specify the year to start.

HH:MM:SS
Specify the end time of send-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to end. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to end as the first three letters of the month with first letter in caps, for example, Jan. (case sensitive)

<1993-2035>
Specify the year to end.

duration
Indicate the duration parameter.

<1-2147483646>
Specify the actual end time duration of a key in seconds.

infinite
Specify the end time to never expire.

Default

No default value is specified

Command Mode

Keychain-key mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of `send-lifetime` for `key-id 1` on the key chain named `mychain`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#send-lifetime 03:03:01 Jan 03 2004 04:04:02 Dec 06 2006
```

© 2026 IP Infusion Inc. Proprietary

set-overload-bit

Use this command to set the overload-bit in self link-state packets (LSPs), preventing the router from being used as a transit router during SPF calculation. The router will still receive LSPs even when the overload bit is set.

Use the no parameter to clear the overload-bit from self-LSPs.

Command Syntax

```
set-overload-bit ({suppress (external|interlevel|external interlevel|interlevel external)|on-startup
(<5-86400>|wait-for-bgp)}|)
no set-overload-bit
```

Parameters

suppress
Suppresses the redistribution of the specified types of reachability data during overload state.

external
Suppresses the redistribution of external reachability, preventing the advertisement of IP prefixes learned from other protocols.

interlevel
Suppresses the redistribution of interlevel reachability.

external interlevel or interlevel external
Suppresses the redistribution of both external and interlevel reachability.

on-startup
Sets the overload bit only at startup and clears the bit after the specified interval has elapsed.

<5-86400>
Specifies the time in seconds to advertise oneself as overloaded after a reboot.

wait-for-bgp
Sets the overload bit at startup, then clears the bit after BGP signals it has finished converging, or clears it after 10 minutes if BGP does not signal convergence. If BGP is not running, clears the overload bit immediately.

Default

Not set

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.4.2.

Example

This example configures the router to set the overload bit at startup, does not allow the unset of the overload bit until BGP converges, suppresses redistribution between levels, and suppresses redistribution from external routing protocols while the overload bit is set.

© 2026 IP Infusion Inc. Proprietary

```
OcNOS(config)#router isis bb
OcNOS(config-router)#set-overload-bit on-startup wait-for-bgp suppress interlevel external
```

© 2026 IP Infusion Inc. Proprietary

snmp context

Use this command to configure the SNMP context name that is mapped to each isis instance.

When context name is configured isis OID is registered with SNMP to that context.

Use no form of the command to un-map the SNMP context name from isis instance and unregister isis OID from SNMP.

Command Syntax

```
snmp context-name WORD
no snmp context-name
```

Parameters

WORD

SNMP context name (Maximum 32 alphanumeric characters)

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
OcNOS(config)#router isis 1
OcNOS(config-router)#snmp context-name context1
```

© 2026 IP Infusion Inc. Proprietary

spf-interval-exp

Use this command to set the minimum and maximum hold intervals between Shortest Path First (SPF) calculations.

The spf-interval-exp command configures the minimum and maximum interval time between the receipt of a topology change and the calculation of the SPF.

Use the `no` parameter with this command to set the minimum and maximum hold intervals to the default.

Command Syntax

```
spf-interval-exp <0-2147483647> <0-2147483647>
spf-interval-exp (level-1|level-2) <0-2147483647> <0-2147483647>
no spf-interval-exp ((level-1|level-2)|)
```

Parameters

<0-2147483647>
Specify the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF minimum hold-time interval value is 500 milliseconds.

<0-2147483647>
Specify the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF maximum hold-time interval value is 50 seconds.

level-1
Specify an interval for Level-1 IS.

level-2
Specify an interval for Level-2 IS.

Default

ISIS uses 500 milliseconds and 50,000 milliseconds for the minimum and maximum hold intervals, respectively. The values are applied to both level-1 and level-2 if the `level` parameter is omitted.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#spf-interval-exp level-1 600 60000

(config)#router isis bb
(config-router)#no spf-interval-exp level-1
```

© 2026 IP Infusion Inc. Proprietary

summary-address

Use this command to configure Summary Address to summarize IPv4 reachability information.

Use the no parameter with this command to unconfigure the summary.

Command Syntax

```
summary-address A.B.C.D/M (level-1 |level-1-2 |level-2) (metric <1-63>|)
no summary-address A.B.C.D/M
```

Parameters

A.B.C.D/M
Specify the IPv4 prefix to be announced.

level-1
Specify the reachability information only for Level-1.

level-1-2
Specify the reachability information for both Level-1 and Level-2.

level-2
Specify the reachability information only for Level-2.

metric
Specify the metric for the summarized address.

<1-63>
Specify the metric. The default is 0.

Default

ISIS does not configure the summary-address. Level must be configured along with summary-address. Metric is optional.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#summary-address 10.10.0.0/16 level-1-2 metric 3

(config)#router isis bb
(config-router)#no summary-address 10.10.0.0/16
```

© 2026 IP Infusion Inc. Proprietary

summary-prefix

Use this command to configure Summary Prefix to summarize IPv6 reachability information.

Use the `no` parameter with this command to unconfigure the summary.

Command Syntax

```
summary-prefix X:X::X:X/M (level-1 |level-1-2 |level-2) (metric <1-63>|)
no summary-prefix X:X::X:X/M
```

Parameters

X:X::X:X/M
Specify the IPv6 prefix to be announced.

level-1
Specify the reachability information only for Level-1.

level-1-2
Specify the reachability information for both Level-1 and Level-2.

level-2
Specify the reachability information only for Level-2.

metric
Specify the metric for the summarized address.

<1-63>
Specify the metric. The default is 0.

Default

By default, ISIS does not configure the summary-prefix. Level must be configured along with summary-prefix. Metric is optional.

Command Mode

Address Family IPv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#address-family ipv6
(config-router-af)#summary-prefix 2356::1/64 level-1 metric 30
```

IS-IS Graceful Restart Commands

This section describes the IS-IS graceful restart commands:

capability restart graceful 2024
isis restart grace-period 2025
isis restart-hello-interval 2026
isis restart helper 2027
isis restart suppress-adjacency 2028
restart isis graceful 2029
restart-timer 2030

© 2026 IP Infusion Inc. Proprietary

capability restart graceful

Use this command to enable the graceful restart capability.

Use the `no` parameter with this command to negate this command.

Command Syntax

```
capability restart graceful
no capability restart graceful
```

Parameters

None

Default

By default, graceful restart capability is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables the graceful restart capability on a router.

```
#configure terminal
(config)#router isis bb
(config-router)#capability restart graceful
```

© 2026 IP Infusion Inc. Proprietary

isis restart grace-period

Use this command to configure the T3 timer, the time the restarting router retains the forwarding table.

Use the `no` parameter to use the default value.

Command Syntax

```
isis restart grace-period <1-65535>
no isis restart grace-period
```

Parameters

<1-65535>
Grace period in seconds.

Default

By default, ISIS uses 65535 for the period value, and the value is applied to both level-1 and level-2.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables and then disables a restart grace period at one second.

```
#configure terminal
(config)#isis restart grace-period 1

(config)#no isis restart grace-period
```

© 2026 IP Infusion Inc. Proprietary

isis restart-hello-interval

Use this command to configure the T1 timer, interval of ISIS Hello packet with restart TLV.

Use the `no` parameter to use the default value.

Command Syntax

```
isis restart-hello-interval <1-65535> (level-1|level-2|)
no isis restart-hello-interval (level-1|level-2|)
```

Parameters

<1-65535>
Specify the number of seconds in the interval.

level-1
Specify the hello-interval for level-1 IIHs.

level-2
Specify the hello-interval for level-1 IIHs.

Default

By default, ISIS uses 3 seconds for the hello value, and the interval is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables a restart hello interval at 123 seconds for a level 1 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#isis restart-hello-interval 123 level-1

(config-if)#no isis restart-hello-interval level-1
```

© 2026 IP Infusion Inc. Proprietary

isis restart helper

Use this command to configure the router's helper mode capability.

Use the `no` parameter to disable the helper mode for this router.

Command Syntax

```
isis restart helper
no isis restart helper
```

Parameters

None

Default

By default, most routers are not a restart helper router.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables ISIS restart helper.

```
#configure terminal
(config)#isis restart helper

(config)#no isis restart helper
```

© 2026 IP Infusion Inc. Proprietary

isis restart suppress-adjacency

Use this command to enable ISIS to request that its adjacency be suppressed after the ISIS daemon process starts or restarts until the Link State Packet Database (LSPDB) synchronizes.

Use the `no` parameter to disable suppress-adjacency.

Command Syntax

```
isis restart suppress-adjacency
no isis restart suppress-adjacency
```

Parameters

None

Default

By default, ISIS does not request that its adjacency be suppressed after the ISIS daemon process starts or restarts.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables ISIS restart suppress adjacency.

```
#configure terminal
(config)#isis restart suppress-adjacency

(config)#no isis restart suppress-adjacency
```

© 2026 IP Infusion Inc. Proprietary

restart isis graceful

Use this command to restart the ISIS router.

Command Syntax

```
restart isis graceful (grace-period <1-65535>|)
```

Parameters

<1-65535>
Grace period in seconds.

Default

By default, the ISIS router is not restarted gracefully. Default grace-period is 65535 seconds.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#restart isis graceful grace-period 60

#restart isis graceful
% Warning : ISISD process will stop and needs to restart manually,
You may loose ISIS configuration, if not saved
Proceed for graceful restart? (y/n):y
```

© 2026 IP Infusion Inc. Proprietary

restart-timer

Use this command to restart the ISIS T2 timer. When a node comes up after graceful restart, within this time, the LSPDB sync should be completed.

Use the `no` parameter with this command to negate this command.

Command Syntax

```
restart-timer <5-65535> (level-1|level-2|)
no restart-timer (level-1|level-2|)
```

Parameters

<5-65535>
Restart time in seconds

level-1
Restart is only for Level-1.

level-2
Restart is only for Level-2.

Default

The default value is 60 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables the restart timer at 555 seconds for a level 2 interface.

```
#configure terminal
(config)#router isis bb
(config-router)# restart-timer 555 level-2

(config)#router isis bb
(config-router)#no restart-timer level-2
```

© 2026 IP Infusion Inc. Proprietary

ISIS Show Commands

This section describes the ISIS Show commands.

show clns is-neighbors 2032
show clns neighbors 2034

show clns is-neighbors

Use this command to display IS neighbor adjacencies.

Command Syntax

```
show clns is-neighbors (detail|)
show clns WORD is-neighbors (detail|)
show clns is-neighbors IFNAME (detail|)
show clns WORD is-neighbors IFNAME (detail|)
```

Parameters

detail
Detailed information.

WORD
Information for a single IS-IS area.

IFNAME
Information for a single interface.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show clns is-neighbors detail
Tag abc: VRF : default
System Id      Interface   State  Type Priority  Circuit Id
0000.0000.0003 eth1        Up     L1   64        0000.0000.0003.01
L1 Adjacency ID: 1
L2 Adjacency ID: 2
Uptime: 00:12:31
Area Address(es): 52
IP Address(es): 11.11.11.2
Level-1 Protocols Supported: IPv4
Adjacency advertisement: Advertise
```

Table 50. show clns is-neighbors output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
System Id	Uniquely identifies a system within an area.
Interface	Interface from which the system was learned.
State	Adjacency state:

Table 50. show clns is-neighbors output (continued)

Field	Description
	Init: Router is an IS and is waiting for an IS-IS hello message. IS-IS regards the neighbor as not adjacent. Up: IS is considered reachable
Type	Type of adjacency: L1: Router adjacency for level 1 routing only L2: Router adjacency for level 2 only L1L2: Router adjacency for level 1 and level 2 routing
Priority	IS-IS priority that the respective neighbor is advertising. The highest priority neighbor is elected the designated IS-IS router for the interface.
Circuit Id	Number that the router uses to uniquely identify its IS-IS interface. When the interface is attached to a broadcast network, the Circuit ID is concatenated with System ID of the designated router for the interface.
Adjacency ID	Adjacency identifier.
Uptime	How long the adjacency has existed.
Area Addresses	Area addresses associated with the intermediate-system adjacencies.
IPv4/IPv6 address(es)	IP addresses of the ES or IS.
Protocols Supported	IPv4 and/or IPv6.
Adjacency advertisement	Restart: Suppress or Advertise.

© 2026 IP Infusion Inc. Proprietary

show clns neighbors

Use this command to display ES and IS neighbor adjacencies.

Command Syntax

```
show clns neighbors (detail|)
show clns WORD neighbors (detail|)
show clns neighbors IFNAME (detail|)
show clns WORD neighbors IFNAME (detail|)
```

Parameters

detail
Detailed information for all interfaces.

WORD
Information for a single IS-IS area.

IFNAME
Information for a single interface.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show clns neighbors detail

Tag abc: VRF : default
System Id      Interface   SNPA            State  Holdtime  Type Protocol
0000.0000.0003 eth1        0800.277b.411d      Up     6         L1   IS-IS
L1 Adjacency ID: 1
L2 Adjacency ID: 2
Uptime: 00:15:58
Area Address(es): 52
IP Address(es): 11.11.11.2
Level-1 Protocols Supported: IPv4
Adjacency advertisement: Advertise
```

Table 51. show clns neighbors output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
System Id	Uniquely identifies a system within an area.
Interface	Interface from which the system was learned.

© 2026 IP Infusion Inc. Proprietary

Table 51. show clns neighbors output (continued)

Field	Description
SNPA	SubNetwork Point of Attachment (SNPA): MAC address of the next-hop.
State	Adjacency state: Init: Router is an IS and is waiting for an IS-IS hello message. IS-IS regards the neighbor as not adjacent. Up: ES or IS is considered reachable
Holdtime	Number of seconds before this adjacency entry times out.
Type	Type of adjacency: L1: Router adjacency for level 1 routing only L2: Router adjacency for level 2 only L1L2: Router adjacency for level 1 and level 2 routing
Protocol	Protocol through which the adjacency was learned.
Adjacency ID	Adjacency identifier.
Uptime	How long the adjacency has existed.
Area Addresses	Area addresses associated with the intermediate-system adjacencies.
IPv4/IPv6 address(es)	IP addresses of the ES or IS.
Topology	IPv4 and/or IPv6.
Protocols Supported	IPv4 and/or IPv6.
Adjacency advertisement	Restart: Suppress or Advertise.

show cspf lsp

Use this command to display CSPF statistics, including counts or status of CSPF-computed paths for label-switched paths. Displays the actual CSPF-selected paths with extensive constraint detail.

Command Syntax

```
Show cspf lsp
Show cspf lsp SESSION-NAME
show cspf lsp count
```

Parameters

SESSION-NAME

Use this parameter to display only the CSPF LSPs matching a specific RSVP session name.

count

Use this parameter to display the LSP count.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 7.0.0.

Example

Following is a sample output from the command.

```
OcNOS#show cspf lsp
   LSP Name        : t1-Primary
   Trunk ID        : 5001
   Lsp Id          : 2202
   OSPF ID         : 1
   Ingress         : 2.2.2.2

```

show cspf rsvp forwarding-timer

This command displays the information of Graceful Restart capable RSVP client to ISIS or OSPF, CSPF that are currently shutdown.

Command Syntax

```
show cspf rsvp forwarding-timer
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#show cspf rsvp forwarding-timer
CSPF Server      Protocol-Name   GR-State        Time Remaining (sec)    Disconnected-time
OSPF             RSVP            ACTIVE          88                      2021/08/18 04:49:23
```

© 2026 IP Infusion Inc. Proprietary

show debugging isis

Use this command to display the status of the debugging of the ISIS system.

Command Syntax

```
show debugging isis
```

Parameters

None

Command Mode

Execution modePrivileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# show debugging isis
IS-IS debugging status:
IS-IS Interface FSM debugging is on
IS-IS Neighbor FSM debugging is on
IS-IS events debugging is on
IS-IS PDU debugging is on
IS-IS lsp debugging is on
IS-IS spf debugging is on
IS-IS NSM debugging is on
IS-IS Check-sum debugging is on
IS-IS Authentication debugging is on
IS-IS Protocol-error debugging is on
IS-IS Local Updates debugging is on
IS-IS Hello debugging is on
IS-IS BFD debugging is on
IS-IS RIB debugging is on
```

© 2026 IP Infusion Inc. Proprietary

show ip isis igp-shortcut-lsp

Use this command to display IS-IS shortcut MPLS label-switched paths (LSPs).

Command Syntax

```
show ip isis (WORD|) igp-shortcut-lsp
```

Parameters

WORD
Information for a single IS-IS area.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# show ip isis igp-shortcut-lsp
```

Table 52. show ip isis igp-shortcut-lsp output

Field	Description
Tunnel-endpoint	Tunnel endpoint address.
Tunnel-id	Tunnel identifier.
Tunnel-metric	Tunnel metric.
active/inactive	Whether the tunnel is active or inactive.

© 2026 IP Infusion Inc. Proprietary

show ip isis lfa-config

Use this command to display the Loop Free Alternate Fast Reroute (LFA FRR) tie-break preferences for protection types and the termination hold-on timer.

Command Syntax

```
show ip isis (WORD|) lfa-config (level-1|level-2))
```

Parameters

WORD
Routing area tag.

level-1
Level 1 only.

level-2
Level 2 only

Command Mode

Execution modeand Privileged execution mode

Default

None

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#show ip isis lfa-config level-1

TIE-Breaker           Preference values
-------------------------------------------------
Primary Path:                 20
Link Protecting:              30
Node Protecting:              60
Broadcast Interface Disjoint: 70
Secondary Path:                0
Downstream Path:               0
Termination Hold On Interval : 1000 ms
```

© 2026 IP Infusion Inc. Proprietary

show ip isis route

Use this command to display IS-IS routing table for IPv4.

Command Syntax

```
show ip isis route (algorithm|detail|fast-reroute|igp-shortcut|prefix|tilfa)
```

Parameters

word
Information for an IS-IS area.

algorithm
Displays information of the flexible algorithm.

detail
Displays detailed information.

fast-reroute
Displays Fast-reroute information.

igp-shortcut
Displays IS-IS IGP shortcut routing table information.

prefix
Displays IPv4 prefix information.

tilfa
Displays IPv4 prefix information.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3. Added parameter algorithm in OcNOS version 6.6.0.

Example

```
ocnos#show ip isis route
Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, D - discard, e - external metric
       ** - invalid

Tag 10:  VRF : default
Total number of routes: 3

 Destination         Metric      Next-Hop            Interface      Tag
C    2.2.2.2/32          10          --                  lo             0
L1   5.5.5.5/32          20          25.25.25.2          eth2           0
C    25.25.25.0/24       10          --                  eth2           0
```

Each entry in this table has a code preceding it, indicating the source of the routing entry.

The following table explains the fields in the output.

Table 53. route codes and modifiers

Code	Description
C	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols.
E	External.
L1	IS-IS level-1.
L2	IS-IS level-2.
ia	IS-IS inter area (leaked).
D	Discard route. A device performing summarization installs a discard route in its routing table for the summarized network range to prevent routing loops where portions of the summarized network range do not have a more specific route in the RIB. External and internal discard route entries are installed by default. During route summarization, routing loops can happen if data sent to a nonexisting network appears to be a part of the summary, and the router doing the summarization has a less specific route that points back to the sending router for the network.
e	External metric. Routes can be redistributed into IS-IS with either internal or external metrics (internal is the default). The metric type determines the base metric value of the redistributed routes. The value of an internal metric is lower than 64. The value of an external metric is 64-128.

Route Entry Fields

The following table shows the route entry fields.

Table 54. route entry fields

Field	Description
Code	As explained in Table 53.
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
Destination	IP address of the remote network.
Metric	ISIS metric used for SPF calculation (1-63). When a route is imported into the IS-IS network without a specified metric, IS-IS uses 10 for the metric value and the value is applied to both level-1 and level-2.
Next-Hop	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Interface	Interface used to get to the next-hop address for this route.
Tag	Name that identifies the IS-IS area.

show ip isis route fast-reroute

Use this command to display Loop Free Alternate Fast Reroute (LFA FRR) route information and interfaces on which LFA FRR is disabled.

Command Syntax

```
show ip isis (WORD|) route fast-reroute
```

Parameters

WORD
Routing area tag.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#show ip isis route fast-reroute
Tag   : 1  VRF : default
Total number of routes: 6

Codes : L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
        D - discard, LP - Link Protecting, NP - Node Protecting,
        BP - Broadcast Interface Disjoint, Pri - Primary Path,
        Sec - Secondary Path, DP - Downstream Path

L2  1.1.1.1/32
    Primary Path via    : 172.27.1.2, xe15
    FRR Backup Path via : 172.26.1.1, xe20
    FRR Metric          : 50
    Protection Provided : LP NP BP DP

L2  3.3.3.3/32
    Primary Path via    : 172.27.1.2, xe15
    FRR Backup Path via : 172.26.1.1, xe20
    FRR Metric          : 60
    Protection Provided : LP BP

L2  4.4.4.4/32
    Primary Path via    : 172.28.1.1, xe3
    FRR Backup Path via : 172.27.1.2, xe15
    FRR Metric          : 30
    Protection Provided : LP BP

L2  7.7.7.77/32
    Primary Path via    : 172.28.1.1, xe3
    FRR Backup Path via : 172.27.1.2, xe15
    FRR Metric          : 30
    Protection Provided : LP BP
```

show ip isis route igp-shortcut

Use this command to display the IS-IS IGP shortcut routing table.

Command Syntax

```
show ip isis (WORD|) route igp-shortcut
```

Parameters

WORD
Information for an IS-IS area.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip isis new_isis route igp-shortcut
Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, D - discard, e - external metric

Tag aa: VRF : default
     Destination         Metric      Tunnel-ID         Tunnel-End-Point
```

Each entry in this table has a code preceding it, indicating the source of the routing entry. The following table shows these codes.

Table 55. Route codes and modifiers

Code	Description
C	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols.
E	External.
L1	IS-IS level-1.
L2	IS-IS level-2.
ia	IS-IS inter area (leaked).
D	Discard route. A device performing summarization installs a discard route in its routing table for the summarized network range to prevent routing loops where portions of the summarized network range do not have a more specific route in the RIB. External and internal discard route entries are installed by default. During route summarization, routing loops can happen if data sent to a nonexisting network appears to be a part of the summary, and the

show ip protocols

Use this command to display information about the IP protocols such as IP routing process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols bgp
```

Parameters

bgp
BGP information

Command Mode

Privileged execution modeand Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip protocols bgp
Routing Protocol is "bgp 100"
Sending updates every 30 seconds with +/-50%, next due in 12 seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface        Send  Recv   Key-chain
   eth0                 2     2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
 Distance: (default is 120)
```

The following explains the fields shows for each route.

Table 57. show ip protocols output details

Field	Description
Routing Protocol is "bgp 100"	Specifies the routing protocol used.
Sending updates every 30 seconds	Specifies the time between sending updates.
Next due in 12 seconds	Precisely when the next update is due to be sent.
Timeout after 180 seconds	Specifies the value of the timeout parameter.

© 2026 IP Infusion Inc. Proprietary

Table 57. show ip protocols output details (continued)

Field	Description
Redistributing	Lists the protocol that is being redistributed.
Routing for Networks	Specifies the networks for which the routing process is currently injecting routes.
Routing Information Sources	Lists all the routing sources the IP Infusion software is using to build its routing table.

show ip route fast-reroute

Use this command to display Loop Free Alternate Fast Reroute (LFA FRR) routes.

Command Syntax

```
show ip route fast-reroute
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#show ip route fast-reroute
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2 E1 - OSPF external type 1, E2 - OSPF
external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area ,p - stale info
* - candidate default

IP Route Table for VRF "default"
i L1   40.40.40.0/24 [115/10] via 10.10.10.142, eth1, 00:00:50
                         [FRR-NH] via 30.30.30.144, eth3

i L1   50.50.50.0/24 [115/15] via 20.20.20.143, eth2, 00:00:50
                         [FRR-NH] via 10.10.10.142, eth1

i L1   60.60.60.0/24 [115/15] via 10.10.10.142, eth1, 00:00:50
                         [FRR-NH] via 20.20.20.143, eth2
```

show ipv6 isis route

Use this command to display IPv6 IS-IS route information, including reachable prefixes, next-hop addresses, metrics, interfaces, and optional fast reroute or Flex-Algo data.

Command Syntax

```
show ipv6 isis route algorithm (128-255)(fast-reroute)
show ipv6 isis WORD topology (level-1|level-2|)
```

Parameters

128–255
Filters the route table to display only IPv6 IS-IS routes associated with a specific flex-Algo.

fast-reroute
Displays routes that have an associated fast reroute (FRR) backup path configured via mechanisms like TI-LFA.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 isis route
Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, D - discard, e - external metric

Tag 10:  VRF : default
Total number of routes: 1

C    1111::1/128 [10]
      via ::, lo
```

The following table explains the output fields.

Table 58. show ipv6 isis topology output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
Prefix	IPv6 network prefix learned through IS-IS or configured locally (for example: connected).
Metric	ISIS metric used for SPF calculation (1-63).
Next-Hop	This route is available through the next hop router located at this IP address.
Interface	Interface from which the system was learned.

© 2026 IP Infusion Inc. Proprietary

Table 58. show ipv6 isis topology output (continued)

Field	Description
Level	IS-IS level from which the route was learned: L1 (Level-1) or L2 (Level-2).
Algo	Flexible Algorithm ID used for route calculation, if applicable.

show ipv6 isis topology

Use this command to display IPv6 paths to Intermediate Systems.

Command Syntax

```
show ipv6 isis topology (level-1|level-2|)
show ipv6 isis WORD topology (level-1|level-2|)
```

Parameters

WORD
Display information for specified instance.

level-1
Display the path to all level-1 routers in the area.

level-2
Display the path to all level-2 routers in the domain.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 isis topology

Tag abc: VRF : default
IS-IS paths to level-1 routers
System Id            Metric     Next-Hop            Interface   SNPA
000F.0000.0001       --
000F.0000.0002       10         000F.0000.0002      eth2        0006.5B0E.D27D

IS-IS paths to level-2 routers
System Id            Metric     Next-Hop            Interface   SNPA
0000.0000.0001       10         0000.0000.0001      eth2        0000.0CFA.F002
```

The following table explains the output fields.

Table 59. show ipv6 isis topology output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
IS-IS paths to level-n routers	Each IS-IS level has a section with topology information.
System Id	Uniquely identifies a system within an area.
Metric	ISIS metric used for SPF calculation (1-63).

© 2026 IP Infusion Inc. Proprietary

Table 59. show ipv6 isis topology output (continued)

Field	Description
Next-Hop	This route is available through the next hop router located at this IP address.
Interface	Interface from which the system was learned.
SNPA	SubNetwork Point of Attachment (SNPA): MAC address of the device.

show isis counter

Use this command to display the MIB variables used to construct routing tables for IP networks for IS-IS as defined in RFC 4444.

Command Syntax

```
show isis counter
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis counter
Tag abc: VRF : default
IS-IS Level-1 isisSystemCounterEntry:
isisSysStatCorrLSPs: 0
isisSysStatAuthTypeFails: 0
isisSysStatAuthFails: 0
isisSysStatLSPDbaseOloads: 0
isisSysStatManAddrDropFromAreas: 0
isisSysStatAttmptToExMaxSeqNums: 0
isisSysStatSeqNumSkips: 0
isisSysStatOwnLSPPurges: 0
isisSysStatIDFieldLenMismatches: 0
isisSysStatMaxAreaAddrMismatches: 0
isisSysStatPartChanges: 0
isisSysStatSPFRuns: 7
isisSysStatPRCRuns: 0

IS-IS Level-2 isisSystemCounterEntry:
isisSysStatCorrLSPs: 0
isisSysStatAuthTypeFails: 0
isisSysStatAuthFails: 0
isisSysStatLSPDbaseOloads: 0
isisSysStatManAddrDropFromAreas: 0
isisSysStatAttmptToExMaxSeqNums: 0
isisSysStatSeqNumSkips: 0
isisSysStatOwnLSPPurges: 0
isisSysStatIDFieldLenMismatches: 0
isisSysStatMaxAreaAddrMismatches: 0
isisSysStatPartChanges: 0
isisSysStatSPFRuns: 3
isisSysStatPRCRuns: 0
```

show isis database

Use this command to display link-state database (LSDB) database information. The LSDB is the core of IS-IS routing. All link-state information advertised by neighbors in the same area is stored in the LSDB.

Command Syntax

```
show isis database
show isis database (detail|verbose)
show isis database (detail|verbose) WORD
show isis database (detail|verbose) WORD (level-1|level-2)
show isis database (detail|verbose) (level-1|level-2)
show isis database (detail|verbose) (level-1|level-2) WORD
show isis database WORD
show isis database WORD (level-1|level-2)
show isis database WORD (level-1|level-2) (detail|verbose)
show isis database WORD (detail|verbose)
show isis database WORD (detail|verbose) (level-1|level-2)
show isis database (level-1|level-2)
show isis database (level-1|level-2) (detail|verbose)
show isis database (level-1|level-2) (detail|verbose) WORD
show isis database (level-1|level-2) WORD
show isis database (level-1|level-2) WORD (detail|verbose)
```

Parameters

detail
Detailed information.

verbose
Verbose information.

WORD
Link-state packet (LSP) identifier in the form of XXXX.XXXX.XXXX.XX-XX.

level-1
IS-IS level-1.

level-2
IS-IS level-2.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis database detail
Area bb:
IS-IS Level-1 Link State Database:
LSPID                 LSP Seq Num  LSP Checksum  LSP Holdtime      ATT/P/OL
000F.0000.0001.00-00* 0x00000007   0xE15E        1188              1/0/0
  Area Address: 49.000F
  NLPID:        0xCC
```

```
   IP Address:   10.10.12.97
   Metric: 10         IP 10.10.12.0 255.255.255.0
   Metric: 10         IS 000F.0000.0001.02
 000F.0000.0001.02-00* 0x00000003   0x3C66        1026              1/0/0
   Metric:  0         IS 000F.0000.0001.00
   Metric:  0         IS 000F.0000.0002.00
 000F.0000.0002.00-00  0x00000003   0x8C4B        1025              1/0/0
   Area Address: 49.000F
   NLPID:        0xCC
   Hostname:     isisd@redhat
   IP Address:   10.10.12.94
   Metric: 10         IP 10.10.12.0 255.255.255.0
   Metric: 10         IS 000F.0000.0001.02
```

The following table explains the output fields.

Table 60. show isis database output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
IS-IS Level-n Link State Database	Each IS-IS level has a section with Link-State Packet (LSP) information.
LSPID	Link-state packet identifier in the form of XXXX.XXXX.XXXX.XX-XX. The first six octets (“XXXX.XXXX.XXXX”) are the system identifier of the router that originated the LSP. The next octet is the pseudonode identifier: When this octet is nonzero, the LSP describes links from a designated router (pseudonode) that creates and floods an LSP that describes all systems attached to the network. This mechanism is similar to a router link-state advertisement (LSA) in OSPF. When this octet is zero, the LSP is from a nonpseudonode which describes the state of the originating router. The last octet is the LSP number. If the value is 0x00, the entire LSP was carried in one LSP. If there is more data than can fit in a single LSP, the LSP is divided into multiple LSP fragments and each fragment has a different LSP number. An asterisk (*) means the LSP originated on the system where the command was given.
LSP Seq Num	LSP sequence number.
LSP Checksum	LSP checksum.
LSP Holdtime	Amount of time the LSP remains valid (in seconds). An LSP hold time of zero means the LSP was purged and is being removed from the link-state database (LSDB) of all routers. The value indicates how long the purged LSP will stay in the LSDB before being completely removed.
ATT	Attached bit. A Level-2 IS indicates its attachment to other areas by setting its attached bit in its Level-1 LSP 0. In other words, this is only set for inter-area routes. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 2 routers will use the attach bit to find the closest Level-2 router. They will point a default route to the closest Level-2 router.
P	Partition repair. A Level-1 area can become partitioned; this bit means the partition can be

Table 60. show isis database output (continued)

Field	Description
	repaired via use of Level-2 routes.
OL	Overload bit. Determines whether the IS is congested. When the overload-bit is set in an LSP, other routers will not use this router as a transit router during SPF calculation. Only packets for destinations directly connected to the overloaded router will be sent to this router.

This command also displays information about the IS-IS TLVs in Table 61 if present in an LSP. For more about the TLV information, search for “IS-IS TLV Codepoints” on the Internet, check ISO/IEC 10589:2002(E), or other standard mentioned in the following table.

Table 61. IS-IS TLV Codepoints

IS-IS TLV Codepoint	Description	Standard
1	Area Addresses	ISO 10589
2	IIS Neighbors	ISO 10589
3	ES Neighbors	ISO 10589
10	Authentication	ISO 10589, RFC 6233
22	Extended IS reachability	RFC 5305
128	IP internal reachability	RFC 1195, RFC 5302
129	Protocols supported	RFC 1195
130	IP external reachability	RFC 1195, RFC 5302
132	IP interface address	RFC 1195
134	Traffic engineering router ID	RFC 5305
135	Extended IP reachability	RFC 5305
137	Host name	RFC 5301, RFC 6233
222	Multi IS reachability	RFC 5120
229	Multi topology	RFC 5120
232	IPv6 interface address	RFC 5308
235	Multi IPv4 reachability	RFC 5120
236	IPv6 reachability	RFC 5308
237	Multi IPv6 reachability	RFC 5120

show isis interface

Use this command to display detailed interface information.

Command Syntax

```
show isis interface
show isis interface IFNAME
show isis interface counter
```

Parameters

IFNAME
Interface name.

counter
Interface counters.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis interface
eth2 is up, line protocol is up
Routing Protocol: IS-IS (abc)
Network Type: Broadcast
Circuit Type: level-2
Local circuit ID: 0x01
Extended Local circuit ID: 0x00000004
Local SNPA: 0800.2731.a9a0
IP interface address:
10.10.10.1/24
IPv6 interface address:
fe80::a00:27ff:fe31:a9a0/64
Level-2 Metric: 10/10, Priority: 64, Circuit ID: 0000.0000.0001.01
Number of active level-2 adjacencies: 0
Level-2 LSP MTU: 1492
Next IS-IS LAN Level-2 Hello in 9 seconds
eth1 is up, line protocol is up
Routing Protocol: IS-IS (abc)
Network Type: Broadcast
Circuit Type: level-1
Local circuit ID: 0x02
Extended Local circuit ID: 0x00000003
Local SNPA: 0800.2714.e7f8
IP interface address:
11.11.11.1/24
IPv6 interface address:

Level-1 Metric: 10/10, Priority: 64, Circuit ID: 0000.0000.0003.01
Number of active level-1 adjacencies: 1
Level-1 LSP MTU: 1492
Next IS-IS LAN Level-1 Hello in 5 seconds
```

© 2026 IP Infusion Inc. Proprietary

```
#show isis interface eth1
eth1 is up, line protocol is up
Routing Protocol: IS-IS ((null))
Network Type: Broadcast
Circuit Type: level-1
Local circuit ID: 0x02
Extended Local circuit ID: 0x00000003
Local SNPA: 0800.27e3.0e64
IP interface address:
30.0.0.1/24
IPv6 interface address:
fe80::a00:27ff:fee3:e64/64
LDP-ISIS Sync Configured
Holddown timer = 100 seconds, Remaining time = 90 seconds
Level-1 Metric: 63/16777214, Priority: 64, Circuit ID: 0000.0000.0001.02
Number of active level-1 adjacencies: 1
Level-1 LSP MTU: 1492
Next IS-IS LAN Level-1 Hello in 1 seconds
```

The following table explains the output fields.

Table 62. show isis interface

Field	Description
IFNAME is up, line protocol is up/down	Whether the interface is up or down
Routing Protocol	“IS-IS” and the name that identifies the IS-IS instance.
Network Type	Broadcast Point-to-Point Loopback
Circuit Type	Whether the interface is configured for: Local routing: level-1 Area routing: level 2 Local and area routing: level-1-2
Local circuit ID	Local circuit identifier assigned when interface is created. Each IS-IS interface is assigned a circuit identifier to identify the interface within the link-state database. If the interface is attached to a multiaccess network, the circuit ID is concatenated with the system ID of the designated IS. This is called the pseudonode ID.
Extended Local circuit ID	Interface index.
Local SNPA	SubNetwork Point of Attachment: for broadcast networks, MAC address.
IP interface address	IPv4 addresses assigned to IS-IS interface.
IPv6 interface address	IPv6 addresses assigned to IS-IS interface.
LDP-ISIS Sync Configured	LDP IS-IS synchronization is enabled.
Holddown timer	Delay for notifications of LDP convergence to IS-IS
Remaining time	Remaining LDP convergence hold time in seconds.
Holddown timer not configured	The LDP convergence holddown timer has not been set.
Level-1 Metric	Interface metric value; used for SPF calculation.

© 2026 IP Infusion Inc. Proprietary

Table 62. show isis interface (continued)

Field	Description
Priority	Priority for designated IS election.
Circuit ID	Unique ID assigned to a circuit internally.
Number of active level-1 adjacencies	Number of adjacencies formed with a neighboring router.
Level-1 LSP MTU	Maximum transmission unit: maximum transmission size for a packet on this interface.
Level-2 Metric	Interface metric value; used for SPF calculation.
Priority	Priority for designated IS election.
Circuit ID	Unique ID assigned to a circuit internally.
Number of active level-2 adjacencies	Number of adjacencies formed with a neighboring router.
Level-2 LSP MTU	Maximum transmission unit: maximum transmission size for a packet on this interface.
Next IS-IS LAN Level-1 Hello	For broadcast networks, when the next IS hello will be sent on this interface.
Next IS-IS LAN Level-2 Hello	For broadcast networks, when the next IS hello will be sent on this interface.
Next IS-IS Hello in	For point-to-point networks, when the next IS hello will be sent on this interface.
Bandwidth	Traffic engineering: interface bandwidth.
Maximum reservable bandwidth	Traffic engineering: maximum reservable interface bandwidth.
Available bandwidth at priority	Traffic engineering: available interface bandwidth at priority.
Bidirectional Forwarding Detection is disabled/enabled/configured	BFD state

show isis microloop-avoidance

Use this command to display microloop avoidance FSM states, timer values, and the oFIB route table.

Command Syntax

```
show isis microloop-avoidance ( algorithm|level-1|level-2|segment-routing) ( previous-info|detail|)
```

Parameters

algorithm
Display flexible algorithm

level-1
Display level-1 information only

level-2
Display level-2 information only

segment-routing
Display details of segment-routing

detail
Display detailed information for one or both levels

previous-info
Display details of previous oFIB execution

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.3.0. Added parameter algorithm in OcNOS version 6.6.0

Example

```
PE1#sh isis microloop-avoidance
Tag 1:  VRF : default
Level-1 status:
 FSM State: OFIB_STABLE

Level-2 status:
 FSM State: OFIB_STABLE

PE1#show isis microloop-avoidance detail
Tag 1:  VRF : default
Level-1 status:
 FSM State: OFIB_HOLDING_DOWN
 Event type: Neighbor Down
 Near end: 0000.0000.0001.00    Far end:0000.0000.0004.00
 Hold-down timer running: Yes    Time Remaining: 00:00:02.716
 Delay timer running: No

Level-2 status:
 FSM State: OFIB_STABLE
```

© 2026 IP Infusion Inc. Proprietary

```
oFIB Route Table:

     Destination         Metric      Next-Hop            Interface      Tag
L1   3.3.3.3/32          30          10.0.0.2            xe2            0
     Src: 0000.0000.0003
L1   4.4.4.4/32          40          10.0.0.2            xe2            0
     Src: 0000.0000.0004
L1   30.0.0.0/24         30          10.0.0.2            xe2            0
     Src: 0000.0000.0003
```

show isis spf-logs

Use this command to display the Shortest Path First (SPF) related information. It also display Partial Route Calculation (PRC) related information only when prc-interval-exp is enabled.

Command Syntax

```
show isis (WORD|) spf-logs (level-1|level-2|level-1-2)( algorithm)
```

Parameters

WORD
Routing area tag.

level-1
Displays Level 1 information only.

level-2
Displays Level 2 information only.

level-1-2
Displays both Level 1-2 information.

algorithm
Level 1-2

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 3.0. Added parameter algorithm in OcNOS version 6.6.0

Example

```
#show isis spf-logs level-1
Tag 1:  VRF : default
Level-1 spf logs:
 Next SPF is not scheduled yet
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 SPF algorithm executed 5 times
 SPF algorithm last executed 00:05:06.106 ago

PRC logs:
Next PRC is not scheduled yet
PRC schedule delay min 16 secs 0 msecs
PRC schedule delay max 65 secs 0 msecs
PRC algorithm executed 2 times
PRC algorithm last executed 00:03:58.256 ago
```

© 2026 IP Infusion Inc. Proprietary

show isis topology

Use this command to display paths to Intermediate Systems.

Command Syntax

```
show isis topology ( algorithm|level-1|level-2|)
show isis WORD topology (algorithm|level-1|level-2|)
```

Parameters

WORD
Display information for specified instance.

l1
Display the path to all level-1 routers in the area.

l2
Display the path to all level-2 routers in the domain.

level-1
Display the path to all level-1 routers in the area.

level-2
Display the path to all level-2 routers in the domain.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis topology

Tag abc: VRF : default
IS-IS paths to level-1 routers
System Id            Metric     Next-Hop            Interface   SNPA
000F.0000.0001       --
000F.0000.0002       10         000F.0000.0002      eth2        0006.5B0E.D27D

IS-IS paths to level-2 routers
System Id            Metric     Next-Hop            Interface   SNPA
0000.0000.0001       10         0000.0000.0001      eth2        0000.0CFA.F002
```

The following table explains the output fields.

Table 63. show isis topology output

Field	Description
Tag	Name that identifies the IS-IS area.

Table 63. show isis topology output (continued)

Field	Description
VRF	VRF name.
IS-IS paths to level-n routers	Each IS-IS level has a section with topology information.
System Id	Uniquely identifies a system within an area.
Metric	ISIS metric used for SPF calculation (1-63).
Next-Hop	This route is available through the next hop router located at this IP address.
Interface	Interface from which the system was learned.
SNPA	SubNetwork Point of Attachment (SNPA): MAC address of the device.

© 2026 IP Infusion Inc. Proprietary

show running-config interface isis

Use this command to display the ISIS interface configuration.

Command Syntax

```
show running-config interface IFNAME isis
```

Parameters

IFNAME
Interface name.

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth0 isis
!
interface eth0
 isis tag 500 level-1
!
```

© 2026 IP Infusion Inc. Proprietary

show running-config router isis

Use this command to display the ISIS router configuration.

Command Syntax

```
show running-config router isis
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config-router)#show running-config router isis
!
router isis 1
passive-interface eth1
!
```

IS-IS Microloop-Avoidance Commands

This section describes the IS-IS microloop-avoidance commands:

microloop-avoidance 2070
microloop-avoidance flex-algo 2072
microloop-avoidance hold-timer 2073
microloop-avoidance max-fib 2074
microloop-avoidance segment-routing 2075
show isis microloop-avoidance 2076

© 2026 IP Infusion Inc. Proprietary

microloop-avoidance

Use this command to enable microloop avoidance using ordered FIB (oFIB) for an ISIS process.

Use the `no` form of this command to disable microloop avoidance for an ISIS process.

Microloop avoidance will be enabled with default hold-timer and max-fib values if it is not configured by the user:

- Default value of hold-timer is 6 seconds
- Default value for max-fib is 2 seconds

Microloop avoidance has to be enabled in conjunction with a fast reroute (FRR) mechanism such as TILFA that converts a sudden link or node failure into a non-urgent topology change by having complete repair path for all affected destinations. With microloop-avoidance, the convergence will be slower compared to traditional (SPF) convergence mechanisms. So, when there is any failure of a link or a set of links that are not protected using an FRR mechanism, it is advised to use conventional SPF (faster) mode of operation to minimize packet loss during convergence/reconvergence.

Command Syntax

```
microloop-avoidance(flex-algo|hold-timer|level-1|level-2|max-fib|segment-routing)
no microloop-avoidance(flex-algo|hold-timer|level-1|level-2|max-fib|segment-routing)
```

Parameters

flex-algo
Specifies the algorithm number used for Flexible Algorithm

hold-timer
Specifies the hold-timer value in seconds.

level-1
Applies the configuration to IS-IS Level-1 only.

level-2
Applies the configuration to IS-IS Level-2 only.

max-fib
Specifies the max-fib value for microloop-avoidance.

segment-routing
Enables Segment Routing functionality.

Default

None

Command Mode

ISIS router mode

Applicability

This command was introduced in OcNOS version 6.3.0. Added parameters flex-algo, hold-timer, max-fib, and segment-routing in OcNOS version 6.6.1.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#microloop-avoidance level-1
(config-router)#microloop-avoidance level-2
(config-router)#

#configure terminal
(config)#router isis 100
(config-router)#no microloop-avoidance level-1
(config-router)#no microloop-avoidance level-2
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

microloop-avoidance flex-algo

Use this command to enable microloop avoidance using ordered FIB (oFIB) for an IS-IS Flexible Algorithm (Flex-Algo) instance.

Use the `no` form of this command to disable microloop avoidance for a Flex-Algo instance.

Microloop avoidance ensures loop-free convergence during topology changes by delaying FIB updates in a controlled sequence. When used with Flex-Algo, this feature applies the same loop-prevention behavior within the topology defined by that algorithm (for example: specific metric types, link affinities).

Command Syntax

```
microloop-avoidance flex-algo (128-255)(level-1|level-2)
no microloop-avoidance flex-algo (128-255)(level-1|level-2)
```

Parameters

128-255
Specifies the flex- algo instance range for which microloop-avoidance is to be enabled.

level-1
Applies microloop-avoidance to IS-IS Level-1 routing under the specified Flex-Algo.

level-2
Applies microloop-avoidance to IS-IS Level-2 routing under the specified Flex-Algo.

Default

None

Command Mode

ISIS router mode

Applicability

This command was introduced in OcNOS version 6.6.1.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#microloop-avoidance flex-algo 129 level-1
(config-router)#microloop-avoidance flex-algo 130 level-2

#configure terminal
(config)#router isis 1
(config-router)#no microloop-avoidance flex-algo 129 level-1
(config-router)#no microloop-avoidance flex-algo 130 level-2
```

© 2026 IP Infusion Inc. Proprietary

microloop-avoidance hold-timer

Use this command to configure the hold-timer value for microloop avoidance.

Use the `no` form of this command to return to the default hold-timer value for microloop avoidance.

Hold-timer value means the time that router will wait after receiving first LSP update with a topology change, to group all related LSP updates together to process using oFIB.

Microloop avoidance has to be enabled first for the particular level before configuring the hold-timer.

Hold-timer value must be configured same across all routers in the network to get the desired results.

Command Syntax

```
microloop-avoidance hold-timer (1-60) (level-1|level-2)
no microloop-avoidance hold-timer (level-1|level-2)
```

Parameters

1-60
Specifies the hold-timer value in seconds.

level-1
Applies the configuration to IS-IS Level-1 only.

level-2
Applies the configuration to IS-IS Level-1 only.

Default

Default value for hold-timer is 6 seconds

Command Mode

ISIS router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#microloop-avoidance hold-timer 3 level-1
(config-router)#microloop-avoidance hold-timer 3 level-2
(config-router)#

#configure terminal
(config)#router isis 100
(config-router)#no microloop-avoidance hold-timer level-1
(config-router)#no microloop-avoidance hold-timer level-2
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

microloop-avoidance max-fib

Use this command to configure the max-fib value for microloop avoidance.

Use the `no` form of this command to return to the default max-fib value for microloop avoidance.

The max-fib value is a network-wide constant that reflects the maximum time required to update a FIB irrespective of the change required. This value will be further multiplied by the oFIB RANK to get the actual FIB update delay time.

Microloop avoidance has to be enabled first for the particular level before configuring max-fib.

Max-fib value must be configured same across all routers in the network to get the desired results.

Command Syntax

```
microloop-avoidance max-fib (1-60) (level-1|level-2)
no microloop-avoidance max-fib (level-1|level-2)
```

Parameters

1-60
Specifies the max-fib value in seconds

level-1
Applies the configuration to IS-IS Level-1 only.

level-2
Applies the configuration to IS-IS Level-2 only.

Default

2 seconds

Command Mode

ISIS router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#microloop-avoidance max-fib 3 level-1
(config-router)#microloop-avoidance max-fib 3 level-2
(config-router)#

#configure terminal
(config)#router isis 100
(config-router)#no microloop-avoidance max-fib level-1
(config-router)#no microloop-avoidance max-fib level-2
```

© 2026 IP Infusion Inc. Proprietary

microloop-avoidance segment-routing

Use this command to configure a SR micro-loop avoidance under IS-IS Segment Routing (SR) mode.

Use the `no` form of this command to disable microloop avoidance for under IS-IS Segment Routing (SR) mode.

When microloop avoidance is enabled under Segment Routing, the router ensures loop-free convergence by controlling FIB updates across the network during topology changes.

Command Syntax

```
microloop-avoidance segment-routing (level-1 | level-2)(proto ipv4|ipv6 fib-delay) <100-300000>
no microloop-avoidance segment-routing (level-1 | level-2)(proto ipv4|ipv6)
```

Parameters

level-1
Applies Segment Routing microloop-avoidance logic only to IS-IS Level-1.

level-2
Applies Segment Routing microloop-avoidance logic only to IS-IS Level-2.

prot0
Specifies the protocol family (IPv4 or IPv6) to which microloop avoidance will be applied.

ipv4
Specifies the IPv4 protocol family to which microloop avoidance will be applied.

ipv6
Specifies the IPv6 protocol family to which microloop avoidance will be applied.

100–300000
Sets the delay in milliseconds for updating the Forwarding Information Base (FIB). This delay helps prevent microloops by controlling the rate at which FIB changes are applied.

Default

If fib-delay is not configured, default fib-delay of 1500ms(1.5 sec) is configured.

Command Mode

ISIS router mode

Applicability

This command was introduced in OcNOS version 6.6.1.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#microloop-avoidance segment-routing level-1 proto ipv4 fib-delay 100
(config-router)#microloop-avoidance segment-routing level-2 proto ipv6 fib-delay 1000

#configure terminal
(config)#router isis 1
(config-router)#no microloop-avoidance segment-routing level-1 proto ipv4
(config-router)#no microloop-avoidance segment-routing level-2 proto ipv6
```

© 2026 IP Infusion Inc. Proprietary

show isis microloop-avoidance

Use this command to display microloop avoidance FSM states, timer values, and the oFIB route table.

Command Syntax

```
show isis microloop-avoidance (flex-algo|level-1|level-2|segment-routing) (previous-info|detail|)
```

Parameters

flex-algo
Specifies the algorithm number used for Flexible Algorithm

detail
Display detailed information for one or both levels.

level-1
Filters the output to show microloop avoidance data for IS-IS Level-1 topology.

level-2
Filters the output to show microloop avoidance data for IS-IS Level-2 topology.

previous-info
Provides the details of previous oFIB executions.

segment-routing
Displays microloop avoidance configuration and state for IS-IS SR instances.

Command Mode

Privileged execution mode

Applicability

This command was introduced in OcNOS version 6.3.0. Added parameters flex-algo and previous-info in OcNOS version 6.6.1.

Example

```
ocnos#show isis microloop-avoidance detail
Tag 1:  VRF : default
Level-1 status:
 FSM State: OFIB_STABLE

Level-2 status:
 FSM State: OFIB_HOLDING_DOWN

LAYER 3 SUB-INTERFACE CONFIGURATION

Layer 3 Sub-interface Configuration 2079
Topology 2079
Creating a Sub-interface 2079

© 2026 IP Infusion Inc. Proprietary

Layer 3 Sub-interface Configuration

This section contains examples of configuring sub-interfaces.

A single physical interface when required to handle multiple VLAN traffic, can be divided into multiple logical interfaces called sub-interfaces.

All sub-interfaces under a physical port will use their parent port for transmitting and receiving data.

Sub-interfaces can be used for various purposes, as for inter-vlan routing to happen when router has only one physical interface, two sub-interfaces each with different IP network can be created under it and data can be routed between them.

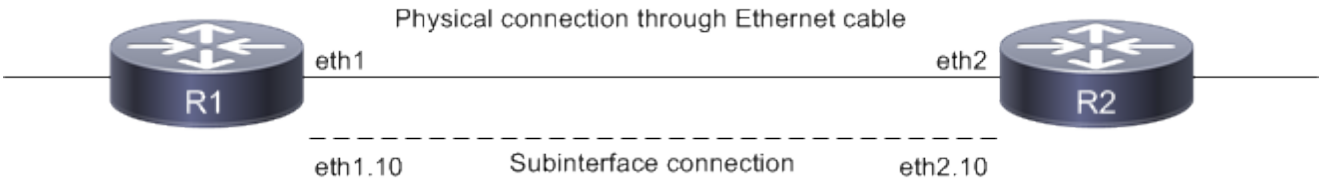
Sub-interfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN identifiers. Because VLANs allow you to keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces.

Note: Refer to the release note for features supported by L3 Sub-interface.

Topology

Figure 141 shows and example of sub-interface configuration. In this example, there are two routers, R1 and R2, and the eth1 interface of R1 is connected directly to eth2 of R2 using an Ethernet cable.

Figure 141. Subinterface connections



The eth1.10 subinterface is created on R1, and eth2.10 is created on R2.

Note: Layer 3 Subinterfaces can be created on physical and LAG interfaces.

Creating a Sub-interface

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#interface eth1.10`	Creates a sub-interface as eth1.10
`(config-if)#encapsulation dot1q 10`	Configure the encapsulation as dot1q matching VLAN 10
`(config-if)#ip address 10.10.10.1/24`	Assigning IP address to sub-interface
`(config-if)#commit`	Commit the candidate configuration to the running

© 2026 IP Infusion Inc. Proprietary

	configuration
(config-if)#exit	Exit interface mode

Creating a Sub-interface with Encapsulation

Double encapsulation as dot1q

#configure terminal	Configure terminal
(config)#interface eth1.1010	Configure sub-interface
(config-if)# encapsulation dot1q 10 inner-dot1q 10	Configure encapsulation with inner tag
(config-if)#ip address 192.168.1.50/24	Configuring ip address
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit configure mode

Double encapsulation as dot1ad

#configure terminal	Configure terminal
(config)#interface eth1.20	Configure sub-interface
(config-if)# encapsulation dot1ad 20 inner-dot1q 20	Configure encapsulation with inner tag
(config-if)#ip address 192.168.2.50/24	Configuring ip address
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit configure mode

Notes:

- Use dot1ad ethertype (0x8100 | 0x88a8 | 0x9100 | 0x9200) command to configure the service-tpid value on parent port of a sub-interface. By this the tpid used for service tag for a sub-interface may be inherited from the one applied to parent interface.
- For any dot1ad sub-interface to be functional, dot1ad ethertype should be set to desired value as 0x88a8/0x9100/0x9200. Default value is 0x8100. To verify the ethertype value for the interface use show interface <subinterface> command.

L3SI Statistics

Enable below commands to get sub-interface statistics

#configure terminal	Configure terminal
(config)#hardware-profile statistics ac-lif enable	Enable hardware profile statistics
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode

© 2026 IP Infusion Inc. Proprietary

Note: Reload the node, and then only statistics command will get effective.

Displaying Sub-interfaces

In OcNOS, sub-interfaces appear as any physical interface in the `show running-config` or the show ip interface brief output and can be configured as any other interface.

The following examples display subinterface information from various `show` commands.

Note: The below command output is just for reference and is not directly related to the configuration provided above.

show interface brief

```
RTR1#show interface brief

Codes: ETH - Ethernet, LB - Loopback, AGG - Aggregate, MLAG - MLAG Aggregate
       FR - Frame Relay, TUN -Tunnel, PBB - PBB Logical Port, VP - Virtual Port

Layer 3 Sub-interface Commands

This section describes the Layer 3 sub-interface commands:

encapsulation 2086
interface IFNAME.SUBINTERFACE_ID 2087
show interface IFNAME.SUBINTERFACE_ID 2088

© 2026 IP Infusion Inc. Proprietary

encapsulation

Use this command to configure encapsulation under a sub-interface. Using this command, a Layer 3 sub-interface can be configured as a port-vlan or stacked vlan. Before configuring the encapsulation on sub-interface, the operating state of the sub-interface is admin down. After configuring the encapsulation, the operating state of the sub-interface becomes up.

Note: Due to hardware solution restriction,MPLS termination on double-tagged sub-interface is not supported for Qumran1 (Q1) series platforms devices.

Command Syntax

```
encapsulation ((dot1q|dot1ad) VLAN_ID (inner-dot1q VLAN_ID|))
no encapsulation
```

Parameters

dot1q
IEEE 802.1Q VLAN-tagged packets

dot1ad
IEEE 802.1ad VLAN-tagged packets

VLAN_ID
First (outer) VLAN identifier on the subinterface <2-4094>

inner-dot1q VLAN_ID
Second (inner 802.1Q) VLAN identifier on the subinterface <2-4094>

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 3.0. For DC - OcNOS version 7.0.0 is the applicability.

Example

```
#configure terminal
(config-if)#interface xe9.1
(config-if)#encapsulation dot1q 10

(config-if)#interface xe9.2
(config-if)#encapsulation dot1q 20 inner-dot1q 20

(config-if)#interface xe9.3
(config-if)#encapsulation dot1ad 30

(config-if)#interface xe9.4
(config-if)#encapsulation dot1ad 40 inner-dot1q 40
```

© 2026 IP Infusion Inc. Proprietary

interface IFNAME.SUBINTERFACE_ID

Use this command to configure a sub-interface. Sub-interfaces are supported for raw Ethernet interfaces as well as dynamic/static LAG interfaces. The number of sub-interfaces supported is 2000 per parent port and a total of 4000 sub-interfaces per device. This command displays an error when the identifier of the sub-interface is out of range.

Use `no` form of this command to unconfigure a sub-interface.

Command Syntax

```
interface IFNAME
no interface IFNAME
```

Parameters

IFNAME

Specifies the sub-interface name, represented in the format interface-name.sub-interface ID (for example, xe1.5, where xe1 is the interface name and 5 is the sub-interface ID). The valid sub-interface range is <1-2000> .

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 3.0. For DC - OcNOS version 7.0.0 is the applicability.

Example

```
(config)#int xe1.5
(config-if)#exit
(config)#no interface xe1.5

(config)#int po1
(config-if)#exit
(config)#int po1.1
(config-if)#exit
(config)#no interface po1.1

(config)#int sa1
(config-if)#exit
(config)#int sa1.1
(config-if)#exit
(config)#no interface sa1.1
```

© 2026 IP Infusion Inc. Proprietary

show interface IFNAME.SUBINTERFACE_ID

Use this command to display the details of the sub-interface.This command displays the information about the operating status, hardware address, VRF binding details, and input/output counters. This command can display details of the a sub-interface for a dynamic/static LAG as well.

Command Syntax

```
show interface IFNAME
```

Parameters

IFNAME

Specifies the sub-interface name, represented in the format interface-name.sub-interface ID (for example, xe1.5, where xe1 is the interface name and 5 is the sub-interface ID). The valid sub-interface range is <1-2000> .

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 3.0. For DC - OcNOS version 7.0.0 is the applicability.

Example

```
#show int xe1.1

NEIGHBOR DISCOVERY CONFIGURATION

Neighbor Discovery Configuration 2091
ARP/Neighbor Discovery Operation 2091

Neighbor Discovery Configuration

This section provides an overview of Neighbor Discovery (ND) configuration.

The Address Resolution Protocol (ARP) translates network layer addresses into link-layer addresses. ARP converts a an IPv4 address to an Ethernet address (MAC address).

In Internet Protocol Version 6 (IPv6) networks, the functionality of ARP is provided by the Neighbor Discovery (ND) protocol. Neighbor Discovery operates at the link layer and is responsible for auto configuration of nodes, discovery of other nodes on the link, determining the link layer addresses of other nodes, duplicate address detection, finding available routers and Domain Name System (DNS) servers, address prefix discovery, and maintaining reachability information about the paths to other active neighbor nodes.

ARP/Neighbor Discovery Operation

Neighbor Discovery module manages the ARP and IPv6 ND entries and provides information to other protocols, the forwarding module for their use, and reports state changes.

Neighbor Entry States

INCOMPLETE	Address resolution is in progress and the link-layer address of the neighbor has not yet been determined.
REACHABLE	The neighbor is known to have been reachable recently.
STALE	The neighbor is no longer known to be reachable (not used by higher level protocol for reachable-time) but still valid and used for forwarding. Until any control packet is sent to the neighbor, no attempt will be made to verify its reachability.
DELAY	The neighbor is no longer known to be reachable, and traffic has recently been sent to the neighbor. Rather than probing the neighbor immediately, delay sending probes for a short while to give upper-layer protocols a chance to provide reachability confirmation.
PROBE	The neighbor is no longer known to be reachable, and probes are being sent to verify reachability.
FAILED	

Below are timers that control the above state transitions.

reachable-time	The amount of time the entry is in REACHABLE state. The default value is 60 seconds. Once a neighbor is found, the entry is considered reachable for at least a random value between (A) and (3xA) where: A = reachable-time /2 Once entry reachability expires it moves to STALE state. The entry's reachability is extended if it receives positive feedback (ARP reply/NA).

© 2026 IP Infusion Inc. Proprietary

stale-time	Determines how often to check for stale neighbor entries. The default value is 1440 seconds. Once the stale-timer expires, the entry is marked for garbage collection.
arp-aging-time	The approximate amount of time an ARP entry is valid. The default value is 1500 seconds. Aging time is configured internally as: aging-time = reachable-time + stale-time

The garbage collector runs every 60 seconds once, to clean-up the entries which have crossed STALE timeout and FAILED entries. For improved performance, the following are the additional criteria for the neighbor entries to be garbage collected (removal of the entry completely).

- The garbage collector does not run if the total number of entries is less than 2048 that conveys some STALE, and FAILED entries still exist. The entry is refreshed ONLY when higher-level protocols use it.
- The garbage collector always runs if the number of entries is more than 262144 for IPv4 and 131072 for IPv6.

The garbage collection triggers the refresh of neighbor entries which are marked to be garbage collected. A total of 3 retries with a 3 second interval is done to reach the neighbor, before declaring the neighbor as not reachable by the forwarder. During this retry period, neighbor entries are still in use for hardware forwarding. If the neighbor is still not reachable after retries (after 9 seconds), the neighbor entry is removed from hardware forwarding as well.

Configuring ARP for IPv4

The procedures in this section use the topology in Figure 142

Figure 142. ARP for IPv4

RTR1

`#configure terminal`	Enter the configure mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/24`	Configure IP address on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#arp 2.2.2.3 0000.0000.0003`	Configure ARP entry for neighbor.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

© 2026 IP Infusion Inc. Proprietary

RTR2

`#configure terminal`	Enter the configure mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 2.2.2.3/24`	Configure IP address on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#arp 2.2.2.2 0000.0000.0004`	Configure ARP entry for neighbor.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show arp
Address                  HWaddress             Interface      Type
2.2.2.3                  00:00:00:00:00:03      eth1          Static
10.12.65.1               00:07:7d:67:6f:bf      eth0          Dynamic
```

Configuring Neighbor Discovery for IPv6

The procedures in this section use the topology in Figure 143.

Figure 143. ND for IPv6

RTR1

`#configure terminal`	Enter the configure mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 3ffe:506::1/48`	Configure IPv6 address on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)# ipv6 neighbor 3ffe:506::2 xe1 0000.0000.0004`	Configure neighbor IPv6 address and MAC.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

© 2026 IP Infusion Inc. Proprietary

RTR2

`#configure terminal`	Enter the configure mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 3ffe:506::2/48`	Configure IPv6 address on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)# ipv6 neighbor 3ffe:506::1 xe1 0000.0000.0003`	Configure neighbor IPv6 address and MAC.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.

Validation

```
#show ipv6 neighbors
IPv6 Address            MAC Address      Interface        Type
3ffe:506::2             0000.0000.0004    xe1             static

arp-ageing-timeout

Use this command to set the ARP aging timeout.

Note: The bridge aging time affects the ARP entries which are dependent upon the MAC addresses in hardware. If a MAC address ages out, it causes the corresponding ARP entry to refresh.

Use `no` form of this command to set the aging to its default value.

Command Syntax

```
arp-ageing-timeout <60-36000>
no arp-ageing-timeout
```

Parameter

<60-36000>
ARP aging timeout.

Default value

By default, the ARP aging timeout is 1500.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe2
(config-if)#arp-ageing-timeout 5000
(config-if)#exit

(config)#interface xe2
(config-if)#no arp-ageing-timeout
```

© 2026 IP Infusion Inc. Proprietary

arp-reachable-time

Use this command to set the ARP reachable time.

Use `no` form of this command to set the reachable time to its default value.

Command Syntax

```
arp-reachable-time <10-36000>
no arp-reachable-time
```

Parameters

<10-36000>
Specify the ARP reachable time.

Default value

By default, arp-reachable-time is 60

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe2
(config-if)#arp-reachable-time 120
(config-if)#exit

(config)#interface xe2
(config-if)#no arp-reachable-time
```

© 2026 IP Infusion Inc. Proprietary

clear arp

Use this command to clear dynamic ARP entries.

Command Syntax

```
clear arp (| A.B.C.D) (| vrf (all | VRFNAME | default))
clear arp IFNAME (| vrf (all | VRFNAME | default))
```

Parameters

A.B.C.D
Specify the IP address of the ARP entry.

IFNAME
Specify the name of the interface.

all
All VRFs.

VRFNAME
VPN routing/forwarding instance name.

default
Default VRF.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear arp
#clear arp xe1
#clear arp 10.10.10.10
#clear arp vrf VRF1
```

© 2026 IP Infusion Inc. Proprietary

clear ipv6 neighbors

Use this command to clear dynamic neighbor entries.

Command Syntax

```
clear ipv6 neighbors (|X:X::X:X) (|vrf (all | VRFNAME | default))
clear ipv6 neighbors IFNAME (|vrf (all | VRFNAME | default))
```

Parameters

X:X::X:X
Specify the neighbor's IPv6 address.

IFNAME
Specify the name of the interface.

all
All VRFs.

VRFNAME
VPN routing/forwarding instance name.

default
Default VRF.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ipv6 neighbors
#clear ipv6 neighbors xe1
#clear ipv6 neighbors 2000::3
#clear ipv6 neighbors vrf VRF1
```

© 2026 IP Infusion Inc. Proprietary

debug ip arp

Use this command to enable debugging for ARP events.

Note: Packet dumps are not available as part of debug logs. Use the `tcpdump` command to view packets.

Use the `no` parameter with this command to disable event debugging.

Command Syntax

```
debug ip arp event
no debug ip arp event
```

Parameters

event
ARP event debugging.

Command Mode

Exec mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ip arp event
```

debug ipv6 nd

Use this command to enable debugging for neighbor events.

Note: Packet dumps are not available as part of debug logs. Use the `tcpdump` command to view packets.

Use the `no` parameter with this command to disable event debugging.

Command Syntax

```
debug ipv6 nd event
no debug ipv6 nd event
```

Parameters

event
ND event debugging.

Command Mode

Exec mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ipv6 nd event
```

© 2026 IP Infusion Inc. Proprietary

ip arp

Use this command to create a static ARP entry.

Use the `no` parameter to remove the static ARP entry.

Command Syntax

```
ip arp A.B.C.D XXXX.XXXX.XXXX (alias|)
no ip arp A.B.C.D
```

Parameters

A.B.C.D
Specify the IP address of the ARP entry.

XXXX.XXXX.XXXX
Specify the MAC (hardware) address of the ARP entry.

alias
Specify the response to ARP requests for the IP address.

Default value

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip arp 10.10.10.10 0000.0001.4566
(config)#no ip arp 10.10.10.10
```

© 2026 IP Infusion Inc. Proprietary

ip arp vrf

Use this command to create a static ARP entry for the non-default VRF.

Note: This command is supported only for multiple VRF support.

Command Syntax

```
ip arp vrf NAME A.B.C.D XXXX.XXXX.XXXX (alias|)
```

Parameter

NAME
Specify VRF name to which entry need to be added.

A.B.C.D
Specify the IP address of the ARP entry.

XXXX.XXXX.XXXX
Specify the MAC (hardware) address of the ARP entry.

alias
Specify the response to ARP requests for the IP address.

Default value

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip arp vrf VRF1 10.10.10.10 0000.0001.4566
```

© 2026 IP Infusion Inc. Proprietary

ip proxy-arp

Use this command to enable the proxy ARP feature.

Use the `no` parameter to disable the proxy ARP feature.

Command Syntax

```
ip proxy-arp
no ip proxy-arp
```

Parameter

None

Default value

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ip proxy-arp
(config-if)#no ip proxy-arp
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd current-hoplimit

Use this command to set an ND (Neighbor Discovery) advertised hop limit for an interface.

Use the `no` option of this command to set the current hop limit to its default value.

Command Syntax

```
ipv6 nd current-hoplimit <0-255>
no ipv6 nd current-hoplimit
```

Parameter

<0-255>
Hop limit.

Default

By default, hop limit is 64

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd current-hoplimit 10
(config-if)#no ipv6 nd current-hoplimit
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd link-mtu

Use this command to set an advertised maximum transmission unit (MTU).

Use the `no` option with the command to reset the MTU to the default statute.

Command Syntax

```
ipv6 nd link-mtu (<1280-65535>)
no ipv6 nd link-mtu
```

Parameters

<1280-65535>
Link MTU value.

Default

By default, link MTU value is 1500

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd link-mtu 1600
(config-if)#no ipv6 nd link-mtu
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd managed-config-flag

Use this command to set the managed address configuration flag in the Router Advertisement to be used for the IPv6 address auto-configuration.

Use the `no` parameter with this command to reset the value to default.

Command Syntax

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
```

Parameters

None

Default

The managed address configuration flag is not set.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd managed-config-flag
(config-if)#no ipv6 nd managed-config-flag
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd other-config-flag

Use this command to set the other stateful configuration flag in Router Advertisement to be used for IPv6 address auto-configuration.

Use `no` parameter with this command to reset the value to default.

Command Syntax

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
```

Parameters

None

Default

Other stateful configuration flag is not set.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd other-config-flag
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd prefix

Use this command to set IPv6 prefix information that is advertised for address auto-configuration.

Use `no` parameter with this command to remove an IPv6 prefix.

Command Syntax

```
ipv6 nd prefix X:X::X:X/M <0-4294967295> <0-4294967295> (off-link|) (no-autoconfig|)
ipv6 nd prefix X:X::X:X/M
ipv6 nd prefix valid-lifetime <0-4294967295>
ipv6 nd prefix preferred-lifetime <0-4294967295>
ipv6 nd prefix offlink
ipv6 nd prefix no-autoconf
no ipv6 nd prefix X:X::X:X/M (off-link|) (no-autoconfig|)
no ipv6 nd prefix valid-lifetime
no ipv6 nd prefix preferred-lifetime
```

Parameters

`X:X::X:X/M`
IPv6 prefix.

`<0-4294967295>`
Valid lifetime in seconds. Use the preferred-lifetime value < valid-lifetime.

`<0-4294967295>`
Preferred lifetime in seconds. Use the preferred-lifetime value < valid-lifetime.

`off-link`
Do not use prefix for onlink determination.

`no-autoconfig`
Do not use prefix for autoconfiguration.

Default

By default, valid life time is 2592000 seconds and preferred life time is 604800 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Defaults

The default valid lifetime is 2592000 seconds.

The default preferred lifetime is 604800 seconds.

Examples

```
(config)#interface eth3
(config-if)#ipv6 nd prefix 2001:ffff::/64
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#interface eth3
(config-if)#ipv6 nd prefix no-autoconf

(config)#interface eth3
(config-if)#ipv6 nd prefix preferred-lifetime 550000
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd ra-interval

Use this command to specify the interval between IPv6 Router Advertisements (RA).

Use `no` parameter with this command to set the value to its default.

Note: The RA interval will have a random variation from configured interval to avoid synchronization of advertisement with routers.

Command Syntax

```
ipv6 nd ra-interval <4-1800> (<3-1350>|)
no ipv6 nd ra-interval
```

Parameter

<4-1800>
RA interval in seconds.

<3-1350>
Minimum RA interval (in seconds).

Default

By default, RA interval is 600 seconds, and Minimum RA interval is 0.33*RA interval.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd ra-interval 60 15
(config-if)#ipv6 nd prefix 3ffe:ffff:ffff::/64

(config-if)#no ipv6 nd ra-interval
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd ra-lifetime

Use this command to specify the Router Advertisement (RA) lifetime for this device to act as a default gateway for the network.

Use `no` parameter with this command to reset the value to default.

Command Syntax

```
ipv6 nd ra-lifetime <0-9000>
no ipv6 nd ra-lifetime
```

Parameter

<0-9000>
RA lifetime duration in seconds.

Default

The default RA lifetime is 1800 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd ra-lifetime 9000
(config-if)#no ipv6 ra-lifetime 9000
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd reachable-time

Use this command to specify the reachable time in the Router Advertisement to be used for detecting unreachability of the IPv6 neighbor.

Use the `no` parameter with this command to set the value to its default.

Command Syntax

```
ipv6 nd reachable-time <0-3600000>
no ipv6 nd reachable-time
```

Parameter

<0-3600000>
Reachable time in milliseconds.

Default

By default, reachable time is zero (0) milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd reachable-time 1800000
(config-if)#no ipv6 nd reachable-time 1800000
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd retransmission-time

Use this command to set an IPv6 advertised retransmission time for the current interface.

Use the `no` form of the command to set the retransmission time to its default value.

Command Syntax

```
ipv6 nd retransmission-time (0-4294967295)
no ipv6 nd retransmission-time
```

Parameter

<0-4294967295>
Retransmission time in milliseconds

Default

By default, retransmission time is zero (0) milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd retransmission-time 1200
(config-if)#no ipv6 nd retransmission-time
```

© 2026 IP Infusion Inc. Proprietary

ipv6 nd suppress-ra

Use this command to suppress IPv6 Router Advertisement (RA) transmission for the current interface. Router Advertisement is used for IPv6 stateless auto-configuration.

Use the `no` parameter with this command to enable Router Advertisement transmission.

Command Syntax

```
ipv6 nd suppress-ra (mtu |)
no ipv6 nd suppress-ra (mtu |)
```

Parameters

mtu
Send maximum transmission unit (MTU) in Router Advertisement messages

Default

By default, `ipv6 nd suppress-ra` is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd suppress-ra
```

© 2026 IP Infusion Inc. Proprietary

ipv6 neighbor

Use this command to add a static neighbor entry.

Use the `no` form of this command to remove a static neighbor entry.

Command Syntax

```
ipv6 neighbor X:X::X:X IFNAME XXXX.XXXX.XXXX
no ipv6 neighbor X:X::X:X IFNAME
```

Parameter

X:X::X:X
Specify the neighbor's IPv6 address.

IFNAME
Specify the name of the interface.

xxxx.xxxx.xxxx

Specify the MAC hardware address.

Default value

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 neighbor 2000::3 xe1 0000.0002.3dc1
(config)#no ipv6 neighbor 2000::3 xe1
```

© 2026 IP Infusion Inc. Proprietary

nd-ageing-timeout

Use this command to set the neighbor ageing timeout value.

Use `no` form of this command to set the ageing to its default value.

Command Syntax

```
nd-ageing-timeout <60-36000>
no nd-ageing-timeout
```

Parameters

<60-36000>
ND ageing timeout in seconds.

IFNAME
Specify the name of the interface.

XXXX.XXXX.XXXX
Specify the MAC hardware address.

Default value

By default, nd-ageing-timeout is 1500 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#nd-ageing-timeout 3600
(config-if)#no nd-ageing-timeout
```

© 2026 IP Infusion Inc. Proprietary

nd-reachable-time

Use this command to set neighbor reachable time value.

Use `no` form of this command to set the reachable time to its default value.

Command Syntax

```
nd-reachable-time <10-36000>
no nd-reachable-time
```

Parameter

<10-36000>
ND reachable time in seconds.

Default value

By default, nd-reachable-time is 60 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#nd-reachable-time 300
(config-if)#no nd-reachable-time
```

© 2026 IP Infusion Inc. Proprietary

no debug all

Use this command to disable all ARP and the neighbor debugging.

Command Syntax

```
no debug all
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#no debug all
```

© 2026 IP Infusion Inc. Proprietary

show arp

Use this command to display ARP entry information.

Command Syntax

```
show arp (| (A.B.C.D | detail | static) (| vrf (all | VRFNAME | default)))
show arp IFNAME (| vrf (all | VRFNAME | default))
show arp summary (|IFNAME) (| vrf (all | VRFNAME | default))
```

Parameters

detail
Display detailed information.

static
Display static ARP entries.

A.B.C.D
Specify the IP address of the ARP entry.

IFNAME
Specify the name of the interface.

all
All VRFs.

VRFNAME
VPN routing/forwarding instance name.

default
Default VRF.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age      MAC Address     Interface  State
10.12.18.1       00:00:18 44e4.d982.274b  eth0       REACHABLE
10.10.10.20      00:02:33 a8b1.d433.4140  xe1        STALE

#show arp summary vrf default

IP ARP Table - Adjacency Summary

  Resolved   : 2
```

```
Incomplete : 0
Unknown    : 0
Total      : 2
```

Table 64 explains the show commmand output fields.

Table 64. show arp output details

Entry	Description
Address	ARP entry's IP address in the device.
Age	The number of minutes before the ARP entry was refreshed. If this value reaches the ARP aging period, the entry is removed from the table. Static entries do not age out.
MAC Address	Physical address of the host.
Interface	Logical address to connect the device over network.
State	INCOMPLETE – first ARP request sent, send ARP request. REACHABLE – normal expiration reset use counter. STALE – still usable; needs verification reset use counter; change state to delay. DELAY – schedule ARP request; needs verification reset use counter. PROBE – sending ARP request reset use counter. FAILED – no response received send ARP request. NOARP – normal expiration; never verified reset use counter. PERMANENT – never expires; never verified reset use counter. **Note:** INCOMPLETE/FAILED state entries are only cleared if the total number of ARP entries is more than 2048. It might take up to 60 seconds to clear the entries. This is an optimization to improve ND performance.

Network devices are considered adjacent if they can reach each other with a single hop. The summary command shows the count of the state of devices that are adjacencies.

Table 65 explains the show command output fields.

Table 65. show arp summary output details

Field	Description
Resolved	Count of working/known adjacencies.
Incomplete	Count of yet to be established adjacencies.
unknown	Count of adjacencies not currently in ARP table.
Total	Total count of all adjacencies.

© 2026 IP Infusion Inc. Proprietary

show debugging ip arp

Use this command to display debugging information for ARP.

Command Syntax

```
show debugging ip arp
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging ip arp
ND IP Debugging status:
ND ip arp event debugging is off
ND ip arp packet debugging is off
```

© 2026 IP Infusion Inc. Proprietary

show debugging ipv6 nd

Use this command to display debugging information for the neighbor.

Command Syntax

```
show debugging ipv6 nd
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging ipv6 nd
ND IPV6 Debugging status:
ND ipv6 event debugging is off
ND ipv6 packet debugging is off
```

© 2026 IP Infusion Inc. Proprietary

show ipv6 neighbors

Use this command to display the neighbor information.

Command Syntax

```
show ipv6 neighbors (| (X:X::X:X | detail | static) (| vrf (all | VRFNAME | default)))
show ipv6 neighbors IFNAME (| vrf (all | VRFNAME | default))
show ipv6 neighbors summary (| IFNAME) (| vrf (all | VRFNAME | default))
```

Parameters

detail
Show detail information of neighbor.

static
Static entry.

X:X::X:X
Specify the neighbor's IPv6 address.

IFNAME
Specify the name of the interface.

all
All VRFs.

VRFNAME
VPN routing/forwarding instance name.

default
Default VRF.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 neighbors

R - Reachable, I - Incomplete, S - Stale, F - Failed, P - Probe,
D - Delay, PR - Permanent

Flags: (D) - Static neighbors attached to down interface

IPv6 Neighbor Table for context default
Total number of entries:2
Address        Age       MAC Address     Source  Interface      State
fe80::210:18ff:fe7f:f758
               00:43:04  0010.187f.f758  icmpv6  eth0             S
2000::5        00:55:25  0000.0001.0242  icmpv6  xe1              S

#show ipv6 neighbors summary
```

```
IPv6 Neighbors Table - Adjacency Summary

  Resolved   : 2
  Incomplete : 0
  Unknown    : 0
  Total      : 2
```

Table 66 shows the status codes displayed at the start of a route entry.

Table 66. status code output details

Status Code	Field	Description
R	Reachable	Normal expiration reset use counter.
I	Incomplete	First ARP request sent, send ARP request.
S	Stale	Still usable; needs verification reset use counter; change state to delay.
F	Failed	ARP requests response not received.
P	Probe	ARP request reset use counter.
D	Delay	Schedule ARP request; needs verification reset use counter.
PR	Permanent	Never expires; never verified reset use counter.

Table 67 explains the show command output fields.

Table 67. show ipv6 neighbors output details

Field	Description
Address	ARP entry's IP address in the device.
Age	The number of minutes before the ARP entry was refreshed. If this value reaches the ARP aging period, the entry is removed from the table. Static entries do not age out.
MAC Address	Physical address of the host.
Source	ARP request source in the interface.
Interface	Logical address to connect the device over network.
State	ARP request state that is being handled by the IPv6 neighbor session.

Table 68 explains the show command output fields.

Table 68. show arp summary output details

Field	Description
Resolved	Count of working/known adjacencies.

Table 68. show arp summary output details (continued)

Field	Description
Incomplete	Count of yet to be established adjacencies.
unknown	Count of adjacencies not currently in ARP table.
Total	Total count of all adjacencies.

OSPFv2

This section contains basic OSPFv2 (Open Shortest Path First) configuration examples.

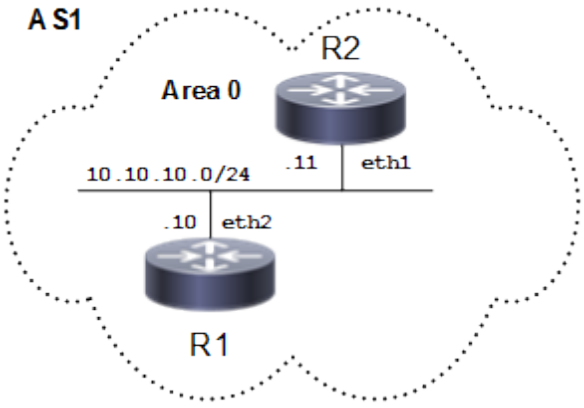
Enable OSPF on an Interface

The diagram shows the minimum configuration required to enable OSPF on an interface. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

Figure 144. Basic OSPF Topology



R1

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode

`(config)#router ospf 200`	Configure the routing process, and specify the Process ID `(200)`. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface `(10.10.10.0/24)` on which OSPF runs, and associate the area ID `(0)` with the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R1

The following provides the R1 validation:

```
#show ip ospf
 Routing Process "ospf 100" with ID 10.12.26.88
 Process uptime is 1 minute
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 0 secs 0 msecs
 Minimum hold time for LSA throttle 5 secs 0 msecs
 Maximum wait time for LSA throttle 5 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 4
 Number of LSA received 4
 Number of areas attached to this router: 1
    Area 0.0.0.0 (BACKBONE)
         Number of interfaces in this area is 1(1)
         Number of fully adjacent neighbors in this area is 1
         Area has no authentication
         SPF algorithm last executed 00:00:08.102 ago
         SPF algorithm executed 3 times
         Number of LSA 7. Checksum 0x0312b5
 Dste Staus: Disabled

#show ip ospf interface

       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

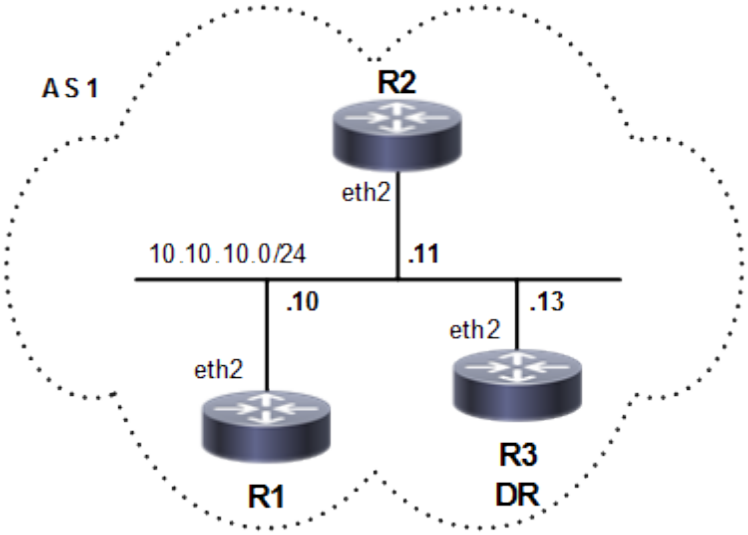
C  10.10.10.0/24 [1] is directly connected, eth1, Area 0.0.0.0
```

Set Priority

This example shows how to set the priority for an interface. Set a high priority for a router to make it the Designated Router (DR). Router R3 is configured to have a priority of 10, which is higher than the default priority (1) of R1 and R2; making it the DR.

Topology

Figure 145. Set OSPF Priority



R3

`#configure terminal`	Enter configure mode
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip ospf priority 10`	Specify the router priority to a higher priority (10) to make R3 the Designated Router (DR).
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R1

`#configure terminal`	Enter configure mode

`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 200`	Configure the routing process, and specify the Process ID (`200`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R1

The following provides the R1 validation:

```
#sh ip ospf neighbor

Total number of full neighbors: 2
OSPF process 100 VRF(default):

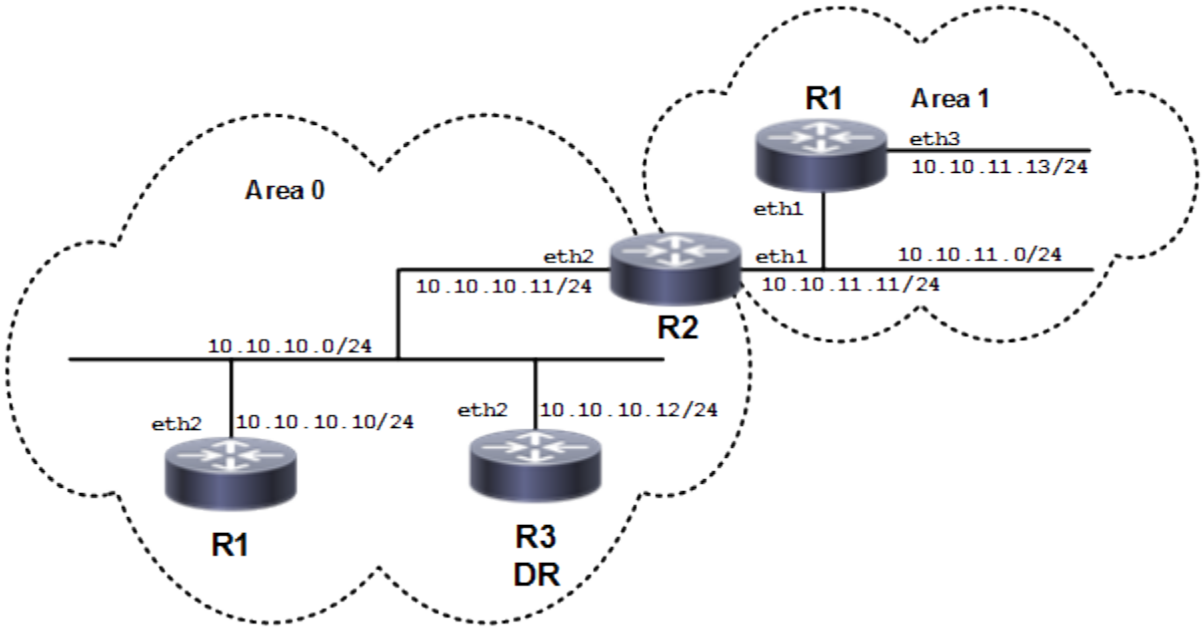
Area Border Router

This example shows configuration for an Area Border Router. R2 is an Area Border Router (ABR). On R2, Interface eth2 is in Area 0, and Interface eth1 is in Area 1.

Topology

Figure 146. OSPF ABR Topology



Configuration

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.
`(config-router)#network 10.10.11.0/24 area 1`	Define the other interface `(10.10.11.0/24)` on which OSPF runs, and associate the area ID `(1)` with the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

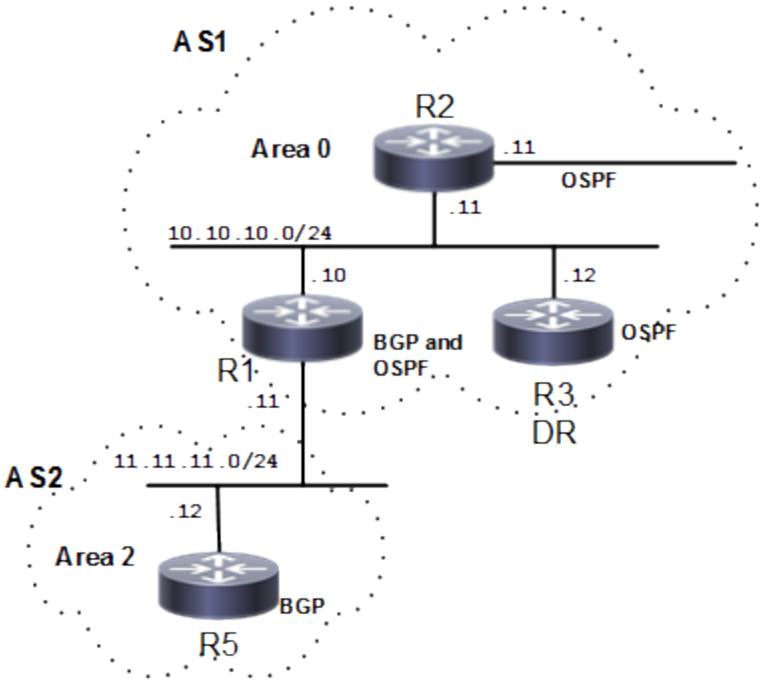
Redistribute Routes into OSPF

In this example, the configuration causes BGP routes to be imported into the OSPF routing table, and advertised as Type 5 External LSAs into Area 0.

Topology

Figure 147. Redistribute Routes



R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#redistribute bgp`	Specify redistributing routes from other routing protocol (BGP) into OSPF.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

```
#show ip ospf route
```

© 2026 IP Infusion Inc. Proprietary

```
OSPF process 100:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

C  10.10.9.0/24 [1] is directly connected, eth2, Area 0.0.0.0
C  10.10.10.0/24 [1] is directly connected, eth3, Area 0.0.0.0
O  10.10.11.0/24 [101] via 10.10.10.11, eth3, Area 0.0.0.0
C  10.10.12.0/24 [1] is directly connected, eth1, Area 0.0.0.0
O  10.10.13.0/24 [102] via 10.10.10.11, eth3, Area 0.0.0.0
O  10.10.14.0/24 [102] via 10.10.10.11, eth3, Area 0.0.0.0
```

Cost

A route can be made the preferred route by changing its cost. In this example, cost has been configured to make R2 the next hop for R1.

The default cost for each interface is 1. Interface eth2 on R2 has a cost of 100, and Interface eth2 on R3 has a cost of 150. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

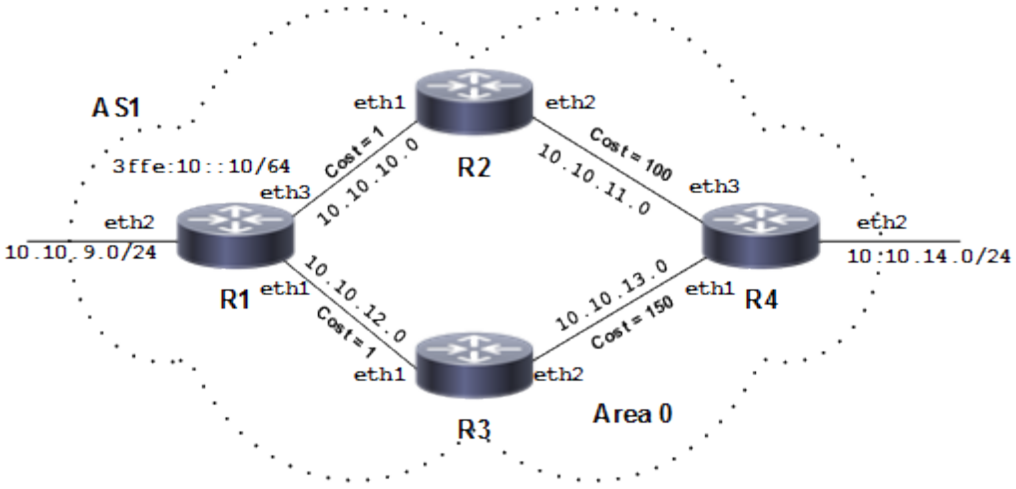
R2: 1+100 = 101

R3: 1+150 = 151

Therefore, R1 chooses R2 as its next hop to destination 10.10.14.0/24 because it has the lower cost.

Topology

Figure 148. Configure Cost Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.9.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 10.10.10.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 10.10.12.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface (area ID

	0 specifies the backbone area).
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

(config)#interface eth2	Enter interface mode.
(config-if)#ip ospf cost 100	Set the OSPF cost of this link to 100.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.10.0/24 area 0	Define the interfaces on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#network 10.10.11.0/24 area 0	Define the interfaces on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

(config)#interface eth2	Enter interface mode.
(config-if)#ip ospf cost 150	Set the OSPF cost of this link to 100.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.12.0/24 area 0	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#network 10.10.13.0/24 area 0	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R4

(config)#router ospf 100	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.11.0/24 area 0	Define interfaces on which OSPF runs, and associate the area ID 0) with the interface.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#network 10.10.13.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface.
`(config-router)#network 10.10.14.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Path MTU for IPv4 and IPv6

In IPv4, path MTU discovery enables a host to actively identify and adapt to variations in the MTU size across different links along a data path. In contrast, IPv6 adopts an approach where fragmentation is managed by the packet's source when the path MTU of a specific link along the data path cannot accommodate the packet's size. This approach, where IPv6 hosts handle packet fragmentation, conserves processing resources in IPv6 devices and enhances the overall efficiency of IPv6 networks.

Topology

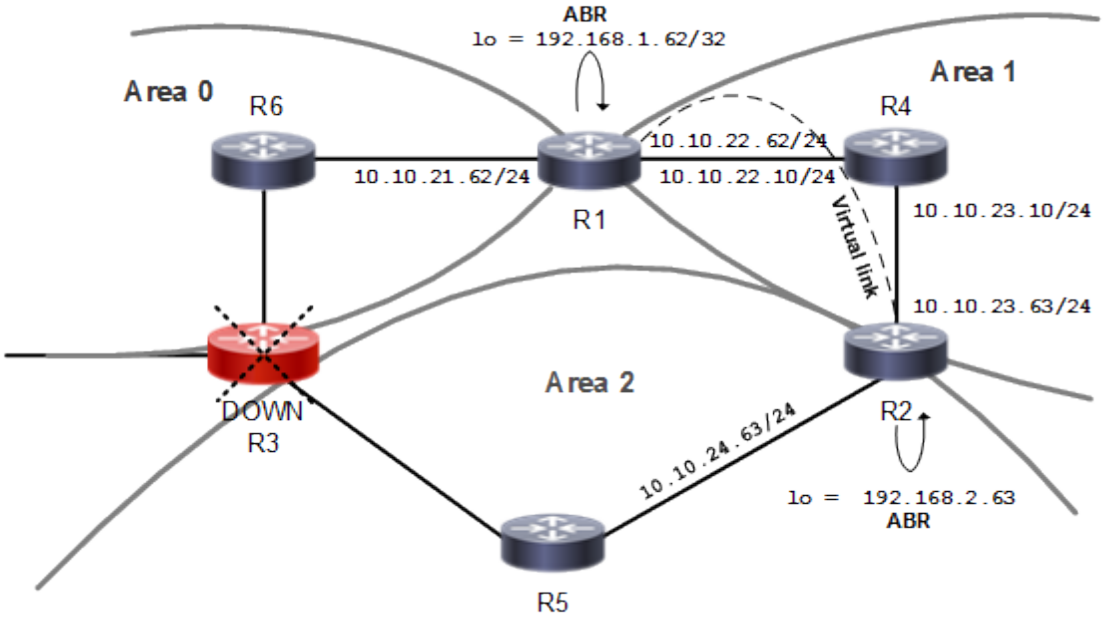
Virtual Links

Virtual links are used to connect a temporarily-disjointed non-backbone area to the backbone area, or to repair a non-contiguous backbone area. In this example, the ABR R3 has temporarily lost connection to Area 0, in turn, disconnecting Area 2 from the backbone area. The virtual link between ABR R1 and ABR R2 connects Area 2 to Area 0. Area 1 is used as a transit area.

Topology

Figure 150. Virtual Links Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify loopback as the interface you want to configure.
`(config-if)#ip address 192.168.1.62/32 secondary`	Configure the IP address of the interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 192.168.1.62`	Configure the OSPF Router ID (`192.168.1.62`) for this router.
`(config-router)#network 10.10.21.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area IDs `(0)` with the interface.
`(config-router)#network 10.10.22.0/24 area 1`	Define interfaces on which OSPF runs, and

	associate the area IDs (1) with the interface.
`(config-router)#area 1 virtual-link 192.168.2.63`	Configure a virtual link between this router R1 and R2 (Router ID `192.168.2.63`) through transit area 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`(config)#interface lo`	Specify loopback as the interface you want to configure.
`(config-if)#ip address 192.168.2.63/32 secondary`	Configure the IP address of the interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 192.168.2.63`	Configure the OSPF Router ID (`192.168.1.63`) for this router.
`(config-router)#network 10.10.23.0/24 area 1`	Define interfaces on which OSPF runs, and associate the area IDs `(1)` with the interface.
`(config-router)#network 10.10.24.0/24 area 2`	Define interfaces on which OSPF runs, and associate the area IDs `(2)` with the interface.
`(config-router)#network 192.168.2.63/32 area 2`	Define interfaces on which OSPF runs, and associate the area IDs `(2)` with the interface.
`(config-router)#area 1 virtual-link 192.168.1.62`	Configure a virtual link between this router R2 and R1 (Router ID `192.168.2.62`) through transit area `1`.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

The following provides the validation for virtual links configuration:

```
R1#show ip ospf virtual-links

OSPF Authentication

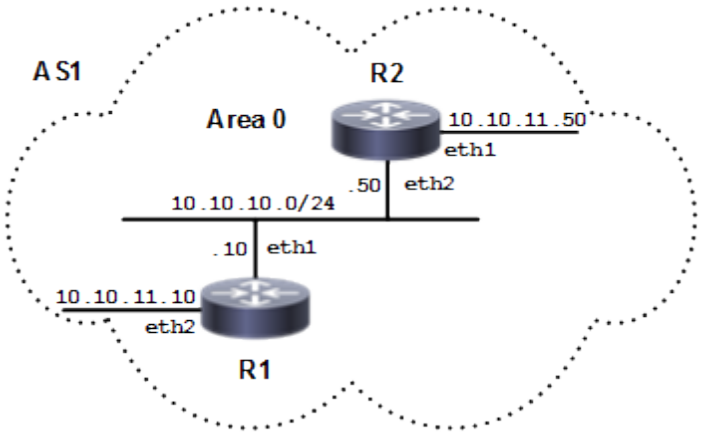
There are three types of OSPF authentications--Null (Type 0), Simple Text (Type 1), and MD5 (Type 2). With Null authentication, routing exchanges over the network are not authenticated. In Simple Text authentication, the authentication type is the same for all routers that communicate using OSPF in a network. For MD5 authentication, configure a key and a key ID on each router. The router generates a message digest on the basis of the key, key ID, and OSPF packet, and adds it to the OSPF packet.

The authentication type can be configured on a per-interface basis or a per-area basis. Additionally, Interface and Area authentication can be used together. Area authentication is used for an area, and interface authentication is used for a specific interface in the area. If the Interface authentication type is different from the Area authentication type, the Interface authentication type overrides the Area authentication type. If the Authentication type is not specified for an interface, the Authentication type for the area is used. The authentication command descriptions contain details of each type of authentication.

In the example below, R1 and R2 are configured for both the interface and area authentications. The authentication type of interface eth1 on R1 and interface eth2 on R2 is MD5 mode, and is defined by the area authentication command; however, the authentication type of interface eth2 on R1 and interface eth1 on R2 is plain text mode, and is defined by the ip ospf authentication command. This interface command overrides the area authentication command.

Topology

Figure 151. OSPF Authentication Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and

	associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).
`(config-router)#area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)# ip ospf message-digest-key 1 md5 0x293da85becc67703`	Register the MD5 key test for OSPF authentication. The key ID is 1.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip ospf authentication`	Enable the OSPF packet to use text authentication on the current interface (`eth2`).
`(config-if)#ip ospf authentication-key 0x3a24102d157b1618`	Specify an OSPF authentication password (`test`) for the neighboring routers.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)# ip ospf authentication-key 0x293da85becc67703`	Register MD5 key test for OSPF authentication. The key ID is 1.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip ospf authentication`	Enable the OSPF packet to use text authentication on the current interface (`eth1`).
`(config-if)# ip ospf message-digest-key 1 md5 0x293da85becc67703`	Specify an OSPF authentication password `test` for the neighboring routers.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

```

Multiple OSPF Instances

By using multiple OSPF instances, OSPF routes can be segregated, based on their instance number. Routes of one instance are stored differently from routes of another instance running in the same router.

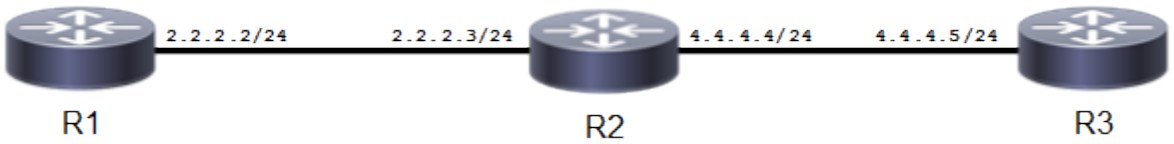
To configure multiple OSPF instances, perform the following procedures referring to the topology diagram below:

1. Enable OSPF on an interface.
2. Enable multiple instances.
3. Configure redistribution among multiple instances.

Note: Optionally, redistribution can be configured with the metric, type or route-map options.

Topology

Figure 152. Multiple OSPF Instances



.

Enable Multiple OSPF Instances on a Router

In this example, routers R1, R2, and R3 are in Area 0, and all run OSPF.

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ip address 2.2.2.2/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 10`	Configure an OSPF instance with an instance ID of 10.
`(config-router)#router-id 5.5.5.5`	Configure the router ID to use on this instance.
`(config-router)#network 2.2.2.0/24 area 0`	Advertise the network with the area ID.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ip address 2.2.2.3/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.

© 2026 IP Infusion Inc. Proprietary

(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure an OSPF instance with an instance ID of 10.
(config-router)#router-id 6.6.6.6	Configure the router ID to use on this instance.
(config-router)#network 2.2.2.0/24 area 0	Advertise the network with the area ID.
(config-router)#exit	Exit router mode.
(config)#interface eth2	Enter interface mode for `eth2`.
(config-if)#ip address 4.4.4.4/24	Configure the IP address.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 15	Configure an OSPF instance with an instance ID of 15.
(config-router)#router-id 8.8.8.8	Configure the router ID to use on this instance.
(config-router)#network 4.4.4.0/24 area 0	Advertise the network with the area ID.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

(config)#interface eth1	Enter interface mode for `eth1`.
(config-if)#ip address 4.4.4.5/24	Configure the IP address.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 15	Configure an OSPF instance with an instance ID of 15.
(config-router)#router-id 7.7.7.7	Configure the router ID to use on this instance.
(config-router)#network 4.4.4.0/24 area 0	Advertise the network with the area ID.
(config-router)#commit	Commit the candidate configuration to the running configuration.

```

Redistribute among Multiple Instances

In this example, routes of one instance are redistributed to another instance to enable ping from R1 to R3 or vice versa; and R2 redistributes routes from one instance to another.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID 15.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10`	Redistribute instance 10 routes.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 15.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID 10.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15`	Redistribute instance 15 routes.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 10.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

Redistribute with the Metric Option

In this example, on R3, R1 and R2 have each other's routes with a metric of 100.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID 15.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10 metric 100`	Redistribute instance 10 routes with metric 100.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 15.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID 10.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric 100`	Redistribute instance 15 routes with metric 100.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 10.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

Redistribute with the Type Option

In this example, on R3, R1 has R3 routes as type 2, and R2 has R1 routes as type 1.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID 15.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10 metric-type 1`	Redistribute instance 10 routes with metric-type 1.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 15.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID 10.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric-type 2`	Redistribute instance 15 routes with type 2.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 10.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

Redistribute with the Route-Map Option

R2

`(config)#route-map 1 permit 10`	Enter route-map mode, specifying route-map ID.
`(config-route-map)#set metric 100`	Set metric value.
`(config-route-map)#set metric-type type-2`	Set metric-type.
`(config-route-map)#exit`	Exit route-map mode.
`(config)#route-map 2 permit 10`	Enter route-map mode, specifying route-map ID.
`(config-route-map)#set metric 200`	Set metric value.
`(config-route-map)#set metric-type type-1`	Set metric-type.
`(config-route-map)#exit`	Exit route-map mode.
`(config)#router ospf 15`	Configure an OSPF instance with instance ID 15.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10 route-map 1`	Redistribute instance 10 routes with route map 1.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 15.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID 10.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15 route-map 2`	Redistribute instance 15 routes with route map 2.
`(config-router)#redistribute connected`	Redistribute connected routes to instance 10.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

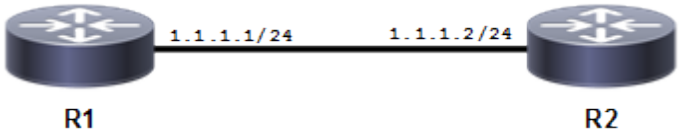
Multiple OSPF Instances on Same Subnet

Multiple OSPF instances can be configured on the same subnet. The OSPF instance ID supports separate OSPFv2 protocol instances. With this feature, an adjacency is formed only if the received packet's instance ID is the same as the instance ID configured for that interface.

Topology

Figure 153. Multiple Instances on the Same Subnet



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#enable ext-ospf-multi-inst`	Enable multiple-instance capability.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 1`	Advertise the network in Area 0 with an instance ID of 1.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 2`	Configure an OSPF instance with an instance ID of 2.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 2`	Advertise the network in Area 0 with an instance ID of 2.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#enable ext-ospf-multi-inst`	Enable multiple-instance capability.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 1`	Advertise the network in Area 0 with an instance ID of 1.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

© 2026 IP Infusion Inc. Proprietary

`(config)#router ospf 2`	Configure an OSPF instance with an instance ID of 2.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 2`	Advertise the network in Area 0 with an instance ID of 2.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

Validation

R1

The following provides the R1 validation:

```
R1#show ip ospf interface
eth1 is up, line protocol is up
  Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500

```

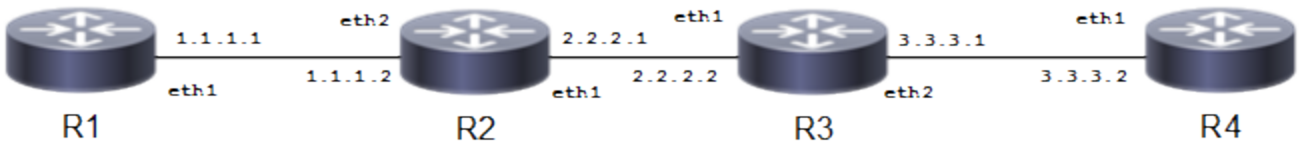
Multi-Area Adjacency Configuration

Multiple OSPF areas for a same subnet can be configured between two routers. In the diagram below, OSPF is enabled between R2 and R3 under area 0 and area 1, though there is only one link available between these two routers. Multi-area adjacency allows establishing adjacency on multiple areas between the Area Border Routers (ABRs). The specified interface of the ABR is associated with multiple areas.

Each multi-area-adjacency internally implements point-to-point functionality, once the adjacency reaches the FULL state. This point-to-point link provides a topological path for that area. Like a virtual link, there is no restriction for multi-area adjacency that the packets always go through the backbone.

Topology

Figure 154. One Subnet with Multiple OSPF Areas



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 1`	Configure OSPF between R1 and R2 under area 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 1`	Configure OSPF between R1 and R2 under area 1.
`(config-router)#network 2.2.2.0/24 area 0`	Configure OSPF between R2 and R3 under area 0.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 2.2.2.1/24`	Configure IP address on the interface.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip ospf 1 multi-area 0.0.0.1 neighbor 2.2.2.2`	Configure multi area adjacency.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.

R3

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 2.2.2.0/24 area 0`	Configure OSPF between R2 and R3 under area 0.
`(config-router)#network 3.3.3.0/24 area 1`	Configure OSPF between R3 and R4 under area 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/24`	Configure IP address on the interface.
`(config-if)#ip ospf 1 multi-area 0.0.0.1 neighbor 2.2.2.1`	Configure multi area adjacency.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.

R4

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 3.3.3.0/24 area 1`	Configure OSPF between R3 and R4 under area 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

LSA Throttling

This section contains basic OSPF LSA throttling configuration examples.

The OSPF Link-State Advertisement (LSA) throttling feature provides a mechanism to dynamically slow down link-state advertisement (LSA) updates in OSPF during times of network instability. It also allows faster OSPF convergence by providing LSA rate limiting in milliseconds, when the network is stable.

How OSPF LSA Throttling Works

The `timers throttle lsa all` command controls the generation (sending) of LSAs. The first LSA is always generated immediately upon an OSPF topology change, and the next LSA generated is controlled by the minimum start interval. The subsequent LSAs generated for the same LSA are rate-limited until the maximum interval is reached. The “same LSA” is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID.

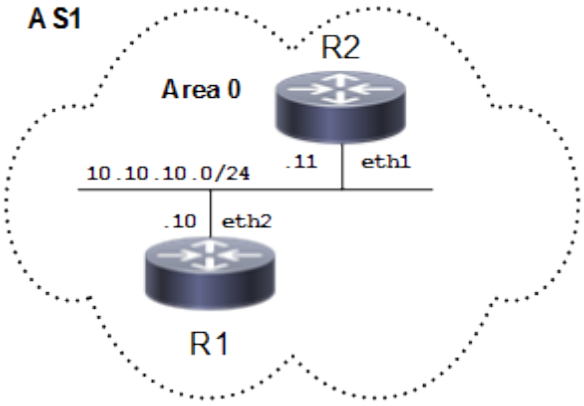
The `timers lsa arrival` command controls the minimum interval for accepting the same LSA. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped. It is recommended that the arrival interval be less than or equal to the hold-time interval of the `timers throttle lsa all` command.

Topology

The diagram shows the minimum configuration required to enable OSPF LSA Throttling Timers feature. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Figure 155. Basic OSPF Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface loopback to configure.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure the ip address (1.1.1.1) of the interface loopback.

`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface (1.1.1.1/32) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#timers throttle lsa all 10000 20000 45000`	Configure LSA Throttling timers (Starting interval: <0-600000>, Min Hold Interval: <1-600000> and Max Wait Interval:< 1-600000>) in milliseconds. The Default value for corresponding timers are: Starting interval: 0, Min Hold Interval: 5 sec and Max Wait Interval: 5 sec.
`(config-router)#logging monitor 7`	Enable logging monitor globally.
`(config)#logging level ospf 7`	Enable logging level ospf globally.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#end`	Exit router mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (0) with the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R1

The following provides the R1 validation:

Check the output of `show ip ospf` and verify the initial throttle delay, minimum hold time for LSA throttle and maximum wait time for LSA throttle.

```
#show ip ospf 1
 Routing Process "ospf 1" with ID 1.1.1.1
 Process uptime is 11 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
```

```
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incoming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 4
 Number of LSA received 4
 Number of areas attached to this router: 1

R2

The following provides the R2 validation:

Check the output of "`show ip ospf neighbor`" and verify that OSPF adjacency is up.

```
#show ip ospf neighbor

Total number of full neighbors: 1
OSPF process 1 VRF(default):
Neighbor ID  Pri  State     Dead Time   Address    Interface  Instance ID
1.1.1.1      1    Full/DR   00:00:33    10.10.10.10   eth1       0
```

Check the output of `show ip ospf database` and verify that LSA (router LSA in this example) is updated according to the configured LSA throttling timers configured on its neighbor.

```
#show ip ospf database

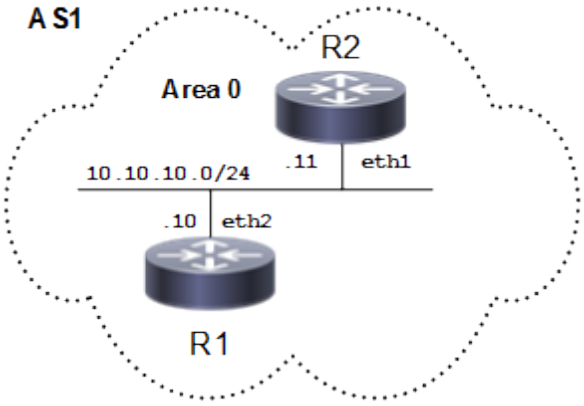
Configure OSPF LSA Arrival Timers

The diagram shows the minimum configuration required to enable OSPF Minimum LSA Arrival Timers feature. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

Figure 156. Basic OSPF Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface loopback to configure.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure the ip address (1.1.1.1) of the interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface (1.1.1.1/32) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#end`	Exit router mode

© 2026 IP Infusion Inc. Proprietary

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID `(1)`. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface `(10.10.10.0/24)` on which OSPF runs, and associate the area ID `(0)` with the interface.
`(config-router)#timers lsa arrival 100000`	Configure Minimum LSA Arrival timers (Minimum LSA arrival Interval:< 0-600000>) in milliseconds. The Default value for Minimum LSA Arrival timer is: 1 sec.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R1

The following provides the R1 validation:

Check the output of `show ip ospf` and verify that the minimum LSA arrival timer by default is set to 1 sec.

```
#show ip ospf
 Routing Process "ospf 1" with ID 1.1.1.1
 Process uptime is 11 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incoming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 4
 Number of LSA received 4
 Number of areas attached to this router: 1
MemPool - struct ospf lsa             : (0-8) | Total (8/100000) blk_size:160
MemPool - struct rxmt                 : | Total (0/0) blk_size:8
    Area 0.0.0.0 (BACKBONE)
        Number of interfaces in this area is 2(2)
        Number of fully adjacent neighbors in this area is 1
        Area has no authentication
        SPF algorithm last executed 00:10:12.807 ago
        SPF algorithm executed 5 times
```

```
        Number of LSA 7. Checksum 0x02c480
  Dste Staus: Disabled

#show ip ospf neighbor

Total number of full neighbors: 1
OSPF process 1 VRF(default):
Neighbor ID     Pri   State           Dead Time   Address         Interface           Instance
ID
3.1.1.1           1   Full/Backup     00:00:34    10.10.10.11     eth1
```

R2

The following provides the R2 validation:

Check the output of `show ip ospf` and verify that the minimum LSA arrival timer is set to 100 sec.

```
#show ip ospf
 Routing Process "ospf 1" with ID 3.1.1.1
 Process uptime is 23 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incoming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 0 secs 0 msecs
 Minimum hold time for LSA throttle 5 secs 0 msecs
 Maximum wait time for LSA throttle 5 secs 0 msecs
 Minimum LSA arrival 100 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 3
 Number of LSA received 10
 Number of areas attached to this router: 1
MemPool - struct ospf lsa             : (0-9) | Total (9/100000) blk_size:160
MemPool - struct rxmt                 : | Total (0/0) blk_size:8
    Area 0.0.0.0 (BACKBONE)
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 1
        Area has no authentication
        SPF algorithm last executed 00:22:12.911 ago
        SPF algorithm executed 4 times
        Number of LSA 7. Checksum 0x02c281
 Dste Staus: Disabled
```

Check the output of show ip ospf neighbor and verify that OSPF adjacency is up.

```
#show ip ospf neighbor

Total number of full neighbors: 1
OSPF process 1 VRF(default):
Neighbor ID     Pri   State           Dead Time   Address         Interface           Instance
ID
1.1.1.1           1   Full/DR         00:00:35    10.10.10.10     eth1                    0
```

Check the output of “show ip ospf database” and verify that LSA is accepted only after a time difference of 100 sec between two consecutive LSAs.

```
#show ip ospf database

Loop-Free Alternate Fast Reroute

This section contains basic OSPF Loop-Free Alternate Fast Reroute (LFA-FRR) configuration examples.

Overview

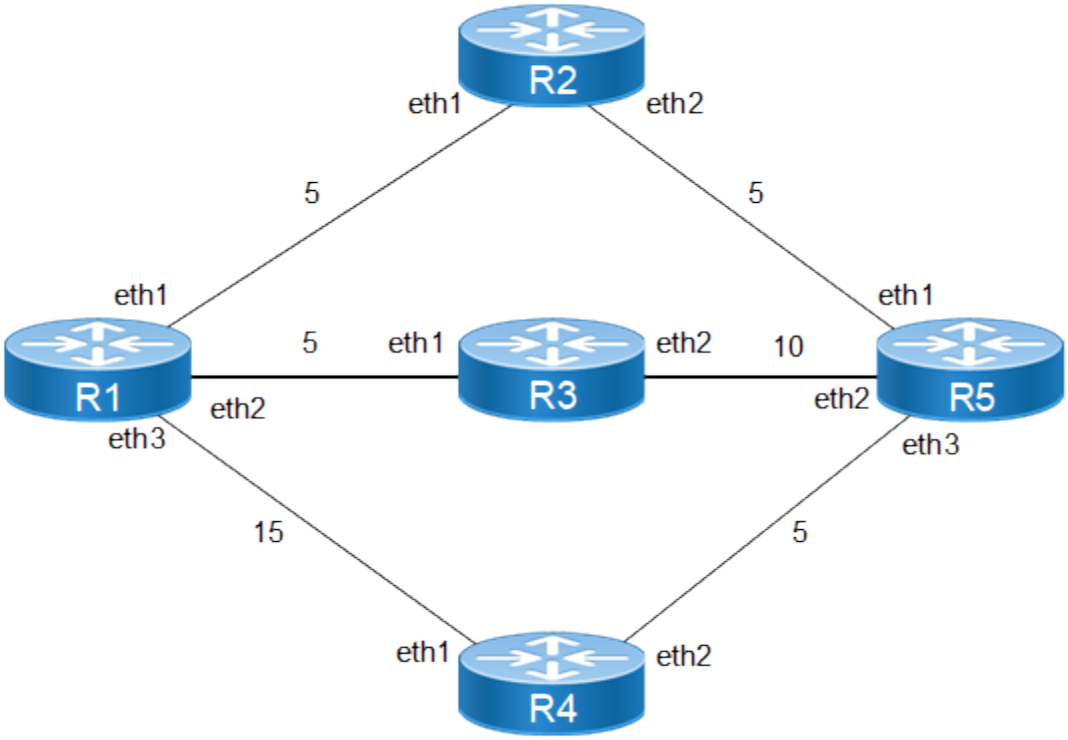
The goal of (LFA-FRR) is to reduce failure reaction time to 10s of milliseconds by using a pre-computed alternate next- hop in the event that the currently selected primary next-hop fails, so that the alternate can be rapidly used when the failure is detected. A network with this feature experiences less traffic loss and less micro-looping of packets than a network without LFA-FRR.

After enabling LFA-FRR on routers, routers calculate a backup path for each primary path to reach the destination.The backup path is calculated based on the attributes such as node protecting, link protecting, broadcast-link protecting and secondary path.

Topology

The diagram shows the configuration required to enable the OSPF LFA feature.

Figure 157. Basic OSPF-LFA Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface

`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 20.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)#ip address 30.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process and specify the Process ID (1).
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.1.1.0/24 area 0`	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 30.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#fast-reroute keep-all- paths`	Configure LFA-FRR to calculate the available backup path.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#end`	Exit router mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10.1.1.2/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 40.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 40.1.1.0/24 area 0`	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface

© 2026 IP Infusion Inc. Proprietary

	(area ID 0 specifies the backbone area).
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#end	Exit router mode.

R3

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 20.1.1.2/24	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 50.1.1.1/24	Configure the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 20.1.1.0/24 area 0	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 50.1.1.0/24 area 0	Define the interface (50.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#end	Exit router mode.

R4

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 30.1.1.2/24	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 60.1.1.1/24	Configure the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 30.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

© 2026 IP Infusion Inc. Proprietary

`(config-router)#network 60.1.1.0/24 area 0`	Define the interface (60.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#end`	Exit router mode.

R5

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 40.1.1.2/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 50.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)#ip address 60.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 40.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 50.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 60.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#end`	Exit router mode.

Validation

R1

The following provides the R1 validation:

Check OSPF neighborship.

```
#show ip ospf neighbor
```

```
OSPF Process 100 VRF (default)
Neighbor ID     Pri   State           Dead Time   Address  Interface Intance ID
2.2.2.2           1   Full/DR         00:00:33    10.1.1.2     eth1  0
3.3.3.3           1   Full/DR         00:00:33    20.1.1.2     eth2  0
4.4.4.4           1   Full/DR         00:00:39    30.1.1.2     eth2  0
#
Check the OSPF route installation and LFA-FRR backup path for the primary path.

```

Note: Now the LFA backup paths have been changed, `eth3` is not used.

LFA Tie-Breaker

Based on the index values configured, if inequalities are satisfied, protections will be provided:

- Lower the index will have the highest priority, the path which provides protection with highest priority will be selected. If there are multiple paths providing the highest priority protection, then we will check which path provides the protection which has 2nd highest priority and so on.
- If all the paths provide same priority, then the LFA route is chosen on the basis of path cost.
- If none of the paths provides the protection with highest priority, then we will see which path provides the 2nd highest priority and so on.

```
config)#router ospf 100
(config-router)#fast-reroute tie-break ?

LFA Termination

A router MUST limit the amount of time an alternate next-hop is used after the primary next-hop has become unavailable. This ensures that the router will start using the new primary next-hops.

LFA termination avoids a micro looping in topology, when particular network goes down, LFA backup path will be installed and if termination interval is configured, LFA backup will be still used till the interval and it is used in order to verify new primary path is loop free.

R1

Configure termination interval on R1 in router mode:

`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#fast-reroute terminate-hold-on interval 100000`	Configure LFA termination interval
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

If you check “show ip ospf” you can see the configured termination-hold on interval value along with ospf output:

```
#show ip ospf
IPFRR per-prefix tiebreakers:
    Name                                Index
    Primary path                        20
    Node Protecting                     30
    Interface disjoint                  60
    Broadcast interface disjoint        70
    Secondary path                      255
 LFA termination hold-on timer : 100 secs 0 msecs

Loop-Free Alternate (LFA) ECMP PATH

This section contains configurations for OSPF LFA ECMP which provides LFA/alternate path from primary ECMP path set or non-primary/non-ECMP path set which improve convergence after a primary path failure occur in network.

Overview

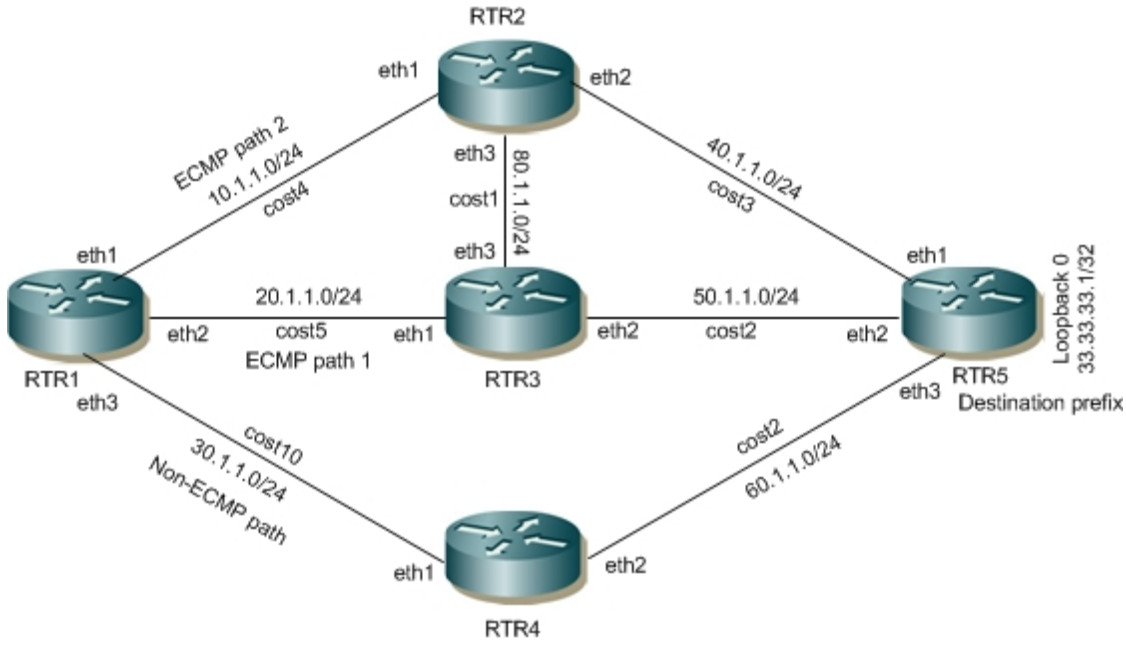
With ECMP, a prefix has multiple primary paths to forward traffic. When a particular primary path fails, the other primary paths are not guaranteed to provide protection against the failure scenario. As part of LFA ECMP, alternate paths are determined for each primary path separately. The selected alternate path can be either one of the primary path from the set of ECMP or a loop-free non-ECMP if available.

In OSPF, by default the LFA algorithm tries to find loop free node protecting alternate from the set of existing primary next-hops. If no loop free node-protecting alternate is available, the LFA algorithm tries to find link-protecting alternate from the set of existing primary next-hops. If no loop-free node-protecting and link-protecting alternate is available, then the LFA algorithm should select a loop-free link-protecting from the non-ECMP next-hops.

Note: RIB errors occur when the hardware profile cannot handle LFA-ECMP. The error prompts users to alter or reverse the configurations.

Topology

Figure 158. OSPF-LFA_ECMP



Configuring OSPF LFA ECMP

Configuration Part 1: with default LFA configuration where primary path priority higher than Secondary-path (non-ECMP) and LFA selection happen within primary ECMP path

RTR1

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 10.1.1.1/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 4	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)# ip address 20.1.1.1/24	A s si gn IP ad dr e s s .
(config-if)#ip ospf cost 5	Assign cost to interface
(config-if)#exit	Exit interface mode.

```

Configuration Part 2: with non-ECMP tiebreaker configured where secondary-path priority higher than primary (ECMP) path

Configure below configuration with config's shown in Part1:

RTR1

`#configure terminal`	Enter configure mode.
`(config)# router ospf 1`	E n t er R o ut er OSPF m o de .
`(config-router)#fast-reroute tie-break secondary-path index 5`	Configure LFA tiebreaker for LFA to be calculate from non-ecmp path set if available (this is user defined to decide the priority to select between ecmp/non-ecmp set)
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	E x it R o ut er OSPF m ode a nd r e t urn to C o nf i g ure m o de .

Validation Part 2: LFA selected from non-ecmp path for each primary ecmp path

RTR1

The following provides the RTR1 validation

```
#show ip ospf route fast-reroute

OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       OSPF LFA attributes:
       P - Primary, SP - Secondary-Path, ID - Interface Disjoint,
       NP - Node Protecting, BID - Broadcast Interface Disjoint

O  33.33.33.1/32 [17] via 10.1.1.2, eth1, Area 0.0.0.0

Configuring OSPF LFA ECMP with Load Balancing

For OSPF LFA ECMP with load balancing, there are two options:

- Option 1: Have more than two links for ECMP, where one path is used for FRR and the other paths are used for load balancing.
- Option 2: Configure OSPF LFA tie-breaker with secondary path, where the secondary path is used for FRR and the other path becomes the primary path for load balancing.

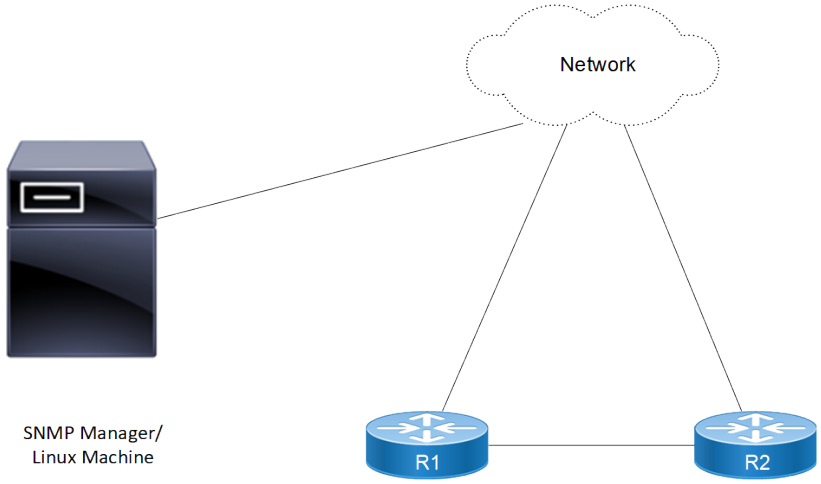
SNMP Support for Multiple Instance of OSPF Configuration

Overview

SNMP operation by default are tied to a specific OID which is unique. However protocol like OSPF can have multiple instances, and have different values of same parameters for different OSPF instances. To be able to support SNMP for each of these instances, it is needed that each instance of the protocol has its own instance of the MIBs. It is aimed to achieve that with mapping each instance to a context. Each context will point to a different copy of the same OID for the protocol.

Topology

Figure 159. SNMP OSPF instance



Enable SNMP and create SNMP Context & Group for OSPF Instances on a Router with SNMPv2

In this example, routers R1 & R2 are in Area 0, and all run OSPF. SNMPv2 user is created and Mapping of user with group and context for SNMPwalk /SNMP get operation on context.

R1

`#configure terminal`	Enter configure mode.
`(config)#snmp-server enable snmp vrf management`	Use this command to start the SNMP agent.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.
`#configure terminal`	Enter configure mode.
`(config)#snmp-server context context1 vrf management`	Creates SNMP Context with Context name.
`(config)#snmp-server group group1 version 2c context context1 vrf management`	Creates SNMP group with Group name and for specific context in SNMP v2 version.
`(config)#snmp-server user user1 group1 vrf management`	Creates SNMP User in SNMPv2 and attach user into a group
`(config)#snmp-server community cm1 vrf management`	Set community string as "cm1"
`(config)#snmp-server community-map cm1 context context1 user user1 vrf management`	Creates Community map SNMPv2 with community name mapping user with a context.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 94.94.94.3/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure an OSPF instance with an instance ID of 100.
`(config-router)#router-id 21.21.21.21`	Configure the router ID to use on this instance.
`(config-router)#network 94.94.94.0/24 area 0`	Advertise the network with the area ID.
`(config-router)#snmp context-name context1`	SNMP Context is mapped with OSPF Instance
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.

(config)#snmp-server enable snmp vrf management	Use this command to start the SNMP agent.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
#configure terminal	Enter configure mode.
(config)#snmp-server context context1 vrf management	Creates SNMP Context with Context name.
(config)#snmp-server group group1 version 2c context context1 vrf management	Creates SNMP group with Group name and for specific context in SNMP v2 version.
(config)#snmp-server user user1 group1 vrf management	Creates SNMP User in SNMPv2 and attach user into a group
(config)#snmp-server community cm1 vrf management	Set community string as "cm1"
(config)#snmp-server community-map cm1 context context1 user user1 vrf management	Creates Community map SNMPv2 with community name mapping user with a context.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ip address 94.94.94.2/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure an OSPF instance with an instance ID of 100.
(config-router)#router-id 23.23.23.23	Configure the router ID to use on this instance.
(config-router)#network 94.94.94.0/24 area 0	Advertise the network with the area ID.
(config-router)#snmp context-name context1	SNMP Context is mapped with OSPF Instance
(config-router)#commit	Commit the candidate configuration to the running configuration.

Perform snmpwalk as mentioned below with IPv4 address using SNMPv2 for R2

```
snmpwalk -v2c -c cm1 10.12.86.111 .1.3
```

Enable SNMP and create SNMP Context & Group for OSPF Instances on a Router with SNMPv3 Configuration

In this example, routers R1 and R2 are in Area 0, and all run OSPF. SNMPv3 user is created and Mapping of user with group and context for SNMPwalk /SNMP get operation on context.

R1

`#configure terminal`	Enter configure mode.
`(config)#snmp-server enable snmp vrf management`	Use this command to start the SNMP agent.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.
`#configure terminal`	Enter configure mode.
`(config)#snmp-server context context1 vrf management`	Creates SNMP Context with Context name.
`(config)#snmp-server group group2 version 3 auth context context1 vrf management`	Creates SNMP group with Group name and for specific context in SNMP v3 version.
`(config)#snmp-server user user2 group2 auth md5 password vrf management`	Creates SNMP User in SNMPv3 and attach user into a group
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 94.94.94.3/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure an OSPF instance with an instance ID of 100.
`(config-router)#router-id 21.21.21.21`	Configure the router ID to use on this instance.
`(config-router)#network 94.94.94.0/24 area 0`	Advertise the network with the area ID.
`(config-router)#snmp context-name context1`	SNMP Context is mapped with OSPF Instance
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#snmp-server enable snmp vrf management`	Use this command to start the SNMP agent.
`(config)#commit`	Commit the candidate configuration to the running configuration

(config)#exit	Exit configure mode.
#configure terminal	Enter configure mode.
(config)#snmp-server context context1 vrf management	Creates SNMP Context with Context name.
(config)#snmp-server group group2 version 3 auth context context1 vrf management	Creates SNMP group with Group name and for specific context in SNMP v3 version.
(config)#snmp-server user user2 group2 auth md5 password vrf management	Creates SNMP User in SNMPv2 and attach user into a group
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ip address 94.94.94.2/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure an OSPF instance with an instance ID of 100.
(config-router)#router-id 23.23.23.23	Configure the router ID to use on this instance.
(config-router)#network 94.94.94.0/24 area 0	Advertise the network with the area ID.
(config-router)#snmp context-name context1	SNMP Context is mapped with OSPF Instance
(config-router)#commit	Commit the candidate configuration to the running configuration.

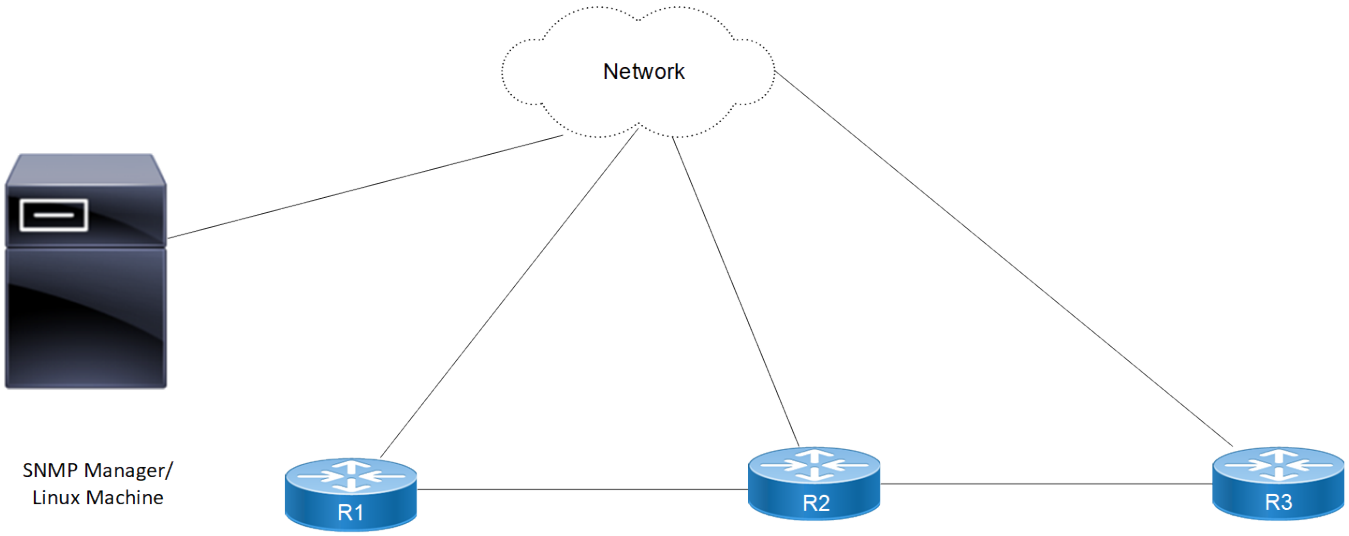
Enable SNMP and create SNMP Context & Group for Multiple OSPF Instances on a Router with SNMPv2/v3

In this example, routers R1, R2 & R3 are in Area 0, and all run OSPF. SNMPv2/v3 user is created and Mapping of user with group and context for SNMPwalk /SNMP get operation on context.

Topology

Figure 160. SNMP OSPF multiple instance



Configurations

R1

`#configure terminal`	Enter configure mode.
`(config)#snmp-server enable snmp vrf management`	Use this command to start the SNMP agent.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode.
`#configure terminal`	Enter configure mode.
`(config)#snmp-server context context1 vrf management`	Creates SNMP Context with Context name.
`(config)#snmp-server group group1 version 2c context context1 vrf management`	Creates SNMP group with Group name and for specific context in SNMP v2 version.
`(config)#snmp-server group group2 version 3 auth context context1 vrf ma`	Creates SNMP group with Group name and for specific context in SNMP v3 version
`(config)#snmp-server user user1 group1 vrf management`	Creates SNMP User in SNMPv2 and attach user into a group
`(config)#snmp-server user user2 group2 auth md5 password vrf management`	Creates SNMP User in SNMPv3 and attach user into a group

© 2026 IP Infusion Inc. Proprietary

(config)#snmp-server community cm1 vrf management	Set community string as "cm1"
(config)#snmp-server community-map cm1 context context1 user user1 vrf management	Creates Community map SNMPv2 with community name mapping user with a context.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ip address 94.94.94.3/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure an OSPF instance with an instance ID of 100.
(config-router)#router-id 21.21.21.21	Configure the router ID to use on this instance.
(config-router)#network 94.94.94.0/24 area 0	Advertise the network with the area ID.
(config-router)#snmp context-name context1	SNMP Context is mapped with OSPF Instance
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#snmp-server enable snmp vrf management	Use this command to start the SNMP agent.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
#configure terminal	Enter configure mode.
(config)#snmp-server context context1 vrf management	Creates SNMP Context with Context name "context1".
(config)#snmp-server context context2 vrf management	Creates SNMP Context with Context name"context2".
(config)#snmp-server group group1 version 3 auth context context1 vrf management	Creates SNMP group with Group name and for context 1 in SNMP v3 version.
(config)#snmp-server group group1 version 3 auth context context2 vrf management	Creates SNMP group with Group name and for context 2 in SNMP v3 version.
(config)#snmp-server user user1 group1 auth md5 password vrf management	Creates SNMP User in SNMPv3 and attach user into a group
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
(config)#interface xe1	Enter interface mode for xe1.

© 2026 IP Infusion Inc. Proprietary

(config-if)#ip address 94.94.94.2/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ip address 10.1.2.2/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure an OSPF instance with an instance ID of 100.
(config-router)#router-id 23.23.23.23	Configure the router ID to use on this instance.
(config-router)#network 94.94.94.0/24 area 0	Advertise the network with the area ID.
(config-router)#snmp context-name context1	SNMP Context is mapped with OSPF Instance
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 200	Configure an OSPF instance with an instance ID of 200.
(config-router)#router-id 24.24.24.24	Configure the router ID to use on this instance.
(config-router)#network 10.1.2.0/24 area 0	Advertise the network with the area ID.
(config-router)#snmp context-name context2	SNMP Context is mapped with OSPF Instance
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#snmp-server enable snmp vrf management	Use this command to start the SNMP agent.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
#configure terminal	Enter configure mode.
(config)#snmp-server context context2 vrf management	Creates SNMP Context with Context name.
(config)#snmp-server group group1 version 2c context context2 vrf management	Creates SNMP group with Group name and for specific context in SNMP v2 version.
(config)#snmp-server group group2 version 3 auth context context2 vrf management	Creates SNMP group with Group name and for specific context in SNMP v3 version
(config)#snmp-server user user1 group1 vrf management	Creates SNMP User in SNMPv2 and attach user into a group
(config)#snmp-server user user2 group2 auth md5 password vrf management	Creates SNMP User in SNMPv3 and attach user into a group

© 2026 IP Infusion Inc. Proprietary

(config)#snmp-server community cm1 vrf management	Set community string as "cm1"
(config)#snmp-server community-map cm1 context context1 user user1 vrf management	Creates Community map SNMPv2 with community name mapping user with a context.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#exit	Exit configure mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ip address 10.1.2.3/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 200	Configure an OSPF instance with an instance ID of 200.
(config-router)#router-id 24.24.24.24	Configure the router ID to use on this instance.
(config-router)#network 10.1.2.0/24 area 0	Advertise the network with the area ID.
(config-router)#snmp context-name context2	SNMP Context is mapped with OSPF Instance
(config-router)#commit	Commit the candidate configuration to the running configuration.

SNMP WALK Command

Perform snmpwalk as mentioned below with IPv4 address using SNMPv3 for R1:

```
snmpwalk -v 3 -u user2 -l auth -r 0 -t 10 -n "context1" -a MD5 -A password
10.12.86.111 iso.3.6.1.2.1
```

Perform snmpwalk as mentioned below with IPv4 address using SNMPv2/SNMPv3 for R2:

```
snmpwalk -v 3 -u user1 -l auth -r 0 -t 10 -n "context2" -a MD5 -A password
10.12.86.116 iso.3.6.1.2.1
```

Perform snmpwalk as mentioned below with IPv4 address using SNMPv3 for R3:

```
snmpwalk -v 3 -u user2 -l auth -r 0 -t 10 -n "context2" -a MD5 -A password
10.12.86.132 iso.3.6.1.2.1
```

OSPF Stub Router Advertisement

The OSPF Stub router feature lets you to prevent a new router in any network from being used as a transit router.

This feature enables the new router to originate link-state advertisement(LSAs) with a maximum metric, thereby causing other routers in the network to prefer alternate-paths instead of using the new router as a transit path to forward traffic. Thereby this feature allows switching and routing functions to be up and running and routing tables to converge before transit traffic is routed again through this new router

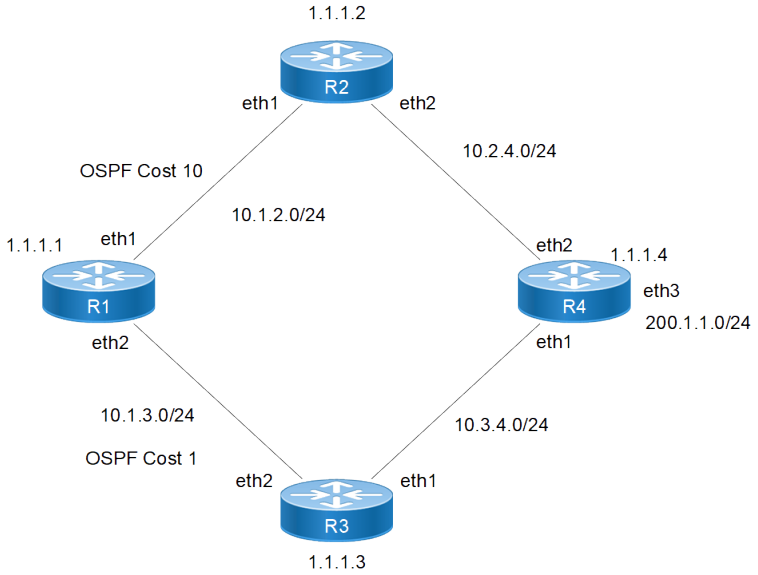
Also a startup timer can be configured on this new router enabling it to advertise a maximum metric when the router is started or reloaded

The configuration given below enables the router R3 to advertise router-LSAs/summary-LSAs with maximum metric two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

Figure 161. OSPF Stub Router Advertisement Topology



Configuration

R1

`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 1.1.1.1`	Configure the OSPF router-id

© 2026 IP Infusion Inc. Proprietary

(config-router)#network 10.1.2.0/24 area 0	Define the interface (10.1.2.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.1.3.0/24 area 0	Define the interface (10.1.3.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit router mode
(config)#interface eth1	Enter the interface configuration mode for interface eth1
(config-if)#ip ospf cost 10	Configure the OSPF cost for the interface
(config-if)#exit	Exit the interface configuration mode
(config)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config)#ospf router-id 1.1.1.2	Configure the OSPF router-id
(config-router)#network 10.1.2.0/24 area 0	Define the interface (10.1.2.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.2.4.0/24 area 1	Define the interface (10.2.4.0/24) on which OSPF runs, and associate the area ID (1) with the interface
(config-router)#exit	Exit router mode
(config)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config)#ospf router-id 1.1.1.3	Configure the OSPF router-id
(config-router)#network 1.1.1.3/32 area 0	Define the interface (1.1.1.3/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.1.3.0/24 area 0	Define the interface (10.1.3.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

© 2026 IP Infusion Inc. Proprietary

`(config-router)#network 10.3.4.0/24 area 1`	Define the interface (10.3.4.0/24) on which OSPF runs, and associate the area ID (1) with the interface
`(config-router)#max-metric router-lsa include-stub summary-lsa 100`	Configure the router to advertise max-metric for router-LSAs, for stub-networks of router-LSAs and to advertise a metric value of 100 for summary-LSAs
`(config-router)# max-metric router-lsa on-startup 300 include-stub summary-lsa 222`	Configure the router to advertise max-metric for router-LSAs, for stub-networks of router-LSAs and to advertise a metric value of 222 for summary-LSAs on-startup
`(config-router)#exit`	Exit router mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

R4

`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config)#ospf router-id 1.1.1.4`	Configure the OSPF router-id
`(config-router)#network 10.2.4.0/24 area 1`	Define the interface (10.2.4.0/24) on which OSPF runs, and associate the area ID (1) with the interface
`(config-router)#network 10.3.4.0/24 area 1`	Define the interface (10.3.4.0/24) on which OSPF runs, and associate the area ID (1) with the interface
`(config-router)#network 200.1.1.0/24 area 1`	Define the interface (200.1.1.0/24) on which OSPF runs, and associate the area ID (1) with the interface
`(config-router)#exit`	Exit router mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

Validation

R3

Multi-Area Redundant Adjacency Configuration

Overview

The Open Shortest Path First (OSPFv2) is an Interior Gateway Protocol (IGP) that uses a link-state methodology, which calculates the distance among the routers (to determine the link cost) in the network and then distributes the routing information to other routers belonging to a single Autonomous System.

In a link-state routing protocol, each participating router in a network maintains an identical database using the same Autonomous System's topology. Each router's database indicates the local state to other routers. It treats itself as a root and constructs a shortest routing path. This path gives a route for each destination in the Autonomous System.

In this protocol, the entire network is divided into sub-domains. Each sub-domain is referred as 'Area'. One of the sub-domains is classified as ‘Area 0‘ which is the ‘Backbone Area’; rest of the Areas are referred as 'Regular Area” or “Non Zero Area”. The routing among the ‘Regular Area’ is via the ‘Backbone Area’ only even though the cost link is high. A node with one ‘Area 0’ and multiple ‘Regular Area’ is named Area Border Router (ABR).

Enabling one or more ‘Regular areas’ to have Multi-Area over an interface that is part of the ‘Backbone Area’, enhances the routing capability to choose more routing paths as against the regular routing path, irrespective of high link cost. This enhances the routing communications from a ‘Regular Area’ to a ‘Regular Area’ in another ABR via ‘Backbone Area’.

This functionality is enhanced to support the Multi-Area over multiple interfaces of the ‘Backbone Area’.

For more information, refer to https://datatracker.ietf.org/doc/html/rfc5185.

Feature Characteristics

Supports Multi-Area redundancy configuration in multiple interfaces of the ‘Backbone Area’ (aka 'Area 0') for the same 'Regular Area'.

After configuring Multi-Area redundancy, the router provides redundancy paths to reach other networks from the ‘Regular Area’ via ‘Backbone Area’.

The Multi-Area redundancy configuration works only when Multi-Area neighbor is specified using `ip ospf <id> multi-area <area-id> neighbor <neighbor-ip>` command.

Limitation:

- It is mandatory to specify the `neighbor ip address` to configure Multi-Area redundancy in more than one interface of ‘Area 0’.
- Only IPv4 support is provided;.
- Configuring more than one Multi-Area in a interface for the same ‘Area 0’ is not supported
- OSPF neighborship should exists to form Multi-Area adjacency
- Multi-Area adjacency is formed between ABR’s.

Benefits

Provides flexibility to use multiple interfaces of Area 0 to reach the Regular Area in different network. Hence, when one of the interfaces goes down the other interface is used to reach the destination.

© 2026 IP Infusion Inc. Proprietary

Prerequisites

The router must be configured with OSPFv2 with Multi-Area support. For more information, refer to .

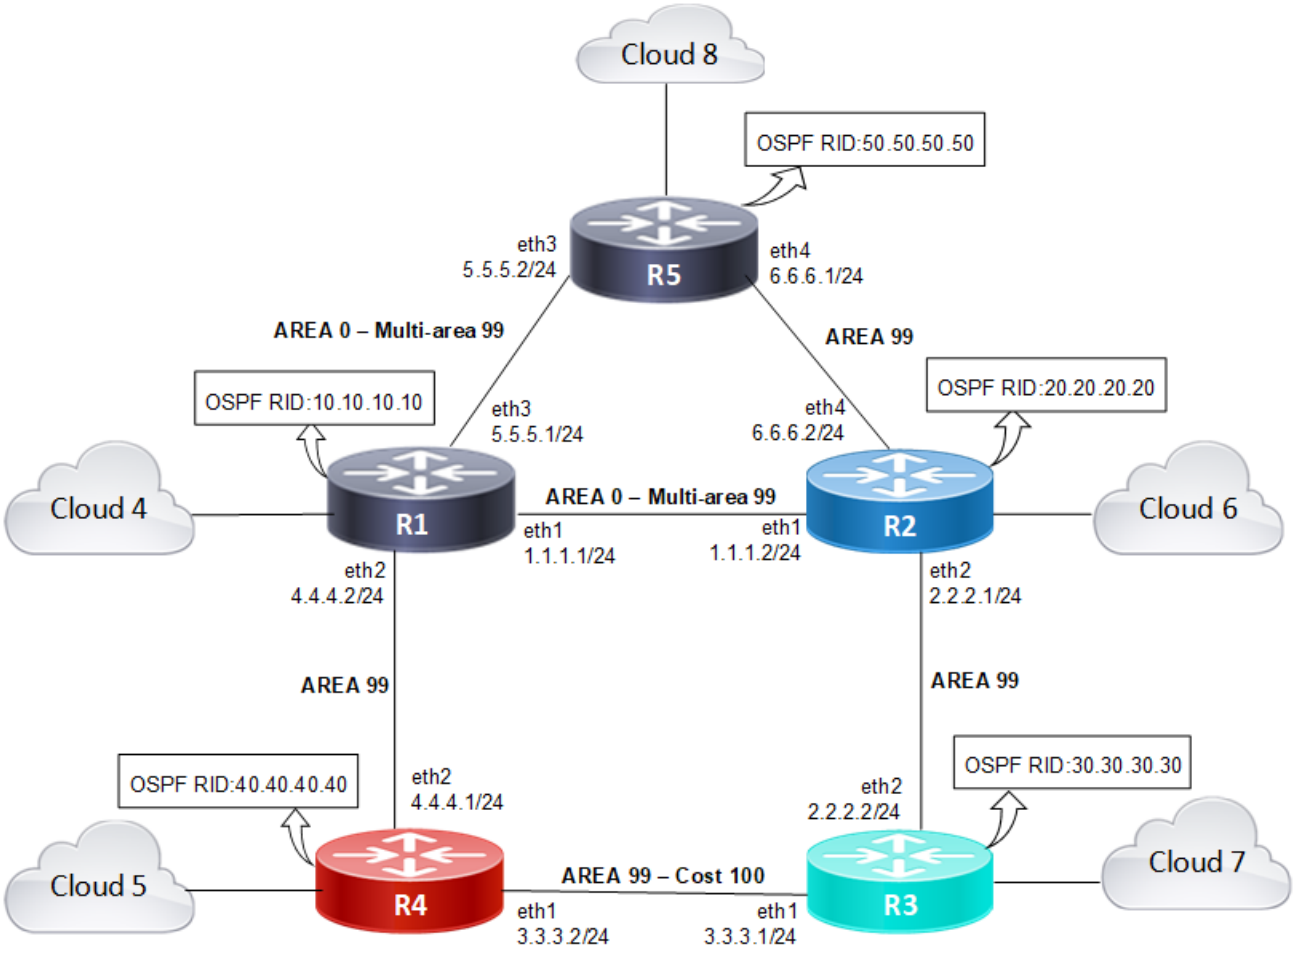
Topology

The following scenario illustrates a Regular Area 99 configured between R1-R4, R4-R3, R3-R2 and R2-R5.

The default routing communication between R1 to R3 is using the Multi-Area 99 via R1-R4-R3 even though the link cost between R4-R3 is high.

The following topology illustrates the Multi-Area Adjacency routing information.

Figure 162. OSPFv2 Multi-Area Adjacency with Multiple Interfaces



The Multi-Area support changes this default behavior and permits that once Multi-Area is enabled on `eth1` Area 0 for Multi-Area 99 in R1, the routing communication between R1 and R3 is via R1-R2-R3 as `eth1` Area 99 link cost is high.

Enabling Multi-Area in multiple interfaces, for example on `eth1` and `eth3` of Area 0 with Multi-Area 99, provides redundancy when `eth1` Area 0 goes down. Hence, the routing communication between R1 and R3 occurs via R1-R5-R2-R3.

© 2026 IP Infusion Inc. Proprietary

Configuration

The following configuration enables the Multi-Area feature on multiple interfaces in the OcNOS devices.

Perform the following steps to configure the Multi-Area Adjacency on OcNOS devices:

1. Configure the OSPFv2 router's source interfaces IP address, network type, Multi-Area information and OSPF cost of the link on R1, R2, R3, R4, and R5 using the following sample configurations:

   R1 source interfaces `eth1, eth2, eth3`

   ```
   (config)#interface eth1
   (config-if)#ip address 1.1.1.1/24
   (config-if)#ip ospf network point-to-point
   (config-if)#ip ospf 0 multi-area 99
   (config-if)#interface eth2
   (config-if)#ip address 4.4.4.2/24
   (config-if)#ip ospf network point-to-point
   (config-if)#interface eth3
   (config-if)#ip address 5.5.5.1/24
   (config-if)#ip ospf network point-to-point
   (config-if)#ip ospf 0 multi-area 99  neighbor 5.5.5.2
   ```

   R2 source interfaces eth1, eth2, eth4

   ```
   (config-if)#interface eth2
   (config-if)#ip address 2.2.2.1/24
   (config-if)#ip ospf network point-to-point
   (config)#interface eth1
   (config-if)#ip address 1.1.1.2/24
   (config-if)#ip ospf network point-to-point
   (config-if)#ip ospf 0 multi-area 99
   (config-if)#interface eth4
   (config-if)#ip address 6.6.6.2/24
   (config-if)#ip ospf network point-to-point
   ```

   R3 source interfaces `eth1, eth2`

   ```
   (config)#interface eth1
   (config-if)#ip address 3.3.3.1/24
   (config-if)#ip ospf network point-to-point
   (config-if)#ip ospf cost 100

   (config)#interface eth2
   (config-if)#ip address 2.2.2.2/24
   (config-if)#ip ospf network point-to-point
   ```

   R4 source interfaces `eth1, eth2`

   ```
   (config)#interface eth1
   (config-if)#ip address 3.3.3.2/24
   (config-if)#ip ospf network point-to-point
   (config-if)#ip ospf cost
   (config)#interface eth2
   (config-if)#ip address 4.4.4.1/24
   (config-if)#ip ospf network point-to-point
   ```

   R5 source interfaces `eth3, eth4`

   ```
   (config)#interface eth3
   (config-if)#ip address 5.5.5.2/24
   (config-if)#ip ospf network point-to-point
   (config-if)#ip ospf 0 multi-area 0.0.0.99
   (config-if)#interface eth4
   (config-if)#ip address 6.6.6.1/24
   (config-if)#ip ospf network point-to-point
   ```

© 2026 IP Infusion Inc. Proprietary

2. Configure an OSPF instance with an instance ID on R1, R2, R3, R4, and R5. Refer to theTopology (page 2244) diagram for the router ID.

```
(config)#router ospf
(config-router)#ospf router-id 10.10.10.10
```

3. Configure OSPF routing with Multi-Area area 0 /area 99 area ID and assign loopback IP address to R1, R2, R3, R4 and R5.

R1 - between R1 - R2, R1 - R4, and R1 - R5

```
(config-router)#network 1.1.1.0/24 area 0.0.0.0
(config-router)#network 4.4.4.0/24 area 0.0.0.99
(config-router)#network 5.5.5.0/24 area 0.0.0.0
(config-router)#network 10.10.10.10/32 area 0.0.0.0
```

R2 - between R1 - R2, R2 - R3, and R2 - R4

```
(config-router)#network 1.1.1.0/24 area 0.0.0.0
(config-router)#network 2.2.2.0   /24 area 0.0.0.99
(config-router)#network 6.6.6.0/24 area 0.0.0.99
(config-router)#network 20.20.20.20/32 area 0.0.0.99
```

R3 - between R2 - R3, and R3 - R4

```
(config-router)#network 2.2.2.0/24 0.0.0.99
(config-router)#network 3.3.3.0/24 area 0.0.0.99
(config-router)#network 30.30.30.30/32 area 0.0.0.99
```

R4 - between R3 - R4, and R1 - R4

```
(config-router)#network 3.3.3.0/24 area 0.0.0.99
(config-router)#network 4.4.4.0/24 area 0.0.0.99
(config-router)#network 40.40.40.40/32 area 0.0.0.99
```

Implementation Example

The OSPF Multi-area is used in high-speed link between two Area Border Routers (ABRs) in multiple areas.

Revised CLI Commands

The following existing CLI is updated to support this feature.

ip ospf multi-area (page 2471)

Glossary

Key Terms/Acronym	Description
OSPF	An Interior Gateway Protocol (IGP) based on link-state routing. Open Shortest Path First (OSPF) is widely deployed in large networks because of its efficient use of network

	bandwidth and its rapid convergence after changes in topology. Defined in RFCs 2328 and RFC 5340. OSPF advertises the states of local network links within an autonomous system (AS) and makes routing decisions based on the shortest path first (SPF) algorithm. Each OSPF router maintains an identical database describing the autonomous system's topology. From this database, a Routing Information Base (RIB) is calculated by constructing a shortest path tree (SPT).
IGP	An intradomain protocol used to exchange network reachability and routing information among devices within an autonomous system (AS), such as Intermediate System to Intermediate System (IS-IS), Open Shortest Path First (OSPF), or Routing Information Protocol (RIP). Contrast with Exterior Gateway Protocol (EGP)
ABR	A router on the border of one or more Open Shortest Path First (OSPF) areas that connects those areas to the backbone network. An ABR is a member of both the OSPF backbone and its attached areas. Therefore, an ABR maintains routing tables for both the backbone topology and the topology of the other areas. See also Not-So-Stubby-Area (NSSA), stub area.

OSPFv3

This section contains basic OSPFv3 configuration examples.

© 2026 IP Infusion Inc. Proprietary

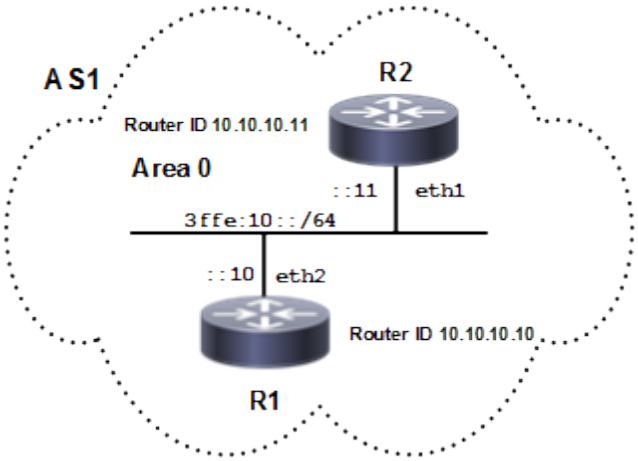
Enable OSPFv3 on an Interface

This example shows the minimum configuration required for enabling OSPFv3 on an interface. R1 and R2 are two routers in Area 0 connecting to the network 3ffe:10::/64. After enabling OSPFv3 on an interface, create a routing instance, and specify the Router ID.

Note: You must explicitly specify a Router ID for the OSPFv3 process to be activated.

Topology

Figure 163. Basic OSPFv3 Topology



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID 0.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#router-id 10.10.10.11`	Specify a Router ID (`10.10.10.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

```

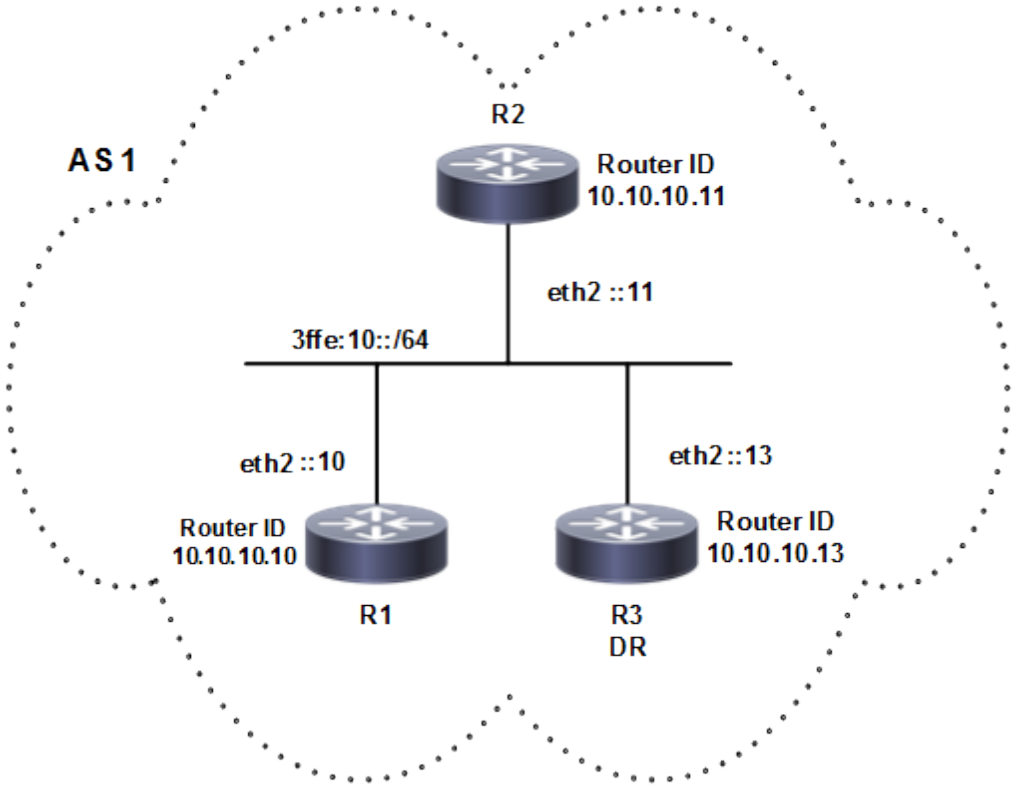
Set Priority

This example shows how to set priority for an interface. Set a high priority for a router to make it the Designated Router (DR). Router R3 is configured with a priority of 10; this is higher than the default priority (default priority is 1) set for R1 and R2. This makes R3 the DR.

Topology

Figure 164. OSPFv3 Set Priority



Configuration

R3

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.13`	Specify a Router ID (`10.10.10.13`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#ipv6 ospf priority 10`	Specify the router priority to a higher priority (10) to

© 2026 IP Infusion Inc. Proprietary

	make R3 the Designated Router (DR).
(config-if)#commit	Commit the candidate configuration to the running configuration.

R1

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.10.10	Specify a Router ID (10.10.10.10) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#commit	Commit the candidate configuration to the running configuration.

R2

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.10.11	Specify a Router ID (10.10.10.11) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#commit	Commit the candidate configuration to the running configuration.

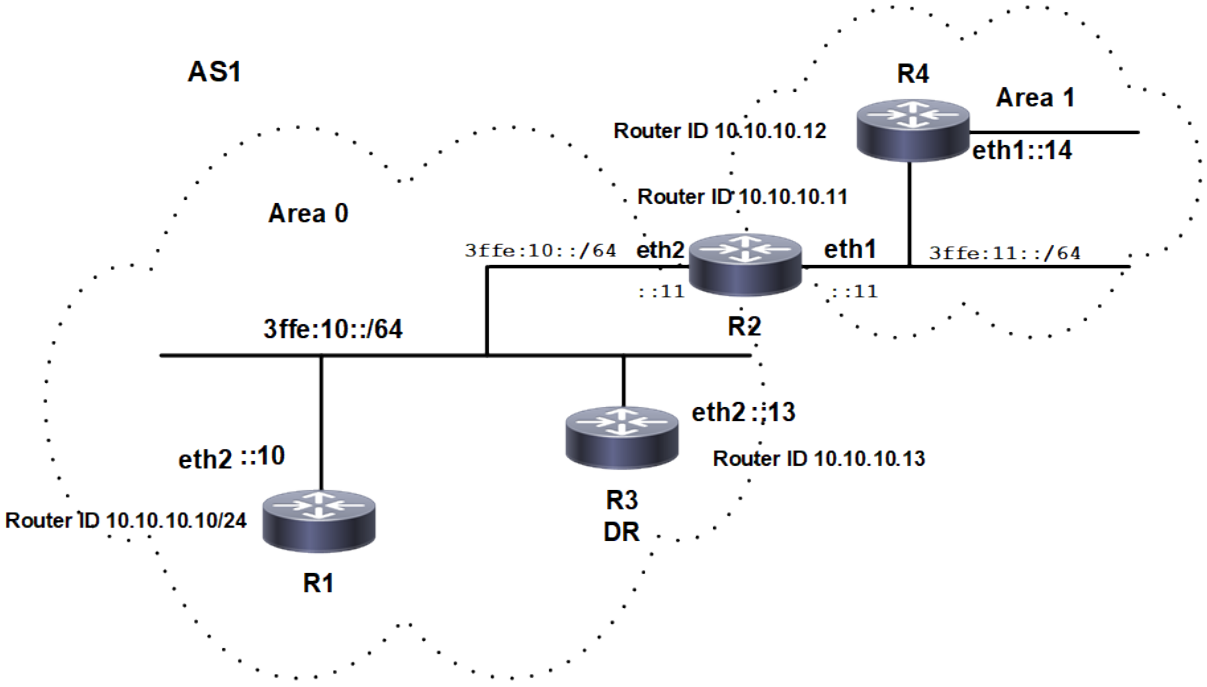
Area Border Router

This example shows configuration for an Area Border Router. R2 is an Area Border Router (ABR). On R2, interface eth2 is in Area 0, and interface eth1 is in Area 1.

Topology

Figure 165. OSPFv3 Area Border Router



Configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.11`	Specify a Router ID (`10.10.10.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on the other interface, and assign the other Area ID `(1)`.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.

R4

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.12`	Specify a Router ID (10.10.10.12) for the OSPFv3 routing process.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on the other interface, and assign the other Area ID (1).
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.

Validation

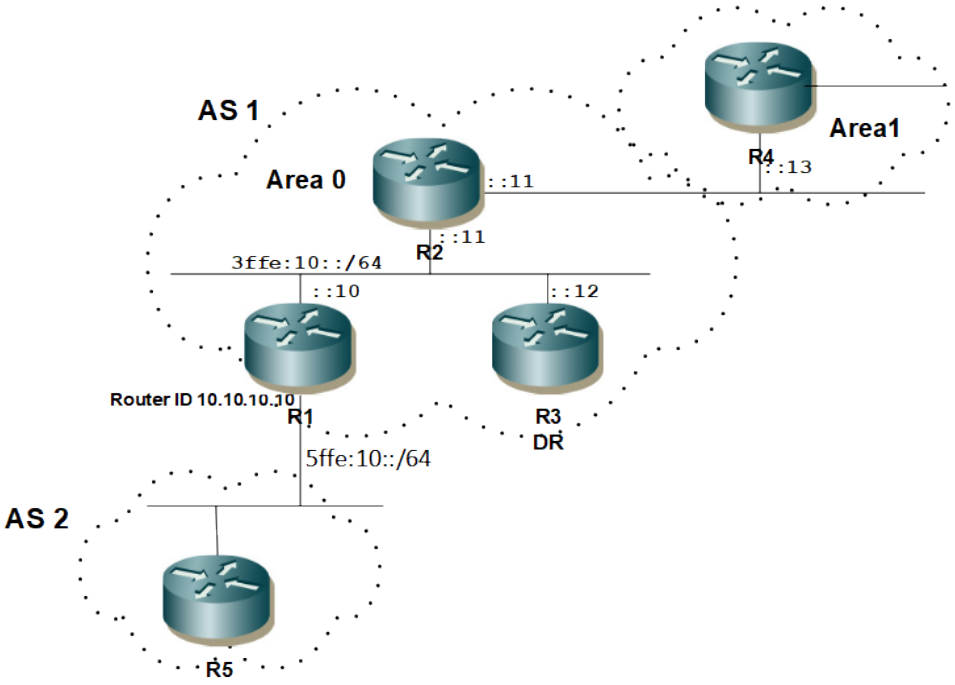
Redistribute Routes into OSPFv3

In this example, the BGP routes are imported into the OSPF routing table, and advertised as Type 5 External LSAs into Area 0.

Topology

Figure 166. OSPFv3 Redistribute Routes



Configuration

R5

`(config)#router bgp 2`	Configure router bgp instance
`(config-router)# neighbor 5ffe:10::10 remote-as 1`	Configure R1 as ipv6 BGP neighbor
`(config-router)# neighbor 5ffe:10::10 ebgp-multihop 4`	Configure the ebgp -multihop for the ebgp neighbor R1
`(config-router)# address-family ipv6 unicast`	
`(config-router-af)# neighbor 5ffe:10::10 activate`	Activate the BGP neighbor on R1 for address-family ipv6 unicast to advertise and receive ipv6 routes
`(config-router-af)#exit`	Exit mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 2`	Configure router bgp instance
`(config-router)# neighbor 5ffe:10::55 remote-as 2`	Configure R5 as ipv6 BGP neighbor
`(config-router)# neighbor 5ffe:10::55 ebgp-multihop 4`	Configure the ebgp -multihop for the ebgp neighbor R5
`(config-router)# address-family ipv6 unicast`	
`(config-router-af)# neighbor 5ffe:10::55 activate`	Activate the BGP neighbor on R5 for address-family ipv6 unicast to advertise and receive ipv6 routes
`(config-router-af)#exit`	Exit address-family ipv6 unicast mode
`(config-router)#exit`	Exit router bgp mode
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID (10.10.10.10) for the OSPFv3 routing process.
`(config-router)#redistribute bgp`	Specify redistributing routes from the other routing protocol (BGP) into OSPFv3.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth12`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Cost

Make a route the preferred route by changing its cost. In this example, cost has been configured to make R2 the next hop for R1.

The default cost for each interface is 10. Interface eth2 on R2 has a cost of 100, and Interface eth2 on R3 has a cost of 150. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

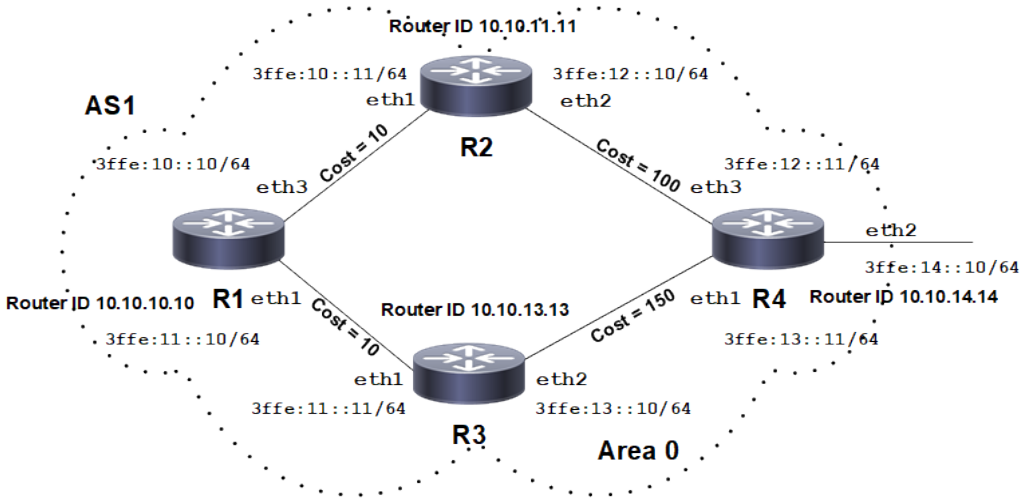
R2: 10+100 = 110

R3: 10+150 = 160

For this reason, R1 chooses R2 as its next hop to destination 10.10.14.0/24, because it has the lower cost.

Topology

Figure 167. Configure Cost OSPFv3



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID (`10.10.10.10`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.11.11`	Specify a Router ID (`10.10.11.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#ipv6 ospf cost 100`	Set the cost of the link-state metric (on `eth2`) to 100.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R3

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.13.13`	Specify a Router ID (`10.10.13.13`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#ipv6 ospf cost 150`	Set the cost of link-state metric to 150.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R4

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.14.14`	Specify a Router ID (`10.10.14.14`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

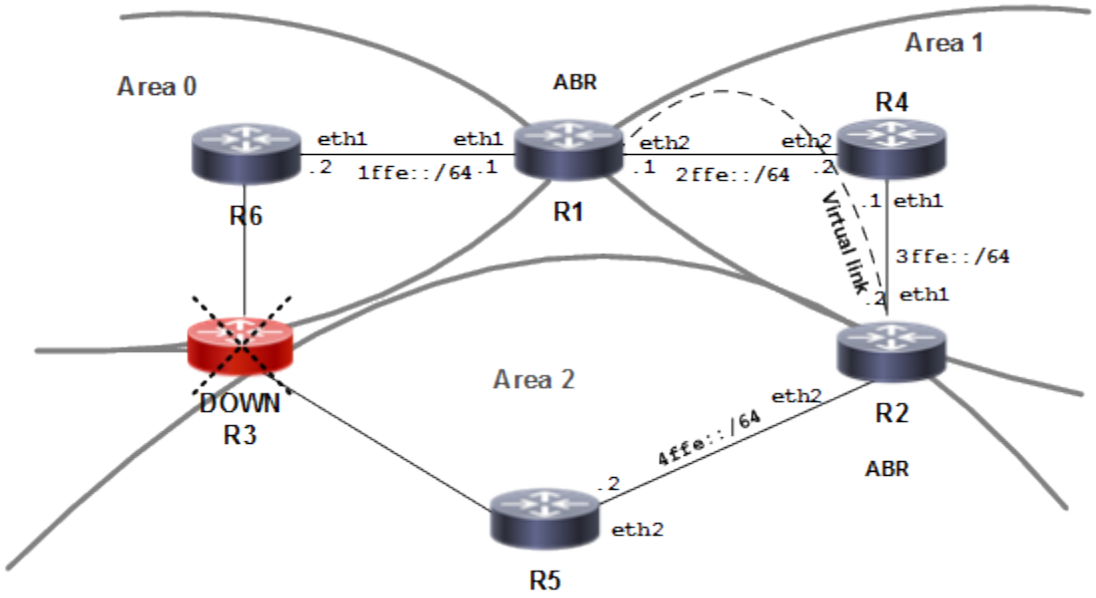
Virtual Links

Virtual links are used to connect a temporarily-disjointed non-backbone area to the backbone area, or to repair a non-contiguous backbone area. In this example, the ABR R3 has temporarily lost connection to Area 0, in turn disconnecting Area 2 from the backbone area. The virtual link between ABR R1 and ABR R2 connects Area 2 to Area 0. Area 1 is used as a transit area.

Topology

Figure 168. OSPFv3 Virtual Links



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Setup loopback interface
`(config-if)#ip address 1.1.1.1/32 secondary`	Specify loopback interface address
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on this interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on this interface, and assign the Area ID `(1)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#router-id 1.1.1.1`	Specify a Router ID (`1.1.1.1`) for the OSPFv3 routing process.
`(config-router)#area 1 virtual-link 2.2.2.2`	Configure a virtual link between this router R1 and R2 (Router ID `2.2.2.2`) through transit area 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Setup loopback interface
`(config-if)#ip address 2.2.2.2/32 secondary`	Specify loopback interface address
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on this interface, and assign the Area ID `(1)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 2`	Enable OSPFv3 routing on this interface, and assign the Area ID `(2)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 2.2.2.2`	Specify a Router ID (`2.2.2.2)` for the OSPFv3 routing process.
`(config-router)#area 1 virtual-link 1.1.1.1`	Configure a virtual link between this router R1 and R2 (Router ID `1.1.1.1`) through transit area 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R4

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on this interface, and assign the Area ID `(1)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on this interface, and assign the Area ID `(1)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 4.4.4.4`	Specify a Router ID (`4.4.4.4`) for the OSPFv3

© 2026 IP Infusion Inc. Proprietary

	routing process.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R5

#configure terminal	Enter configure mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 2	Enable OSPFv3 routing on this interface, and assign the Area ID (2).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 5.5.5.5	Specify a Router ID (5.5.5.5) for the OSPFv3 routing process.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R6

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on this interface, and assign the Area ID (0).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 6.6.6.6	Specify a Router ID (6.6.6.6) for the OSPFv3 routing process.
(config-router)#commit	Commit the candidate configuration to the running configuration.

Multiple Instances

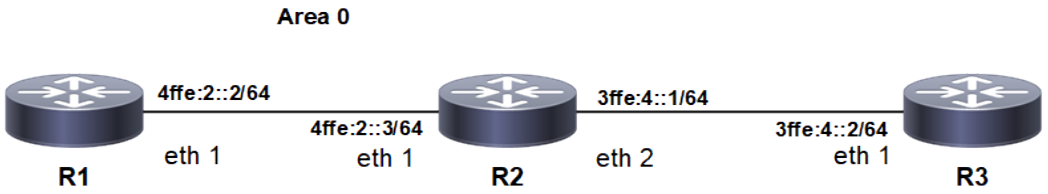
By using multiple OSPFv3 instances, OSPFv3 routes can be segregated, based on their instance number. Routes of one instance are stored differently from routes of another instance running in the same router.

To configure multiple OSPFv3 instances, refer to the topology diagram and follow the procedures below.

1. Enable OSPFv3 on an interface.
2. Enable multiple instances.
3. Configure redistribution among multiple instances.

> **Note:** Optionally, redistribution can be configured with the metric, type, or route-map options.

Topology



Enable Multiple OSPFv3 Instances on a Router Based on Tags

In this example, routers R1, R2, and R3 are in Area 0, and all run OSPFv3.

Configuration

R1

`(config)#router ipv6 ospf 5`	Configure an OSPFv3 instance with an instance ID of 5.
`(config-router)#router-id 5.5.5.5`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Specify the interface on which OSPFv3 is to be enabled.
`(config-if)#ipv6 address 4ffe:2::2/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 5`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R2

`(config)#router ipv6 ospf 5`	Configure an OSPFv3 instance with an instance ID of 5.
`(config-router)#router-id 149.149.149.149`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Configure the interface to connect to R1.
`(config-if)#ipv6 address 4ffe:2::3/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 5`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit Interface mode, and return to Configure terminal mode.
`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with an instance ID of 15.
`(config-router)#router-id 159.159.159.159`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth2`	Configure the interface to connect to R3.
`(config-if)#ipv6 address 3ffe:4::1/64`	Configure the IPv6 address.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#ipv6 router ospf area 0 tag 15`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

R3

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with an instance ID of 15.
`(config-router)#router-id 152.152.152.152`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Specify the interface on which OSPFv3 is to be enabled.
`(config-if)#ipv6 address 3ffe:4::2/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 15`	Configure the area number and instance value: match the instance ID with the instance ID created previously.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#no shutdown`	Activate the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

Redistribute among Multiple Instances

In this example, routes of one ospfv3 instance are redistributed to another ospfv3 instance to enable ping from R1 to R3 or vice-versa; and R2 redistributes routes from one instance to another.

Configuration

R2

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with instance ID 15.
`(config-router)#router-id 159.159.159.159`	Configure the router ID.
`(config-router)#redistribute ospf 5`	Redistribute instance 5 routes.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ipv6 ospf 5`	Configure an OSPFv3 instance with instance ID 5.
`(config-router)#router-id 149.149.149.149`	Configure the router ID.
`(config-router)#redistribute ospf 15`	Redistribute instance 15 routes.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R1

```

```

Redistribute with Metric Option

In this example, on R3, routes of instance 15 are redistributed into instance and vice-versa with metric of 100 so that R1 and R2 have each other's routes with a metric of 100.

Configuration

R2

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with instance ID 15.
`(config-router)#router-id 159.159.159.159`	Configure the router ID.
`(config-router)#redistribute ospf 5 metric 100`	Redistribute instance 5 routes with metric 100.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ipv6 ospf 5`	Redistribute routes into instance 5.
`(config-router)#router-id 149.149.149.149`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric 100`	Redistribute instance 15 routes with metric 100.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Redistribute with Type Option

In this example, on R3, R1 has R3 routes as type 2, and R3 has R1 routes as type 1.

Configuration

R2

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with instance ID 15.
`(config-router)#router-id 159.159.159.159`	Configure the router ID.
`(config-router)#redistribute ospf 5 metric-type 1`	Redistribute instance 5 routes as type 1.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ipv6 ospf 5`	Redistribute routes into instance 5.
`(config-router)#router-id 149.149.149.149`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric-type 2`	Redistribute instance 15 routes as type 2.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

Not-So-Stubby Area

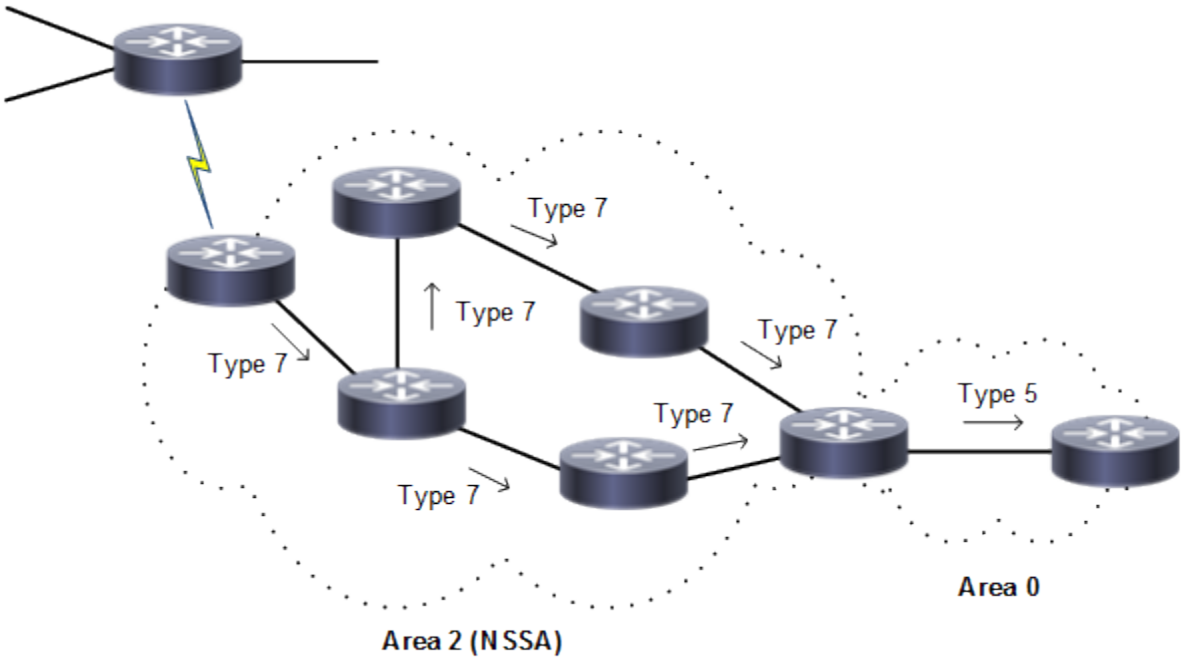
This section contains OSPFv3 NSSA (Not-So-Stubby Area) configuration examples.

An NSSA allows external routes to be advertised into the OSPF autonomous system while retaining the characteristics of a stub area to the rest of the autonomous system. To do this, the ASBR in an NSSA will originate type 7 LSAs to advertise the external destinations. These NSSA external LSAs are flooded throughout the NSSA but are blocked at the ABR.

The NSSA external LSA has a flag in its header known as the P-bit. The NSSA ASBR has the option of setting or clearing the P-bit. If an NSSA's ABR receives a type 7 LSA with the P-bit set to one, it translates the type 7 LSA into a type 5 LSA and floods it throughout the other areas. If the P-bit is set to zero, no translation takes place and the destination in the type 7 LSA is not advertised outside of the NSSA.

Topology

Figure 169. Translating Type 7 LSAs into Type 5 LSAs



NSSA with Route Option

This example shows the configuration to enable NSSA and to configure different route options for NSSA. There are three `area nssa` command options for originating default Type-3 LSA and default Type-7 LSA, and for blocking redistribution of Type-7 LSA into an NSSA:

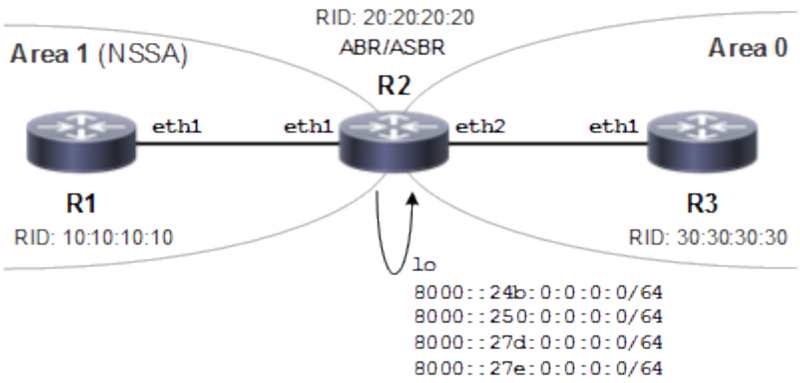
- `no-summary`: The NSSA ABR blocks all type-3 and type-4 LSAs into the NSSA area and sends a single type-3 LSA into the area to advertise a default route
- `default-information-originate`: The NSSA ABR advertises a default route into the NSSA as a type-7 LSA.
- `no-redistribution`: The NSSA ABR bocks type-7 LSA from being redistributed into the NSSA area.

In Figure 170, R2 is an NSSA ABR as well as an NSSA ASBR that maps the router interfaces to two different areas and redistributes the connected routes of the loopback interface. Also, this example sets the `no-summary`, `no-`

`redistribution`, and `default-information-originate` options on R2 to originate default Type-3 LSAs and default Type-7 LSAs into the NSSA and to block Type-7 LSAs.

Topology

Figure 170. NSSA with Route Options



Configuration

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure area as NSSA
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit interface mode

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone
`(config-if)#interface lo`	Enter interface mode for Loopback

© 2026 IP Infusion Inc. Proprietary

(config-if)#ipv6 address 8000::24b:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#ipv6 address 8000::250:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#ipv6 address 8000::27d:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#ipv6 address 8000::27e:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#commit	Commit the candidate configuration to the running configuration.
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 20.20.20.20	Configure the router ID to use on this instance (100)
(config-router)#redistribute connected	Redistribute the configured loopback network into the NSSA
(config-router)#area 1 nssa no-redistribution default-information-originate no-summary	Configure the Router to originate default Type-3 LSAs and default Type-7 LSAs, and to block Type-7 LSAs into the NSSA
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit interface mode

R3

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in an area assigned with the area ID (1).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 30.30.30.30	Configure the router ID to use on this instance (100)
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit interface mode

Validation 1

In the output of `show ipv6 ospf neighbor` below, verify that OSPFv3 adjacency is in state “full” for both R1 and R2 under the process identifier 100.

```
R1#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
20.20.20.20       1   Full/DR         00:00:34    eth1       0

R2#show ipv6 ospf neighbor

Total number of full neighbors: 2
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
```

```
10.10.10.10       1   Full/DR         00:00:36    eth1       0
30.30.30.30       1   Full/Backup     00:00:39    eth2       0
R2#
```

Validation 2

The output below shows originating default Type-3 LSAs into the NSSA with the no-summary option. The advertising router identifier is for R2 (20.20.20.20, the NSSA-ABR). Also, the prefix is ::/0 and the LS-Type is Inter-Area-Prefix-LSA for the default Type-3 LSA route into the NSSA.

```
R1#sh ipv6 ospf database inter-prefix

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

                Inter-Area-Prefix-LSA (Area 0.0.0.1)

  LS age: 1234
  LS Type: Inter-Area-Prefix-LSA
  Link State ID: 0.0.0.6
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000001
  Checksum: 0x17D0
  Length: 28
    Metric: 1
    Prefix: ::/0
    Prefix Options: 0
```

Validation 3

The output below shows originating default type-7 LSAs alone after setting the no-redistribution and default-information originate options. The advertising router identifier is for R2 (20.20.20.20, the NSSA-ABR). Also, the prefix is ::/0 and LS-Type is NSSA-external-LSA for the default Type-7 LSA route into the NSSA

```
R1#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

                NSSA-external-LSA (Area 0.0.0.1)

  LS age: 1758
  LS Type: NSSA-external-LSA
  Link State ID: 0.0.0.20
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000002
  Checksum: 0x6468
  Length: 32
    Metric Type: 2 (Larger than any link state path)
    Metric: 1
    Prefix: ::/0
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 0
```

NSSA with the Summary Address Option

Figure 171 shows the configuration to originate external LSAs (Type-7) and translate them into external LSAs (Type-5):

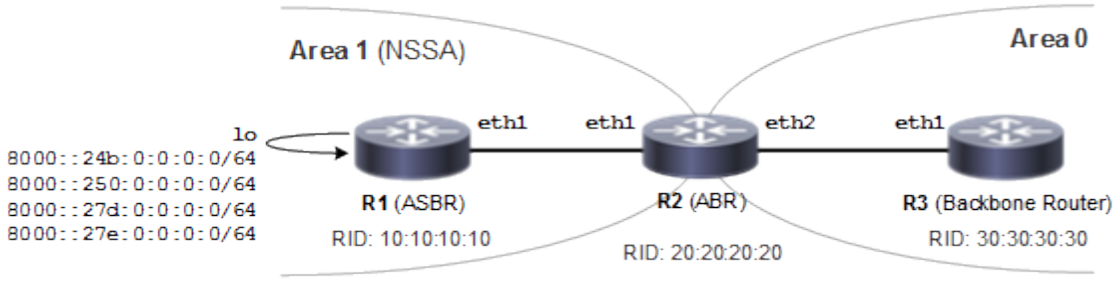
- R1 is an NSSA-ASBR configured with loopback IPv6 addresses that are redistributed into OSPFv3
- R2 is an NSSA-ABR
- R3 is backbone router

R1 originates Type-7 LSAs which are summarized into a single Type-7 into the NSSA by the `summary-address` option and this summarized Type-7 is converted to Type-5 LSA by R2.

Also, the summarized route can be tagged using the `tag` command and the advertisement of summarized routes can be suppressed by the `not-advertise` option.

Topology

Figure 171. Using the summary-address Option



Configuration

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 address 1000::1/64`	Configure ipv6 address for interface eth1
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config-if)#interface lo`	Enter interface mode for loopback
`(config-if)#ipv6 address 8000::24b:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::250:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27d:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27e:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)

© 2026 IP Infusion Inc. Proprietary

`(config-router)#area 1 nssa`	Configure the area as NSSA.
`(config-router)#redistribute connected`	Redistribute the configured loopback network into OSPFv3 NSSA. Connected networks can be redistributed by setting the metric and metric type.
`(config-router)#summary-address 8000::/48 all-tag 10`	Summarize the address range and tag the summarized route
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit interface mode

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 address 1000::2/64`	Configure ipv6 address for interface eth1
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 address 2000::1/64`	Configure ipv6 address for interface eth2
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure the Router in NSSA
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit interface mode

R3

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 address 2000::2/64`	Configure ipv6 address for interface eth1
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 30.30.30.30`	Configure the router ID to use on this instance (100)
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

In the configurations above, you can suppress the external route summarization by NSSA-ASBR by specifying the `not-advertise` parameter as shown below:

```
(config-router)#summary-address 8000::/48 not-advertise
```

Also, connected networks can be redistributed by setting the metric and metric type as shown below:

```
(config-router)#redistribute connected metric 20 metric-type 1
```

Validation 1

The output below shows the summarized route generated by NSSA-ASBR (R1) with a tag. The output has the LS Type as NSSA-external-LSA with advertising router identifier (10.10.10.10) of the NSSA-ASBR (R1). Also, check the Prefix which is summarized route and external route tag as configured.

```
R1#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID ( 10.10.10.10) (Process 100)

                NSSA-external-LSA ( Area 0.0.0.1)

  LS age: 90
 LS Type: NSSA-external-LSA

  Link State ID: 0.0.0.11
 Advertising Router: 10.10.10.10

  LS Seq Number: 0x80000003
  Checksum: 0x69B3
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
 Prefix: 8000::/48

    Prefix Options: 8 (P|-|-|-)
 External Route Tag: 10
```

Validation 2

The output below on the NSSA-ABR that is translating Type-7 LSAs to Type-5 LSAs shows summarized address in Type-7 and Type-5 LSA. Check for the same prefix, external route tag in both Type7 and Type-5 LSA.

```
R2#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID (20.20.20.20) (Process 100)

                NSSA-external-LSA (Area 0.0.0.1)

  LS age: 241
  LS Type: NSSA-external-LSA
  Link State ID: 0.0.0.11
  Advertising Router: 10.10.10.10
  LS Seq Number: 0x80000003
  Checksum: 0x69B3
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 8 (P|-|-|-)
    External Route Tag: 10

R2#sh ipv6 ospf database external

            OSPFv3 Router with ID (20.20.20.20) (Process 100)
```

```
                AS-external-LSA

  LS age: 245
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000003
  Checksum: 0x8660
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 10
```

Validation 3

The output below on the backbone router shows the summarized address in the translated Type-5 LSA. The prefix and external route tag are the same as the summarized Type-7 LSA originated by R1.

```
R3#sh ipv6 ospf database external

            OSPFv3 Router with ID (30.30.30.30) (Process 100)

                AS-external-LSA

  LS age: 409
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000003
  Checksum: 0x8660
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 10
```

NSSA with the Translator Role Option

Type-7 to Type-5 translation is done by an NSSA-ABR. If an NSSA has multiple NSSA-ABRs, only one will perform the translation. The NSSA-ABR translator role options are:

- Candidate (default)
- Always

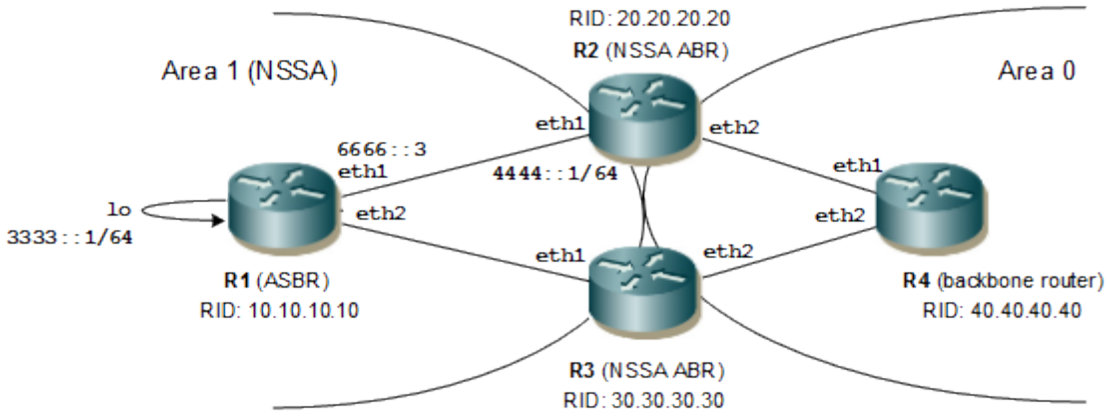
In the topology below:

- R1 is NSSA-ASBR
- R2 and R3 are NSSA-ABRs
- R4 is a backbone router

In this example, the NSSA translator role `candidate` is configured on both NSSA-ABRs (R2 and R3). The Type-7 to Type-5 translation is done by the router with the higher router identifier (R3).

Topology

Figure 172. Using the translator-role Option



Configuration

When one NSSA-ABR is configured with the translator role as `always` and the other as `candidate`, then translation is done by the router configured as `always`. In this scenario, the translation can be biased by setting the translator role to `always` on the router that has the lower router identifier.

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config-if)#interface lo`	Enter interface mode for Loopback
`(config-if)#ipv6 address 3333::1/64`	Assign IPv6 address to loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure the area as NSSA.
`(config-router)#redistribute static`	Redistribute the static route configured into the OSPF NSSA
`(config-router)#redistribute connected`	Redistribute the connected network into OSPF NSSA
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit interface mode
`(config)#ipv6 route 4444::1:0:0:0:0/64 6666::3`	Configure the static route with the nexthop address as R2's `eth1` IPv6 address
`(config)#exit`	Exit interface mode.

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa translator-role candidate`	Configure the NSSA-ABR with the translator role candidate.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit interface mode

R3

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the

	area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 30.30.30.30	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa translator-role candidate	Configure the NSSA-ABR with the translator role candidate.
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit interface mode

R4

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 40.40.40.40	Configure the router ID to use on this instance (100)
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit interface mode

The command to configure the NSSA-Translator role as always is:

```
(config-router)#area 1 nssa translator-role always
```

The NSSA-ABR can continue to perform translation after its services are no longer required for the stability interval which is set using the command below on the NSSA-ABR.

```
(config-router)#area 1 nssa stability-interval 7777
```

Validation 1

The translation is done by the NSSA-ABR with the higher router identifier. In the output below, check the router identifier of the NSSA-ABR. Also, check the router which is elected and the router which is disabled.

```
R2#sh ipv6 ospf
 Routing Process "OSPFv3 (100)" with ID 20.20.20.20
 Process uptime is 21 minutes
 SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
 Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
```

```
 Number of incoming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Number of external LSA 4. Checksum Sum 0x1F816
 Number of AS-Scoped Unknown LSA 0
 Number of LSA originated 28
 Number of LSA received 58
 Number of areas in this router is 2
    Area BACKBONE(0)
        Number of interfaces in this area is 1(1)

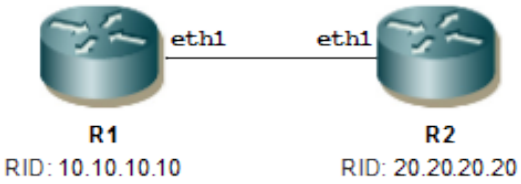
  Forwarding Address: 6666::3
  External Route Tag: 0
```

Link LSA Suppression

If link LSA suppression is enabled and the interface type is not broadcast or NBMA, the router will not originate a link-LSA for the link. This implies that other routers on that link will determine the router's next hop address using a mechanism other than the link LSA.

Topology

Figure 173. LSA Suppression



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf tag 100-ABC area 1`	Configure interface in an area assigned with the area ID (1). The tag uniquely identifies the routing process.
`(config-if)#ipv6 ospf network point-to-point`	Configure the OSPF interface network type as point to point
`(config-if)#ipv6 ospf link-lsa-suppression enable`	Enable the link LSA suppression mechanism
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf tag 100-ABC area 1`	Configure interface in an area assigned with the area ID (1). The tag uniquely identifies the routing process.
`(config-if)#ipv6 ospf network point-to-point`	Configure the OSPF interface network type as point to point
`(config-if)#ipv6 ospf link-lsa-suppression enable`	Enable the link LSA Suppression Mechanism
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

Note: This is not applicable for broadcast and NBMA networks.

Validation 1

Verify that adjacency has been established.

```
R1#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
20.20.20.20       1    Full/ -         00:00:37    eth1       0
```

Validation 2

Verify that R1 should not have the Link LSA in the Link state database.

Note: The output below is captured after link lsa suppression enabled which has not Link LSA in the LSDB.

```
R1#sh ipv6 ospf database

            OSPFv3 Router with ID (10.10.10.10) (Process 100-ABC)

R1#sh ipv6 ospf database link

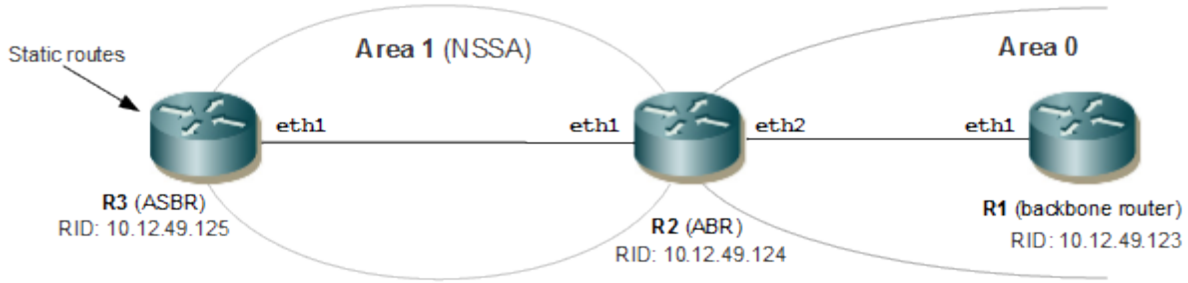
            OSPFv3 Router with ID (10.10.10.10) (Process 100-ABC)
```

Originate Type-7 LSAs and Translate to Type-5

Figure 174 shows the configuration to originate Type-7 LSAs and translate them into Type-5 LSAs. R3 is an NSSA-ASBR that originates Type-7 LSAs into the NSSA which are converted to Type-5 LSAs by R2 which is an NSSA-ABR. R1 is a backbone router.

Topology

Figure 174. Originate Type-7 LSAs and Translate to Type-5 under Address Family IPv4



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use on this tag
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100- ABC instance-id 31`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv6 address family
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#ip route 15.15.15.0/24 null`	Configure the static route with the nexthop address

© 2026 IP Infusion Inc. Proprietary

	set to null
`(config-router)#router-id 10.12.49.125`	Configure the router ID to use for this process
`(config-router)#area 1 nssa`	Configure the area 1 as NSSA.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 31`	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 30`	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 0-30 for the IPv6 address family.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

R3

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.12.49.125`	Configure the router ID to use for this process
`(config-router)#area 1 nssa`	Configure the area 1 as NSSA.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 30`	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv6 address family.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation 1

Verify that adjacency has been established with the configured instance identifier.

```
R2#sh ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri   State           Dead Time   Interface   Instance ID
10.12.49.123      1   Full/DR         00:00:31       eth1           31
10.12.49.125      1   Full/Backup     00:00:38    eth2          30
```

Validation 2

Verify that R3 has generated a Type-7 LSA and that the ABR R2 has External LSA Type 5 in its Database.

R3

```
R3#show ipv6 ospf database nssa-external

            OSPFv3 Router with ID (10.12.49.125) (Process 100-ABC)

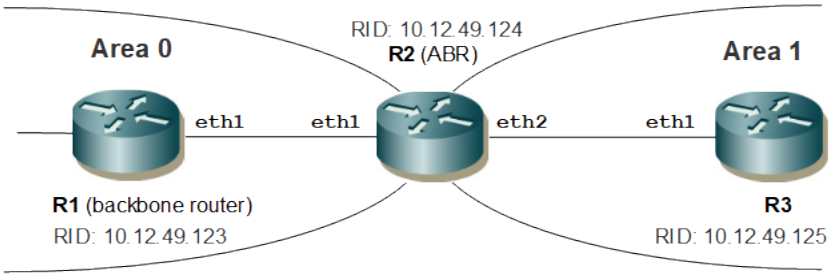
Summarize Inter-Area and External Routes

Figure 175 shows the configuration to enable inter-area and external route summarization. The IPv4 address family is enabled on R1. R2 summarizes the internal OSPF routes which R3 redistributes.

Topology

Figure 175. Enabling Intra-Area and External Route Summarization



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use for this process.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.10.10.1/24`	Specify IP address for interface eth1
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 31`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv6 address family.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.124`	Configure the router ID to use for this process
`(config-router)#exit`	Exit OSPF router mode

© 2026 IP Infusion Inc. Proprietary

`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.10.10.2/24`	Specify an IP address for the interface
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 31`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv4 address family.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 20.20.20.1/24`	Specify an IP address for the interface
`(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 30`	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv6 address family.
`(config-if)#exit`	Exit interface mode
`(config)#interface lo`	Enter interface mode
`(config-if)#ipv6 router ospf area 1 tag 101 instance-id 30`	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv6 address family.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

R3

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.125`	Configure the router ID to use for this process
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 20.20.20.2/24`	Specify an IP address for the interface
`(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 30`	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 0-31 for the IPv4 address family.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode

Validation

Validation 1: Verify that adjacency has been established with the configured instance identifier.

```
R2#show ipv6 ospf neighbor
OSPFv3 Process (100-ABC)
Neighbor ID     Pri   State              Dead Time   Interface  Instance ID
10.12.49.123      1   Full/Backup     00:00:38       eth1       31
10.12.49.125      1   Full/DR            00:00:38       eth2       30
```

Validation 2: Verify that a single summarized OSPF IA route and a single summarized external route is available in FIB of R1

```
R1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C            10.0.0.0/8 is directly connected, eth0, 00:45:18
C            11.1.1.0/24 is directly connected, eth1, 00:40:01
O IA         22.1.1.0/24 [110/2] via 11.1.1.2, eth1, 00:37:57
O IA         100.1.1.0/24 [110/2] via 11.1.1.2, eth1, 00:24:59
C            127.0.0.0/8 is directly connected, lo, 00:45:18
O E2         200.1.1.0/24 [110/20] via 11.1.1.2, eth1, 00:00:54

Gateway of last resort is not set
R1#
```

Validation 3: Verify that the Inter-Area Prefix LSA and External LSA in OSPFv3 database of R1 consists of just a single prefix 100.1.1.0/24 and 200.1.1.0/24 respectively

```
R1#show ipv6 ospf database inter-prefix

Distribute List

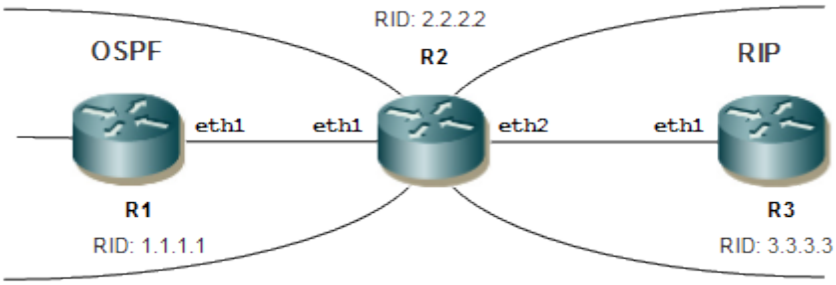
To filter the routes that Open Shortest Path First Version 3 (OSPFv3) installs in the Routing Information Base (RIB), use the `distribute-list in` command in an appropriate configuration mode.

To filter the routes redistributed into Open Shortest Path First Version 3 (OSPFv3) from other routing protocols, use the `distribute-list out`command in an appropriate configuration mode.

Topology

Below figure shows the configuration to illustrate the distribute-list support for OSPFv3

Figure 176. Basic Topology for Distribute-list



Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2000::1/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag proc1`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)# ipv6 address 1111::1/128`	Configure the IPv6 address of the interface.
`(config-if)# ipv6 address 2222::2/128`	Configure the IPv6 address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf proc1`	Configure the routing process
`(config-router)#router-id 1.1.1.1`	Configure router-id to uniquely identify the router
`(config-router)#redistribute connected`	Redistribute connected routes into ospfv3
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#end`	Exit router mode.

© 2026 IP Infusion Inc. Proprietary

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2000::50/64`	Configure the IPv6 address of the interface
`(config-if)#ipv6 router ospf area 0 tag proc1`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ipv6 address 4000::50/64`	Configure the IPv6 address of the interface.
`(config-if)#exit`	Exit interface mode
`(config-if)#ipv6 router rip`	Configure rip instance under interface
`(config-if)#exit`	Exit interface mode
`(config)#router ipv6 rip`	Configure the rip routing process
`(config-router)#neighbor fe80::5054:ff:fe85:19bc eth2`	Configure RIP neighbor peer
`(config-router)#exit`	Exit router mode.
`(config)#ipv6 access-list 1`	Configure ipv6 access list
`(config-ipv6-acl)# permit any 7777::/64 any`	Configure ipv6 access-list to permit 7777::/64 and deny 8888::/64
`(config-ipv6-acl)#exit`	Exit ipv6 access-list mode
`(config)#ipv6 access-list 2`	Configure ipv6 access-list
`(config-ipv6-acl)#permit any 1111::1/128 any`	Configure ipv6 access-list to permit 1111::1/128 and deny 2222::2/128
`(config-ipv6-acl)#exit`	Exit ipv6 access-list mode
`(config)#router ipv6 ospf proc1`	Configure the ospfv3 routing process
`(config-router)#router-id 2.2.2.2`	Configure router-id to uniquely identify the router
`(config-router)#redistribute rip`	Redistribute rip routes
`(config-router)#distribute-list 1 out rip`	Configure distribute list to allow only the permitted routes redistributed from RIP
`(config-router)#distribute-list 2 in`	Configure distribute list to allow the installation of only the permitted OSPFv3 routes in RIB
`(config-router)#exit`	Exit router mode
`(config)#ipv6 access-list 1`	Enter access-list mode
`(config-ipv6-acl)#permit any 8888::/64 any`	Configure the ipv6 access-list to permit 8888::/64 alongwith 7777::/64
`(config-ipv6-acl)#exit`	Exit access-list mode
`(config)#ipv6 access-list 2`	Enter access-list mode

© 2026 IP Infusion Inc. Proprietary

(config-ipv6-acl)#permit any 2222::2/128 any	Configure the ipv6 access-list to permit 2222::2/128 alongwith 1111::1/128
(config-ipv6-acl)#exit	Exit access-list mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#exit	Exit configure mode

R3

#configure terminal	Enter configure mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 address 4000::51/64	Configure the IPv6 address of the interface.
(config-if)#ipv6 router rip	Configure rip instance under interface
(config-if)#exit	Exit interface mode
(config)#router ipv6 rip	Configure the rip routing process
(config-router)#neighbor fe80::5054:ff:fec6:69f eth1	Configure rip neighbor peer
(config-router)#exit	Exit router mode
(config)#ipv6 route 7777::/64 eth2	Configure static route
(config)#ipv6 route 8888::/64 eth3	Configure static route
(config)#router ipv6 rip	Configure the rip routing process
(config-router)#redistribute static	Redistribute configured static routes
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#end	Exit router mode

Validation 1

Verify OSPF neighborship is up between R1and R2

R2

```
R2#show ipv6 ospf neighbor
OSPFv3 Process (Proc1)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
1.1.1.1           1   Full/Backup     00:00:38    eth1       0
```

Validation 2

Check if permitted route 7777::/64 is present in R1's routing table and denied route 8888::/64 is not present.

R1

```
R1#show ipv6 ospf route
OSPFv3 Process (Proc1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
   Destination     Metric           Next-hop
C  2000::/64         1             directly connected, eth1, Area 0.0.0.0
E2 7777::/64        1/20   via    fe80::5054:ff:fe1e:269d, eth1
```

Validation 3

Check both the routes 7777::/64 and 8888::/64 are present after 8888::/64 is permitted

R1

```
rtr1#show ipv6 ospf route
OSPFv3 Process (Proc1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

   Destination    Metric    Next-hop
C  2000::/64        1      directly connected, eth1, Area 0.0.0.0
E2 7777::/64       1/20   via fe80::5054:ff:fe1e:269d, eth1
E2 8888::/64       1/20   via fe80::5054:ff:fe1e:269d, eth1
```

Validation 4

Check if permitted route 1111::1/128 is present in R2's routing table and denied route 2222::2/128 is not present.

R1

```
R2#show ipv6 route
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area, E1 - OSPF external type 1,

OSPFv3 Authentication

This example shows the configuration required for enabling OSPFv3 authentication with IPSEC on an OSPFv3-enabled interface. R1 and R2 are two routers in Area 0 connecting to the network 2000::/64.

Notes:

- You must explicitly specify a Router ID for the OSPFv3 process to be activated.
- Supported authentication algorithms are: MD5, SHA1, SHA256.

Topology

Figure 177. OSPFv3 Authentication

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#crypto ipsec transform-set tset1 esp-auth esp-md5 esp-enc esp-3des`	Create a transform-set with the ESP Authentication and encryption parameters
`(config)#crypto map map1 ipsec-manual`	Create manual key association to the crypto-map
`(config-crypto)#sequence 100`	Create sequence in crypto-map
`(config-crypto-seq)# set transform-set tset1`	Attach transform set to cryptomap
`(config-crypto-seq)# set peer fe80::923c:b3ff:fe82:8d88 spi 2`	Set IPv6 peer (OSPFv3 neighbor) and SPI value
`(config-crypto-seq)# set session-key outbound esp 1 cipher 66546A576E5A72346A586E3272357538782F413F4428472B authenticator 3777217A25432A46763979244226452948404D6351655468`	Set the outbound session-key with cipher and auth values
`(config-crypto-seq)#exit`	Exit sequence mode in crypto
`(config-crypto)#exit`	Exit crypto mode
`(config)#router ipv6 ospf 1`	Create an OSPFv3 routing instance.
`(config-router)#router-id 1.1.1.1`	Specify a Router ID for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0 tag 1`	Enable OSPFv3 routing on an interface, and assign the Area ID 0.
`(config-if)# ipv6 ospf authentication cryptomap map1`	Configure OSPFv3 authentication over the

© 2026 IP Infusion Inc. Proprietary

	OSPFv3 interface by applying the configured cryptomap
(config-if)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#crypto ipsec transform-set tset1 esp-auth esp-md5 esp-enc esp-3des	Create a transform-set with the ESP Authentication and encryption parameters
(config)#crypto map map1 ipsec-manual	Create manual key association to the crypto-map
(config-crypto)#sequence 100	Create sequence in crypto-map
(config-crypto-seq)# set transform-set tset1	Attach transform set to cryptomap
(config-crypto-seq)# set peer fe80::fa8e:a1ff:fe0b:dd9a spi 1	Set IPv6 peer (OSPFv3 neighbor) and SPI value
(config-crypto-seq)# set session-key outbound esp 2 cipher 66546A576E5A72346A586E3272357538782F413F4428472B authenticator 3777217A25432A4676397924422645294840 4D6351655468	Set the outbound session-key with cipher and auth values
(config-crypto-seq)#exit	Exit sequence mode in crypto
(config-crypto)#exit	Exit crypto mode
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 2.2.2.2	Specify a Router ID for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)# ipv6 ospf authentication cryptomap map1	Configure OSPFv3 authentication over the OSPFv3 interface by applying the configured cryptomap
(config-if)#commit	Commit the candidate configuration to the running configuration.

OSPFv3 Graceful Restart Configuration

The possibility of maintaining a router's data forwarding capability while the router's control software restarts is called graceful restart or non-stop forwarding. After the router restarts and reloads, it must change its OSPF processing until it re-establishes full adjacencies with all its former fully adjacent neighbors. The time period between the restart/reload and re-establishment of adjacencies is called the grace period.

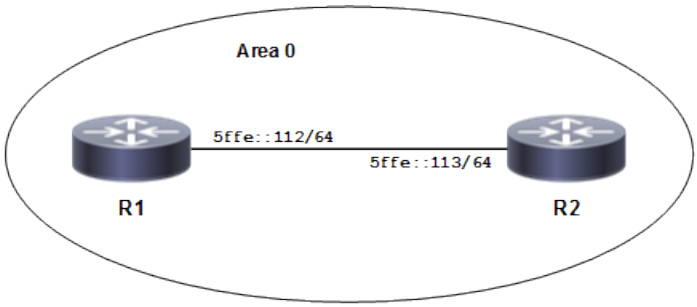
Essentially, the OSPF procedure for graceful restart is as follows:

- The router attempting a graceful restart originates link-local Opaque-LSAs, called Grace-LSAs, announcing its intention to perform a graceful restart within a specified amount of time (grace period).
- During the grace period, neighbors continue to announce the restarting router in their LSAs as if it were fully adjacent (OSPF neighbor state Full), but only if the network topology remains static (the contents of the LSAs in the link-state database that have LS types 1-5 and 7 remain unchanged, and periodic refreshes are allowed).

Note: The Graceful restart configuration is applicable for both OSPFv2 and OSPFv3.

Topology

Figure 178. OSPFv3 Graceful Restart



Configure R1 for Graceful Restart

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ipv6 address 5ffe::112/64`	Assign the IPv6 address to the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Configure the interface for OSPFv3 on area 0.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 1`	Create an OSPFv3 routing instance.
`(config-router)#router-id 1.1.1.1`	Specify a Router ID (`1.1.1.1`) for the OSPFv3 routing process.
`(config-router)#capability restart graceful`	The graceful restart capability is enabled by default. If the user disabled it already, execute this CLI to

© 2026 IP Infusion Inc. Proprietary

	enable graceful restart capability.
(config-router)#end	Exit Configure mode and enter Privileged Exec mode.
#write	Save the configuration.
#restart ipv6 ospf graceful grace-period 100	Restart OSPFv3 with a 200-second grace period, so that the neighbor maintains adjacency and preserves the routes for 100 seconds.

Configure R2 as Restart Helper

#configure terminal	Enter configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 address 5ffe::113/64	Assign the IPv6 address to the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Configure the interface for OSPFv3 on area 0.
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 2.2.2.2	Specify a Router ID (2.2.2.2) for the OSPFv3 routing process.
(config-router)#exit	Exit Router mode and enter Configure mode.
(config)#ipv6 ospf restart helper max-grace-period 1800	Configure R2 to act as the helper when the grace period is less than 1800.

Remove Capability Restart Configuration from R1

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 1.1.1.1	Specify a Router ID (1.1.1.1) for the OSPFv3 routing process.
(config-router)#no capability restart	Unconfiguring graceful restart capability under router ipv6 ospf 1.
(config-router)#exit	Exit Router mode and enter Configure mode.

Remove Helper Configuration from R2

#configure terminal	Enter configure mode.
(config)#ipv6 ospf restart helper never	Configure R2 to not work as the helper.
(config)#commit	Commit the configuration.
(config)#exit	Exit Router mode and enter Configure mode.

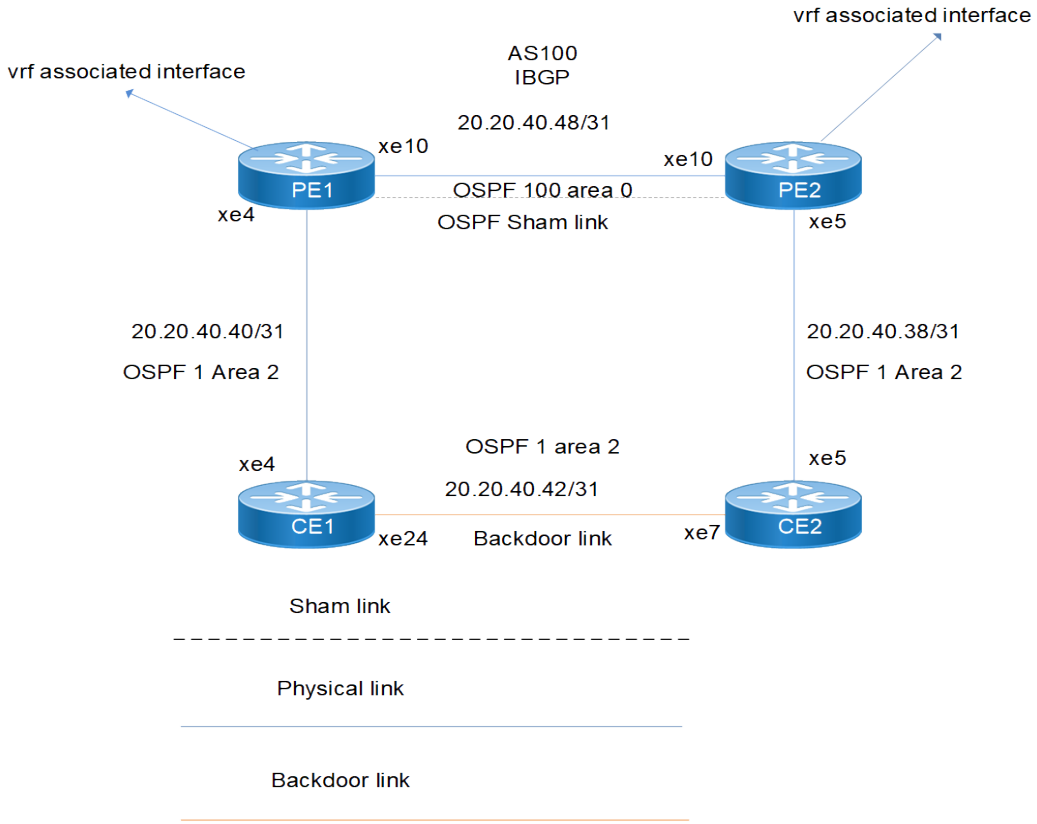
OSPF Sham-link for VPN Sites Configuration

This feature is to ensure that the OSPF Client sites that share a backdoor link can communicate over the MPLS VPN backbone and participate in VPN services.

Suppose that there are two sites in same OSPF area and each of them is attached to a different PE router, and there is also an intra-area ospf backdoor link connecting the two sites. There will be routes between sites that go through the PE routers, but these routes will appear to be inter area routes, and OSPF will consider them less preferable than the intra-area routes through the backdoor link. To make a route through the backbone appear to be an intra-area route, it is necessary to make it appear as if there is an intra-area link connecting the two PE routers. Sham-links are those links routes the intra-area routes through the backbone.

Topology

Figure 179. OSPF SHAM-LINK FOR VPN SITES



CE1 Configuration

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure the IP address of the interface loopback

(config-if)#exit	Exit interface mode
(config)# commit	Committing the configuration to apply in running configuration
(config)#interface xe4	Enter interface mode
(config-if)#ip address 20.20.40.40/31	Configure the IP address on the interface
(config-if)# description to_pe1	Adding Description to interface
(config-if)#exit	Exit interface mode.
(config)# commit	Committing the configuration to apply in running configuration
(config)#interface xe24	Enter interface mode
(config-if)#ip address 20.20.40.42/31	Configure the IP address on the interface
(config-if)# description ospf backdoor	Adding Description to interface
(config-if)# ip ospf cost 10	Set the OSPF cost of this link
(config-if)#exit	Exit interface mode.
(config)# commit	Committing the configuration to apply in running configuration
(config)#router ospf 1	Configure the routing process OSPF with process id
(config-router)#network 1.1.1.1/32 area 2	Define the interface on which OSPF runs, and associate the area ID with the interface.
(config-router)#network 20.20.40.40/31 area 2	Define the interface on which OSPF runs, and associate the area ID with the interface.
(config-router)#network 20.20.40.42/31 area 2	Define the interface on which OSPF runs, and associate the area ID with the interface.
(config-router)#exit	Exit from router ospf mode
(config)# commit	Committing the configuration to apply in running configuration

PE1 Configuration

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.2/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)# commit	Committing the configuration to apply in running configuration
(config)#ip vrf vrf1	Create vrf1
(config-vrf)# description vrf1	Adding description to vrf
(config-vrf)#rd 100:1	Specify the route distinguisher in the VRF
(config-vrf)#route-target both 100:1	Specify the import & export route target

© 2026 IP Infusion Inc. Proprietary

`(config)# commit`	Committing the configuration to apply in running configuration
`(config)# router ldp`	Configure Router LDP instance
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#interface xe4`	Enter interface mode
`(config-if)# description to_ce1`	Adding description to interface
`(config-if)# ip vrf forwarding vrf1`	Associate the interface to vrf1
`(config-if)#ip address 20.20.40.41/31`	Configure the IP address on the interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe10`	Enter interface mode
`(config-if)# description to_pe2`	Adding description to interface
`(config-if)#ip address 20.20.40.48/31`	Configure the IP address on the interface
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)# enable-ldp ipv4`	Enable LDP process on interface
`(config-if)#exit`	Exit interface mode.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)# interface lo.vrf1`	Enter interface mode
`(config-if)# ip vrf forwarding vrf1`	Associate the interface to vrf1
`ip address 11.11.11.11/32 secondary`	Configure the IP address on the interface
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router ospf 1 vrf1`	Associate the ospf process with vrf1.
`(config-router)# redistribute bgp`	Redistribute BGP into OSPF.
`(config-router)#network 20.20.40.40/31 area 2`	Define the interface on which OSPF runs, and associate the area ID with the interface.
`(config-router)# area 0.0.0.2 sham-link 11.11.11.11 22.22.22.22 cost 5`	Configuring Sham-link between PE routers with cost 5.
`(config-router)#exit`	Exit from router ospf mode
`(config)#router ospf 100`	Configure the routing process OSPF with process id
`(config-router)#network 2.2.2.2/32 area 2`	Define the interface on which OSPF runs, and associate the area ID with the interface.
`(config-router)#network 20.20.40.48/31 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# commit`	Committing the configuration to apply in running configuration

© 2026 IP Infusion Inc. Proprietary

(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 3.3.3.3 remote-	
as 100	Add loopback ip of ABR2 as neighbor with neighbor AS
(config-router)#neighbor 3.3.3.3 update- source 2.2.2.2	Update the source for that particular neighbor as loopback interface
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor inside vpnv4 address family
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)# address-family ipv4 vrf vrf1	Enter into vrf address family
(config-router-af)# network 11.11.11.11/32	Advertise a route via iBGP connection.
(config-router-af)#redistribute ospf 1	Redistribute ospf routes into bgp
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#exit	Exit from router BGP mode
(config)# commit	Committing the configuration to apply in running configuration
(config)#end	Exit from config mode into privilege mode

PE2 Configuration

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 3.3.3.3/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)# commit	Committing the configuration to apply in running configuration
(config)#ip vrf vrf1	Create vrf1
(config-vrf)# description vrf1	Adding description to vrf
(config-vrf)#rd 100:1	Specify the route distinguisher in the VRF
(config-vrf)#route-target both 100:1	Specify the import & export route target
(config)# commit	Committing the configuration to apply in running configuration
(config)# router ldp	Configure Router LDP instance
(config)# commit	Committing the configuration to apply in running configuration
(config)#interface xe5	Enter interface mode
(config-if)# description to_ce2	Adding description to interface
(config-if)# ip vrf forwarding vrf1	Associate the interface to vrf1

© 2026 IP Infusion Inc. Proprietary

`(config-if)# ip address 20.20.40.38/31`	Configure the IP address on the interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe10`	Enter interface mode
`(config-if)# description to_pe1`	Adding description to interface
`(config-if)#ip address 20.20.40.49/31`	Configure the IP address on the interface
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)# enable-ldp ipv4`	Enable LDP process on interface
`(config-if)#exit`	Exit interface mode.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)# interface lo.vrf1`	Enter interface mode
`(config-if)# ip vrf forwarding vrf1`	Associate the interface to vrf1
`ip address 22.22.22.22/32 secondary`	Configure the IP address on the interface
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router ospf 1 vrf1`	Associate the ospf process with vrf1.
`(config-router)# redistribute bgp`	Redistribute BGP into OSPF.
`(config-router)#network 20.20.40.38/31 area 2`	Define the interface on which OSPF runs, and associate the area ID with the interface.
`(config-router)# area 0.0.0.2 sham-link 22.22.22.22 11.11.11.11 cost 5`	Configuring Sham-link between PE routers with cost 5.
`(config-router)#exit`	Exit from router ospf mode
`(config)#router ospf 100`	Configure the routing process OSPF with process id
`(config-router)#network 3.3.3.3/32 area 2`	Define the interface on which OSPF runs, and associate the area ID with the interface.
`(config-router)#network 20.20.40.48/31 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 2.2.2.2 remote-as 100`	Add loopback ip of ABR2 as neighbor with neighbor AS
`(config-router)#neighbor 2.2.2.2 update- source 3.3.3.3`	Update the source for that particular neighbor as loopback interface
`(config-router)#address-family vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 2.2.2.2 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4

© 2026 IP Infusion Inc. Proprietary

(config-router)# address-family ipv4 vrf vrf1	Enter into vrf address family
(config-router-af)# network 22.22.22.22/32	Advertise a route via iBGP connection.
(config-router-af)#redistribute ospf 1	Redistribute ospf routes into bgp

OSPF TE-Metric Extension

This section contains basic OSPF TE-Metric Extension configuration examples.

A TE link represents an IS-IS/OSPF link state advertisement and a link state database of certain physical resources and their properties between two nodes. Typically, a TE link is advertised as an adjunct to a "regular" OSPF or IS-IS link. That is, an adjacency is brought up on the link. When the link is up, both the regular IGP properties of the link (for example, the SPF metric) and the TE properties of the link are then advertised.

Note: Bandwidth-measurement values should be less than maximum link bandwidth configuration.

Topology

Figure 180. Basic OSPF Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)# router ospf 100`	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 30.30.30.0/24 area 0`	Define the interface (30.30.30.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#commit`	Commit the configurations
`(config-router)#exit`	Exit mode
`(config)#interface eth1`	Interface mode
`(config-if)# delay-measurement uni-link-delay static 1`	Configure the delay-measurement uni-link-delay
`(config-if)# delay-measurement uni-link-delay a-bit-threshold min 2 max 4`	Configure the delay-measurement unilink delay a bit threshold
`(config-if)# bandwidth-measurement uni-available-bandwidth static 200k`	Configure the bandwidth-measurement unilink available bandwidth
`(config-if)#commit`	Commit the configurations
`(config-if)#exit`	Exit mode

R2

`#configure terminal`	Enter configure mode.
`(config)# router ospf 100`	Configure the routing process, and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.20.20.0/24 area 0`	Define the interface (20.20.20.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#commit`	Commit the configurations
`(config-router)#exit`	Exit mode
`(config-if)# delay-measurement uni-link-delay static 1`	Configure the delay-measurement uni-link-delay
`(config-if)# delay-measurement uni-link-delay a-bit-threshold min 2 max 4`	Configure the delay-measurement unilink delay a bit threshold
`(config-if)# bandwidth-measurement uni-available-bandwidth static 200k`	Configure the bandwidth-measurement unilink available bandwidth
`(config-if)#commit`	Commit the configurations

OSPFv2 LDP Remote Loop-Free Alternate (RLFA)

A basic mechanism using Loop-Free Alternates (LFAs) is described in RFC5286 that provides good repair coverage in many topologies, especially those that are highly meshed.

However, some topologies, notably ring-based topologies, are not well protected by LFAs alone. This is because there is no neighbor of the Point of Local Repair (PLR) that has a cost to the destination via a path that does not traverse the failure that is cheaper than the cost to the destination via the failure.

RFC 7490 provides extensions to the basic repair mechanism in which tunnels are used to provide additional logical links that can be used as loop-free alternates where none exist in the original topology. It provides loop-free alternates that guarantee only link protection.

RFC 8102 provides remote-loop-free-based IP fast reroute mechanisms that specifies procedures for determining whether or not a given PQ-node provides node protection for a specific destination. It provides node protection for all destinations covered by the same remote-LFA alternate, in case of failure of the primary next-hop node

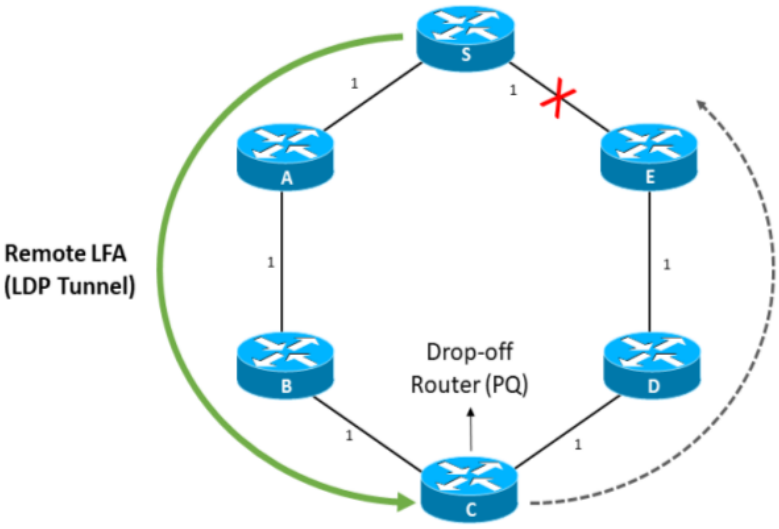
Ospf shall compute PQ node and LDP shall dynamically create tunnel to PQ node so that if primary path fails traffic can be rerouted to backup rLFA tunnel and hence to destination.

Remote LFA involves the use of a tunnel to a next-hop that is not directly connected. This is the primary difference between the LFA and Remote LFA.

RLFA Terminology

Note: Terms used for defining tunnel as below:

Figure 181. Understanding RLFA



Repair tunnel

A tunnel established for the purpose of providing a virtual neighbor that is a Loop-Free Alternate.

P-space

The P-space of a router with respect to a protected link is the set of routers reachable from that specific router using the pre-convergence shortest paths, without any of those paths (including equal cost path splits) transiting that protected link.

For example, the P-space of S with respect to link S-E is the set of routers that S can reach without using the protected link S-E.

Extended P-space

Consider the set of neighbors of a router protecting a link. Exclude the router reachable over the protected link from that set of routers. The extended P-space of the protecting router with respect to the protected link is the union of the P spaces of the neighbors in that set of neighbors with respect to the protected link.

Q-space

Q-space of a router with respect to a protected link is the set of routers from which that specific router that can be reached without any path (including ECMP Splits) transiting that protected link.

© 2026 IP Infusion Inc. Proprietary

PQ node

A PQ node of a node S with respect to a protected link S-E is a node that is a member of both the P-space (or the extended P-space) of S with respect to that protected link S-E and the Q-space of E with respect to that protected link S-E. A repair tunnel endpoint is chosen from the set of PQ-nodes.

Remote LFA (RLFA)

The use of a PQ node rather than a neighbor of the repairing node as the next hop in an LFA repair.

In Figure 181, S can reach A, B, and C without going via S-E; these form S's extended P-space with respect to S-E. The routers that can reach E without going through S-E will be in E's Q-space with respect to link S-E; these are D and C.B has equal-cost paths to E via B-A-S-E and B-C-D-E, and so the forwarder at S might choose to send a packet to E via link S-E. Hence, B is not in the Q-space of E with respect to link S-E. The single node in both S's extended P-space and E's Q-space is C; thus, node C is selected as the repair tunnel's endpoint. thus, node C is selected as the repair tunnel's endpoint.

Establishing RLFA Tunnel

To calculate the Remote LFA backup path and to determines the Remote LFA node the software requirement can be broadly classified as below:

OSPF

OSPF shall calculate Repair path that are P space (routers it can reach without traversing the protected link) and Q space (routers that can reach the protected destination without traversing the protected link). Hence routers that belong to both spaces called as PQ routers has to be calculated. It has to inform LDP about PQ node so that RLFA tunnel can be established.

LDP

LDP shall establish targeted session with PQ node and shall advertise label to peer node for the destination FEC. LDP shall send primary and backup path FTN/ILM add/delete info to NSM for further programing.

NSM

NSM shall maintain Primary and Backup path FTN/ILM and shall send information to HSL for data-plane programing.

HSL

HSL program primary and backup FTN/ILM entry in hardware.

Configure LDP Remote Loop-Free Alternate (RLFA)

The LDP RLFA configuration process can be divided into the following tasks:

1. Enable label-switching on the interface on NSM.
2. Establish ospf routing between the nodes (to distribute reachability information within the MPLS cloud)
3. Configure ospf RLFA on Source node
4. Enabling LDP on an interface in the LDP daemon
5. Configure LDP FRR with Auto-targeted-session (Allow creating TLDP session dynamically)

© 2026 IP Infusion Inc. Proprietary

6. Enable BFD interval globally and for all ISIS enabled interfaces

Notes:

- Faster convergence can be achieved with lower BFD interval enabled globally.
- Dynamically created RLFA T-LDP sessions will be removed only after disabling LDP auto-targeted-session CLI or LDP FRR.
- When targeted-peer ipv4 CLI is configured with auto-targeted-session CLI, T-LDP session created for targeted-peer only remove after disabling auto-targeted-session CLI.
- After Enabling Ospf RLFA, Both LFA and RLFA computation will be done and RLFA path will be preferred to provide node-protection.
- Better convergence can be achieved with LDP-IGP-SYNC enabled.

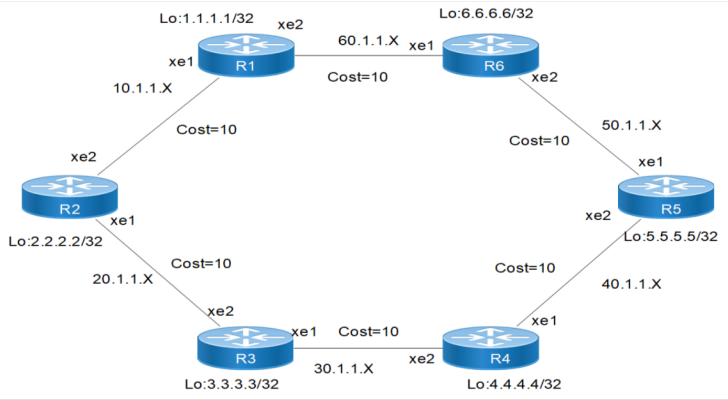
Assumptions and Limitations

- RLFA Backup path computation will be supported only via IGP as IS-IS/Ospf.
- Only LDP(MPLS) will be used as a tunnel mechanism to reach a Remote-LFA repair node.
- Only IPv4 protocol is supported.
- RFC 7916 [LFA-MANAGE] is not supported.
- ECMP will not be supported for RLFA next-hop.

Topology

Figure 182 shows the configuration required to enable the RLFA feature.

Figure 182. RLFA Topology



R1

`#configure terminal`	Enter configure mode
`(config)#router ldp`	Enable LDP process
`(config-router)#fast-reroute`	Enable LDP FRR

`(config-router)#auto-targeted-session`	To Allow creating TLDP session dynamically
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config-router)#exit`	Exit LDP process
`(config)#router rsvp`	Enable RSPVP
`(config-router)#srlg-disjoint forced`	Configure SRLG to enable MPLS-TE
`(config-router)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip ospf cost 10`	Configure the OSPF cost
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#enable-ldp ipv4`	Enable LDP process on xe1 interface
`(config-if)#mpls traffic-eng srlg 11`	Enable MPLS-TE
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 60.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip ospf cost 10`	Configure OSPF cost
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)#mpls traffic-eng srlg 11`	Enable MPLS-TE
`(config-if)#enable-ldp ipv4`	Enable LDP process on xe2 interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Create an OSPF instance
`(config-router)# ospf router-id 1.1.1.1`	Configure router ID
`(config-router)# bfd all-interfaces`	Configure BFD
`(config-router)# timers spf exp 50 50`	Configure the OSPF timers
`(config-router)# timers throttle lsa all 0 1 1`	Configure the OSPF timer LSA throttle
`(config-router)# timers lsa arrival 1`	Configure the OSPF timer LSA arrival
`(config-router)# fast-reroute per-prefix remote-lfa area 0.0.0.0 tunnel mpls-ldp`	Configure Remote LFA to calculate backup paths to those destinations whichever does not satisfy basic LFA FRR inequalities

Validation

R1

Check LDP neighborship before enabling RLFA.

```
#show ldp session
Peer IP Address          IF Name    My Role    State      KeepAlive  UpTime
2.2.2.2                  xe20       Passive   OPERATIONAL   30    00:02:43
6.6.6.6                  ge10       Passive   OPERATIONAL   30    00:00:30
```

Check the output of `show ip ospf neighbors` to verify that OSPF adjacency is up.

```
#show ip ospf neighbor

Total number of full neighbors: 2
OSPF process 1 VRF(default):
Neighbor ID     Pri   State            Dead Time   Address         Interface
       Instance ID
2.2.2.2           1   Full/Backup      00:00:39    10.1.1.2        xe20
           0
6.6.6.6           1   Full/DR          00:00:35    60.1.1.2        ge10
           0
```

Check the OSPF route installation in the OSPF table and RIB table.

```
#show ip route

area authentication

Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or simple text password authentication (details in RFC 2328). Setting up a Type 1 authentication configures a 64-bit field for that particular network. All packets sent on this network must have this configured value in their OSPF header. This allows only routers that have the same passwords to join the routing domain. Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the ip ospf authentication-key (page 2456) command to specify a simple text password.

Use the ip ospf message-digest-key (page 2467) command to specify an MD5 password.

Use the no parameter to remove the authentication specification for an area.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) authentication
area (A.B.C.D|<0-4294967295>) authentication message-digest
no area (A.B.C.D|<0-4294967295>) authentication message-digest
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as 4-octet unsigned integer value.

message-digest
Enables MD5 authentication in the specified area ID .

Default

Null authentication

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 authentication message-digest

(config)#router ospf 100
(config-router)#no area 1 authentication
```

area default-cost

Use this command to specify a cost for the default summary route sent into a stub or NSSA area. This command provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

Use the no form of this command to remove the assigned default-route cost.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) default-cost <0-16777215>
no area (A.B.C.D|<0-4294967295>) default-cost
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

default-cost
Indicates the cost for the default summary route used for a stub or NSSA area .

<0-16777215>
Stub's advertised default summary cost. The default is 1.

Default

By default, route cost is 1

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example sets the default-cost to 10 for area 1.

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 default-cost 10

(config)#router ospf 100
(config-router)#no area 1 default-cost
```

© 2026 IP Infusion Inc. Proprietary

area filter-list

Use this command to configure a filter to advertise summary routes on an Area Border Router (ABR).

This command suppresses incoming and outgoing summary routes between this area and other areas. You use this command in conjunction with the prefix-list and access-list commands.

Use the no form of this command to remove a filter.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) filter-list prefix WORD (in|out)
area (A.B.C.D|<0-4294967295>) filter-list access WORD (in|out)
no area (A.B.C.D|<0-4294967295>) filter-list prefix WORD (in|out)
no area (A.B.C.D|<0-4294967295>) filter-list access WORD (in|out)
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address.

<0-4294967295>
OSPF area ID as a decimal value.

prefix
Use prefix list to filter summary.

WORD
Name of the prefix list.

access
Use access list to filter summary.

WORD
Name of the access list.

in
Filter routes from other areas into this area.

out
Filter routes from this area into other areas.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#ip access-list standard 1
(config)#deny host 172.22.0.0
(config)#router ospf 100
(config-router)#area 1 filter-list access 1 in
```

© 2026 IP Infusion Inc. Proprietary

area interface

Use this command to enable OSPF routing on the current interface.

Use no form of this command to disable OSPF routing on the current interface.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface IFNAME
no area (A.B.C.D|<0-4294967295>) interface IFNAME
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address.

<0-4294967295>
OSPF area ID as a decimal value.

IFNAME
Specify the interface name.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1
```

© 2026 IP Infusion Inc. Proprietary

area interface authentication

Use this command to send and receive OSPF packets with the specified authentication method on the current interface.

Use no form of this command to stop sending and receiving OSPF packets with the specified authentication method on the current interface.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface IFNAME authentication (null|message-digest|)
no area (A.B.C.D|<0-4294967295>) interface IFNAME authentication
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address.

<0-4294967295>
OSPF area ID as a decimal value.

IFNAME
Specify the interface name.

null
Use no authentication.

message-digest
Use message digest authentication.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 authentication null
```

© 2026 IP Infusion Inc. Proprietary

area interface cost

Use this command to explicitly specify the cost of the link-state metric in a router-LSA.

The interface cost indicates the overhead required to send packets across an interface. This cost is stated in the Router-LSA's link. The cost is inversely proportional to the bandwidth of an interface. By default, the cost of an interface is calculated based on the bandwidth (108/ bandwidth). Use this command to set the cost manually.

Use the no parameter with this command to reset the cost to its default value.

Command Syntax

```
area (<0-4294967295> |  A.B.C.D) interface <IFNAME> cost <1-65535>
no area (<0-4294967295> |  A.B.C.D) interface <IFNAME> cost
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

<0-65535>
Link-state metric

Default

By default, cost is 10.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 cost 10
```

© 2026 IP Infusion Inc. Proprietary

area interface database-filter

Use this command to turn on the LSA database-filter for a particular interface.

OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use this command to block flooding of LSAs over specified interfaces.

Use the no parameter with this command to turn off the filter.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> database-filter all out
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> database-filter all out
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

Default

Disabled, all outgoing LSAs are flooded to the interface.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 database-filter all out
```

© 2026 IP Infusion Inc. Proprietary

area interface dead-interval

Use this command to set the interval during which the router waits to receive an OSPF hello packet from the neighbor before declaring the neighbor down. This value is advertised in the router's hello packets. It must be a multiple of hello-interval and be the same for all routers on a specific network.

Use the no parameter with this command to return to the default time. If you have configured this command specifying the IP address of the interface and want to remove the configuration, use the no parameter with the specified IP address (no ip ospf dead-interval A.B.C.D).

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> dead-interval <1-65535>
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> dead-interval
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

dead-interval
Specify the interval

<1-65535>
Specify the interval in seconds

Default

No default value is specified.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 dead-interval 10
```

© 2026 IP Infusion Inc. Proprietary

area interface hello-interval

Use this command to specify the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes but results in more routing traffic.

Use the no parameter with this command to return to the default time.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> hello-interval <1-65535>
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> hello-interval
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

hello-interval
Specify the interface name

<1-65535>
Specify the interval in seconds

Default

By default, hello interval is 10 seconds.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 hello-interval 3
```

© 2026 IP Infusion Inc. Proprietary

area interface IFNAME bfd

Use this command to enable the BFD option for OSPF neighbors on an interface. Use the no form of the command to disable the BFD option for OSPF neighbors on an interface.

Note: When BFD monitoring is enabled for ospf session, protocol admin events like clear/ shutdown will cause BFD session to go to admin down.Due to this, neigbourship/adjacency down detection on peer will be according to the protocol configured dead interval and is not based on BFD interval.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> bfd (disable|)
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> bfd (disable|)
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

disable
Disable the BFD option for neighbors on an interface

Default

No default value is specified.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 bfd
```

© 2026 IP Infusion Inc. Proprietary

area interface IFNAME priority

Use this command to set the router priority to determine the designated router (DR) for the network.

- A router with the higher router priority becomes the DR. If the priority is the same for two routers, the router with the higher router ID takes precedence.
- Only routers with a nonzero priority value are eligible to become the designated or backup designated router. Configure router priority for broadcast or NBMA networks only and not for point-to-point networks.

Use the no parameter with this command to return to the default value.

Command Syntax

```
area (<0-4294967295> |  A.B.C.D) interface <IFNAME> priority <0-255>
no area (<0-4294967295> |  A.B.C.D) interface <IFNAME> priority
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

priority
Specify the router priority of the interface

<0-255>
Specify the router priority of the interface. The default value is 1

Default

By default, priority is 1.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 priority 3
```

© 2026 IP Infusion Inc. Proprietary

area interface mpls ldp-igp

Use this attribute to enable the MPLS LDP IGP SYNC on OSPF.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> mpls ldp-igp sync ospf
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> mpls ldp-igp sync ospf
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

sync
Enable MPLS LDP IGP SYNC on OSPF

Default

No default value is specified.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 mpls ldp-igp sync ospf
```

© 2026 IP Infusion Inc. Proprietary

area interface mpls ldp-igp sync ospf holddown-timer

Use this attribute to configure the hold-down timer for which OSPF will wait for LDP to converge and advertises Max cost.

When the configured time expires, OSPF starts advertising the actual cost in the Router-LSA.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> mpls ldp-igp sync ospf holddowntimer <1-2147483>
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> mpls ldp-igp sync ospf
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

sync
Enable MPLS LDP IGP SYNC on OSPF

holddown-time
Holddown timer values in seconds.

<1-2147483>
OSPF area ID as a decimal value

Default

By default, holddown-timer is 70000 seconds.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 mpls ldp-igp sync ospf holddown-timer 140000
```

© 2026 IP Infusion Inc. Proprietary

area interface network-type

Use this command to set the OSPF network type on the current interface.

Use no form of this command to unset the OSPF network type on the current interface.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface IFNAME network-type (broadcast|non-broadcast|point-to-
multipoint (non-broadcast|)|point-to-point)
no area (A.B.C.D|<0-4294967295>) interface IFNAME network-type
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address.

<0-4294967295>
OSPF area ID as a decimal value.

IFNAME
Specify the interface name.

broadcast
Sets the network type to broadcast.

non-broadcast
Sets the network type to NBMA.

point-to-multipoint
Sets the network type to point-to-multipoint..

non-broadcast
Sets the network type to NBMA.

point-to-point
Sets the network type to point-to-point.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 network-type point-to-point
```

© 2026 IP Infusion Inc. Proprietary

area interface passive

Use this command to suppress sending hello packets on the current interface.

Use no form of this command to unsuppress sending Hello packets on the current interface.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface IFNAME passive
no area (A.B.C.D|<0-4294967295>) interface IFNAME passive
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address.

<0-4294967295>
OSPF area ID as a decimal value.

IFNAME
Specify the interface name.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 passive
```

© 2026 IP Infusion Inc. Proprietary

area interface retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. If the router does not receive an acknowledgement during the retransmit interval, it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Use the no parameter with this command to return to the default value.

Command Syntax

```
router ospf <0-65535> / area (A.B.C.D|<0-4294967295>) interface <IFNAME> retransmit-interval <1-3600>
router ospf <0-65535> / no area (A.B.C.D|<0-4294967295>) interface <IFNAME> retransmit-interval
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

retransmit-interval
Holddown timer values in seconds

<1-3600>
Specify the interval in seconds

Default

By default, retransmit interval is 5 seconds.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 retransmit-interval 6
```

© 2026 IP Infusion Inc. Proprietary

area interface te-metric

This command sets the traffic engineering (TE) metric for an interface.

The traffic engineering metric is used in OSPF-TE Link State Advertisements. If the traffic engineering metric is not set, the ip ospf cost value for an interface is used in OSPF-TE Link State Advertisements.

Use the no parameter with this command to set the traffic engineering metric to its default.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) interface <IFNAME> te-metric <1-65535>
no area (A.B.C.D|<0-4294967295>) interface <IFNAME> te-metric <1-65535>
```

Parameters

A.B.C.D
OSPF area ID as an IPv4 address

<0-4294967295>
OSPF area ID as a decimal value

IFNAME
Specify the interface name

<1-65535>
Traffic engineering metric

Default

By default, the area interface cost value for an interface is used.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 6.3.0.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 interface xe1 te-metric 6
```

© 2026 IP Infusion Inc. Proprietary

area nssa

Use this command to set an area as a Not-So-Stubby-Area (NSSA). There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. However, the external routes from other areas still do not enter the NSSA. You can configure an area to be a stub area or an NSSA, but not both.

This command simplifies administration when connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as a NSSA.

Use the no form of this command to remove this designation.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) nssa {translator-role (candidate|always|never)| stability-interval < 0-
2147483647>|no-redistribution|default-information-originate (metric < 0-16777214>|metric-type <1-
2>|metric <0-16777214> metric-type <1-2>|metric-type< 1-2> metric <0-16777214>|)|no-summary}
no area (A.B.C.D|<0-4294967295>) nssa
no area (A.B.C.D|<0-4294967295>) nssa {translator-role|stability-interval|no-redistribution |default-
information-originate (route-map |) |no-summary}
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

translator-role
NSSA-ABR translator role

candidate
Translate NSSA-LSA to Type-5 LSA if router is elected.

never
Do not translate NSSA-LSA to Type-5 LSA.

always
Always translate NSSA-LSA to Type-5 LSA.

stability-interval
Stability timer for a NSSA area. If an elected translator determines its services are no longer required, it continues to perform its duties for this time interval. This minimizes excess flushing of translated Type-7 LSAs and provides a more stable translator transition.

<0-2147483647>
Stability interval in seconds.

no-redistribution
Do not redistribute into the NSSA.

default-information-originate
Originate Type-7 default LSA into the NSSA.

metric
Specify metric for default routes.

<0-16777214>
Specify metric value.

© 2026 IP Infusion Inc. Proprietary

metric-type
Specify metric type (see RFC 3101).

<1-2>
Specify metric type:

1: Type 1 external route

2: Type 2 external route

route-map
OSPF default Route map reference.

WORD
Pointer to route-map entries.

no-summary
Do not inject inter-area routes into the NSSA.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ospf 100
(config-router)#area 3 nssa translator-role candidate no-redistribution default-information-originate
metric 34 metric-type 2
```

© 2026 IP Infusion Inc. Proprietary

area range

Use this command to summarize OSPF routes at an area boundary. A single summary route is then advertised to other areas by the Area Border Routers (ABRs). Routing information is condensed at area boundaries and outside the area. If the network numbers in an area are assigned in a way such that they are contiguous, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

Use the no parameter with this command to disable this function.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D)
area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D) non-advertise
area (A.B.C.D|<0-4294967295>) range A.B.C.D A.B.C.D (advertise|non-advertise)
no area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D)
no area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D) not-advertise
```

Parameters

A.B.C.D
Area range prefix or length e.g. X.X.X.X/length

A.B.C.D
Area range prefix e.g. A.B.C.D

<0-4294967295>
OSPF Area ID as a decimal value.

A.B.C.D/M
The area range prefix and length .

advertise
Advertise this range.

not-advertise
Does not advertise this range.

Default

Range is advertised by default.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 range 192.16.0.0/24
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#router ospf 100
(config-router)#no area 1 range 192.16.0.0/24
```

© 2026 IP Infusion Inc. Proprietary

area sham-link

Use this command to configure a sham link between two Provider Edge on MPLS backbone to make them appear as intra-area link.

If it is desired to have OSPF prefer the routes through the MPLS backbone over the routes through the backdoor link, then the routes through the MPLS backbone must be appear to be intra-area routes. To make a route through the backbone appear to be an intra-area route, it is necessary to make it appear as if there is an intra-area link connecting the two PE routers. This is what we refer to as a "sham link.

Use the no parameter with this command to remove a sham link.

Note: Sham-link is not supported on default VRF.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) sham-link A.B.C.D A.B.C.D
area (A.B.C.D|<0-4294967295>) sham-link A.B.C.D A.B.C.D {cost <1-65535>}
no area (A.B.C.D|<0-4294967295>) sham-link A.B.C.D A.B.C.D
no area (A.B.C.D|<0-4294967295>) sham-link A.B.C.D A.B.C.D cost
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

A.B.C.D
Specify IP address of source sham link.

A.B.C.D
Specify IP address of destination sham link.

<1-65535>
cost of sham link (cost preferably to be configured lower than the backdoor link cost).

Default

Cost: 1

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#configure terminal
```

© 2026 IP Infusion Inc. Proprietary

```
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router ospf 1 vrf1
(config-router)#area 1 sham-link 1.1.1.1 2.2.2.2 cost 10
(config-router)#
```

area shortcut

Use this command to configure the short-cutting mode of an area. An area shortcut enables traffic to go through the non-backbone area with a lower metric whether or not an ABR router is attached to the backbone area.

Use the no form of this command to disable this function.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) shortcut (default|enable|disable)
no area (A.B.C.D|<0-4294967295>) shortcut
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

default
Sets default short-cutting behavior .

enable
Forces short-cutting through the area.

disable
Disables short-cutting through the area.

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 shortcut default

(config)#router ospf 100
(config-router)#area 52 shortcut disable

(config)#router ospf 100
(config-router)#no area 42 shortcut enable
```

© 2026 IP Infusion Inc. Proprietary

area stub

Use this command to define an area as a stub area. There are two stub area router configuration commands: the stub and default-cost commands. In all routers attached to the stub area, configure the area by using the stub option of the area command. For an area border router (ABR) attached to the stub area, use the area default-cost command.

Use the no-summary parameter with this command to define a totally stubby area. Define an area as a totally stubby area when routers in the area do not need to learn about summary LSAs from other areas.

Use the no form of this command to disable this function.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) stub
area (A.B.C.D|<0-4294967295>) stub no-summary
no area (A.B.C.D|<0-4294967295>) stub
no area (A.B.C.D|<0-4294967295>) stub no-summary
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

no-summary
Stops an ABR from sending summary link advertisements into the stub area.

Default

By default, no stub area is defined.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 stub no-summary
```

© 2026 IP Infusion Inc. Proprietary

area virtual-link

Use this command to configure a link between two backbone areas that are physically separated through other non-backbone area.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection. Configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these routers joined by a virtual link as if they were connected by an unnumbered point-to-point network.

Configure the hello-interval to be the same for all routers attached to a common network. A short hello-interval results in the router detecting topological changes faster but also an increase in the routing traffic. The retransmit-interval is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The transmit-delay is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the transmit-delay to be greater than zero. Also, take into account the transmission and propagation delays for the interface. Include the transit area ID and the corresponding virtual link neighbor's router ID in each virtual link neighbor to properly configure a virtual link.

Use the no parameter with this command to remove a virtual link.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {authentication (message-
digest|null|)|authentication-key LINE|message-digest-key <1-255> md5 LINE}
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {dead-interval <1-65535>|hello-interval <1-
65535>|retransmit-interval <1-3600>|transmit-delay <1-3600>}
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D fall-over bfd
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {authentication (messagedigest|
null|)|authentication-key LINE|message-digest-key <1-255> md5 LINE}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {dead-interval <1-65535>|hello-interval <1-
65535>|retransmit-interval <1-3600>|transmit-delay <1-3600>}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D fall-over bfd
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

A.B.C.D
Specify IP address of the virtual link neighbor.

authentication message-digest
Enable cryptographic authentication on the configured virtual link.

authentication null
Enable null authentication on the configured virtual link.

authentication-key LINE
Set authentication key ID of 8 characters.

© 2026 IP Infusion Inc. Proprietary

message-digest-key <1-255>
Set message digest key.

md5 LINE
Specify the MD5 key.

dead-interval <1-65535>
The interval during which no packets are received and after which the router acknowledges a neighboring router as off-line. The interval in seconds. The default is 40 seconds.

hello-interval <1-65535>
The interval the router waits before it sends a hello packet. The interval in seconds. The default is 10 seconds.

retransmit-interval <1-3600>
The interval the router waits before it retransmits a packet. The interval in seconds. The default is 5 seconds.

transmit-delay <1-3600>
The interval the router waits before it transmits a packet. The interval in seconds. The default is 1 second

fall-over bfd
Specify fall-over Bidirectional Forwarding Detection (BFD) detection.

Default

Default intervals:

- Dead interval : 40 seconds
- Hello interval: 10 seconds
- Retransmit interval: 5 seconds
- Transmit delay: 1 second

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 virtual-link 10.10.11.50 hello 5 dead 10
```

The below example shows the differences between with and without encrypted passwords.

- 0x - Already encrypted password
- WORD - Authentication key (without encryption, ie doesn't begin with 0x)

```
(config-router)#area 0.0.0.1 virtual-link 2.2.2.2 authentication authentication-key
0x1234567891234567

(config-router)#area 0.0.0.1 virtual-link 2.2.2.2 authentication authentication-key test
```

auto-cost reference bandwidth

Use this command to control how OSPF calculates the default metric for the interface.

Use the `no` form of this command to assign cost based only on the interface bandwidth.

Command Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameters

<1-4294967>

The reference bandwidth in Mbps. The default is 100 Mbps.

Default

By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default value for the reference bandwidth is 100Mbps. The auto-cost command is used to differentiate high bandwidth links. For multiple links with high bandwidth, specify a larger reference bandwidth value to differentiate cost on those links.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#auto-cost reference-bandwidth 50

(config)#router ospf 100
(config-router)#no auto-cost reference-bandwidth
```

© 2026 IP Infusion Inc. Proprietary

bfd all-interfaces

Use this command to enable Bidirectional Forwarding Detection (BFD) on all interfaces.

Use the no form of this command to disable BFD.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#bfd all-interfaces

(config)#router ospf 100
(config-router)#no bfd all-interfaces
```

© 2026 IP Infusion Inc. Proprietary

capability cspf

Use this command to enable the Constrained Shortest Path First (CSPF) feature for an OSPFv2 or OSPFv3 instance.

Use the no parameter with this command to disable CSPF functionality for the OSPFv2 or OSPFv3 instance.

Command Syntax

```
capability cspf
no capability cspf
```

Parameters

None

Default

By default, CSPF functionality for the OSPFv2 or OSPFv3 instance is enabled.

When CSPF is enabled, disable-better-protection option is by default enabled for OSPFv2.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability  cspf

(config)#router ospf 100
(config-router)#no capability  cspf
```

© 2026 IP Infusion Inc. Proprietary

capability lls

Use this command to enable link-local signaling feature on OSPF router.

Use no parameter to disable link-local signaling feature on OSPF router.

Command Syntax

```
capability lls
no capability lls
```

Parameters

None

Default

By default, capability lls is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability lls

(config-router)#no capability  lls
```

© 2026 IP Infusion Inc. Proprietary

capability opaque

Use this command to enable opaque-LSAs which are Type 9, 10 and 11 LSAs that deliver information used by external applications.

Use the no form of this command to disable the feature.

Command Syntax

```
capability opaque
no capability opaque
```

Parameters

None

Default

By default, opaque-LSA is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability opaque

(config)#router ospf 100
(config-router)#no capability opaque
```

© 2026 IP Infusion Inc. Proprietary

capability traffic-engineering

Use this command to enable traffic engineering feature on OSPF router.

Use no parameter to disable traffic engineering feature on OSPF router.

Command Syntax

```
capability traffic-engineering
no capability traffic-engineering
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf
(config-router)#capability traffic-engineering

(config-router)#no capability traffic-engineering
```

© 2026 IP Infusion Inc. Proprietary

capability vrf-lite

Use this command to apply multi-VRF capability to OSPF process or to decouple the PE router from the VPN backbone.

Use no parameter to deny multi-VRF capability to OSPF process or to avoid decoupling the PE router from the VPN backbone.

Command Syntax

```
capability vrf-lite
no capability vrf-lite
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf
(config-router)#capability vrf-lite

(config-router)#no capability vrf-lite
```

© 2026 IP Infusion Inc. Proprietary

clear ip ospf

Use this command to clear and restart all OSPF routing processes or a given OSPF routing process.

Command Syntax

```
clear ip ospf (<0-65535>|) process
```

Parameter

<0-65535>
Specify the process ID.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip ospf process
#clear ip ospf 555 process
```

© 2026 IP Infusion Inc. Proprietary

compatible rfc1583

Use this command to restore the method used to calculate summary route costs per RFC.

RFC 1583 specified a method for calculating the metrics for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost. With this change, it is possible that all of the ABRs in an area might not be upgraded to the new code at the same time. This command addresses this issue and allows the selective disabling of RFC 2328 compatibility.

Use the no parameter with this command to disable RFC 1583 compatibility.

Command Syntax

```
compatible rfc1583
no compatible rfc1583
```

Parameters

None

Default

By default, OSPF is RFC 2328 compatible

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#compatible rfc1583

(config)#router ospf 100
(config-router)#no compatible rfc1583
```

© 2026 IP Infusion Inc. Proprietary

debug ip ospf dist-ls

Use this command to display information about OSPF BGP link state distribution.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf dist-ls
no debug ip ospf dist-ls
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
# debug ip ospf dist-ls
```

© 2026 IP Infusion Inc. Proprietary

debug ip ospf lfa

Use this command to specify the debugging options for OSPFv2 Loop-free Alternate path

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf lfa
no debug ip ospf lfa
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf lfa
```

© 2026 IP Infusion Inc. Proprietary

debug ip ospf redist

Use this command to display debugging option for OSPF redistribute information

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf redist (detail|terse|)
no debug ip ospf redist (detail|terse|)
```

Parameters

detail

Debug OSPF redistribute detail information

terse

Debug OSPF redistribute summary information

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf redistribute detail
```

© 2026 IP Infusion Inc. Proprietary

debug ip ospf retransmission

Use this command to display debug logs of OSPF retransmission information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf retransmission
no debug ip ospf retransmission
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3

Examples

```
#debug ip ospf  retransmission
```

© 2026 IP Infusion Inc. Proprietary

debug ospf

Use this command to specify debugging options for OSPF.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf (all|bfd|database-timer|events|ifsm|lsa|nfsm|nsm| packet|route|sr|)
debug ospf rib ({interface|redistribute}|)
no debug ospf (all|bfd|database-timer|events|ifsm|lsa|nfsm|nsm| packet|route|sr|)
no debug all ospf
no debug all
no debug ospf rib ({interface|redistribute}|)
```

Parameters

all
Enable or disable debugging for ifsm, nsfm, lsa, nsm, events, and route.

bfd
Debug Bidirectional Forwarding Detection (BFD)

database-timer
Debug OSPF rate-limiting values for LSA throttling (see debug ospf database-timer rate-limit (page 2429))

events
Debug OSPF events information (see debug ospf events (page 2430))

ifsm
Debug OSPF Interface State Machine (see debug ospf ifsm (page 2431))

lsa
Debug OSPF Link State Advertisement (see debug ospf lsa (page 2432))

nfsm
Debug OSPF Neighbor State Machine (see debug ospf nfsm (page 2433))

nsm
Debug OSPF NSM information (see debug ospf nsm (page 2434))

packet
Debug OSPF packets (see debug ospf packet (page 2435))

route
Debug OSPF route information (see debug ospf route (page 2437))

rib
Debug OSPF RIB information (see debug ospf rib (page 2436))

sr
Debug OSPF segment routing information

interface
Debug OSPF RIB interface

redistribute
Debug OSPF RIB redistribute

Default

None

© 2026 IP Infusion Inc. Proprietary

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf  all

#debug ospf bfd
#no debug ospf bfd
```

© 2026 IP Infusion Inc. Proprietary

debug ospf database-timer rate-limit

Use this command to log when link-state advertisement (LSA) rate-limiting timers will expire. These messages are logged only when debug ospf lsa (page 2432) generate or debug ospf lsa (page 2432) refresh is enabled

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf database-timer rate-limit

no debug ospf database-timer rate-limit
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
# debug ospf database-timer rate-limit
```

© 2026 IP Infusion Inc. Proprietary

debug ospf events

Use this command to specify debugging options for OSPF event troubleshooting. Use this command without parameters to turn on all the options.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf events ({abr|asbr|lsa|nssa|os|router|vlink}|)

no debug ospf events ({abr|asbr|lsa|nssa|os|router|vlink}|)
```

Parameters

abr
Debug OSPF ABR events.

asbr
Debug ASBR events.

lsa
Debug LSA events.

nssa
Debug NSSA events.

os
Debug OS interaction events.

router
Debug other router events.

vlink
Debug virtual link events.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ospf event abr
#debug ospf event asbr
#debug ospf event lsa
#no debug ospf event nssa
#debug ospf event os
#debug ospf event router
#debug ospf event vl
```

© 2026 IP Infusion Inc. Proprietary

debug ospf ifsm

Use this command to specify debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf ifsm ({events|status|timers}|)

no debug ospf ifsm ({events|status|timers}|)
```

Parameters

events
Debug IFSM event information

status
Debug IFSM status information

timers
Debug IFSM timer information

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ospf ifsm events
#debug ospf ifsm status
#debug ospf ifsm timers
```

© 2026 IP Infusion Inc. Proprietary

debug ospf lsa

Use this command to specify debugging options for OSPF Link State Advertisements (LSA) troubleshooting.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf lsa ({flooding|generate|install|maxage|refresh}|)

no debug ospf lsa ({flooding|generate|install|maxage|refresh}|)
```

Parameters

flooding
Debug LSA flooding.

generate
Debug LSA generation.

install
Debug LSA installation.

maxage
Debug the maximum age processing.

refresh
Debug LSA refresh.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ospf lsa refresh
#debug ospf lsa flooding
#debug ospf lsa install
#debug ospf lsa maxage
#debug ospf lsa generate
```

© 2026 IP Infusion Inc. Proprietary

debug ospf nfsm

Use this command to specify debugging options for OSPF Neighbor Finite State Machines (NFSMs).

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf nfsm ({events|status|timers}|)

no debug ospf nfsm ({events|status|timers}|)
```

Parameters

events
Debug NFSM event information

status
Debug NFSM status information

timers
Debug NFSM timer information

Default

None

Command Mode

Privileged Exec mode Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf nfsm events
#no debug ospf nfsm timers
```

© 2026 IP Infusion Inc. Proprietary

debug ospf nsm

Use this command to specify debugging options for OSPF NSM information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf nsm ({interface|redistribute}|)

no debug ospf nsm ({interface|redistribute}|)
```

Parameters

interface
Debug NSM interface information.

redistribute
Debug NSM redistribute information.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The debug ospf nsm command enables the display of debug information related to NSM.

```
#debug ospf nsm interface
#no debug ospf nsm redistribute
```

© 2026 IP Infusion Inc. Proprietary

debug ospf packet

Use this command to specify debugging options for OSPF packets.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)

no debug ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)
```

Parameters

hello
Debug OSPF hello packets.

dd
Debug OSPF database.

ls-request
Debug OSPF link state requests.

ls-update
Debug OSPF link state updates.

ls-ack
Debug OSPF link state acknowledgments.

send
Debug OSPF sent packets.

recv
Debug OSPF received packets.

detail
Debug OSPF detailed information.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf packet detail
#debug ospf packet dd send detail
#no debug ospf packet ls-request recv detail
```

© 2026 IP Infusion Inc. Proprietary

debug ospf rib

Use this command to display debug information about the interaction between the OSPF process and the Routing Information Base (RIB).

Use no parameter of this command to disable debugging output.

Command Syntax

```
debug ospf rib ({interface|redistribute}|)
no debug ospf rib ({interface|redistribute}|)
debug ip ospf redistribute
no debug ip ospf redistribute
```

Parameters

interface
Debug RIB interface information.

redistribute
Debug RIB redistribute information.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ospf rib interface
#no debug ospf rib redistribute
```

© 2026 IP Infusion Inc. Proprietary

debug ospf route

Use this command to debug route calculation. Use this command without parameters to turn on all the options.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf route ({ase|ia|install|spf}|)
no debug ospf route ({ase|ia|install|spf}|)
```

Parameters

ase
Debug OSPF external route calculation.

ia
Debug OSPF Inter-Area route calculation.

install
Debug OSPF route installation.

spf
Debug OSPF SPF calculation.

Default

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf route
#no debug ospf route ia
#debug ospf route install
```

© 2026 IP Infusion Inc. Proprietary

default-information originate

Use this command to create a default external route into an OSPF routing domain.

Use the `no` parameter with this command to disable this feature.

The system acts like an Autonomous System Boundary Router (ASBR) when you use the `default-information originate` command to redistribute routes into an OSPF routing domain. An ASBR does not by default generate a default route into the OSPF routing domain.

When you give the `default-information originate` command, also specify a `route-map` to avoid a dependency on the default network in the routing table.

Command Syntax

```
default-information originate
default-information originate {metric <0-16777214>|metric-type (1|2)|route-map WORD|always}
no default-information originate
no default-information originate {metric|metric-type|route-map|always}
```

Parameters

always
Used to advertise the default route regardless of whether there is a default route.

metric <0-16777214>
Sets the OSPF metric used in creating the default route. The default metric value is 10. The value used is specific to the protocol.

metric-type 1
The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101). Sets OSPF External Type 1 metric.

metric-type 1
The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101). Sets OSPF External Type 2 metric (default).

route-map WORD
Specify the name of route map.

Default

Sets the OSPF metric used in creating the default route. The default metric value is 10.

The value used is specific to the protocol. metric-type The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).

By default, 2 Sets OSPF External Type 2 metric.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#default-information originate always metric 23 metric-type 2 route-map myinfo

(config)#router ospf 100
(config-router)#no default-information originate metric metric-type route-map
```

© 2026 IP Infusion Inc. Proprietary

default-metric

Use this command to set a default metric for OSPF.

A default metric facilitates redistributing routes with incompatible metrics. If the metrics do not convert, the default metric provides an alternative. Use this command to use the same metric value for all redistributed routes. Use this command in conjunction with the redistribute (page 2495) command.

Use the no parameter with this command to return to the default state.

Command Syntax

```
default-metric <1-16777214>
no default-metric
```

Parameters

<1-16777214>
Default metric value.

Default

Built-in, automatic metric translations, as appropriate for each routing protocol.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#default-metric 100
```

© 2026 IP Infusion Inc. Proprietary

distance

Use this command to set OSPF administrative distances.

The administrative distance rates the trustworthiness of a routing information source. A higher distance value means a lower trust rating. For example, an administrative distance of 255 means that the routing information source cannot be trusted and should be ignored.

Use the `no` form of this command to restore the default value (110).

Command Syntax

```
distance <1-255>
distance <1-255> A.B.C.D/M (WORD|)
distance ospf {intra-area <1-255>|inter-area <1-255>|external <1-255>}
no distance <1-255>
no distance <1-255> A.B.C.D/M (WORD|)
no distance ospf {intra-area |inter-area |external}
```

Parameters

<1-255>
Used alone, this parameter specifies a default administrative distance used when no other specification exists for a routing information source.

intra-area <1-255>
Distance for all routes within an area

inter-area <1-255>
Distance for all routes from one area to another area.

external <1-255>
Distance for routes from other routing domains learned by redistribution.

A.B.C.D/M
Distance for routes to prefixes whose nexthop matches this address.

WORD
Name of access list to apply to route updates.

Default

By default, distance for each type of route (intra, inter, or external) is 110

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#distance ospf inter-area 20 intra-area 10 external 40
```

© 2026 IP Infusion Inc. Proprietary

© 2026 IP Infusion Inc. Proprietary

distribute bgp-ls

Use this command to advertise IGP (OSPFv3) Updates to BGP module. Throttle value is optional, which can be used to delay the transmission of processing and sending updates to BGP

Use the `no` command to disable this function.

Command Syntax

```
distribute bgp-ls
distribute bgp-ls (throttle <val>)
no distribute bgp-ls
```

Parameters

`distribute`
distribute information

`bgp-ls`
Link State distribution to BGP

Default

By default, bgp-ls is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 6.1.0.

Examples

```
OcNOS#conf t
Enter configuration commands, one per line. End with CNTL/Z.
(config)#router ipv6 ospf 1
(config-router)#distribute bgp-ls throttle 10
```

© 2026 IP Infusion Inc. Proprietary

distribute-list

Use this command to filter networks in routing updates. This command redistributes other routing protocols into the OSPF routing table.

Use the no parameter with this command to disable this function.

Command Syntax

```
distribute-list WORD out (kernel|connected|static|rip|bgp|isis|ospf (<0-65535>|))
distribute-list WORD in
no distribute-list WORD out (kernel|connected|static|rip|bgp|isis|ospf (<0-65535>|))
no distribute-list WORD in
```

Parameters

WORD
Specify the name of the access list.

in
Filter incoming routing updates.

out
Filter outgoing routing updates.

kernel
Specify kernel routes.

connected
Specify connected routes.

static
Specify static routes.

rip
Specify RIP routes.

bgp
Specify BGP routes.

isis
Specify IS-IS routes.

ospf <1-65535>
Specify OSPF process ID <1-65535>. If not specified, this command redistribute OSPF instance with process ID 0.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

The following example shows the distribution of BGP routing updates based on the access list list1 (network 172.10.0.0).

```
#configure terminal
(config)#ip access-list list1 permit 172.10.0.0
(config)#router ospf 100
(config-router)#distribute-list list1 out bgp
(config-router)#redistribute bgp
```

© 2026 IP Infusion Inc. Proprietary

enable db-summary-opt

Use this command to enable the database summary list optimization for OSPFv2.

When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in database summary list is the same as or less recent than the listed LSA in the database description packet received from the neighbor.

Use the no form of this command to disable database summary list optimization.

Command Syntax

```
enable db-summary-opt
no enable db-summary-opt
```

Parameters

None

Default

By default, database summary list optimization for OSPFv2 is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf
(config-router)#enable db-summary-opt
(config-router)#no enable db-summary-opt
```

© 2026 IP Infusion Inc. Proprietary

enable ext-ospf-multi-inst

Use this command to run multiple OSPF instances on a subnet.

Use the no parameter with this command to disable OSPF multiple-instance support and reset all OSPF instances to the default instance ID.

Command Syntax

```
enable ext-ospf-multi-inst
no enable ext-ospf-multi-inst
```

Parameters

None

Default

Multiple-instance support is disabled. The default instance ID is 0.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# enable ext-ospf-multi-inst
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute keep-all-paths

Use this command to enable fast rerouting on all OSPF interfaces.

Use the no parameter with this command to disable fast rerouting.

Command Syntax

```
fast-reroute keep-all-paths
no fast-reroute keep-all-paths
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 200
(config-router)# fast-reroute keep-all-paths
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute per-prefix remote-lfa area

Use this command to configure remote-lfa on an area in OSPF.

Use the no form of this command remove the remote-lfa configuration.

Command Syntax

```
fast-reroute per-prefix remote-lfa area (A.B.C.D|<0-4294967295>) tunnel mpls-ldp
no fast-reroute per-prefix remote-lfa area (A.B.C.D|<0-4294967295>) tunnel mpls-ldp
```

Parameters

A.B.C.D
Area-ID in IP address notation.

0-4294967295
Area-ID in integer notation.

Default

None

Command Mode

Router OSPF mode.

Applicability

This command was introduced before OcNOS version 6.0.0.

Examples

```
(config)#router ospf 1
(config-router)#fast-reroute per-prefix remote-lfa area 0 tunnel mpls-ldp
(config-router)#

(config-router)#no fast-reroute per-prefix remote-lfa area 0 tunnel mpls-ldp
(config-router)#commit
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute per-prefix route-map

Use this command to configure route-map in OSPF for fast-reroute calculation.

Use the no form of this command remove the route-map applied on fast-reroute calculation.

Command Syntax

```
fast-reroute per-prefix route-map WORD
no fast-reroute per-prefix route-map
```

Parameters

WORD
Route-map name.

Default

None

Command Mode

Router OSPF mode.

Applicability

This command was introduced before OcNOS version 6.0.0.

Examples

```
(config)#router ospf 1
(config-router)#fast-reroute per-prefix route-map rmap1
(config-router)#

(config-router)#no fast-reroute per-prefix route-map
(config-router)#commit
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute terminate-hold-on interval

Use this command to set the delay of primary route installation (to avoid micro loop) after a failover.

Use the no form of this command to set the termination hold-on timer to its default value (600 milliseconds).

Command Syntax

```
fast-reroute terminate-hold-on interval <100-100000>
no fast-reroute terminate-hold-on interval
```

Parameters

<100-100000>
Hold on interval in milliseconds

Default

600 milliseconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 1
(config-router)#fast-reroute terminate-hold-on interval 7000
(config-router)#no fast-reroute terminate-hold-on interval
```

© 2026 IP Infusion Inc. Proprietary

fast-reroute tie-break

Use this command to set the tie-breaking policy for selecting a fast reroute repair path. You assign a priority to each type of repair path. The tie-breaker value is used to select an LFA FRR route when multiple LFA FRR routes are available for the same primary route.

Use the `no` form of this command to set the tie-break preference value for a protection type to its default value as shown in Table 69 table.

To set all types of repair paths to their default priorities, do not specify a repair path with the `no` form of this command.

Command Syntax

```
fast-reroute tie-break (primary-path|interface-disjoint|node-protecting|broadcast-interface-
disjoint|downstream-path|secondary-path) index <1-255>
no fast-reroute tie-break
no fast-reroute tie-break (primary-path|interface-disjoint|node-protecting|broadcast-interface-
disjoint|downstream-path|secondary-path)
```

Parameters

primary-path
Use a path from the Equal-Cost Multipath Path (ECMP) set. An ECMP found during the primary shortest path first (SPF) repair might not be desirable in networks where traffic exceeds the capacity of any single link.

interface-disjoint
Prefer a backup path that uses a different interface than the interface used to reach destination via the primary path.

node-protecting
Bypass the `primary-path` gateway router which might not protect the router that is the next hop in the primary path. This ensures complete traffic protection even if the primary next-hop router fails.

broadcast-interface-disjoint
Do not use the interface if connected to a broadcast network. Repair paths protect links when a repair path and a protected primary path use *different* next-hop interfaces. However, on broadcast interfaces, if the repair path is computed via the same interface as the primary path, but their next-hop gateways are different, the router is protected but the link might not be.

downstream-path
Prefer a backup path to the destination which satisfies the downstream condition where the path cost to reach the destination from the LFA next hop is less than the path cost to the destination from the self node via primary next hop:

- Distance_opt(N, D) < Distance_opt(S, D)
- This might result in lost traffic, but prevents looping.

secondary-path
Prefer a non-ECMP backup path.

index <1-255>
Tie break priority. A lower value has higher preference. Range of priority values.

© 2026 IP Infusion Inc. Proprietary

Default

Table 69. Default Value

`primary-path`	20
`interface-disjoint`	60
`node-protecting`	30
`broadcast-interface-disjoint`	70
`secondary-path`	255
`downstream-path`	90

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 200
(config-router)# fast-reroute tie-break interface-disjoint index 1
```

host area

Use this command to configure a stub host entry belonging to a particular area.

Using this command, you can advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is not important.

Use the no form of this command to remove the host area configuration.

Command Syntax

```
host A.B.C.D area (A.B.C.D|<0-4294967295>)
host A.B.C.D area (A.B.C.D|<0-4294967295>) cost <0-65535>
no host A.B.C.D area (A.B.C.D|<0-4294967295>)
no host A.B.C.D area (A.B.C.D|<0-4294967295>) cost
```

Parameters

A.B.C.D
Specify IP address of the host.

area A.B.C.D
Set the OSPF area ID in IPv4 address format.

area <0-4294967295>
Set the OSPF Area ID as a decimal value.

cost <0-65535>
Specify cost for stub host entry.

Default

No host entry is configured

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#host 172.16.10.100 area 1
(config-router)#host 172.16.10.101 area 2 cost 10
```

© 2026 IP Infusion Inc. Proprietary

ip ospf authentication

Use this command to send and receive OSPF packets with the specified authentication method on the current interface.

Use the no parameter with this command to disable the authentication.

Command Syntax

```
ip ospf authentication (null|message-digest|)
ip ospf A.B.C.D authentication (null|message-digest|)
no ip ospf (A.B.C.D|) authentication
```

Parameters

A.B.C.D
The IP address of the interface.

null
Use no authentication.

message-digest
Use message digest authentication.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In this example, interface xe2 is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
#configure terminal
(config)#interface xe2
(config-if)#ip ospf authentication null
```

© 2026 IP Infusion Inc. Proprietary

ip ospf authentication-key

Use this command to specify an OSPF authentication password for neighboring routers.

This command creates a password (key) that is inserted into the OSPF header when OcNOS originates packets. Assign a separate password to each network for different interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area with the area authentication command.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

Use the no parameter with this command to remove an OSPF authentication password.

Command Syntax

```
ip ospf (A.B.C.D|) authentication-key WORD
no ip ospf (A.B.C.D|) authentication-key
```

Parameters

A.B.C.D
The IP address of the interface.

authentication-key WORD
Specify the OSPF Encrypted password (key) of 8 bytes.

Default

By default, no password used when exchanging OSPF routing data

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, an authentication key test is created on interface xe2 in area 0. Note that first authentication is enabled for area 0.

```
#configure terminal
(config)#router ospf 100
(config-router)#network 10.10.10.0/24 area 0
(config-router)#area 0 authentication
(config-router)#exit
(config)#interface xe2
(config-if)#ip ospf 3.3.3.3 authentication-key test

#sh run int xe2
!
interface xe2
```

© 2026 IP Infusion Inc. Proprietary

```
ip ospf authentication
ip ospf authentication-key 0x94eebee8c349a4b0
!
```

Encrypted password of 16 characters which can be obtained from `sh run <int>` command.

```
(config)#int xe2
(config-if)#ip ospf authentication-key 0x94eebee8c349a4b0
```

ip ospf bfd

Use this command to enable Bidirectional Forwarding Detection (BFD).

Use this command with either the `no` or `disable` parameter to disable BFD.

Command Syntax

```
ip ospf bfd (disable|)
no ip ospf bfd (disable|)
```

Parameters

disable
Specify to disable BFD.

Default

By default, ip ospf bfd is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf bfd
```

© 2026 IP Infusion Inc. Proprietary

ip ospf cost

Use this command to explicitly specify the cost of the link-state metric in a router-LSA.

The interface cost indicates the overhead required to send packets across an interface. This cost is stated in the Router-LSA's link. The cost is inversely proportional to the bandwidth of an interface. By default, the cost of an interface is calculated based on the bandwidth (10 8/ bandwidth). Use this command to set the cost manually.

Use the no parameter with this command to reset the cost to its default value.

Command Syntax

```
ip ospf (A.B.C.D|) cost <1-65535>
no ip ospf (A.B.C.D|) cost
```

Parameters

A.B.C.D
The IP address of the interface.

<1-65535>
Link-state metric.

Default

By default, the cost of an interface is calculated based on the bandwidth (10^8/ bandwidth). The default cost value is 10.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the cost as 10 on interface xe1 for IP address 10.10.10.50.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf 10.10.10.50 cost 10
```

© 2026 IP Infusion Inc. Proprietary

ip ospf database-filter

Use this command to turn on the LSA database-filter for a particular interface.

OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use this command to block flooding of LSAs over specified interfaces.

Use the no parameter with this command to turn off the filter.

Command Syntax

```
ip ospf (A.B.C.D|) database-filter all out
no ip ospf (A.B.C.D|) database-filter
```

Parameters

A.B.C.D
The IP address of the interface.

Default

Disabled, all outgoing LSAs are flooded to the interface.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf  database-filter all out
```

© 2026 IP Infusion Inc. Proprietary

ip ospf dead-interval

Use this command to set the interval during which the router waits to receive an OSPF hello packet from the neighbor before declaring the neighbor down. This value is advertised in the router's hello packets. It must be a multiple of hello-interval and be the same for all routers on a specific network.

Use the no parameter with this command to return to the default time. If you have configured this command specifying the IP address of the interface and want to remove the configuration, use the no parameter with the specified IP address (`no ip ospf dead-interval A.B.C.D`).

Command Syntax

```
ip ospf (A.B.C.D|) dead-interval <1-65535>
no ip ospf (A.B.C.D|) dead-interval
```

Parameters

A.B.C.D
The IP address of the interface.

dead-interval <1-65535>
Specify the interval in seconds.

Default

By default, dead interval is 40 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows configuring dead-interval for 10 seconds on xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf dead-interval 10
```

© 2026 IP Infusion Inc. Proprietary

ip ospf demand-circuit

Use this command to enable hello suppression and LSA suppression sent on OSPF interface. Enabling demand circuit on one interface enables hello suppression only for that particular interface.

Note: Hellos and LSAs are suppressed on Point-to-point and Point-to-multipoint links and only LSAs are suppressed for a broadcast link.

Use the no parameter with this command to disable hello suppression and LSA suppression

Command Syntax

```
ip ospf demand-circuit
no ip ospf demand-circuit
```

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows configuring demand-circuit on xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf demand-circuit

(config-if)#no ip ospf demand-circuit
```

© 2026 IP Infusion Inc. Proprietary

ip ospf disable

Use this command to completely disable OSPF packet processing on an interface.

This command overrides the network (page 2484) command.

Use the no option with this command to return to the default setting.

Command Syntax

```
ip ospf disable all
no ip ospf disable all
```

Parameters

None

Default

By default, this feature is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf disable all
```

© 2026 IP Infusion Inc. Proprietary

ip ospf fast-reroute per-prefix candidate disable

Use this command to prohibit the interface from being used as the next hop in a repair path.

Use the no option with this command to use the interface as the next hop in a repair path.

Command Syntax

```
ip ospf fast-reroute per-prefix candidate disable
no ip ospf fast-reroute per-prefix candidate disable
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)# ip ospf fast-reroute per-prefix candidate disable
```

© 2026 IP Infusion Inc. Proprietary

ip ospf flood-reduction

Use this command to enable flood reduction on an interface. When this command is configured, an LSA sent out on the interface is set with the DNA bit in the LSA age field. The LSA is not refreshed every refresh interval if there is no change in LSA. Only changed LSAs are sent out on the interface

Use the no option with this command to disable flood reduction on an interface.

Command Syntax

```
ip ospf flood-reduction
no ip ospf flood-reduction
```

Parameters

None

Default

By default, flood reduction on an interface is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf flood-reduction

(config-if)#no ip ospf flood-reduction
```

© 2026 IP Infusion Inc. Proprietary

ip ospf hello-interval

Use this command to specify the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes but results in more routing traffic.

Use the no parameter with this command to return to the default time.

Command Syntax

```
ip ospf (A.B.C.D|) hello-interval <1-65535>
no ip ospf (A.B.C.D|) hello-interval
```

Parameters

A.B.C.D
The IP address of the interface.

hello-interval <1-65535>
Specify the interval in seconds.

Default

By default, hello interval is 10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the hello-interval for 3 seconds on interface xe1.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf hello-interval 3
```

© 2026 IP Infusion Inc. Proprietary

ip ospf message-digest-key

Use this command to register an MD5 key for OSPF authentication.

- Message Digest Authentication is cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a message digest that is appended to the packet.
- Use this command for uninterrupted transitions between passwords. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.
- Maintain only one password per interface, removing the old password whenever you add a new one. This prevents the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

Use the no parameter with this command to remove an MD5 key.

Command Syntax

```
ip ospf (A.B.C.D|) message-digest-key <1-255> md5 WORD
no ip ospf (A.B.C.D|) message-digest-key <1-255>
```

Parameters

A.B.C.D
IPv4 address of the interface.

message-digest-key <1-255>
Specify a message digest authentication password (key ID).

md5 WORD
Specify an encrypted password (key) (1-16 characters).

Default

By default, MD5 key for OSPF authentication is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows OSPF authentication on the interface eth0 when IP address has not been specified. Encrypted password of 16 characters which can be obtained from `sh run <int>` command.

© 2026 IP Infusion Inc. Proprietary

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf authentication message-digest
(config-if)#ip ospf message-digest-key 1 md5 yourpass

(config-if)#sh run int xe1

!

interface xe1

 ip ospf authentication

 ip ospf authentication-key 0x94eebee8c349a4b0

 ip ospf message-digest-key 1 md5 0x94eebee8c349a4b0

!

(config-if)#ip ospf message-digest-key 1 md5 0x94eebee8c349a4b0
```

The following example shows OSPF authentication on the interface eth0 for the IP address 1.1.1.1. (If the interface has two IP addresses assigned-- 1.1.1.1 & 2.2.2.2, OSPF authentication will be enabled only for the IP address 1.1.1.1)

```
(config)#interface eth0
(config-if)#ip ospf 1.1.1.1 authentication message-digest
(config-if)#ip ospf 1.1.1.1 message-digest-key 2 md5 yourpass
```

© 2026 IP Infusion Inc. Proprietary

ip ospf mtu

Use this command to set MTU size for OSPF to construct packets based on this value. Whenever OSPF constructs packets, it uses interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value overriding the actual interface MTU size.

This command does not configure the MTU settings in the kernel. OSPF does not recognize MTU size changes made in the kernel until the MTU size is updated through this command.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf mtu <576-65535>
no ip ospf mtu
```

Parameters

mtu <576-65535>
Specify an MTU size.

Default

By default, OSPF uses interface MTU derived from the kernel.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf mtu 1480
```

© 2026 IP Infusion Inc. Proprietary

ip ospf mtu-ignore

Use this command to configure OSPF so that it does not check the MTU size during Database Description (DD) exchange.

Use the no form of this command to make OSPF check the MTU size during DD exchange.

Command Syntax

```
ip ospf (A.B.C.D|) mtu-ignore
no ip ospf (A.B.C.D|) mtu-ignore
```

Parameters

A.B.C.D
IP address of the interface.

Default

By default, during the DD exchange process, OSPF checks the MTU size described in DD packets received from its neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-router)#ip ospf mtu-ignore
```

© 2026 IP Infusion Inc. Proprietary

ip ospf multi-area

Use this command to enable multi-area adjacency on point-to-point network and other network types. Multi-area adjacency establishes adjacency between the Area Border Routers (ABRs). The interface of the ABR where this command is configured, shall be associated with multiple areas.

Use the no parameter to disable multi-area adjacency on the given interface on point-to-point network.

Command Syntax

```
ip ospf <0-65535> multi-area (A.B.C.D|<0-4294967295>)(neighbor A.B.C.D |)
no ip ospf <0-65535> multi-area (A.B.C.D|<0-4294967295>) (neighbor|)
```

Parameters

<0-65535>
OSPF process ID.

A.B.C.D
OSPF area ID in IP address format.

<0-4294967295>
OSPF area ID as a decimal value.

neighbor A.B.C.D
Neighbor IP address.

Note: The neighbor parameter is mandatory to create redundant Multi-Area adjacencies in one Area.

Default

By default, multi-area adjacency is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf 0 multi-area 1
(config-if)# no ip ospf 0 multi-area 1
```

To configure redundant multi-area adjacency configuration with same area in an OSPF instance.

```
#configure terminal
```

© 2026 IP Infusion Inc. Proprietary

```
(config)#interface xe1
(config-if)#ip ospf 0 multi-area 1
(config)#interface xe2
(config-if)#ip ospf 0 multi-area 1 neighbor 5.5.5.2
(config-if)# no ip ospf 0 multi-area 1
```

© 2026 IP Infusion Inc. Proprietary

ip ospf network

Use this command to set the OSPF network type.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf network (broadcast|non-broadcast|point-to-multipoint|point-to-point)
ip ospf network point-to-multipoint non-broadcast
no ip ospf network
```

Parameters

broadcast
Sets the network type to broadcast.

non-broadcast
Sets the network type to NBMA.

point-to-multipoint
Sets the network type to point-to-multipoint.

point-to-multipoint non-broadcast
Sets the network type to NBMA.

point-to-point
Sets the network type to point-to-point.

Default

By default, OSPF network type is broadcast

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the network to point-to-point type on the xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf network point-to-point
```

© 2026 IP Infusion Inc. Proprietary

ip ospf priority

Use this command to set the router priority to determine the designated router (DR) for the network.

Notes:

- A router with the higher router priority becomes the DR. If the priority is the same for two routers, the router with the higher router ID takes precedence.
- Only routers with a nonzero priority value are eligible to become the designated or backup designated router. Configure router priority for broadcast or NBMA networks only and not for point-to-point networks.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf (A.B.C.D|) priority <0-255>
no ip ospf (A.B.C.D|) priority
```

Parameters

A.B.C.D
The IP address of the interface.

priority <0-255>
Specify the router priority of the interface. The default value is 1.

Default

By default, ip ospf priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the OSPF priority value to 3 on the xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf priority 3
```

© 2026 IP Infusion Inc. Proprietary

ip ospf resync-timeout

Use this command to set the interval after which adjacency is reset if out-of-band re-synchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the no parameter with this command to set the default value (40 seconds).

Command Syntax

```
ip ospf (A.B.C.D|) resync-timeout <1-65535>
no ip ospf (A.B.C.D|) resync-timeout
```

Parameters

A.B.C.D
IP address of the interface.

<1-65535>
Re-synchronization timeout of the interface in seconds.

Default

By default, the re-synchronization timeout is 40 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the OSPF re-synchronization timeout value to 65 seconds on the xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf resync-timeout 65
```

© 2026 IP Infusion Inc. Proprietary

ip ospf retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. If the router does not receive an acknowledgement during the retransmit interval, it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf (A.B.C.D|) retransmit-interval <1-3600>
no ip ospf (A.B.C.D|) retransmit-interval
```

Parameters

A.B.C.D
The IPv4 address of the interface.

retransmit-interval <1-3600>
Specify the interval in seconds.

Default

By default, retransmit interval is 5 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the ospf retransmit interval to 6 seconds on the xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf retransmit-interval 6
```

© 2026 IP Infusion Inc. Proprietary

ip ospf transmit-delay

Use this command to set the estimated time it takes to transmit a link-state-update packet on the interface.

The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

Use the no parameter with this command to return to the default value (1 second).

Command Syntax

```
ip ospf (A.B.C.D|) transmit-delay <1-3600>
no ip ospf (A.B.C.D|) transmit-delay
```

Parameters

A.B.C.D
IPv4 address of the interface.

<1-3600>
Time in seconds to transmit a link-state update.

Default

By default, the transmit delay is 1 second

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the OSPF transmit delay time to 3 seconds on the xe1 interface.

```
#configure terminal
(config)#interface xe1
(config-if)#ip ospf transmit-delay 3
```

© 2026 IP Infusion Inc. Proprietary

log-adjacency-changes

Use this command for the router to send a SYSLOG message when an OSPF neighbor goes up or down.

Use no parameter of this command to stop sending SYSLOG message.

Command Syntax

```
log-adjacency-changes (brief|detail|)
no log-adjacency-changes
```

Parameters

brief

Sends a SYSLOG message for each state change, not just when a neighbor goes up or down.

detail

Sends a SYSLOG message for each state change, not just when a neighbor goes up or down.

Default

If not specified, brief is the default option.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#log-adjacency-changes
(config-router)#log-adjacency-changes detail

(config-router)#no log-adjacency-changes
(config-router)#no log-adjacency-changes detail
```

© 2026 IP Infusion Inc. Proprietary

max-concurrent-dd

Use this command to limit the number of Database Descriptors (DD) that can be processed concurrently.

This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

Use the no option with this command to remove the limit.

Command Syntax

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

Parameters

<1-65535>
Specify the number of DD processes.

Default

By default, max concurrent dd value is 64

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example set the max-concurrent-dd value to 4.

```
#configure terminal
(config)#router ospf 100
(config-router)#max-concurrent-dd 4
```

© 2026 IP Infusion Inc. Proprietary

maximum-area

Use this command to configure the maximum number of OSPF areas.

Use the no parameter with this command to disable the limit.

Command Syntax

```
maximum-area <1-4294967294>
no maximum-area
```

Parameters

<1-4294967294>
Specify the maximum number of OSPF areas.

Default

By default, ospf maximum area is 4294967294

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#maximum-area 5
```

© 2026 IP Infusion Inc. Proprietary

max-metric

Use this command to advertise a maximum cost i.e 65535 for the LSA's that the router generates. This feature can be configured for in a router-LSA, summary-LSA, external-LSA and stub links.

It also provides support to configure an on-startup time. On-startup time is a one-time event which occurs when the node is up initially. The time configured will be the duration till which the router advertises its LSA’s with the maximum cost.

Based on the metric that is advertised, the neighboring OSPF routers re-trigger their SPF's, and calculate routes that don't pass through the new router.

Use the no parameter with this command to remove the configuration.

Command Syntax

```
max-metric router-lsa (on-startup (<5-86400>)|) ({ external-lsa (<1-16777215>|) | summary-lsa (<1-
16777215>|) | include-stub }|)
no max-metric router-lsa (on-startup |) ({ external-lsa  | summary-lsa  | include-stub }|)
```

Parameters

router-lsa
router-lsa

external-lsa <1-16777215 >
External LSA max metric values

include-stub
Set the metric of a stub link in the router LSA to the default max-metric value.

on-startup <5-86400>
Startup metric values for router LSA

summary-lsa <1-16777215>
Summary LSA max metric values

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 6.0.0.

Examples

```
OcNOS(config)#router ospf 1
OcNOS(config-router)#max-metric router-lsa summary-lsa 2000 external-lsa 300 include-stub
OcNOS(config-router)#commit
OcNOS(config-router)#
OcNOS(config-router)#do sh run ospf
```

neighbor

Use this command to configure OSPF routers interconnecting to Non-Broadcast Multi-Access (NBMA) networks. Include one neighbor entry for each known non-broadcast network neighbor. Configure the neighbor address on the primary address of the interface.

Use the no parameter with this command to remove a configuration.

Command Syntax

```
neighbor A.B.C.D {cost <1-65535> | priority <0-255>| poll-interval <1-2147483647>}
no neighbor A.B.C.D { cost | priority | poll-interval}
no neighbor A.B.C.D
```

Parameters

A.B.C.D
Interface IP address of the neighbor.

priority <0-255>
Router priority of the non-broadcast neighbor associated with the specified IP address.This parameter does not apply to point-to-multipoint interfaces.

poll-interval <1-2147483647>
Reduced rate at which routers continue to send hello packets when a neighboring router has become inactive. Dead neighbor polling interval in seconds. Set this value much larger than hello interval.

cost <1-65535>
OSPF cost metric for point-to-multipoint neighbor.

Default

The default priority is 0 and polling interval is 120 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows neighbor configured with a priority value and poll interval time.

```
#configure terminal
(config)#router ospf 100
(config-router)#neighbor 1.2.3.4 priority 1 poll-interval 90
```

© 2026 IP Infusion Inc. Proprietary

network

Use this command to enable OSPF routing with a specified area ID (and optionally an instance ID) on interfaces with IP addresses that match the specified network address.

OSPF routing is enabled per IPv4 subnet basis. You define the network address using the prefix length or a subnet mask.

Use the `no` parameter with this command to disable OSPF routing on the interfaces.

Command Syntax

Network address defined using the prefix length:

```
network A.B.C.D/M area (A.B.C.D|<0-4294967295>) (instance-id <0-255>|)
no network A.B.C.D/M area (A.B.C.D|<0-4294967295>) (instance-id)
```

Network address defined using subnet mask:

```
network A.B.C.D A.B.C.D area (A.B.C.D|<0-4294967295>) (instance-id <0-255>|)
no network A.B.C.D A.B.C.D area (A.B.C.D|<0-4294967295>) (instance-id)
```

Parameters

A.B.C.D/M
IPv4 network address with prefix length.

A.B.C.D
IPv4 network address.

A.B.C.D
Subnet mask where the bits on left side are set to 1 to represent the network part and the bits on the right side are set to 0 to represent the host part.

area A.B.C.D
OSPF area ID in IPv4 address format.

area <0-4294967295>
OSPF area ID as a decimal value.

instance-id <0-255>
Instance ID value.

Default

No network area is configured

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following the use of the network command with OSPF multiple-instance support disabled.

© 2026 IP Infusion Inc. Proprietary

```
#configure terminal
(config-router)#network 10.0.0.0/8 area 3
(config-router)#network 10.0.0.0/8 area 1.1.1.1
```

The following shows the use of the network command with OSPF multiple-instance support enabled.

```
(config)#router ospf 100
(config-router)#network 10.0.0.0/8 area 3 instance-id 4
```

© 2026 IP Infusion Inc. Proprietary

ospf abr-type

Use this command to set an OSPF Area Border Router (ABR) type.

Use the no parameter with this command to revert the ABR type to the default setting (cisco).

Specifying the ABR type allows better functioning in a multi-vendor environment. The ABR types are:

- Cisco (RFC 3509): A router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM (RFC 3509): A router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard (RFC 2328): A router is considered an ABR if it has more than one area actively attached to it.

Command Syntax

```
ospf abr-type (cisco|ibm|standard|shortcut|)
no ospf abr-type
```

Parameters

cisco
Specify an alternative ABR using Cisco implementation. This is the default ABR type.

ibm
Specify an alternative ABR using IBM implementation.

standard
Specify a standard ABR.

shortcut
Shortcut ABR.

Default

By default, ABR type is Cisco

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#ospf abr-type ibm
```

© 2026 IP Infusion Inc. Proprietary

ospf area-interface-config-mode

Use this command to attach the interface to the router OSPF area. When this is enabled, any existing configuration of router ospf attached to the interface is erased.

Use no form of this command to disable. When this is disabled, any existing configuration of interface attached to the router ospf is erased.

Command Syntax

```
ospf area-interface-config-mode
no ospf area-interface-config-mode
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 4.2.

Examples

```
#configure terminal
(config)#ospf area-interface-config-mode
```

© 2026 IP Infusion Inc. Proprietary

ospf flood-reduction

Use this command to Enable flood reduction on all OSPF interface. When this command is configured, an LSA sent out on the OSPF interface is set with the DNA bit in the LSA age field. If there is no change in LSA, it is not refreshed every refresh interval. LSAs are sent out on the interface only if there is a change in an LSA

Use the no option with this command to disable flood reduction on all OSPF interfaces.

Command Syntax

```
ospf flood-reduction
no ospf flood-reduction
```

Parameters

None

Default

By default, flood reduction on all OSPF interfaces is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#ospf flood-reduction

(config-router)#no ospf flood-reduction
```

© 2026 IP Infusion Inc. Proprietary

ospf point-point rfc-incompatible

Use this command to disable RFC 2328 compatibility on point-to-point interfaces.

By default, in a point-to-point network OSPF packets are transmitted using multicast addresses. By disabling point-to-point RFC 2328 compatibility, packets are transmitted using the unicast address of the neighbor.

Use the no parameter with this command to enable RFC 2328 compatibility on point-to-point interfaces.

Command Syntax

```
ospf point-point rfc-incompatible
no ospf point-point rfc-incompatible
```

Parameters

None

Default

By default, RFC 2328 compatibility is enabled (packets transmitted using multicast addresses).

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)# ospf point-point rfc-incompatible
```

© 2026 IP Infusion Inc. Proprietary

ospf router-id

Use this command to specify a router ID for the OSPF process.

Configure each router with a unique router ID. In an OSPF router process which has active neighbors, a new router ID is used at the next reload or when you start the OSPF manually.

Use the no parameter with this command to force OSPF to use the previous router ID.

Command Syntax

```
ospf router-id A.B.C.D
router-id A.B.C.D

no ospf router-id
no router-id (A.B.C.D|)
```

Parameters

A.B.C.D
Specify the router ID in IPv4 address format.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows a specified router ID `2.3.4.5`.

```
#configure terminal
(config)#router ospf 100
(config-router)#ospf router-id 2.3.4.5
```

© 2026 IP Infusion Inc. Proprietary

overflow database

Use this command to limit the maximum number of LSAs that can be supported by the OSPF instance.

Use the no parameter with this command to have an unlimited number of LSAs.

Command Syntax

```
overflow database <0-4294967294> (hard|soft|)
no overflow database
```

Parameters

<0-4294967294>
The maximum number of LSAs

hard
Shutdown occurs if the number of LSAs exceeds the specified value.

soft
Warning message appears if the number of LSAs exceeds the specified value.

Default

No default value is specified. unlimited number of LSAs.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the database overflow to 5 and shutting down in that event.

```
#configure terminal
(config)#router ospf 100
(config-router)#overflow  database 5 hard
```

© 2026 IP Infusion Inc. Proprietary

overflow database external

Use this command to limits the number of AS-external-LSAs a router can receive once it is in the wait state.

Use the no parameter with this command to revert to default.

Command Syntax

```
overflow database external <0-2147483647> <0-65535>
no overflow database external
```

Parameters

<0-2147483647>

The maximum number of LSAs. This value should be the same on all routers in the AS.

<0-65535>

The number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, the router exits the overflow state only after an explicit administrator command.

Default

The default OSPF exit overflow interval is 0 second and number of external LSDB limit is unlimited.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3.

```
#configure terminal
(config)#router ospf 100
(config-router)#overflow  database external 5 3
```

© 2026 IP Infusion Inc. Proprietary

passive-interface

Use this command to suppress sending Hello packets on all interfaces or on a specified interface.

This command configures OSPF on simplex Ethernet interfaces. Since a simplex interface represents only one network segment between two devices, configure the transmitting interface as a passive interface. This ensures that OSPF does not send hello packets for the transmitting interface. Both the devices can see each other via the hello packet generated for the receiving interface.

Use the no form with this command to resume sending hello packets on all interfaces, or on a specified interface.

Note: The command passive-interface configures all interfaces as passive. If it is re-applied, the other passive configurations will be removed and all interfaces will become passive again.

Command Syntax

```
passive-interface
passive-interface IFNAME ( ( disable | enable) |)
passive-interface IFNAME A.B.C.D (enable|)
no passive-interface
no passive-interface IFNAME
no passive-interface IFNAME A.B.C.D
```

Parameters

enable
Enable passive interface

disable
Disable passive interface

IFNAME
The name of the interface

A.B.C.D
IPv4 address of the interface

Default

The default OSPF exit overflow interval is 0 second and number of external LSDB limit is 100000.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ospf 100
(config-router)#passive-interface
(config-router)#passive-interface xe1 enable
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#passive-interface xe2 10.1.2.3 enable
```

redistribute

This command redistributes routes from routing protocols, static routes, and kernel routes into an OSPF routing table.

Use the `no` form of this command to disable redistribution.

Command Syntax

```
redistribute (connected|static|rip|bgp|isis (WORD|)|ospf (<1-65535>|)) {metric <0-16777214>|metric-
type (1|2)|route-map WORD|tag <0-4294967295>}
no redistribute (connected|static|rip|bgp|isis(WORD|)|ospf (<1-65535>|)) metric|metric-type|route-
map|tag}
```

Parameters

connected
Redistribute connected routes.

static
Redistribute static routes.

rip
Redistribute RIP routes.

bgp
Redistribute BGP routes.

isis
Redistribute IS-IS routes.

isis WORD
IS-IS instance identifier.

ospf
Redistribute OSPF routes.

ospf <1-65535>
OSPF process ID to redistribute a particular OSPF instance into another OSPF instance. If not specified, this command redistributes into the OSPF instance with process ID 0.

metric <0-16777214>
External metric value.

metric-type 1
OSPF External Type 1 metrics. (see RFC 3101)

metric-type 2
OSPF External Type 2 metrics. (see RFC 3101)

route-map WORD
Route map name.

tag <0-4294967295>
Route tag value to use as a “match” value for controlling redistribution via route maps.

Default

By default, redistribution is disabled.

© 2026 IP Infusion Inc. Proprietary

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ospf 100
(config-router)#redistribute bgp metric 12
```

The following example shows redistributing OSPF instance 2 into OSPF instance 1.

```
(config)#router ospf 1
(config-router)#redistribute ospf 2
```

The following example shows redistributing OSPF instance 2 into OSPF instance 1, with an external metric of 10, metric type 1, a route-map named rmp1, and an external route tag of 3.

```
(config)#router ospf 1
(config-router)#redistribute ospf 2 metric 10 metric-type 1 route-map rmp1 tag 3
```

© 2026 IP Infusion Inc. Proprietary

router ospf

Use this command to enter router mode and to configure an OSPF routing process.

Specify the process ID to configure multiple instances of OSPF. When running a single instance of OSPF, you do not need to specify a process ID.

Use the no parameter with this command to terminate an OSPF routing process.

Note: The CSPF database is maintained globally within OSPF. Removing any OSPF instance from a multi-instance setup impacts all CSPF LSP sessions and disrupts all ingress RSVP sessions. As a result, it is possible to restore only those sessions that still have a valid path after removing the OSPF instance.

Command Syntax

```
router ospf
router ospf <0-65535>

no router ospf
no router ospf <0-65535>
```

Parameters

<0-65535>
Process ID; should be unique for each routing process.

Default

No routing process defined

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows the use of the router ospf command to enter router mode. Note the change in the prompt.

```
#configure terminal
(config)#router ospf 100
(config-router)#
```

show cspf lsp

Use this command to display CSPF statistics, including counts or status of CSPF-computed paths for label-switched paths. Displays the actual CSPF-selected paths with extensive constraint detail.

© 2026 IP Infusion Inc. Proprietary

Command Syntax

```
Show cspf lsp
Show cspf lsp SESSION-NAME
show cspf lsp count
```

Parameters

SESSION-NAME

Use this parameter to display only the CSPF LSPs matching a specific RSVP session name.

count

Use this parameter to display the LSP count.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 7.0.0.

Example

Following is a sample output from the command.

```
OcNOS#show cspf lsp
   LSP Name        : t1-Primary
   Trunk ID        : 5001
   Lsp Id          : 2202
   OSPF ID         : 1
   Ingress         : 2.2.2.2
   Egress          : 3.3.3.3
   Ext Tunnel ID   : 2.2.2.2
   LSP Type        : 0
   Client ID       : 1
   State           : Established(3)
   Setup Priority  : 7
   Hold Priority   : 0
   Hop Limit       : 255
   Include Mask    : 0x0
   Exclude Mask    : 0x0
   Include All Mask: 0x0
   LSP Metric      : 1
   LSP Reoptimize  : Yes
   LSP in ReopList : Yes
   LSP ReopTime    : 1 minutes (Offset 18 seconds)
   Next Reop Due in: 60 seconds
   Computed ERO    :

show cspf rsvp forwarding-timer

This command displays the information of Graceful Restart capable RSVP client to ISIS or OSPF, CSPF that are currently shutdown.

Command Syntax

```
show cspf rsvp forwarding-timer
```

Parameters

None

Default

None

Command Mode

Privileged Exec modes

Applicability

This command was introduced before OcNOS version 5.0.

Example

```
#show cspf rsvp forwarding-timer
CSPF Server Protocol-Name GR-State Time Remaining (sec) Disconnected-time
ISIS RSVP ACTIVE 88 2021/08/18 04:49:23
```

© 2026 IP Infusion Inc. Proprietary

show debugging ospf

Use this command to display the set OSPF debugging option.

Command Syntax

```
show debugging ospf
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the show debugging ospf command. Some lines in this output wrap around, they might not wrap around in the actual display.

```
#show debugging ospf
OSPF debugging status:
  OSPF packet Link State Update debugging is on
  OSPF all events debugging is on
```

© 2026 IP Infusion Inc. Proprietary

show ip ospf

Use this command to display general information about all OSPF routing processes.

Command Syntax

```
show ip ospf (<0-65535>|)
```

Parameters

<0-65535>
The ID of the router process for which information will be displayed. If this parameter is specified, only the information for the specified routing process is displayed.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip ospf 1
 Routing Process "ospf 1" with ID 4.1.1.1
 Process uptime is 1 minute
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 This router is an ASBR (injecting external routing information)
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 5. Checksum 0x010632
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 5
 External LSA database is unlimited.
 Number of LSA originated 6
 Number of LSA received 0
 Number of areas attached to this router: 1
    Area 0 (BACKBONE)
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 0
        Area has no authentication
```

```
        SPF algorithm last executed 00:00:47.558 ago
        SPF algorithm executed 2 times
        Number of LSA 1. Checksum 0x0041e0
```

Here is the explanation of the "show command" output fields.

Table 70. show ip ospf output details

Field	Description
Routing Process with ID	OSPF process identifier and router identifier.
Process is not up	OSPF process is not running.
Process uptime is	OSPF process running time.
Process bound to VRF	VRF name
Router is in Graceful Restart	When in graceful restart.
Router is in Restart Signaling	When in restart signalling.
Bidirectional Forwarding Detection is configured	When BFD is enabled.
Conforms to RFC2328, and RFC1583 Compatibility flag is enabled	RFC compatibility.
Supports only single TOS (TOS0) routes	OSPF TOS-based routing was never deployed.
Supports opaque LSA	When opaque LSAs are supported.
Do not support Restarting	When restart is not supported.
Supports Graceful Restart	Method of restart in process.
Supports Restart Signaling	Method of restart in signaling process.
Connected to MPLS VPN Super backbone	VRF is enabled and the process is connected to the MPLS VPN backbone.
This router is an ABR, ABR Type is	Type of ABR: Standard (RFC2328) Alternative Cisco (RFC3509) Alternative IBM (RFC3509) Alternative Shortcut
This router is an ASBR (injecting external routing information)	Type of router function in the process.
SPF schedule delay initial	Initial SPF schedule delay.
SPF schedule delay min	Minimum delay between receiving a change to SPF calculation.
SPF schedule delay max	Maximum delay between receiving a change to SPF calculation.
Refresh timer	LSA refresh interval.
Number of incoming current DD exchange neighbors	Incoming neighbor Database Descriptors and maximum concurrent DDs.
Number of outgoing current DD exchange neighbors	Outgoing neighbor Database Descriptors and maximum concurrent DDs.

© 2026 IP Infusion Inc. Proprietary

Table 70. show ip ospf output details (continued)

Field	Description
Initial LSA throttle delay	Initial delay for the generation of LSAs.
Minimum hold time for LSA throttle	Minimum hold time between generation of the same LSA.
Maximum wait time for LSA throttle	Maximum wait time between generation of the same LSA.
Minimum LSA arrival	Minimum time between reception of new LSAs during flooding.
Number of external LSA	Number of AS external LSAs and checksum.
Number of opaque AS LSA	Number of AS opaque LSAs and checksum.
Number of non-default external LSA	For database overflow, number of non-default external LSAs.
External LSA database is unlimited	When the external LSA database is unlimited.
External LSA database limit	Maximum number of LSAs in database.
Exit database overflow state interval is	Exit database overflow state interval.
Exit database overflow state interval is not configured	When the exit database overflow state interval is not set.
OSPF is [not] in database overflow state now	Whether OSPF is in database overflow state now.
Next attempt to exit database overflow state in	How long until OSPF tries to exit the database overflow state.
LSDB database overflow limit	Maximum number of LSAs that can be supported by the OSPF instance.
LSDB exceed overflow limit	Whether OSPF is exceeding the maximum number of LSAs.
Number of LSA originated	LSAs originated by the OSPF instance.
Number of LSA received	LSAs received by the OSPF instance.
Number of areas attached to this router	As stated
Next fields are repeated for each area	As stated
Area	Area identifier.
(BACKBONE)	Area is a backbone.
no-summary	Area is a stub and does no import summaries.
(Inactive)	Area is not active.
Number of interfaces in this area is	Number of interfaces in this area.
Number of fully adjacent neighbors in this area	As stated.
Number of fully adjacent virtual neighbors through this area	As stated.
Area has no authentication	Area does not use authentication.
Area has simple password authentication	Area uses password authentication.
Area has message digest authentication	Area uses MD5 authentication.
SPF algorithm last executed	As stated.

© 2026 IP Infusion Inc. Proprietary

Table 70. show ip ospf output details (continued)

Field	Description
SPF algorithm executed	As stated.
Number of LSA	Number of LSAs in area link-state database and checksum.
End of area field	As stated.
NSSA Translator Role is	candidate: Translate Type-7 LSAs to Type-5 if router is elected. never: Do not translate Type-7 LSAs to Type-5. always: Always translate Type-7 LSAs to Type-5.
NSSA Translator State is	disabled: Router is not a border router. enabled: Router is a border router. elected: Router has been elected to be an NSSA translator.
Stability Interval	If an elected translator determines its services are no longer required, how long it continues to perform its services.
Number of NSSA Translator Events	As stated.
Shortcutting mode	Shortcut ABR that installs inter-area routes through non-backbone areas if non-backbone paths are really better: Default Enabled Disabled
S-bit consensus	Whether other ABR agrees on S-bit: ok no
Dste Status	Whether DSTE is enabled or disabled.

show ip ospf border-routers

Use this command to display the ABRs and ASBRs for OSPF instances.

Command Syntax

```
show ip ospf (<0-65535>|) border-routers
```

Parameters

<0-65535>
The ID of the router process for which information will be displayed.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the `show ip ospf border-routers` command.

```
#show ip ospf border-routers
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, eth0, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, eth1, ABR, ASBR, Area 0.0.0.0
```

Here is the explanation of the "show command" output fields.

Table 71. border router output details

Field	Description
Code	i: Intra-area route I: Inter-area route
Router ID	Router identifier of the destination
Cost	Cost of using this route.
via	Next hop IP address toward the destination.
is directly connected	Destination is directly connected.
Interface	Outgoing interface name.

© 2026 IP Infusion Inc. Proprietary

Table 71. border router output details (continued)

Field	Description
Type	Router type of the destination: ABR or ASBR.
through Transit Area	Next hop is an area that carries traffic that neither originates nor terminates in the area itself.
Area	Area identifier from which this route was learned.
Transit	Area is a transit area.

show ip ospf database brief

Use this command to display a summary of the OSPF database.

Command Syntax

```
show ip ospf database (self-originate|max-age|adv-router A.B.C.D|)
show ip ospf <0-65535> database(self-originate|max-age|adv-router A.B.C.D|)
```

Parameters

self-originate
Self-originated link states.

max-age
LSAs which have reached the maximum age (3600 seconds).

A.B.C.D
IPv4 address of the advertising router.

<0-65535>
ID of the router process

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip ospf database
       OSPF Router process 100 with ID (100.100.100.72)
                Router Link States (Area 0.0.0.0)
Link ID         ADV Router      Age   Seq#       CkSum  Link count
10.100.12.57    10.100.12.57     930  0x80000003 0x90de 2
100.100.100.72  100.100.100.72   933  0x80000004 0x7592 2
                Net Link States (Area 0.0.0.0)
Link ID         ADV Router      Age   Seq#       CkSum
10.100.10.72    100.100.100.72   933  0x80000001 0x0bef
                Summary Link States (Area 0.0.0.0)
Link ID         ADV Router      Age   Seq#       CkSum  Route
10.60.0.0       10.100.12.57     928  0x80000001 0x5108 10.60.0.0/24
71.87.120.0     10.100.12.57     928  0x80000001 0xc2c5 71.87.120.0/24
127.0.0.1       10.100.12.57     928  0x80000001 0x23fb 127.0.0.1/32
```

Here is the explanation of the "show command" output fields.

© 2026 IP Infusion Inc. Proprietary

Table 72. ospf database output details

Field	Description
Link ID	The meaning of this field depends on the type of Link-State Advertisement (LSA). Type 1: Router LSA (depends on the type of network to which the router connects): Point-to-point network: neighbor's router ID. Transit network: IP address of the designated router's interface. Stub network: IP network or subnet address Virtual link: Neighbor's Router ID. Type 2: Network LSA: The IP address of the designated router's interface. Type 3: Summary LSA: The IP address of the network or subnet being advertised.
ADV Router	The ID of the router advertising the LSA.
Age	The age of the LSA.
Seq#	The sequence number of the LSA. This number increments each time a new instance of the LSA originates. This update helps other routers identify the most recent instance of the LSA.
CkSum	The fetch checksum of the complete LSA except the Age field.
Link count	Total number of links.
Route	Summary prefix address.

show ip ospf database detail

Use this command to display details of the OSPF database.

Command Syntax

```
show ip ospf database (asbr-summary|external|network|router|summary|nssa-external|opaque-link|opaque-area|opaque-as) (self-originate|adv-router A.B.C.D|)
show ip ospf <0-65535> database (asbr-summary|external|network|router|summary) (self-originate|adv-router A.B.C.D|)
show ip ospf database (asbr-summary|external|network|router|summary|nssa-external|opaque-link|opaque-area|opaque-as) A.B.C.D (self-originate|adv-router A.B.C.D|)
show ip ospf <0-65535> database (asbr-summary|external|network|router|summary|nssa-external|opaque-link|opaque-area|opaque-as) A.B.C.D (self-originate|adv-router A.B.C.D|)
```

Parameters

<0-65535>
The ID of the router process for which information should be displayed.

asbr-summary
Type 4 ASBR summary LSAs.

external
Type 5 external LSAs.

network
Type 2 network LSAs.

router
Type 1 router LSAs.

summary
Type 3 summary LSAs.

nssa-external
Type 7 NSSA external LSAs.

opaque-link
Type 9 LSAs which are not flooded beyond the local network.

opaque-area
Type 10 LSAs which are not flooded beyond the borders of their area.

opaque-as
Type 11 LSAs which are flooded throughout the AS.

A.B.C.D
Link state ID as an IP address.

self-originate
Display self-originated link states.

adv-router
Advertising router link states.

A.B.C.D
IPv4 address of advertising router.

Default

None

© 2026 IP Infusion Inc. Proprietary

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

External and Self-originate Parameters

This is sample output with the external and self-originate parameters.

```
#show ip ospf  database external self-originate

 OSPF Router process 100 with ID (10.10.11.50)

 AS External Link States
  LS age: 298
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external-LSA
  Link State ID: 10.10.100.0 (External Network Number)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x7033
  Length: 36
  Network Mask: /24
 Metric Type: 2 (Larger than any link state path)
 TOS: 0
 Metric: 20
 Forward Address: 10.10.11.50
 External Route Tag: 0
```

Opaque-as and Self-originate Parameters

This is sample output with the opaque-as and self-originate parameters.

```
#show ip ospf  database opaque-as self-originate
 OSPF Router process 100 with ID (10.10.11.50)
 AS-Global Opaque-LSA
  LS age: 325
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external Opaque-LSA
  Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
  Opaque Type: 11
  Opaque ID: 657687
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xb018
 Length: 25
```

Example: adv-router Parameter

This is a sample output with the adv-router parameter.

```
#show ip ospf  database nssa-external adv-router 10.10.11.50
  OSPF Router process 100 with ID (10.10.11.50)
 NSSA-external Link States (Area 0.0.0.0)
 NSSA-external Link States (Area 0.0.0.1 [NSSA])
```

© 2026 IP Infusion Inc. Proprietary

```
  LS age: 78
  Options: 0x0 (*|-|-|-|-|-|-|-)
  LS Type: AS-NSSA-LSA
  Link State ID: 0.0.0.0 (External Network Number For NSSA)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xc9b6
  Length: 36
  Network Mask: /0
 Metric Type: 2 (Larger than any link state path)
 TOS: 0
 Metric: 1
 NSSA: Forward Address: 0.0.0.0
OSPF Router process 100 with ID (10.10.11.50)
 NSSA-external Link States (Area 0.0.0.0)
 NSSA-external Link States (Area 0.0.0.1 [NSSA])
  LS age: 78
  Options: 0x0 (*|-|-|-|-|-|-|-)
  LS Type: AS-NSSA-LSA
 Link State ID: 0.0.0.0 (External Network Number For NSSA)
```

Router and Link State ID Parameters

This is sample output with the router and link state ID parameters.

```
#show ip ospf  database router 10.10.11.50
 OSPF Router process 100 with ID (10.10.11.50)
 Router Link States (Area 0.0.0.0)
  LS age: 878
  Options: 0x2 (*|-|-|-|-|-|E|-)
  Flags: 0x3 : ABR ASBR
  LS Type: router-LSA
  Link State ID: 10.10.11.50
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000004
  Checksum: 0xe39e
  Length: 36
Number of Links: 1
 Link connected to: Stub Network
 (Link ID) Network/subnet number: 10.10.10.0
 (Link Data) Network Mask: 255.255.255.0
Number of TOS metrics: 0
 TOS 0 Metric: 10
 Router Link States (Area 0.0.0.1)
  LS age: 877
  Options: 0x2 (*|-|-|-|-|-|E|-)
  Flags: 0x3 : ABR ASBR
  LS Type: router-LSA
  Link State ID: 10.10.11.50
  Advertising Router: 10.10.11.50
 LS Seq Number: 80000003
```

Example: adv-router Parameter for Flood Reduction

This is sample output using the adv-router parameter for flood reduction.

```
#show ip ospf  database summary adv-router 10.10.11.50

 OSPF Router process 100 with ID (10.10.11.50)
 Summary Link States (Area 0.0.0.0)
  LS age: 1(DoNotAge)
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: summary-LSA
  Link State ID: 10.10.11.0 (summary Network Number)
```

```
   Advertising Router: 10.10.11.50
   LS Seq Number: 80000001
   Checksum: 0x36ac
   Length: 28
   Network Mask: /24
  TOS: 0 Metric: 10
Summary Link States (Area 0.0.0.1)
   LS age: 989
   Options: 0x2 (*|-|-|-|-|-|E|-)
LS Type: summary-LSA
   Link State ID: 10.10.11.0 (summary Network Number)
   Advertising Router: 10.10.11.50
   LS Seq Number: 80000001
   Checksum: 0x36ac
   Length: 28
   Network Mask: /24
  TOS: 0 Metric: 10

#show ip ospf  database external self-originate

 OSPF Router process 100 with ID (10.10.11.50)

 AS External Link States
  LS age: 298
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external-LSA
  Link State ID: 10.10.100.0 (External Network Number)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x7033
  Length: 36
  Network Mask: /24
 Metric Type: 2 (Larger than any link state path)
 TOS: 0
 Metric: 20
 Forward Address: 10.10.11.50
 External Route Tag: 0
```

Output Fields Description

Database Detail Header Fields

Here is the explanation of the "show command" output fields.

Table 73. ospf database detail header fields

Field	Description
LS age	Age of the LSA in seconds. “Do Not Age” is displayed if the DNA bit is set.
Options	LSA options as explained in Table 74.
Flags	ABR: Area border router ASBR: AS boundary router VL-endpoint: Endpoint of an active virtual link that is using the described area as a transit area Shortcut: shortcut ABR NSSA-Translator: NSSA border router with NSSA Translate or State enabled
LS Type	Type of LSA:

Table 73. ospf database detail header fields (continued)

Field	Description
	Router-LSA Network-LSA Summary-LSA ASBR-summary-LSA AS-external-LSA AS-NSSA-LSA Link-Local Opaque-LSA Area-Local Opaque-LSA AS-external Opaque-LSA
Link State ID	Identifier of the router described by the LSA.
Opaque Type	Opaque type used to identify the application type of the LSA: 9: link-local scope 10: area-local scope 11: LSA flooded throughout the AS
Opaque ID	Identifier used to differentiate LSAs of the same type.
Advertising Router	Identifier of the router that originated the LSA.
LS Seq Number	Sequence number of the LSA. This number increments each time a new instance of the LSA originates. This update helps other routers identify the most recent instance of the LSA.
Checksum	Checksum of the entire LSA, except the LS age field.
Length	Length of the LSA
I LSA	Indication LSA: ASBR set the infinity metric to tell all routers in the backbone not to originate DNA LSAs.

OSPF LSA Option Bits

Here is the explanation of the "show command" output fields.

Table 74. ospf LSA option bits output details

Bit	Description
DN	Used in MPLS-based L3 VPNs. When a route learned from a customer network via OSPF is advertised across a BGP/MPLS VPN using Multiprotocol BGP and advertised back to a customer network via OSPF, a loop can happen where the OSPF route is redistributed back to the VPN service provider network via BGP. The DN-bit prevents this type of routing loop. When an OSPF router receives a Type 3, 5, or 7 LSA with the DN-bit set, it foes use that LSA for OSPF route calculations.
O	Originating router supports Type 9, 10, and 11 Opaque LSAs.

© 2026 IP Infusion Inc. Proprietary

Table 74. ospf LSA option bits output details (continued)

Bit	Description
DC	Originating router supports OSPF over Demand Circuits.
L	Whether the OSPF packet contains a Link-Local Signaling (LLS) data block. This bit is set only in Hello and database description packets.
N/P	The N-bit is used only in Hello packets when the originating router supports Type-7 NSSA-External-LSAs. Neighboring routers with mismatched N-bit will not form a neighbor relationship. This restriction ensures that all OSPF routers within an area support NSSA capabilities. When the N-bit is set, the E-bit must be 0. The P-bit is used only in Type-7 NSSA-External-LSA headers. Due to this reason, the N- and P-bits share the same position in the options field. The P (Propagate) bit is set to inform an NSSA ABR to translate Type-7 LSAs into Type-5 LSAs.
MC	Originating router supports multicast extensions to OSPF (MOSPF)
E	Originating router accepts AS External LSAs. The bit is set in all AS External LSAs and in all LSAs originated in the backbone and non-stub areas; and is be set to 0 in all Hellos and LSAs originated within a stub area. Additionally, this bit is used in Hello packets to indicate the capability of a router interface to send and receive Type-5 AS-External-LSAs. Neighboring routers with mismatched E-bit do not form a neighbor relationship. This restriction ensures that all OSPF routers within an area support the stub capabilities.
T	Originating router supports Multitopology OSPF (MT-OSPF.) Older OSPF specifications used this bit when the originating router support TOS-based routing. However, OSPF TOS-based routing was never deployed; therefore the T-bit was never used.

Type 1 Router LSAs ("router" Parameter)

Here is the explanation of the "show command" output fields.

Table 75. router LSAs

Field	Description
Number of Links	Number of router links the LSA describes.
Link connected to	Description of the router link: another Router (point-to-point) a Transit Network Stub Network a Virtual Link
(Link ID)	Identifier of the router to which the link connects: Neighboring Router ID Designated Router address Network/subnet number Neighboring Router ID

Table 75. router LSAs (continued)

Field	Description
(Link Data)	Extra information: Router Interface address Network Mask
Number of TOS metrics	Number of TOS (Type of Service) metrics for this link, not including the metric for TOS 0.
TOS 0 Metric	Cost of using this router link for TOS 0.

Type 2 Net Link States ("network" Parameter)

Here is the explanation of the "show command" output fields.

Table 76. net LSAs

Field	Description
Network Mask	IP address mask for the network.
Attached Router	Identifiers of each router attached to the network.

Type 3 Summary LSAs ("summary" Parameter) and Type 4 ASBR Summary LSAs ("asbr-summary" Parameter)

Here is the explanation of the "show command" output fields.

Table 77. summary and ASBR summary link states

Field	Description
Network Mask	For Type 3 LSAs, the destination network's IP address mask. Not meaningful for Type 4 link state advertisements.
TOS: 0 Metric	Cost of using this router link for TOS 0.

Type 5 AS External LSAs ("external" Parameter)

Here is the explanation of the "show command" output fields.

Table 78. external LSAs

Field	Description
Network Mask	IP address mask for the advertised destination
Metric Type	1: Type 1 external metric that is comparable directly (without translation) to the link state metric 2: Type 2 external metric that is considered larger than any link state path
TOS	Always zero.
Metric	The cost of this route.
Forward	Data traffic for the advertised destination is forwarded to this address.

© 2026 IP Infusion Inc. Proprietary

Table 78. external LSAs (continued)

Field	Description
Address	
External Route Tag	Custom field attached to each external route whose use is defined by the application.

Type 7 NSSA External Link States ("nssa-external" Parameter)

Here is the explanation of the "show command" output fields.

Table 79. NSSA external LSAs

Field	Description
Network Mask	IP address mask for the advertised destination
Metric Type	1: Type 1 external metric that is comparable directly (without translation) to the link state metric 2: Type 2 external metric that is considered larger than any link state path
Metric	The cost of this route.
NSSA: Forward Address	Data traffic for the advertised destination is forwarded to this address.
External Route Tag	Custom field attached to each external route whose use is defined by the application.

show ip ospf igp-shortcut-lsp

Use this command to show the IGP shortcut LSP used by OSPF.

Command Syntax

```
show ip ospf igp-shortcut-lsp
```

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf igp-shortcut-lsp
 Tunnel-endpoint     Tunnel-id     Tunnel-metric
 8.8.8.8             101           2              active
```

Here is the explanation of the "show command" output fields.

Table 80. show ip ospf igp-shortcut-lsp output details

Field	Description
Tunnel-endpoint	Tunnel endpoint address of ospf.
Tunnel-id	Tunnel address (destination port) for the session.
Tunnel-metric	Number of tunnel-metric.
active/inactive	Whether the tunnel is active or inactive.

© 2026 IP Infusion Inc. Proprietary

show ip ospf igp-shortcut-route

Use this command to show the IGP shortcut route calculated by OSPF.

Command Syntax

```
show ip ospf (<0-65535>|) igp-shortcut-route
```

Parameters

<0-65535>
ID of the router process.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf igp-shortcut-route
OSPF process 0:
8.8.8.8/32 [2] tunnel-id: 101, 8.8.8.8
15.15.15.15/32 [0] tunnel-id: 101, 8.8.8.8
20.20.15.0/24 [0] tunnel-id: 101, 8.8.8.8
```

Here is the explanation of the "show command" output fields.

Table 81. show ip igp-shortcut-route output details

Field	Description
OSPF process	OSPF process identifier.
Destination	IP address of the destination port.
Metric	Number of tunnel metric.
Tunnel-ID	Tunnel address (destination port) for the session.
Tunnel-End-Point	Tunnel endpoint address of ospf.

© 2026 IP Infusion Inc. Proprietary

show ip ospf interface

Use this command to display interface information for OSPF.

Command Syntax

```
show ip ospf interface (IFNAME|) brief
show ip ospf interface brief
```

Parameters

IFNAME
Interface name.

brief
Brief summary of interface

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf interface

eth1 is up, line protocol is up
 Internet Address 10.100.10.72/24, Area 0.0.0.0, MTU 1500
    Router ID 100.100.100.72, Network Type BROADCAST, Cost: 10, TE Metric 0
    Transmit Delay is 1 sec, State DR, Priority 1
    LDP-OSPF Sync configured
    Holddown timer : 50 seconds, Remaining time =  30seconds
    Designated Router (ID) 100.100.100.72, Interface Address 10.100.10.72
    Backup Designated Router (ID) 10.100.12.57, Interface Address 10.100.10.105
    Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
      Hello due in 00:00:05
    Neighbor Count is 1, Adjacent neighbor count is 1
    Crypt Sequence Number is 0
    Hello received 19 sent 106, DD received 4 sent 3
    LS-Req received 1 sent 1, LS-Upd received 3 sent 3
    LS-Ack received 2 sent 3, Discarded 0
```

Here is the explanation of the "show command" output fields.

© 2026 IP Infusion Inc. Proprietary

Table 82. OSPF interface output details

Field	Description
Internet address	IP address and subnet mask of the interface.
Area	OSPF area to which the interface belongs.
MTU	Maximum Transmission Unit (MTU) of the interface.
Transmit Delay	Transmit delay of the interface.
Priority	OSPF priority of the interface used for election of Designated Router (DR) and Backup Designated Router (BDR).
Hello	OSPF hello-interval.
Dead	OSPF dead-interval.
Wait	Hello wait-interval.
Retransmit	The period, in seconds, for which the router waits between retransmissions of OSPF packets that have not been acknowledged.
Hello due in	Time period for which router expects to receive hello packet.
Neighbor Count	OSPF neighbor count.
Adjacent neighbor	OSPF adjacent neighbor count.
Crypt Sequence Number	Used for authentication.
Hello received	Number of Hello packets and DD packets sent and received.
LS-Req	Number of LSA requests and LSA updates sent and received.
LS-Ack	Number of LSA acknowledgments sent and received number of LSA acknowledgment discards.

Example: DoNotAge

The following is sample output of this command when DoNotAge is enabled:

```
#show ip ospf interface eth1
eth1 is up, line protocol is up
 Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
 Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST, Cost: 10
 Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric 0
 No designated router on this network
 No backup designated router on this network
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Neighbor Count is 0, Adjacent neighbor count is 0
 Crypt Sequence Number is 1106347721
 Hello received 0 sent 1, DD received 0 sent 0
 LS-Req received 0 sent 0, LS-Upd received 0 sent 0
 LS-Ack received 0 sent 0, Discarded 0
 Reduce LSA flooding
```

Example: Hello Suppression

The following is sample output of this command when Hello-Suppression is enabled:

```
#sh ip os interface
p7p1 is up, line protocol is up
```

```
  Internet Address 14.1.1.2/24, Area 0.0.0.0, MTU 1500
  Process ID 1, VRF (default), Router ID 2.2.2.2, Network Type POINTOMULTIPOINT, Cost:
1
  Reduce LSA flooding.
  Transmit Delay is 1 sec,  State Point-To-Point, TE Metric 1
  Timer intervals configured, Hello 30, Dead 120, Wait 120, Retransmit 5
    Hello due in 00:00:03
  Neighbor Count is 1, Adjacent neighbor count is 1
  Suppress hello for 1 neighbor(s)
  Hello received 5 sent 8, DD received 8 sent 6
  LS-Req received 2 sent 2, LS-Upd received 8 sent 9
  LS-Ack received 6 sent 6, Discarded 0
  No authentication

#show ip ospf interface brief

Interface    PID   Area            Intf ID    Cost  State           Neighbors  Status
lo           1     0.0.0.0         1          1     Loopback        0            Up
Interface    PID   Area            Intf ID    Cost  State           Neighbors  Status
xe1          1     0.0.0.0         4          10    DR              1            Up

show ip ospf multi-area-adjacencies

Use this command to display multi-area adjacency information for OSPF.

Command Syntax

```
show ip ospf (<0-65535>|) multi-area-adjacencies
```

Parameters

<0-65535>
The ID of the router process for which information should be displayed.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of this command:

```
#show ip ospf 1 multi-area-adjacencies

Multi-area-adjacency on interface eth1 to neighbor 20.20.20.10
Internet Address 20.20.20.11/24, Area 0.0.0.1, MTU 1500
Process ID 1, Router ID 10.10.10.10, Network Type POINTOPOINT, Cost: 10
Transmit Delay is 1 sec, State Point-To-Point
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
Neighbor Count is 0, Adjacent neighbor count is 0
Crypt Sequence Number is 1229928206
Hello received 0 sent 513, DD received 0 sent 0
LS-Req received 0 sent 0, LS-Upd received 0 sent 0
LS-Ack received 0 sent 0, Discarded 0
```

Here is the explanation of the "show command" output fields.

Table 83. show ip ospf multi-area-adjacencies output details

Field	Description
Multi-area-adjacency	Specifies the interface name and the router ID to which it is connected.
Internet Address	As Stated
Area	As Stated

© 2026 IP Infusion Inc. Proprietary

Table 83. show ip ospf multi-area-adjacencies output details (continued)

Field	Description
MTU	Maximum Transmission Unit in bytes.
Process ID	The Process Identifier.
Router ID	As Stated
Network Type	In multi-area adjacencies, this is a point-to-point network with the neighbor.
Cost	A reference bandwidth of 100 Mbps for cost calculation. The formula to calculate the cost is reference bandwidth divided by interface bandwidth.
Transmit Delay	A stated
State	As stated
Timer intervals configured	Hello timer = 10, Dead timer = 40, Wait timer = 40, Retransmit timer = 5
Hello due in	Countdown timer for a Hello message from the neighbor.
Neighbor Count	The number of neighbor.
Adjacent neighbor count	The number of neighbors participating in adjacencies.
Crypt Sequence Number	The 32-bit cryptographic sequence number appended on each OSPF protocol packet.
Hello received, sent	Hello packets sent and received.
DD received, sent	Database Description packets sent and received.
LS-Req received, sent	Link State Request packets sent and received.
LS-Upd received, sent	Link State Update packets sent and received.
LS-Ack received, sent, discarded	

© 2026 IP Infusion Inc. Proprietary

show ip ospf neighbor

Use this command to display information about OSPF neighbors.

Command Syntax

```
show ip ospf (<0-65535>|) neighbor
show ip ospf (<0-65535>|) neighbor all
show ip ospf (<0-65535>|) neighbor interface A.B.C.D
show ip ospf (<0-65535>|) neighbor A.B.C.D
show ip ospf (<0-65535>|) neighbor A.B.C.D detail
show ip ospf (<0-65535>|) neighbor detail
show ip ospf (<0-65535>|) neighbor detail all
```

Parameters

<0-65535>
The ID of the router process

all
Include downstatus neighbor

A.B.C.D
IPv4 address

detail
Details of neighbors

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf neighbor

Total number of full neighbors: 3
OSPF process 1 VRF(default):
Neighbor ID     Pri   State       Dead Time   Address      Interface    Instance ID
1.1.1.1           1   Full/ -     inactive    14.1.1.1     p7p1                0
3.3.3.3           1   Full/ -     00:01:41    15.1.1.2     p8p1                0
3.3.3.3           1   Full/ -     inactive    15.1.1.2     VLINK0
```

OSPF Neighbor Fields

Here is the explanation of the "show command" output fields.

© 2026 IP Infusion Inc. Proprietary

Table 84. OSPF neighbor output details

Field	Description
OSPF process	OSPF process identifier.
Neighbor ID	OSPF router identifier of the neighbor.
Pri	OSPF priority of the neighbor.
State	State of the OSPF neighbor: DependUpon: dummy state Down: no OSPF neighbors detected at this instant Attempt: in an NBMA environment, the router sends unicast hello packets every poll interval to the neighbor, from which hellos have not been received within the dead interval Init: hello packet received, but the receiving router's ID was not included in the hello packet 2-Way: bi-directional communication established between two routers ExStart: master and slave roles determined Exchange: database description packets (DBD) sent Loading: exchange of LSRs (link state request) and LSUs (link state update) packets Full: routers fully adjacent with each other.
Dead Time	If a new Hello is not received within this duration, the neighbor is declared dead.
Address	IP address of neighbor’s interface attached to the network.
Interface	The interface attached to the network on which the neighbor is located.
Instance ID	Instance identifier for the session.

Example: Detail Parameter

This is sample output from the command when the detail parameter is specified:

```
#show ip ospf neighbor detail
 Neighbor 10.10.10.50, interface address 10.10.10.50
 In the area 0.0.0.0 via interface eth0
 Neighbor priority is 1, State is Full, 5 state changes
 DR is 10.10.10.50, BDR is 10.10.10.10
 Options is 0x42 (*|O|-|-|-|-|E|-)
 Dead timer due in 00:00:38
 Neighbor is up for 00:53:07
  Database Summary List 0
 Link State Request List 0
 Link State Retransmission List 0
```

```
Crypt Sequence Number is 0
Thread Inactivity Timer on
Thread  Database Description Retransmission off
```

OSPF Neighbor Detail Fields

Here is the explanation of the "show command" output fields.

Table 85. OSPF neighbor output detail

Field	Description
Neighbor	OSPF router identifier of the neighbor.
interface address	IP address of the neighbor interface.
In the area	Area and interface through which the OSPF neighbor is known.
Neighbor priority	OSPF priority of the neighbor.
State	OSPF state as explained in Table 84.
state changes	Number of state changes since the neighbor was created.
Hello is suppressed	Hello suppression is enabled.
Poll interval	Poll timer value.
DR is	Router ID of the designated router for the interface.
BDR is	Router ID of the backup designated router for the interface.
Options	LSA options as explained in Table 74.
LLS Options	LSDB Resynchronization (LR) Restart Signal (RS-bit) Whether link-local signalling (LLS) and out-of-band (OOB) link-state database resynchronization are performed for nonstop forwarding (NSF).
OOB-Resync in progress (receiver)/last OOB-Resync	Last successful OOB resynchronization with the NSF-capable neighbor. The router waits before taking a neighbor adjacency down if the OOB resynchronization has not taken place since the time a restart signal (Hello packet with RS-bit set) was received from the neighbor.
Dead timer due in	Expected time before declaring the neighbor dead.
Poll due in	Poll timer thread.
Neighbor is up for	Time since the neighbor went into the two-way state.
Database Summary List	Number of LSAs in the neighbor’s database.
Link State Request List	Number of LSAs that need to be received from this neighbor to synchronize the neighbors' topological databases.
Link State Retransmission List	Number of advertisements flooded out an adjacency. To ensure flooding is reliable, advertisements are retransmitted until they are acknowledged.
Crypt Sequence Number is	MD5 cryptographic sequence number.
Thread Inactivity Timer	Off if hello suppression is enabled, on otherwise.
Thread Database	Off if hello suppression is enabled, on otherwise.

© 2026 IP Infusion Inc. Proprietary

Table 85. OSPF neighbor output detail (continued)

Field	Description
Description Retransmission	
Thread Link State Request Retransmission	Off if hello suppression is enabled, on otherwise.
Thread Link State Update Retransmission	Off if hello suppression is enabled, on otherwise.
Thread Poll Timer	Whether the poll timer thread is on.
Bidirectional Forwarding Detection is enabled	Status of BFD, enabled or disabled.

Example: Hello-Suppression Option

This is sample output from the command when the detail parameter is specified and Hello-Suppression is enabled:

```
#sh ip os neighbor detail
 Neighbor 1.1.1.1, interface address 14.1.1.1
    In the area 0.0.0.0 via interface p7p1
    Neighbor priority is 1, State is Full, 5 state changes
    Hello is suppressed
    DR is 0.0.0.0, BDR is 0.0.0.0
    Options is 0x62 (-|O|DC|-|-|-|E|-)
    Dead timer due in inactive
    Neighbor is up for 00:05:03
    Database Summary List 0
    Link State Request List 0
    Link State Retransmission List 0
    Crypt Sequence Number is 0
    Thread Inactivity Timer off
    Thread Database Description Retransmission off
    Thread Link State Request Retransmission off
    Thread Link State Update Retransmission off
```

show ip ospf route

Use this command to display the OSPF routing table.

Command Syntax

```
show ip ospf (<0-65535>|) route ( A.B.C.D |A.B.C.D/M |summary |)
show ip ospf (<0-65535>|) route ( A.B.C.D |A.B.C.D/M |summary | fast-reroute |)
```

Parameters

<0-65535>
Router process identifier.

A.B.C.D
Single route.

A.B.C.D/M
Single exact match route.

summary
Route counts.

fast-reroute
Fast-reroute routes.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf route
OSPF process 10:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
C 50.0.0.0/24 [10] is directly connected, eth1, Area 0.0.0.10
C 60.0.0.0/24 [10] is directly connected, eth3, Area 0.0.0.10
OSPF process 15:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
C 80.0.0.0/24 [1] is directly connected, eth4, Area 0.0.0.15
```

Header Fields

Each entry in this table has a code preceding it indicating the source of the routing entry.

Here is the explanation of the "show command" output fields.

Table 86. route codes

Code	Meaning	Description
C	connected	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from routing protocols.
O	OSPF	Modifiers: IA - OSPF inter area N1 - OSPF NSSA external type 1 N2 - OSPF NSSA external type 2 E1 - OSPF external type 1 E2 - OSPF external type 2
D	discard	An ABR or ASBR performing summarization installs a discard route in its routing table for the summarized network range to prevent routing loops where portions of the summarized network range do not have a more specific route in the RIB. External and internal discard route entries are installed by default. During route summarization, routing loops can happen if data sent to a nonexisting network appears to be a part of the summary, and the router doing the summarization has a less specific route that points back to the sending router for the network.

Route Entry Fields

Here is the explanation of the "show command" output fields.

Table 87. route entry output details

Field	Description
Codes	As explained in Table 86.
IP address	IP address of the remote network.
Metric	For OSPF the metric is cost, which indicates the best quality path to use to forward packets.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.
Area	OSPF area identifier

Example: Process Identifier

The following is a sample output with the process identifier parameter.

© 2026 IP Infusion Inc. Proprietary

```
#show ip ospf 10 route
OSPF process 10:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
C 50.0.0.0/24 [10] is directly connected, eth1, Area 0.0.0.10
C 60.0.0.0/24 [10] is directly connected, eth3, Area 0.0.0.10
```

© 2026 IP Infusion Inc. Proprietary

show ip ospf sham-links

Use this command to display sham link information.

Command Syntax

```
show ip ospf (<0-65535>|) sham-links (brief|)
```

Parameters

<0-65535>
The ID of the router process for which information will be displayed.

brief
Display summary of OSPF sham-links.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 5.0.

Examples

The following is the display of the sham link information for two routers, one with the sham link up and one with sham link down.

```
#show ip ospf sham-links
Sham Link SLINK0 to destination 2.2.2.2 is down
  area 0.0.0.1 source 1.1.1.1
  Transmit Delay is 1 sec, State Down,
  Timer intervals , Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in inactive
  No authentication
    Adjacency state Down

#show ip ospf sham-links brief

  OSPF Process ID 1 VRF vrf1
  Total number of slinks: 1
  Shamlink Name    DestinationID  SourceID  Area    Status
  SLINK0          2.2.2.2              1.1.1.1  0.0.0.1  down

  OSPF Process ID 100 VRF default
  Total number of slinks: 0
  Shamlink Name    DestinationID  SourceID  Area    Status

#show ip ospf sham-links
Sham Link SLINK0 to destination 44.44.44.44 is up
  area 0.0.0.2 source 33.33.33.33
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals , Hello 10, Dead 40, Wait 40, Retransmit 5
```

© 2026 IP Infusion Inc. Proprietary

```
    Hello due in 00:00:05
  No authentication
    Adjacency state Full

#show ip ospf sham-links brief

  OSPF Process ID 1 VRF vrf1
  Total number of slinks: 1
  Shamlink Name    DestinationID  SourceID  Area    Status
  SLINK0          44.44.44.44          33.33.33.33 0.0.0.2  up

  OSPF Process ID 100 VRF default
  Total number of slinks: 0
  Shamlink Name    DestinationID  SourceID  Area    Status
```

Here is the explanation of the "show command" output fields.

Table 88. show ip ospf sham-links output details

Field	Description
sham Link	Sham link name, the Destination to which it is connected, and the state of the link.
Area	The area the sham link is connected to
Source	Source address of the sham link
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 0 to 65535. The default is 1. The state is point-to-point.
Timer intervals	The Default values in seconds of the following timers: Hello, Dead, Wait, Retransmit.
Hello due in	A countdown timer that indicates when the next Hello packet should arrive.
Adjacency State	Whether the adjacency state is either up or down.

© 2026 IP Infusion Inc. Proprietary

show ip ospf valid

Use this command to display information about opaque LSAs.

Command Syntax

```
show ip ospf (<0-65535>|) opaque-link valid
```

Parameters

<0-65535>
The ID of the router process for which information will be displayed.

opaque-link
Displays information about the opaque link-local LSAs.

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip ospf 1 opaque-link valid
```

© 2026 IP Infusion Inc. Proprietary

show ip ospf virtual-links

Use this command to display virtual link information.

Command Syntax

```
show ip ospf (<0-65535>|) virtual-links (brief|)
```

Parameters

<0-65535>
The ID of the router process for which information will be displayed.

brief
Display summary of OSPF virtual-links.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is the display of the virtual link information for two routers, one with the virtual link up and one with virtual link down.

```
OcNOS#show ip ospf virtual-links
Virtual Link VLINK0 to router 10.10.0.9 is up
 Transit area 0.0.0.1 via interface eth0
 Transmit Delay is 1 sec, State Point-To-Point,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
 Transit area 0.0.0.1 via interface *
 Transmit Delay is 1 sec, State Down,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in inactive
 Adjacency state Down
```

The following is the display of the virtual link information for two routers, one with the virtual link up and one with virtual link down when flood reduction is enabled

```
OcNOS#show ip ospf virtual-links
Virtual Link VLINK0 to router 10.10.0.9 is up
 Transit area 0.0.0.1 via interface eth0
 Transmit Delay is 1 sec, State Point-To-Point,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
```

© 2026 IP Infusion Inc. Proprietary

```
 Hello due in 00:00:02
 Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
 Transit area 0.0.0.1 via interface *
 Transmit Delay is 1 sec, State Down,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in inactive
 Adjacency state Down

DoNotAge LSA Allowed
```

If Hello-Suppression is enabled

```
OcNOS#sh ip os virtual-links
Virtual Link VLINK0 to router 3.3.3.3 is up
  Transit area 0.0.0.1 via interface p8p1
  Hello suppression enabled
  DoNotAge LSA allowed
  Local address 15.1.1.1/32
  Remote address 15.1.1.2/32
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in inactive
  No authentication
    Adjacency state Full
```

Here is the explanation of the "show command" output fields.

Table 89. show ip ospf virtual-links output details

Field	Description
Virtual Link	Virtual link name, the router ID to which it is connected, and the state of the link.
Transit area	Transit area ID, the interface it uses, and its instance ID – an Instance ID should default to 0. It is only necessary to assign a value other than 0 on those links that will contain multiple separate communities of OSPF routers.
Local address	The local IP address and subnet mask.
Remote address	The remote IP address and subnet mask.
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 0 to 65535. The default is 1. The state is point-to-point.
Timer intervals configured	The configured values in seconds of the following timers: Hello, Dead, Wait, Retransmit.
Hello due in	A countdown timer that indicates when the next Hello packet should arrive.
Adjacency State	Whether the adjacency state is either up or down.

© 2026 IP Infusion Inc. Proprietary

show ip protocols

Use this command to display OSPF process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols ospf
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This is an example of the output from the `show ip protocols` command:

```
#show ip protocols
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
 Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
 192.30.30.0/24
 192.40.40.0/24
  Routing Information Sources:
 GatewayDistanceLast Update
  Distance: (default is 110)
 AddressMaskDistance List
```

Here is the explanation of the "show command" output fields.

Table 90. show ip protocols output details

Field	Description
Routing Protocol is "ospf 200"	Specifies the routing protocol used.
Invalid after 0 seconds	Specifies the value of the invalid parameter.

© 2026 IP Infusion Inc. Proprietary

Table 90. show ip protocols output details (continued)

Field	Description
Hold down 0	Specifies the current value of the hold-down parameter.
Flushed after 0	Specifies the time in seconds after which the individual routing information will be thrown (flushed) out.
Outgoing update	Specifies whether the outgoing filtering list has been set.
Incoming update	Specifies whether the incoming filtering list has been set.
Redistributing	Lists the protocol that is being redistributed.
Routing for Networks	Specifies the networks for which the routing process is currently injecting routes.
Routing Information Sources	Lists all the routing sources the IP Infusion software is using to build its routing table.

© 2026 IP Infusion Inc. Proprietary

show ip route fast-reroute

Use this command to display routes with alternate next hops.

Command Syntax

```
show ip route fast-reroute
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip route fast-reroute
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area ,p - stale info
       * - candidate default

IP Route Table for VRF "default"
O       10.1.1.0/24 [110/10] via 20.1.1.1, eth1, 00:00:34
                    [FRR-NH] via 50.1.1.2, eth2

O       30.1.1.0/24 [110/20] via 20.1.1.1, eth1, 00:00:34
                    [FRR-NH] via 50.1.1.2, eth2

O       60.1.1.0/24 [110/15] via 50.1.1.2, eth2, 00:02:27
                    [FRR-NH] via 20.1.1.1, eth1

O       70.1.1.0/24 [110/20] via 20.1.1.1, eth1, 00:02:27
                    [FRR-NH] via 50.1.1.2, eth2

O       80.1.1.0/24 [110/20] via 50.1.1.2, eth2, 00:02:27
```

© 2026 IP Infusion Inc. Proprietary

shutdown

Use the this command to temporarily shut down a protocol in the least disruptive manner and to notify its neighbors that it is going away.

Use the no parameter of this command.

Command Syntax

```
shutdown
no shutdown
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#shutdown

#configure terminal
(config)#router ospf 100
(config-router)#no shutdown
```

© 2026 IP Infusion Inc. Proprietary

snmp context-name

Use this command to configure the SNMP context name which will be mapped to each OSPFv2 instance. When context name is configured OSPF OID will be registered with SNMP to that context.

Use no form of the command to un-map the SNMP context name from OSPFv2 instance and unregister OSPF OID from SNMP.

Note: `snmp context-name` will not be allowed in default OSPF context.

Command Syntax

```
snmp context-name <WORD>
no snmp context-name <WORD>
```

Parameters

WORD

SNMP context-name mapped to ospf instance. Max length is 32.

Default

None

Command Mode

Router OSPF mode

Applicability

This command was introduced before OcNOS version 5.1.

Examples

```
(config)#router ospf 1
(config-router)#snmp context-name context1
```

snmp restart ospf

Use this command to restart SNMP in OSPF.

Command Syntax

```
snmp restart ospf
```

Parameter

None

Default

By default, SNMP restart is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart ospf
```

© 2026 IP Infusion Inc. Proprietary

summary-address

Use this command to summarize or suppress external routes with the specified address range.

Use the `no` option with this command to disable summary address.

An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This minimizes the size of the OSPF link state database.

Command Syntax

```
summary-address (A.B.C.D/M | A.B.C.D A.B.C.D) (not-advertise|tag <0-4294967295>|)
no summary-address (A.B.C.D/M | A.B.C.D A.B.C.D) (not-advertise|tag)
```

Parameters

A.B.C.D/M
The range of addresses given as IPv4 starting address and a mask.

A.B.C.D
IP summary prefix e.g. i.i.i.i

A.B.C.D
IP summary prefix mask e.g. m.m.m.m

not-advertise
Suppress routes that match the range.

tag <0-4294967295>
Set tag value to use as a “match” value for controlling redistribution via route maps.

Default

By default, tag value is 0

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example uses the `summary-address` command to aggregate external LSAs that match the network 172.16.0.0/24 and assign a tag value of 3.

```
#configure terminal
(config)#router ospf 100
```

© 2026 IP Infusion Inc. Proprietary

```
(config-router)#summary-address 172.16.0.0/16 tag 3
```

te-metric

This command sets the traffic engineering (TE) metric for an interface.

The traffic engineering metric is used in OSPF-TE Link State Advertisements. If the traffic engineering metric is not set, the ip ospf cost (page 2459) value for an interface is used in OSPF-TE Link State Advertisements.

Use the no parameter with this command to set the traffic engineering metric to its default.

Command Syntax

```
te-metric <1-65535>
no te-metric
```

Parameters

<1-65535>
Traffic engineering metric.

Default

By default, the ip ospf cost (page 2459) value for an interface is used.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#te-metric 6
```

© 2026 IP Infusion Inc. Proprietary

timers lsa arrival

This command sets the minimum interval to accept the same link-state advertisement (LSA) from OSPF neighbors.

Use the no form of this command to restore the default value.

Command Syntax

```
timers lsa arrival <0-600000>
no timers lsa arrival
```

Parameters

<0-600000>

The minimum delay in milliseconds between accepting the same LSA from neighbors.

Default

By default, Minimum LSA Arrival timer is 1 sec.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#timers lsa arrival 5000
```

© 2026 IP Infusion Inc. Proprietary

timers spf exp

Use this command to set the Shortest-Path First (SPF) best-path schedule minimum and maximum delay between receiving a change to SPF calculation in milliseconds.

Use no parameter of this command to unset the SPF best-path schedule.

Command Syntax

```
timers spf exp <0-2147483647> <0-2147483647>
no timers spf exp
```

Parameters

<0-2147483647>

The minimum delay in milliseconds between receiving a change to SPF calculation.

<0-2147483647>

The maximum delay in milliseconds between receiving a change to SPF calculation.

Default

Default minimum delay: 500 milliseconds

Default maximum delay: 50000 milliseconds (50 seconds)

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#timers spf exp 300 300
```

© 2026 IP Infusion Inc. Proprietary

timers throttle lsa

This command sets the rate-limiting intervals for OSPF link-state advertisement (LSA) generation.

Use the no form of this command to restore the default values.

Command Syntax

```
timers throttle lsa all <0-600000> <1-600000> <1-600000>
no timers throttle lsa all
```

Parameters

<0-600000>

Start interval: The minimum delay in milliseconds for the generation of LSAs. The first instance of LSA is always generated immediately upon a local OSPF topology change. The generation of the next LSA is not before the start interval.

<1-600000>

Hold interval: The hold time in milliseconds. This value is used to calculate the subsequent rate limiting times for LSA generation.

<1-600000>

Maximum interval: The maximum wait time in milliseconds between generation of the same LSA.

Default

Default start interval: 0 milliseconds

Default hold interval: 5000 milliseconds

Default maximum interval: 5000 milliseconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#timers throttle lsa all 200 10000 45000
```

© 2026 IP Infusion Inc. Proprietary

OSPFv2 Graceful Restart Commands

This section describes the OSPFv2 graceful restart commands.

action interface 2550
capability restart 2551
event nbr 2552
debug ip ospf graceful-restart 2553
if-event-track ospf event 2554
ospf restart grace-period 2555
ospf restart helper 2556
restart ip ospf graceful 2557

© 2026 IP Infusion Inc. Proprietary

action interface

Configure action for an interface whose cost has to be updated on neighbor going down.

Use the no parameter with this command to remove the configs.

Command Syntax

```
action interface IFNAME cost <1-65535>
```

Parameters

interface
Apply action on interface

IFNAME
Interface's name

cost
Interface cost

<1-65535>
cost

Command Mode

ospf interface event mode (config-ospf-if-event)

Default

None

Applicability

This command was introduced before OcNOS version 6.3.0.

Example

```
(config-ospf-if-event)#action interface eth1 cost 100
(config-ospf-if-event)#commit
(config-ospf-if-event)#no action interface eth1 cost
(config-ospf-if-event)#commit
```

© 2026 IP Infusion Inc. Proprietary

capability restart

Use this command to enable OSPF graceful restart or restart signaling. If a router is not restart-enabled, it cannot enter graceful restart mode and act as a helper.

Use the `no` parameter with this command to disable the features.

Command Syntax

```
capability restart graceful
no capability restart graceful
```

Parameters

None

Default

By default, OSPF graceful restart or restart signaling is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability restart graceful

(config)#router ospf 100
(config-router)#no capability restart  graceful
```

© 2026 IP Infusion Inc. Proprietary

event nbr

Configure events with OSPF neighbor id to monitor the state of OSPF neighbor in order to trigger events on any of the down states.

Use the `no` parameter with this command to remove the configuration.

Command Syntax

```
event nbr A.B.C.D down
```

Parameters

nbr
Configure neighbor sub-event

A.B.C.D
Destination IPv4 address

down
Event type down

Default

None

Command Mode

ospf interface event mode (config-ospf-if-event)

Applicability

This command was introduced before OcNOS version 6.3.0.

Example

```
(config-ospf-if-event)#event nbr 10.1.1.1 down
(config-ospf-if-event)#commit
(config-ospf-if-event)#no event nbr 10.1.1.1 down
(config-ospf-if-event)#commit
```

© 2026 IP Infusion Inc. Proprietary

debug ip ospf graceful-restart

Use this command to specify debugging option for OSPF graceful restart.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ip ospf graceful-restart (detail|terse|)
no debug ip ospf graceful-restart (detail|terse|)
```

Parameters

`detail`
Debug OSPF graceful restart detail information

`terse`
Debug OSPF graceful restart summary information

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf graceful-restart detail
```

© 2026 IP Infusion Inc. Proprietary

if-event-track ospf event

Use this command to configure an interface-track event with a valid event name with either matching all events or matching any of the events configured.

Use the no parameter with this command to remove the configs.

Command Syntax

```
if-event-track ospf event NAME match < all | any >
```

Parameters

ospf
OSPF specific commands

event
Configure the event

NAME
Event Name

match
Match criteria

all
Match criteria all

any
Match criteria any

Default

None

Command Mode

Config Mode

Applicability

This command was introduced before OcNOS version 6.3.0.

Example

```
(config)#if-event-track ospf event test match all
(config-ospf-if-event)#commit
(config-ospf-if-event)#exit
(config)#no if-event-track ospf event test
(config)#commit
```

© 2026 IP Infusion Inc. Proprietary

ospf restart grace-period

Use this command to set the grace period for restarting the router.

If graceful restart is enabled, NSM is notified about the grace period. If the OSPF daemon unexpectedly shuts down, NSM sends this value to the OSPF daemon when it comes up again which uses this value to end the graceful state.

Use the `no` parameter with this command to revert to the default.

Command Syntax

```
ospf restart grace-period <2-1800>
no ospf restart grace-period
```

Parameters

<2-1800>
Grace period in seconds.

Default

The default grace period for restarting the OSPF router is 120 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ospf restart grace-period 250
```

© 2026 IP Infusion Inc. Proprietary

ospf restart helper

Use this command to configure the helper behavior for graceful restart.

Use the `no` parameter with this command to revert to default.

Command Syntax

```
ospf restart helper max-grace-period <2-1800>
ospf restart helper never (router-id A.B.C.D|)
no ospf restart helper never
no ospf restart helper (never router-id (A.B.C.D | all) | max-grace-period|)
```

Parameters

`max-grace-period`

Help only if received grace-period is less than this value.

<2-1800>

Help only if received grace-period is less than this value.

`router-id`

Neighbor to never to act as helper.

A.B.C.D

Router ID of neighbor to never to act as helper.

never

Prevent the neighbor from entering helper mode.

all

All neighbors to never to act as helper.

Default

By default, router behave as helper. To disable it as helper, `ospf restart helper never` command should be configured. `ospf restart helper max-grace-period` – Max-grace-period to function as helper. If not configured, value will be the grace-period in restarting node.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ospf restart helper never router-id 1.1.1.1

#configure terminal
(config)#no ospf restart helper never router-id all
```

© 2026 IP Infusion Inc. Proprietary

restart ip ospf graceful

Use this command to restart OSPF gracefully.

After this command is executed, the router immediately shuts down. NSM is notified that OSPF has shut down gracefully. NSM preserves routes installed by OSPF until the grace period expires.

Command Syntax

```
restart ip ospf graceful (grace-period <1-1800>|)
```

Parameters

<1-1800>
Grace period in seconds.

Default

By default, restart ospf graceful is disabled. Default value of `grace-period` is 120 seconds.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#restart ip ospf graceful grace-period 200

#restart ospf graceful
% Warning : OSPF process will stop and needs to restart manually,
You may loose ospf configuration, if not saved
Proceed for graceful restart? (y/n):y
```

© 2026 IP Infusion Inc. Proprietary

OSPFv3 Graceful Restart Commands

This section describes the OSPFv3 graceful restart commands.

capability restart 2559
ipv6 ospf restart grace-period 2560
ipv6 ospf restart helper 2561
ipv6 ospf restart planned-only 2562
restart ipv6 ospf graceful 2563

© 2026 IP Infusion Inc. Proprietary

capability restart

Use this command to enable OSPFv3 graceful restart capability. If a router is not restart-enabled, it cannot enter graceful restart mode and act as a helper.

Use the `no` parameter with this command to disable the feature.

Command Syntax

```
capability restart graceful
no capability restart
```

Parameter

None

Default

By default, capability restart graceful is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf 100
(config-router)#capability restart graceful

(config)#router ipv6 ospf 100
(config-router)#no capability restart
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf restart grace-period

Use this command to enable the graceful restart feature and set the grace period for restarting the router.

If graceful restart is enabled, NSM is notified about the grace period. If the OSPF daemon unexpectedly shuts down, NSM sends this value to the OSPF daemon when it comes up again which uses this value to end the graceful state.

Use the `no` parameter with this command to revert to the default grace period.

Command Syntax

```
ipv6 ospf restart grace-period <2-1800>
no ipv6 ospf restart grace-period
```

Parameters

<2-1800>
Grace period in seconds.

Default

By default, grace period is 120 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 ospf restart grace-period 250
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf restart helper

Use this command to configure the helper behavior for graceful restart.

Use the `no` parameter with this command to revert to the default.

Command Syntax

```
ipv6 ospf restart helper {max-grace-period <2-1800>}
ipv6 ospf restart helper never (router-id A.B.C.D|)
no ipv6 ospf restart helper
no ipv6 ospf restart helper never
no ipv6 ospf restart helper {max-grace-period|never router-id (A.B.C.D|all)}
```

Parameters

<2-1800>
Help only if received grace-period is less than this value.

A.B.C.D
Router ID of neighbor to never to act as helper.

never
Prevent the neighbor from entering helper mode.

max-grace-period

Help only if received grace-period is less than this value.

router-id
Router of neighbor to never to act as helper.

Default

By default, router behave as helper. To disable it as helper, `ospf restart helper never` command should be configured. `ospf restart helper max-grace-period` – Max-grace-period to function as helper. If not configured, value will be the grace-period in restarting node.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 ospf restart helper never router-id 1.1.1.1

#configure terminal
(config)#no ipv6 ospf restart helper never
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf restart planned-only

Use this command to configure the OSPFv3 GR support for only planned restart.

Use the `no` parameter with this command to revert to the default.

Note: OSPFv3 supports only planned restart. Hence this command configuration and un-configuration does not have any functionality impact

Command Syntax

```
ipv6 ospf restart planned-only
no ipv6 ospf restart planned-only
```

Parameters

None

Default

By default, OSPFv3 supports planned restart only.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 ospf restart planned-only

#configure terminal
(config)#no ipv6 ospf restart planned-only
```

© 2026 IP Infusion Inc. Proprietary

restart ipv6 ospf graceful

Use this command to restart OSPFv3 gracefully.

After this command is executed, the router immediately shuts down. NSM is notified that OSPF has shut down gracefully. NSM preserves routes installed by OSPF until the grace period expires.

Command Syntax

```
restart ipv6 ospf graceful (grace-period <1-1800>|)
```

Parameters

<1-1800>
Grace period in seconds.

Default

By default, restart ipv6 ospf graceful is disabled. Default value of grace-period is 120 seconds.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#restart ipv6 ospf graceful grace-period 200

#restart ipv6 ospf graceful
% Warning : ipv6 OSPF process will stop and needs to restart manually,
You may loose ospf configuration, if not saved
Proceed for graceful restart? (y/n):y
```

OSPFv3 Commands

This section provides an alphabetized reference for each of the OSPFv3 commands. It includes the following commands:

abr-type 2566
area default-cost 2567
area nssa 2568
area range 2570
area stub 2571
area virtual-link 2572
auto-cost reference bandwidth 2574
bfd all-interfaces 2575
clear ipv6 ospf process 2576
debug ipv6 ospf 2577
debug ipv6 ospf bfd 2578
debug ipv6 ospf events 2579
debug ipv6 ospf ifsm 2580
debug ipv6 ospf lsa 2581
debug ipv6 ospf nfsm 2582
debug ipv6 ospf nsm 2583
debug ipv6 ospf packet 2584
debug ipv6 ospf retransmission 2585
debug ipv6 ospf rib 2586
debug ipv6 ospf route 2587
default-information originate 2588
default-metric 2590
distance 2591
distribute bgp-ls 2592
distribute-list 2593
enable db-summary-opt 2595
ipv6 ospf authentication 2596
ipv6 ospf bfd 2597
ipv6 ospf cost 2598
ipv6 ospf dead-interval 2599
ipv6 ospf display route single-line 2600
ipv6 ospf hello-interval 2601
ipv6 ospf link-lsa-suppression 2602
ipv6 ospf mtu 2603
ipv6 ospf mtu-ignore 2604

abr-type

Use this command to set an OSPFv3 Area Border Router (ABR) type.

Use the `no` parameter with this command to revert the ABR type to the default setting (`cisco`).

Specifying the ABR type allows better functioning in a multi-vendor environment. The ABR types are:

- Cisco (RFC 3509): A router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM (RFC 3509): A router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard (RFC 2328): A router is considered an ABR if it has more than one area actively attached to it.

Command Syntax

```
abr-type (cisco|ibm|standard)
no abr-type
```

Parameters

`cisco`
Specify an alternative ABR using Cisco implementation. This is the default ABR type.

`ibm`
Specify an alternative ABR using IBM implementation.

`standard`
Specify a standard ABR.

Default

Cisco

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#abr-type standard
```

© 2026 IP Infusion Inc. Proprietary

area default-cost

Use this command to specify the cost for default summary route sent into a stub or a NSSA area. If an area is configured as a stub, the OSPFv3 router originates one type-3 inter-area-prefix-LSA into the stub area. This command changes the metric for this LSA.

Use the `no` parameter with this command to remove the assigned default cost.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) default-cost (<0-16777215>)
no area (A.B.C.D|<0-4294967295>) default-cost
```

Parameters

`A.B.C.D`
OSPF Area ID in IPv4 address format.

`<0-4294967295>`
OSPF Area ID as a decimal value.

`<0-16777215>`
The advertised cost for the default summary route used for a stub or NSSA area .

Default

1

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1  default-cost 10
```

© 2026 IP Infusion Inc. Proprietary

area nssa

Use this command to set an area as a Not-So-Stubby-Area (NSSA). There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. However, the external routes from other areas still do not enter the NSSA. You can configure an area to be a stub area or an NSSA, but not both.

This command simplifies administration when connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as a NSSA.

Use the `no` form of this command to make an area a normal area.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) nssa
area (A.B.C.D|<0-4294967295>) nssa {translator-role (candidate|always)|stability-interval <0-
2147483647>|no-redistribution|default-information-originate (metric <0-16777214>|metric-type <1-
2>|)|no-summary}
no area (A.B.C.D|<0-4294967295>) nssa
no area (A.B.C.D|<0-4294967295>) nssa {translator-role|stability-interval|no-redistribution|default-
information-originate|no-summary}
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

translator-role
NSSA-ABR translator role:

candidate
Translate NSSA-LSA to Type-5 LSA if router is elected.

always
Always translate NSSA-LSA to Type-5 LSA.

stability-interval
Stability timer for a NSSA area. If an elected translator determines its services are no longer required, it continues to perform its duties for this time interval. This minimizes excess flushing of translated Type-7 LSAs and provides a more stable translator transition.

<0-2147483647>
Stability interval in seconds.

no-redistribution
Do not redistribute into the NSSA.

default-information-originate
Originate Type-7 default LSA into the NSSA.

metric
Specify metric for default routes.

<0-16777214>
Specify metric value.

© 2026 IP Infusion Inc. Proprietary

metric-type
Specify metric type (see RFC 3101).

<1-2>
Specify metric type:

1: Type 1 external route

2: Type 2 external route

no-summary
Do not inject inter-area routes into the NSSA.

translate-candidate
Translate NSSA-LSA to Type-5 LSA if router is elected.

translate-always
Always translate NSSA-LSA to Type-5 LSA.

Default

Candidate.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ipv6 ospf
(config-router)#area 3 nssa translator-role candidate no-redistribution default-information-originate
metric 34 metric-type 2
```

© 2026 IP Infusion Inc. Proprietary

area range

Use this command to configure the OSPF address range. This command summarizes intra-area routes for an area. The single summary route is then advertised to other areas by the Area Border Routers (ABRs). Routing information is condensed at area boundaries and outside the area. If the network numbers in an area are assigned in a way such that they are contiguous, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

Use the `no` parameter with this command to remove the assigned area range.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) range X:X::X:X/M
area (A.B.C.D|<0-4294967295>) range X:X::X:X/M (not-advertise|)
no area (A.B.C.D|<0-4294967295>) range X:X::X:X/M (not-advertise|)
```

Parameters

`A.B.C.D`
OSPF Area ID in IPv4 address format.

`<0-4294967295>`
OSPF Area ID as a decimal value.

`X:X::X:X/M`
The area IPv6 range prefix and length .

`not-advertise`
Does not advertise this range.

Default

Advertised

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 range 2000::/3
```

area stub

Use this command to define an area as a stub area on all routers. There are two stub area router configuration commands: the `stub` and commands. In all routers attached to the stub area, configure the area by using the `stub` option of the area command. For an area border router (ABR) attached to the stub area, use the `area` command.

Use the `no` form of this command to make an area a normal area.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) stub
area (A.B.C.D|<0-4294967295>) stub no-summary
no area (A.B.C.D|<0-4294967295>) stub
no area (A.B.C.D|<0-4294967295>) stub no-summary
```

Parameters

A.B.C.D
OSPF Area ID in IPv4 address format.

<0-4294967295>
OSPF Area ID as a decimal value.

no-summary
Stops an ABR from sending summary link advertisements into the stub area.

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 stub no-summary
```

© 2026 IP Infusion Inc. Proprietary

area virtual-link

Use this command to configure a link between two backbone areas that are physically separated through other nonbackbone areas.

Use the `no` parameter with this command to remove the virtual link.

In OSPFv3, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network.

Configure the `hello-interval` to be the same for all routers attached to a common network. If the `hello-interval` is short, the router detects topological changes faster, but more routing traffic follows.

The `retransmit-interval` is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The `transmit-delay` is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet are increased by this amount. Set the transmit-delay to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D fall-over bfd
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D (dead-interval <1-65535>|hello-interval <1-
65535>|retransmit-interval <1-1800>|transmit-delay <1-1800>)
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D instance-id (<0-31>|<64-95>)
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D fall-over bfd
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D (dead-interval|hello-interval|retransmit-
interval|transmit-delay)
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D instance-id
```

Parameters

`A.B.C.D`
OSPF Area ID in IP64 address format.

`<0-4294967295>`
OSPF Area ID as a decimal value.

A.B.C.D
Specify router ID associated with a virtual link neighbor.

`dead-interval`
The interval in seconds during which no packets are received and after which the router acknowledges a neighboring router as off-line.

<1-65535>
The timer interval.

`hello-interval`
The interval in seconds the router waits before it sends a hello packet.

<1-65535>
The timer interval.

© 2026 IP Infusion Inc. Proprietary

retransmit-interval
The interval in seconds the router waits before it retransmits a packet.

<1-1800>
The timer interval.

transmit-delay
The interval in seconds the router waits before it transmits a packet.

<1-1800>
The timer interval.

instance-id
The OSPFv3 instance.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

fall-over bfd
Fall-over Bidirectional Forwarding Detection (BFD).

Default

Hello interval:10 seconds.

Dead interval:40 seconds.

Retransmit interval: 5 seconds.

Transmit delay: 1 second

Instance-id: 0

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 virtual-link 10.10.11.50 hello 5 dead 10
(config-router)#area 1 virtual-link 10.10.11.50 instance-id 1
(config-router)#area 1 virtual-link 10.10.11.50 fall-over bfd
```

© 2026 IP Infusion Inc. Proprietary

auto-cost reference bandwidth

Use this command to control how OSPFv3 calculates default metrics for the interface.

By default, OSPFv3 calculates the OSPFv3 metric for an interface by dividing the reference bandwidth by the interface bandwidth. The auto-cost command is used to differentiate high bandwidth links. For multiple links with high bandwidth, specify a larger reference bandwidth value to differentiate cost on those links.

Use the `no` form of this command to assign cost based only on the interface bandwidth.

Command Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameters

<1-4294967>
The reference bandwidth in Mbps per second.

Default

100Mbps

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example changes the reference bandwidth to 1Gbps to change the Fast Ethernet interface cost from 1 to 10.

```
#configure terminal
(config)#router ipv6 ospf 1
(config-router)#auto-cost reference-bandwidth 1000

(config)#router ipv6 ospf 1
(config-router)#no auto-cost reference-bandwidth
```

© 2026 IP Infusion Inc. Proprietary

bfd all-interfaces

Use this command to enable Bidirectional Forwarding Detection (BFD) on all interfaces.

Use the `no` form of this command to disable BFD.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

BFD is disabled on all OSPF enabled interfaces.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example changes the reference bandwidth to 1Gbps to change the Fast Ethernet interface cost from 1 to 10.

```
#configure terminal
(config)#router ipv6 ospf 1
(config-router)#bfd all-interfaces
```

© 2026 IP Infusion Inc. Proprietary

clear ipv6 ospf process

Use this command to clear and restart all OSPFv3 routing processes or a given OSPFv3 routing process.

Command Syntax

```
clear ipv6 ospf (WORD|) process
```

Parameters

WORD
OSPFv3 process tag.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 ospf Tag1 process
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf

Use this command to specify all debugging options for OSPFv3.

Use the `no` form of this command to disable the options.

Command Syntax

```
debug ipv6 ospf (all|bfd|events|ifsm|lsa|nfsm|nsm|packet|retransmission|rib|route|)
no debug ipv6 ospf (all|bfd|events|ifsm|lsa|nfsm|nsm|packet|retransmission|rib|route|)
no debug all ipv6 ospf
no debug all
```

Parameters

all
Enables all debugging information.

bfd
Debug OSPFv3 Bidirectional Forwarding Detection. (see debug ipv6 ospf bfd (page 2578))

events
Debug OSPFv3 events (see debug ipv6 ospf events (page 2579)).

ifsm
Debug OSPFv3 Interface State Machines (see debug ipv6 ospf ifsm (page 2580)).

lsa
Debug OSPFv3 Link State Advertisements (see debug ipv6 ospf lsa (page 2581)).

nfsm
Debug OSPFv3 Neighbor State Machines (see debug ipv6 ospf nfsm (page 2582)).

nsm
Debug OSPFv3 NSM information (see debug ipv6 ospf nsm (page 2583)).

packet
Debug OSPFv3 packets (see debug ipv6 ospf packet (page 2584)).

retransmission
Debug OSPFv3 retransmission information. (see debug ipv6 ospf retransmission (page 2585))

rib
Debug OSPFv3 Routing Information Base.(see debug ipv6 ospf rib (page 2586))

route
Debug OSPFv3 route information (see debug ipv6 ospf route (page 2587)).

Command Mode

Privileged execution modeand Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf all
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf bfd

Use this command to specify the debugging options for OSPFv3 Bidirectional Forwarding Detection

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf bfd
no debug ipv6 ospf bfd
```

Parameters

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf bfd
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf events

Use this command to display debug information related to OSPF internal events. Use this command without parameters to turn on all the options.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf events {(abr|asbr|os|router|vlink|nssa)|}
no debug ipv6 ospf events {(abr|asbr|os|router|vlink|nssa)|}
```

Parameters

`abr`
Debug ABR events

`asbr`
Debug ASBR events

`os`
Debug OS interaction events

`router`
Debug other router events

`vlink`
Debug virtual link events

`nssa`
Debug NSSA events

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ipv6 ospf events abr
#debug ipv6 ospf events asbr
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf ifsm

Use this command to specify debugging options for OSPFv3 Interface Finite State Machine (IFSM) troubleshooting.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf ifsm ({events|status|timers}|)
no debug ipv6 ospf ifsm ({events|status|timers}|)
```

Parameters

`events`
Debug IFSM event information.

`status`
Debug IFSM status information.

`timers`
Debug IFSM timer information.

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf ifsm status
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf lsa

Use this command to specify the debugging options for OSPFv3 Link State Advertisements (LSAs).

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf lsa {(generate|flooding|install|maxage|refresh)|}
no debug ipv6 ospf lsa {(generate|flooding|install|maxage|refresh)|}
```

Parameters

`generate`
Debug LSA generation.

`flooding`
Debug LSA flooding.

`install`
Debug LSA installation.

`maxage`
Debug the maximum age processing.

`refresh`
Debug LSA refresh.

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf lsa
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf nfsm

Use this command to specify debugging options for OSPFv3 Neighbor Finite State Machines (NFSMs).

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf nfsm {(events|status|timers)|}
no debug ipv6 ospf nfsm {(events|status|timers)|}
```

Parameters

`events`
Debug NFSM event information.

`status`
Debug NFSM status information.

`timers`
Debug NFSM timer information.

Command Mode

Privileged execution modeand Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf nfsm events
#no debug ipv6 ospf nfsm timers
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf nsm

Use this command to specify the debugging options for OSPFv3 NSM information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf nsm {(interface|redistribute)|}
no debug ipv6 ospf nsm {(interface|redistribute)|}
```

Parameters

`redistribute`
Debug redistribute.

`interface`
Debug the NSM interface.

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf nsm interface
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf packet

Use this command to specify the packet debugging options for OSPFv3 information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)
no debug ipv6 ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv| detail}|)
```

Parameters

`hello`
Debug OSPFv3 hello.

`dd`
Debug OSPFv3 database description.

`ls-request`
Debug OSPFv3 link state request.

`ls-update`
Debug OSPFv3 link state update.

`ls-ack`
Debug OSPFv3 link state acknowledgment.

`send`
Debug packets sent

`recv`
Debug packets received.

`detail`
Debug detail information.

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf packet ls-request
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf retransmission

Use this command to specify the debugging options for OSPFv3 retransmission information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf retransmission
no debug ipv6 ospf retransmission
```

Parameters

None

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf  retransmission
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf rib

Use this command to specify the debugging options for OSPFv3 RIB information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf rib {(interface|redistribute)|}
no debug ipv6 ospf rib {(interface|redistribute)|}
```

Parameters

`redistribute`
Debug redistribute.

`interface`
Debug the NSM interface.

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf rib interface
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 ospf route

Use this command to specify which route calculation to debug. Use this command without parameters to turn on all the options.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf route {(ase|ia|install|spf)|}
no debug ipv6 ospf route {(ase|ia|install|spf)|}
```

Parameters

`ase`
Debug external route calculations.

`ia`
Debug inter-area route calculations.

`install`
Debug the route installation.

`spf`
Debug the SPF calculation.

Command Mode

Privileged execution modeand Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ipv6 ospf route
#debug ipv6 ospf route ia
```

© 2026 IP Infusion Inc. Proprietary

default-information originate

Use this command to create a default external route into an OSPF routing domain.

The system acts like an Autonomous System Boundary Router (ASBR) when you use the `default-information originate` command to redistribute routes into an OSPF routing domain. An ASBR does not by default generate a default route into the OSPF routing domain.

When you give the `default-information originate` command, also specify a `route-map` to avoid a dependency on the default network in the routing table.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
default-information originate
default-information originate {metric <0-16777214>|metric-type (1|2)|route-map WORD|always}
no default-information originate
no default-information originate {metric|metric-type|route-map|always}
```

Parameters

`always`
Used to advertise the default route regardless of whether there is a default route.

metric
Sets the OSPF metric used in creating the default route.

<0-16777214>
Sets the OSPF metric used in creating the default route. The value used is specific to the protocol.

`metric-type`
The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).

1
Sets OSPF External Type 1 metric.

2
Sets OSPF External Type 2 metric (default).

`route-map`
Route map.

`WORD`
Specify the name of route map.

Default

Sets the OSPF metric used in creating the default route. The default metric value is 20. The value used is specific to the protocol. metric-type The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).

2 sets OSPF External Type 2 metric

Command Mode

Router mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#default-information originate always metric 23 metric-type 2 route-map myinfo

(config)#router ipv6 ospf
(config-router)#no default-information originate metric metric-type route-map
```

© 2026 IP Infusion Inc. Proprietary

default-metric

Use this command to set a default metric for OSPF.

A default metric facilitates redistributing routes with incompatible metrics. If the metrics do not convert, the default metric provides an alternative. Use this command to use the same metric value for all redistributed routes. Use this command in conjunction with the redistribute (page 2617) command.

Use the `no` parameter with this command to return to the default state.

Command Syntax

```
default-metric <1-16777214>
no default-metric
```

Parameter

<1-16777214>
Default metric value.

Default

20.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#default-metric 100
```

distance

Use this command to set BGP administrative distances. The administrative distance rates the trustworthiness of a routing information source. A higher distance value means a lower trust rating. For example, an administrative distance of 255 means that the routing information source cannot be trusted and should be ignored.

Use the no form of this command to restore the default value (110).

Command Syntax

```
distance <1-255> <1-255> <1-255>
distance <1-255> A.B.C.D/M (WORD|)
no distance <1-255>
no distance <1-255> A.B.C.D/M (WORD|)
```

Parameters

<1-255>
Distance for BGP routes

A.B.C.D/M
Distance for routes to prefixes whose nexthop matches this address.

WORD
Name of access list to apply to route updates.

Command Mode

Router BGP mode

Defaults

None

Applicability

This command was introduced in OcNOS version 6.0.0.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#distance 100 10.10.10.10/30
```

© 2026 IP Infusion Inc. Proprietary

distribute bgp-ls

Use this command to advertise IGP (OSPFv3) Updates to BGP module. Throttle value is optional, which can be used to delay the transmission of processing and sending updates to BGP

Use the no command to disable this function.

Command Syntax

```
distribute bgp-ls
distribute bgp-ls (throttle <val>)
no distribute bgp-ls
```

Parameters

distribute
Distribute information.

bgp-ls
Link State distribution to BGP.

Default

Disable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 6.6.1.

Examples

```
OcNOS#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router ipv6 ospf 1
(config-router)#distribute bgp-ls throttle 10
```

© 2026 IP Infusion Inc. Proprietary

distribute-list

Use this command to filter networks in routing updates. This command redistributes other routing protocols into the OSPF routing table.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
distribute-list WORD out ((kernel|connected|static|rip|bgp|isis|ospf (WORD|<1-65535>|)))
distribute-list WORD in
no distribute-list WORD out ((kernel|connected|static|rip|bgp|isis|ospf (WORD|<1-65535>|)))
no distribute-list WORD in
```

Parameters

WORD
Specify the name of the access list.

in
Filter incoming routing updates.

out
Filter outgoing routing updates.

kernel
Specify kernel routes.

connected
Specify connected routes.

static
Specify static routes.

rip
Specify RIP routes.

bgp
Specify BGP routes.

isis
Specify IS-IS routes.

ospf
Specify OSPF routes.

WORD
Specify the OSPF process tag. If not specified, redistribute OSPF process with tag "null".

<1-65535>
Specify OSPF process ID <1-65535>. If not specified, redistribute OSPF instance with process ID 0.

Default

None

Command Mode

Router mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the distribution of BGP routing updates based on the access list `list1` (network 172.10.0.0).

```
#configure terminal
(config)#access-list list1 permit 172.10.0.0/16
(config)#router ipv6 ospf 100
(config-router)#distribute-list list1 out bgp
(config-router)#redistribute bgp
```

© 2026 IP Infusion Inc. Proprietary

enable db-summary-opt

Use this command to enable the database summary list optimization for OSPFv3.

When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor if the LSA instance in the summary list is the same as or less recent than the LSA in the database description packet received from the neighbor.

Use the `no` form of the command to disable database summary list optimization.

Command Syntax

```
enable db-summary-opt
no enable db-summary-opt
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#enable db-summary-opt
(config-router)#no enable db-summary-opt
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf authentication

Use this command to enable the authentication and/or confidentiality for OSPFv3 sessions on this interface using crypto map configuration.

Use no form of this command to disable the authentication and/or confidentiality for OSPFv3 sessions.

Command Syntax

```
ipv6 ospf authentication cryptomap WORD
no ipv6 ospf authentication cryptomap WORD
```

Parameters

authentication
IPsec Authentication

cryptomap
Map used to setup IPsec SA

WORD
Name of the Crypto-map

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.0.0.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 ospf authentication cryptomap map1
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf bfd

Use this command to enable Bidirectional Forwarding Detection (BFD).

Use this command with either the no or disable parameter to disable BFD.

Command Syntax

```
ipv6 ospf bfd (disable|)
ipv6 ospf bfd (disable|)instance-id (<0-31>|<64-95>)
no ipv6 ospf bfd (disable|)
no ipv6 ospf bfd (disable|)instance-id (<0-31>|<64-95>)
```

Parameters

disable
Specify to disable BFD.

instance-id
Specify the instance. Default value for instance-id is 0.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast

Default

Disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 ospf bfd instance-id 2
```

Note: Interface level CLI: "ipv6 ospf bfd" will be displayed as "ipv6 ospf bfd instance-id 0" from 5.0 release.

ipv6 ospf cost

Use this command to specify the link-cost described in LSAs.

The cost (or metric) of an interface in OSPF indicates the overhead required to send packets across a certain interface. The value is taken to describe Link State information, and used for route calculation.

Use the `no` parameter with this command to reset the cost to default.

Command Syntax

```
ipv6 ospf cost <1-65535>
ipv6 ospf cost <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf cost
no ipv6 ospf cost instance-id (<0-31>|<64-95>)
```

Parameters

cost

Specify the link-state metric.

<1-65535>

Specify the link-state metric.

instance-id

Specify the instance.

<0-31>

Interface instance ID for IPv6 unicast

<64-95>

Interface instance ID for IPv4 unicast.

Default

10

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf cost 20 instance-id 1
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf dead-interval

Use this command to set the amount of time that the router waits to receive an OSPF hello packet from the neighbor before declaring the neighbor down.

The dead interval is advertised in hello packets. OSPF compares the dead interval in a received packet to the dead interval configured for the receiving interface. If the intervals do not match, the hello packet is discarded.

Use the `no` parameter with this command to reset the interval to default.

Command Syntax

```
ipv6 ospf dead-interval <1-65535>
ipv6 ospf dead-interval <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf dead-interval
no ipv6 ospf dead-interval instance-id (<0-31>|<64-95>)
```

Parameters

dead-interval
Specify the interval.

<1-65535>
Specify the interval in seconds.

instance-id
Specify the instance.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

40 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf dead-interval 20
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf display route single-line

Use this command to display the output of the show ipv6 ospf route (page 2633) command with each route entry in a single-line.

Use the `no` parameter with this command to display the output with each route entry in a multiple lines.

Command Syntax

```
ipv6 ospf display route single-line
no ipv6 ospf display route single-line
```

Parameters

None

Default

show ipv6 ospf route (page 2633) displays routes in multiple lines

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 ospf display route single-line
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf hello-interval

Use this command to specify the interval between `hello` packets.

The hello interval is advertised in the hello packets. An OSPF router compares the hello interval in a received packet to the interval configured for the receiving interface. If this interval does not match, the hello packet is discarded. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.

Use the `no` parameter with this command to reset the interval to default.

Command Syntax

```
ipv6 ospf hello-interval <1-65535>
ipv6 ospf hello-interval <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf hello-interval
no ipv6 ospf hello-interval instance-id (<0-31>|<64-95>)
```

Parameters

hello-interval
Specify the interval.

<1-65535>
Specify the interval in seconds.

instance-id
Specify the instance.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf hello-interval 5 instance-id 1
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf link-lsa-suppression

Use this command to enable or disable link LSA (type 8) suppression. A type 8 LSA gives information about link-local addresses and a list of IPv6 addresses on the link.

If enabled and the interface type is *not* broadcast or NBMA, the router does not send type 8 link LSAs. This implies that other routers on the link determine the router's next-hop address using a mechanism other than the type 8 link LSA. This feature is implicitly disabled if the interface type is broadcast or NBMA.

Command Syntax

```
ipv6 ospf link-lsa-suppression (enable|disable)
ipv6 ospf link-lsa-suppression (enable|disable) instance-id (<0-31>|<64-95>)
```

Parameters

enable
Enable type 8 link LSA suppression

disable
Disable type 8 link LSA suppression (default).

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

Type 8 link LSA suppression is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf  link-lsa-suppression enable
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf mtu

Use this command to set MTU size for OSPFv3 to construct packets based on this value. Whenever OSPFv3 constructs packets, it uses interface MTU size as Maximum IP packet size. This command forces OSPFv3 to use the specified value overriding the actual interface MTU size.

Use the `no` parameter with this command to return to the default value.

Command syntax

```
ipv6 ospf mtu <1280-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf mtu instance-id (<0-31>|<64-95>)
```

Parameters

<1280-65535>
Interface MTU value from OSPFv3's perspective.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

OSPFv3 uses interface MTU derived from the kernel and Instance ID as 0 if not configured.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#interface eth1
(config-if)#ipv6 ospf mtu 1287 instance-id 10
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf mtu-ignore

Use this command to configure OSPF so that it does not check the MTU size during DD (Database Description) exchange.

Use the `no` form of this command to make OSPF check the MTU size during DD exchange.

Command syntax

```
ipv6 ospf mtu-ignore
ipv6 ospf mtu-ignore instance-id (<0-31>|<64-95>)
no ipv6 ospf mtu-ignore
no ipv6 ospf mtu-ignore instance-id (<0-31>|<64-95>)
```

Parameters

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

During the DD exchange process, OSPF checks the MTU size described in DD packets received from its neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#interface eth1
(config-if)#ipv6 ospf mtu-ignore
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf neighbor

Use this command to connect OSPFv3 routers to non-broadcast multi-access (NBMA) networks.

One neighbor entry must be included for each known NBMA neighbor. The neighbor address must be a link-local address.

Note: For point-to-multipoint interfaces, the cost parameter is the only applicable option.

Use the no parameter with this command to remove a configuration.

Command Syntax

```
ipv6 ospf neighbor X:X::X:X (instance-id (<0-31>|<64-95>)|)
ipv6 ospf neighbor X:X::X:X {cost <1-65535>} (instance-id (<0-31>|<64-95>)|)
ipv6 ospf neighbor X:X::X:X {poll-interval <0-4294967295>|priority <0-255>} (instance-id (<0-31>|<64-
95>)|)
no ipv6 ospf neighbor X:X::X:X ({cost|poll-interval|priority}|) (instance-id (<0-31>|<64-95>)|)
```

Parameters

X:X::X:X
Specify a neighbor IP address.

instance-id
Specify the instance.

<0-255>
Specify the instance ID.

cost
Cost of the interface. This parameter does not apply to NBMA networks.

<1-65535>
Cost of the interface.

poll-interval
Dead neighbor polling interval.

<0-4294967295>
Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval.

priority
Specify a priority. This parameter does not apply to point-to-multipoint interfaces.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

Cost is 10.

Poll interval is 120 seconds.

© 2026 IP Infusion Inc. Proprietary

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf neighbor 2000:500::1 cost 2 instance-id 3
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf network

Use this command to set an OSPFv3 network type.

Use the `no` option with this command to return to the default value.

Command Syntax

```
ipv6 ospf network (broadcast|non-broadcast|point-to-multipoint (non-broadcast|)|point-to-point)
(instance-id (<0-31>|<64-95>)|)
no ipv6 ospf network (instance-id (<0-31>|<64-95>)|)
```

Parameters

broadcast
Sets the network type to broadcast.

non-broadcast
Sets the network type to NBMA.

point-to-multipoint
Sets the network type to point-to-multipoint.

non-broadcast
Sets the network type to NBMA.

point-to-point
Sets the network type to point-to-point.

instance-id
Specify the instance.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

Broadcast type

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to set the network to point-to-point type on the eth0 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf network point-to-point
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf priority

Use this command to set the router priority for determining the designated router (DR) for the network.

A router with the higher router priority becomes the DR. If the priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with a nonzero priority value are eligible to become the designated or backup designated router. Configure router priority for broadcast or NBMA networks only and not for point-to-point networks.

Use the `no` parameter with this command to reset the value to default.

Command Syntax

```
ipv6 ospf priority <0-255>
ipv6 ospf priority <0-255> instance-id (<0-31>|<64-95>)
no ipv6 ospf priority instance-id (<0-31>|<64-95>)
```

Parameters

priority

Specify the router priority of the interface.

<0-255>

Specify the router priority of the interface. The default is 1.

instance-id

Specify the instance.

<0-31>

Interface instance ID for IPv6 unicast

<64-95>

Interface instance ID for IPv4 unicast.

Default

1

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf priority 127
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf retransmit-interval

Use this command to set the interval between retransmission of Link State Update packets. This interval is also used to retransmit DD packets and Link State Request packets.

After sending an LSA to a neighbor, the router keeps the LSA on the LS-retransmission list until it receives an acknowledgement. If the router does not receive an acknowledgment from the neighbor during the retransmit interval, it sends the LSA to the neighbor again.

Use the `no` parameter with this command to reset the interval to the default value.

Command Syntax

```
ipv6 ospf retransmit-interval <1-1800>
ipv6 ospf retransmit-interval <1-1800> instance-id (<0-31>|<64-95>)
no ipv6 ospf retransmit-interval
no ipv6 ospf retransmit-interval instance-id (<0-31>|<64-95>)
```

Parameters

retransmit-interval
Specify the interval.

<1-1800>
Specify the interval in seconds.

instance-id
Specify the instance.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

Default

5 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf retransmit-interval 3
```

© 2026 IP Infusion Inc. Proprietary

ipv6 ospf transmit-delay

Use this command to set the estimated time it takes to transmit a Link State Update packet over the interface. The transmit-delay value is added to the LS age of LSAs and is advertised through this interface whenever the LSAs are transmitted.

Use the `no` parameter with this command to reset the delay to the default value.

Command Syntax

```
ipv6 ospf transmit-delay <1-1800>
ipv6 ospf transmit-delay <1-1800> instance-id (<0-31>|<64-95>)
no ipv6 ospf transmit-delay
no ipv6 ospf transmit-delay instance-id (<0-31>|<64-95>)
```

Parameters

transmit-delay

Specify the time to transmit a link-state update.

<1-1800>

Specify the time in seconds to transmit a link-state update.

instance-id

Specify the instance.

<0-31>

Interface instance ID for IPv6 unicast

<64-95>

Interface instance ID for IPv4 unicast.

Default

1 second

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf transmit-delay 2
```

© 2026 IP Infusion Inc. Proprietary

ipv6 router ospf

Use this command to enable OSPFv3 routing on an interface.

Specify the process ID to configure multiple instances of OSPFv3. When running a single instance of OSPFv3, you do not need to specify a instance ID.

When OSPFv3 receives a packet, it checks if the instance ID in the packet matches the instance ID of the receiving interface.

Use the `no` parameter with this command to disable OSPFv3 routing on an interface.

Command Syntax

```
ipv6 router ospf area (A.B.C.D|<0-4294967295>)
ipv6 router ospf area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD
ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD instance-id (<0-31>|<64-95>)
ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>)
ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
no ipv6 router ospf area (A.B.C.D|<0-4294967295>)
no ipv6 router ospf area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
no ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD
no ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD instance-id (<0-31>|<64-95>)
no ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>)
no ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
```

Parameters

`area`
OSPF Area ID in IPv4 address format.

A.B.C.D
OSPF area ID in IP address format.

<0-4294967295>
OSPF area ID as a decimal value.

instance-id
Specify the instance.

<0-31>
Interface instance ID for IPv6 unicast

<64-95>
Interface instance ID for IPv4 unicast.

`tag`
Tag value to use as a “match” value for controlling redistribution via route maps.

`WORD`
Set the tag value.

Default

Disabled

Command Mode

Interface mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 router ospf area 1 tag Tag1 instance-id 1
```

© 2026 IP Infusion Inc. Proprietary

ipv6 te-metric

Use this command to set the traffic engineering metric for an interface.

The traffic engineering metric is used in OSPF-TE Link State Advertisements. If the traffic engineering metric is not set, the ipv6 ospf cost (page 2598) value for an interface is used in OSPF-TE Link State Advertisements.

Use the `no` parameter with this command to unset the traffic engineering metric for this interface.

Command Syntax

```
ipv6 te-metric <1-65535>
ipv6 te-metric <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 te-metric
no ipv6 te-metric instance-id (<0-31>|<64-95>)
```

Parameters

te-metric

Specify the TE metric.

<1-65535>

Specify the TE metric value.

instance-id

Specify the instance.

<0-31>

Interface instance ID for IPv6 unicast

<64-95>

Interface instance ID for IPv4 unicast.

Default

Zero

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 te-metric 6
```

© 2026 IP Infusion Inc. Proprietary

log-adjacency-changes

Use this command for the router to send a SYSLOG message when an OSPF neighbor goes up or down.

Use `no` parameter of this command to stop sending SYSLOG message.

Command Syntax

```
log-adjacency-changes (brief|detail|)
no log-adjacency-changes
```

Parameters

detail

Sends a SYSLOG message for each state change, not just when a neighbor goes up or down.

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#log-adjacency-changes brief
(config-router)#log-adjacency-changes detail

#configure terminal
(config)#router ipv6 ospf
(config-router)#no log-adjacency-changes
```

© 2026 IP Infusion Inc. Proprietary

max-concurrent-dd

Use this command to limit the number of Database Descriptors (DD) that can be processed concurrently.

This command is useful when a router's performance is affected from simultaneously bringing up several OSPFv3 adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPFv3 instance, thus allowing for all of the adjacencies to come up.

Use the `no` option with this command to remove the limit.

Command Syntax

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

Parameters

<1-65535>
Specify the number of DD processes.

Default

By default, number of maximum concurrent DD processes is 5

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example set the `max-concurrent-dd` value to 4.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#max-concurrent-dd 4
```

© 2026 IP Infusion Inc. Proprietary

passive-interface

Use this command to suppress sending Hello packets on all interfaces, or on a specified interface.

This command configures OSPFv3 on simplex Ethernet interfaces. Since a simplex interface represents only one network segment between two devices, configure the transmitting interface as a passive interface. This ensures that OSPFv3 does not send hello packets for the transmitting interface. Both the devices can see each other via the hello packet generated for the receiving interface.

Use the **no** form with this command to resume sending `hello` packets on all interfaces, or on a specified interface.

Command Syntax

```
passive-interface
passive-interface IFNAME (disable|enable)
no passive-interface
no passive-interface IFNAME
```

Parameters

IFNAME
Specify an interface name

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#passive-interface
(config-router)#passive-interface eth0 disable
```

© 2026 IP Infusion Inc. Proprietary

redistribute

Use this command to import routes from other routing protocols, or from another OSPF instance, into OSPFv3 AS-external-LSAs.

OSPFv3 advertises routes learned from other routing protocols or from other OSPF instances, including static or connected routes. Each injected prefix is put into the AS-external-LSA with a specified metric and metric-type.

Use the **no** parameter with this command to stop redistribution.

Command Syntax

```
redistribute (kernel|connected|static|rip|bgp|isis|ospf (WORD|<1-65535>|)) {metric <0-
16777214>|metric-type (1|2)|route-map WORD|tag <0-4294967295>}
no redistribute (kernel|connected|static|rip|bgp|isis|ospf (WORD|)) (metric|metric-type|route-
map|tag|)
```

Parameters

connected
Specify connected routes.

static
Specify static routes.

rip
Specify RIP routes.

bgp
Specify BGP routes.

isis
Specify IS-IS routes.

ospf
Specify OSPF routes.

WORD
Specify an OSPFv3 Process Tag. If not specified, redistribute OSPF process with tag "null".

<1-65535>
Specify an OSPF process identifier. If not specified, redistribute OSPF instance with process ID 0.

metric
Specify the external metric.

<0-16777214>
Specify the external metric.

metric-type
Specify the external metric-type (see RFC 3101):

1
Set OSPF External Type 1 metric.

2
Set OSPF External Type 2 metric.

route-map
Specify a route map reference.

© 2026 IP Infusion Inc. Proprietary

WORD
Specify name of the route-map.

tag
Tag value to use as a “match” value for controlling redistribution via route maps

<0-4294967295>
Specify the route tag.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows redistribution of BGP routes into the OSPFv3 routing table, with the metric as 10.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#redistribute bgp metric 10 metric-type 1
```

The following example shows redistribution of static IPv4 routes into the OSPFv3 routing table.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#redistribute static
```

© 2026 IP Infusion Inc. Proprietary

router-id

Use this command to specify a router ID for the OSPFv3 process.

Configure each router with a unique router-id. In an OSPFv3 router process that has active neighbors, a new router-id is used at the next reload or when you start the OSPFv3 manually.

Use the **no** form of this command to force OSPFv3 to stop the routing functionality.

Command Syntax

```
router-id A.B.C.D
no router-id
```

Parameters

A.B.C.D
Specify the router ID in IPv4 address format.

Default

Router id is loop-back IP address of IP address with highest IP

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows a fixed router ID 43.3.3.3

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#router-id 43.3.3.3
```

© 2026 IP Infusion Inc. Proprietary

router ipv6 ospf

Use this command to initiate OSPFv3 routing process and enter Router mode to configure OSPFv3 routing process. For making the OSPFv3 routing process functional, you must specify OSPFv3 process tag in router mode and enable OSPFv3 on at least one interface. OSPFv3 is only enabled on interfaces where OSPFv3 process tag matches the tag specified using ipv6 router ospf area command in Interface mode.

Use the **no** parameter with this command to remove OSPFv3 process.

Command Syntax

```
router ipv6 ospf
router ipv6 ospf WORD
router ipv6 vrf ospf WORD
no router ipv6 ospf
no router ipv6 ospf WORD
no router ipv6 vrf ospf WORD
```

Parameters

WORD

Tag value to use as a “match” value for controlling redistribution via route maps.

vrf

Enable an IPv6 VRF routing process

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf Tag1
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

show debugging ipv6 ospf

Use this command to display the OSPFv3 debugging options.

Command Syntax

```
show debugging ipv6 ospf
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging ipv6 ospf

OSPFv3 debugging status:
 OSPFv3 all packet debugging is on
 OSPFv3 all NFSM debugging is on
```

© 2026 IP Infusion Inc. Proprietary

show ipv6 ospf

Use this command to display global and area information about OSPFv3.

Command Syntax

```
show ipv6 ospf (WORD|)
```

Parameters

WORD
Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OcNOS#show ipv6 ospf
 Routing Process "OSPFv3 (null)" with ID 1.2.3.4
 Process uptime is 18 hours 12 minutes
 SPF schedule delay initial 0.500 secs
 SPF schedule delay min 0.500 secs
 SPF schedule delay max 50.0 secs
 Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
 Number of incoming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Number of external LSA 0. Checksum Sum 0x0000
 Number of LSA originated 6
 Number of LSA received 142
 Number of areas in this router is 1
    Area BACKBONE(0)
        Number of interfaces in this area is 2(2)
        SPF algorithm executed 12 times
        Number of LSA 6.  Checksum Sum 0x317BC
        Number of Unknown LSA 0
 Dste Staus: Disabled
```

The following table explains the fields for each ospf entry.

Table 91. show ipv6 ospf output details

Field	Description
Routing Process with ID	OSPFv3 process identifier and router identifier.
Process uptime is	OSPFv3 process is running time.
SPF schedule delay initial	Initial SPF schedule delay.

Table 91. show ipv6 ospf output details (continued)

Field	Description
SPF schedule delay min	Minimum delay between receiving a change to SPF calculation.
SPF schedule delay max	Maximum delay between receiving a change to SPF calculation.
Minimum LSA interval	Minimum LSA refresh interval.
Minimum LSA arrival	Minimum time between reception of new LSAs during flooding.
Number of incoming current DD exchange neighbors	Incoming neighbor Database Descriptors and maximum concurrent DDs. Shows the count of DD that is getting received at the moment of executing the show CLI and the maximum concurrent DDs configured.
Number of outgoing current DD exchange neighbors	Outgoing neighbor Database Descriptors and maximum concurrent DDs. Shows the count of DD that is getting sent at the moment of executing the show CLI and the maximum concurrent DDs configured.
Number of external LSA	Number of AS external LSAs and checksum.
Number of opaque AS LSA	Number of AS opaque LSAs and checksum.
Number of LSA originated	LSAs originated by the OSPFv3 instance.
Number of LSA received	LSAs received by the OSPFv3 instance.
Number of areas in this router is	Number of areas attached to this router.
Area	Area identifier.
(BACKBONE)	Area is a backbone.
no-summary	Area is a stub and does no import summaries.
(Inactive)	Area is not active.
Number of interfaces in this area is	Number of interfaces in this area.
Dste Status	Whether DSTE is enabled or disabled.

© 2026 IP Infusion Inc. Proprietary

show ipv6 ospf database

Use this command to display information in the OSPFv3 Link State database.

Command Syntax

```
show ipv6 ospf database
show ipv6 ospf database (self-originate|max-age|adv-router A.B.C.D|)
show ipv6 ospf database (router|network|inter-prefix|inter-router|external|nssa-external|link|intra-
prefix|te|grace)
show ipv6 ospf database (router|network|inter-prefix|inter-router|external|nssa-external|link|intra-
prefix|te|grace) (self-originate|adv-router A.B.C.D|)
show ipv6 ospf database (router|network|inter-prefix|inter-router|external|nssa-external|link|intra-
prefix|te|grace) A.B.C.D (self-originate|adv-router A.B.C.D|)
show ipv6 ospf WORD database
show ipv6 ospf WORD database (router|network|inter-prefix|inter-router|external|nssa-
external|link|intra-prefix|te|grace)
show ipv6 ospf WORD database (router|network|inter-prefix|inter-router|external|nssa-
external|link|intra-prefix|te|grace) adv-router A.B.C.D
```

Parameters

self-originate
Self-originated link states

max-age
LSAs in MaxAge list

adv-router
Advertising router for Type 8 Link LSAs (Link State Advertisements):

A.B.C.D
Router ID of the advertising router.

router
Router LSAs.

network
Network LSAs.

inter-prefix
Inter-Area-Prefix LSAs.

inter-router
Inter-Area-Router LSAs.

external
AS external LSAs.

nssa-external
NSSA LSAs.

link
Link LSAs.

intra-prefix
Intra-Area-Prefix LSAs (Type 9) with prefixes for stub and transit networks

te
Intra-area TE LSAs.

grace
Grace LSAs.

© 2026 IP Infusion Inc. Proprietary

A.B.C.D
Link state ID as an IP address.

WORD
Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example: adv-router Parameter

This example shows using the `adv-router` parameter:

```
#show ipv6 ospf database link adv-router 10.70.0.58
            OSPFv3 Router with ID (10.70.0.58) (Process 100)
                Link-LSA (Interface eth1)
  LS age: 492
  LS Type: Link-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 10.70.0.58
  LS Seq Number: 0x80000001
  Checksum: 0xC2D6
  Length: 68
  Priority: 1
  Options: 0x000013 (-|R|-|-|E|V6)
  Link-Local Address: fe80::204:75ff:feaa:fedb
  Number of Prefixes: 2
    Prefix: 5f00:1:2:10::/64
    Prefix Options: 0 (-|-|-|-)
```

Header

```
OSPFv3 Router with ID (10.70.0.58) (Process 100)
Link-LSA (Interface eth1)
```

The router ID and OSPFv3 process tag of the local router.

Interface name of the router associated with this Link-LSA.

OSPFv3 Database Fields

The following table explains the fields for each database entry.

Table 92. OSPFv3 database fields

Field	Description
LS age	The length of time in seconds since the LSA was originated.
LS Type	The type of LSA
Link State ID	Interface identifier of the originating router.
Advertising router	The Router ID of the router advertising this LSA. On a transit network, this is always the Designated Router ID.

Table 92. OSPFv3 database fields (continued)

Field	Description
LS Seq Number	Sequence number of an LSA.
Checksum	LSA header checksum (excluding the LS age field).
Length	The length in bytes of the LSA (including the 20-byte header).
Priority	The router priority of the interface attaching the originating router of the link.
Options	Bits in network LSAs that originate on the link: DC-bit: Whether the router supports OSPF over Demand Circuits. R-bit: Whether the router is active. If this bit is clear, routes which transit the advertising node cannot be computed. N-bit: How the router handles Type 7 LSAs. MC-bit: Whether IP multicast packets are forwarded. E-bit: Whether AS-External-LSAs are flooded. This bit is set in all AS External LSAs and in all LSAs. originated in the backbone and non-stub areas. V6-bit: Whether to include the router/link in routing calculations.
Link-Local Address	The originating router's link-local interface address.
Number of Prefixes	The number of IPv6 prefixes associated to the link: Prefix: The global IPv6 prefix associated to this link. Prefix Options: Each prefix is advertised along with an 8-bit capabilities field.They serve as input for routing calculations allowing, for example, some prefixes to be ignored or marked as not re-advertisable.
Referenced LS Type	Identifies the Router-LSA or Network-LSA with which the IPv6 prefixes are associated: Type 0x2001: prefixes associated with Router-LSA Type 0x2002: prefixes associated with Network-LSA
Referenced Link State ID	Referenced LS Type 0x2001: this field is 0 Referenced LS Type 0x2002: the interface ID of the link's Designated Router.
Referenced Advertising Router	Referenced LS Type 0x2001: ID of the originating router. Referenced LS Type 0x2002: ID of the Designated Router Prefix: Referenced LS Type 0x2001: global IPv6 prefix associated with the router Referenced LS Type 0x2002: global IPv6 prefix associated with the transit link Prefix Options: Bits in network LSAs that originate on the link: DC: How the router handles demand circuits R: Whether the router is active. If this bit is clear, routes which transit the advertising node cannot be computed. N: How the router handles Type 7 LSAs MC: Whether IP multicast packets are forwarded E: Whether AS-External-LSAs are flooded V6: Whether to include the router/link in routing calculations Metric: The cost of this prefix.

© 2026 IP Infusion Inc. Proprietary

Example: intra-prefix and adv-router Parameters

This example shows using the `adv-router` and `intra-prefix` parameters.

> **Note:** The same information for OSPFv2 can be viewed in type 1 router LSAs and type 2 network LSAs. However, in OSPFv3 all addressing information has been removed from router LSAs and network LSAs, leading to the introduction of the Intra-Area-Prefix LSA. In a transit network, the Intra-Area-Prefix-LSA serves the same purpose as a network LSA and on a point-to-point or point-to-multipoint network serves the same purpose as a router LSA.

```
#show ipv6 ospf database intra-prefix adv-router 10.70.0.58
           OSPFv3 Router with ID (10.70.0.58) (Process 100)
                Intra-Area-Prefix-LSA (Area 0.0.0.0)
  LS age: 1435
  LS Type: Intra-Area-Prefix-LSA
  Link State ID: 0.0.0.2
  Advertising Router: 10.70.0.58
  LS Seq Number: 0x80000001
  Checksum: 0x1B4E
  Length: 56
  Number of Prefixes: 2
  Referenced LS Type: 0x2002
  Referenced Link State ID: 0.0.0.3
  Referenced Advertising Router: 10.70.0.58
    Prefix: 5f00:1:2:10::/64
    Prefix Options: 0 (-|-|-|-)
    Metric: 0
    Prefix: 6f00:1:2:10::/64
    Prefix Options: 0 (-|-|-|-)
    Metric: 0
Header
OSPFv3 Router with ID (10.70.0.58) (Process 100)
Intra-Area-Prefix-LSA (Area 0.0.0.0)
```

- The router ID and OSPFv3 process tag for the router.
- Intra-Area-Prefix-LSA has area flooding scope. This LSA belongs to Area 0.0.0.0.

© 2026 IP Infusion Inc. Proprietary

show ipv6 ospf interface

Use this command to display OSPFv3 interface information.

Command Syntax

```
show ipv6 ospf interface
show ipv6 ospf interface IFNAME
```

Parameters

IFNAME
The name of the interface.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Usage

This is a sample output from the `show ipv6 ospf interface` command displaying the OSPFv3 interface information:

```
#show ipv6 ospf interface
eth0 is up, line protocol is up
  Interface ID 3, Instance ID 0, Area 0.0.0.0
  IPv6 Link-Local Address fe80::248:54ff:fec0:f32d/10
 Router ID 1.2.3.4, Network Type BROADCAST, Cost: 10
 Transmit Delay is 1 sec, State Backup, Priority 1
 Designated Router (ID) 5.6.7.8
Interface Address fe80::203:47ff:fe4c:776e
 Backup Designated Router (ID) 1.2.3.4
Interface Address fe80::248:54ff:fec0:f32d
 Timer interval configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:01
 Neighbor Count is 1, Adjacent neighbor count is 1
```

If Hello Suppression is enabled

```
RTR_B#show ipv6 ospf interface
eth1 is up, line protocol is up
  Interface ID 3
  IPv6 Prefixes
    fe80::5054:ff:fef3:f166/64 (Link-Local Address)
    2001::2/64
  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 66
    Router ID 2.2.2.2, Network Type P2MP-NBMA, Cost: 1, TE Metric: 1
    Reduce LSA Flooding
    Transmit Delay is 1 sec, State Point-To-Point, Priority 1
    Timer interval configured, Hello 30, Dead 120, Wait 120, Retransmit 5
      Hello due in 00:00:32
    Neighbor Count is 1, Adjacent neighbor count is 1
    Suppress hello for 1 neighbor(s)
    Hello received 2 sent 3, DD received 4 sent 6
    LS-Req received 1 sent 1, LS-Upd received 7 sent 4
```

© 2026 IP Infusion Inc. Proprietary

```
    LS-Ack received 0 sent 3, Discarded 0
```

The following table explains the fields for each ospf interface entry.

Table 93. show ipv6 ospf interface output details

Field	Description
Interface Type and whether it is up or down.	Status of the interface type.
Line protocol	Status of the line protocol.
Interface ID	Interface for which information is displayed.
Instance ID	For running multiple instances of OSPFv3 on the router
Area	Area ID in A.B.C.D form
IPv6 Link-Local Address	link-local address is an IPv6 unicast address – cannot communicate to link-local addresses that are outside the directly connected network. In IPv6 (X:X::X:X/M) form.
Router ID	As stated – In A.B.C.D form.
Network Type	One of the following: 1. Ethernet is Broadcast 2. Serial p2p non-broadcast 3. NBMA – Non-Broadcast MultiAccess (NBMA) media
cost	The cost of sending packets over this interface – range is 1 to 65535.
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 1 to 65535. The default is 1.
Priority	OSPFv3 router priority for the interface. The range is 0 to 255. A router with priority 0 can never become the designated router, the default is 1.
Designated Router (ID)	The ID number of the Designated Router (DR).
Interface Address	The IPV6 address of this device.
Backup Designated Router	The ID number or the Backup Designated Router (BDR).
Interface Address	The IPv6 address of the Backup Designated Router.
Timer interval configured	The timer values of the following instances: Hello, Dead, Wait, Retransmit.
Hello due in	The countdown for receiving the next Hello packet.
Neighbor Count is	Number of neighbor count.
Adjacent neighbor count is	Number of adjacent neighbor count.

© 2026 IP Infusion Inc. Proprietary

show ipv6 ospf neighbor

Use this command to display information about an OSPFv3 neighbor.

Command Syntax

```
show ipv6 ospf neighbor
show ipv6 ospf WORD neighbor
show ipv6 ospf neighbor INTERFACE
show ipv6 ospf WORD neighbor INTERFACE
show ipv6 ospf neighbor INTERFACE detail
show ipv6 ospf WORD neighbor INTERFACE detail
show ipv6 ospf neighbor detail
show ipv6 ospf WORD neighbor detail
show ipv6 ospf neighbor A.B.C.D
show ipv6 ospf WORD neighbor A.B.C.D
```

Parameters

WORD
Tag value to use as a “match” value for controlling redistribution via route maps.

INTERFACE
Display the name of the Interface

A.B.C.D
Neighbor IP address.

detail
Details of neighbors

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the show ipv6 ospf neighbor command displaying information about the OSPFv3 neighbor.

```
#show ipv6 ospf neighbor
OSPFv3 Process (*null*)
Neighbor ID Pri State Dead Time Interface Instance ID
5.6.7.8 1 Full/DR 00:00:38 eth0 0
```

If Hello Suppression is enabled

```
RTR_B#
RTR_B#show ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
1.1.1.1           1   Full/ -         inactive    eth1       0
4.4.4.4           1   Full/DR         00:00:40    eth2       0
4.4.4.4           1   Full/ -         inactive    VLINK1     0
```

© 2026 IP Infusion Inc. Proprietary

```
RTR_B#

RTR_B#
RTR_B#show ipv6 ospf neighbor detail
 Neighbor 1.1.1.1, interface address fe80::5054:ff:feb3:d3bc
    In the area 0.0.0.0 via interface eth1
    Neighbor priority is 1, State is Full, 7 state changes
    Hello is suppressed
    DR is 0.0.0.0 BDR is 0.0.0.0
    Options is 0x000133 (AF|*|*|DC|R|-|-|E|V6)
    Dead timer due in inactive
    Database Summary List 0
    Link State Request List 0
```

The following table explains the fields for each ospf neighbor entry.

Table 94. show ipv6 ospf neighbor output details

Field	Description
Neighbor	Router ID of the neighbor router.
interface address	IPv6 address of the neighbor's interface.
In the area	The neighbor router's area ID.
via interface	Neighbor router's interface name.
Neighbor Priority is	OSPFv3 router priority for the interface. The range is 0 to 255. A router with priority 0 can never become the designated router, the default is 1.
State	The Link State Address (LSA) of the neighbor, and there has been 7 state changes, and sending Hello packets is suppressed.
DR	Designated Router (DR) ID
BDR	Backup Designated Router (BDR) ID
Options is	The hexadecimal representation of the seven bits in the Options Field of Hello packets (see RFC 5340): • AF-bit – Address Family bit. • V6-bit – If this bit is clear, the router/link should be excluded from IPv6 routing calculations. • E-bit – This bit describes the way AS-external-LSAs are flooded. • N-bit – This bit indicates whether or not the router is attached to an NSSA. • R-bit – This bit (the `Router' bit) indicates whether the originator is an active router. If the router bit is clear, then routes that transit the advertising node cannot be computed. Clearing the router bit is appropriate for a multi-homed host that wants to participate in routing, but does not want to forward non-locally addressed packets. • DC-bit – This bit describes the router's handling of demand circuits, as specified in [DEMAND]. • *-bit – These bits are reserved for migration of OSPFv2 protocol extensions.
Dead timer due in	The countdown timer for marking neighbor connections dead. In this

Table 94. show ipv6 ospf neighbor output details (continued)

Field	Description
	example, the Deat Timer has been deactivated.
Database Summary List	Describes routes to IPv6 address prefixes that belong to other areas.
Link State Request List	Sent or received when Link-State Request packets finds that parts of the Link State Database are out of date.
Timer interval configured	The set values for the following packet types: Hello, Dead, Wait, Retransmit.
Neighbor Count	The number of known neighbors.
Adjacent neighbor count	The number of directly adjacent neighbors.

© 2026 IP Infusion Inc. Proprietary

show ipv6 ospf route

Use this command to display the IPv6 routing table for OSPFv3.

The routes can be displayed in two ways:

- Each routing entry in a single-line
- Each routing entry in multiple lines

By default, the routing table is displayed in the multi-line format. For a single line display, give the ipv6 ospf display route single-line (page 2600) command.

Command Syntax

```
show ipv6 ospf route
show ipv6 ospf WORD route
```

Parameters

WORD
Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is sample output in single-line format:

```
#show ipv6 ospf route
Destination Metric Next-hop

IA 3ffe:101:3::/48 20 via fe80::203:47ff:fe4c:776e, eth0
```

The following is sample output in multi-line format:

```
#show ipv6 ospf route
Destination Metric
Next-hop Interface
3ffe:1:1::/48 10
-- eth0
3ffe:2:1::/48 10
-- eth0
```

© 2026 IP Infusion Inc. Proprietary

```
3ffe:2:2::/48 10
-- eth0
3ffe:3:1::/48 10
-- eth0
3ffe:3:2::/48 10
-- eth0
3ffe:3:3::/48 10
-- eth0
E2 3ffe:100:1::1/128 10/20
fe80::203:47ff:fe4c:776e eth0
```

The following explains the fields for each ospf route entry.

Table 95. show ipv6 ospf route output details

Field	Description
IP address	IP address of the remote network.
Metric	For OSPF the metric is cost, which indicates the best quality path to use to forward packets.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.

show ipv6 ospf virtual-links

Use this command to display information about OSPFv3 virtual-links.

Command Syntax

```
show ipv6 ospf virtual-links
show ipv6 ospf WORD virtual-links
```

Parameters

WORD
Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 5.6.7.8 is up
Transit area 0.0.0.1 via interface eth0, instance ID 0
Local address 3ffe:1234:1::1/128
Remote address 3ffe:5678:3::1/128
Transmit Delay is 1 sec, State Point-To-Point,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:01
Adjacency state Up
```

If Hello Suppression is enabled

```
RTR_B#show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 4.4.4.4 is up
  Transit area 0.0.0.1 via interface eth2, instance ID 0
  Hello suppression Enabled
  DoNotAge LSA allowed
  Local address 2002::1/128
  Remote address 2002::2/128
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in inactive
    Adajcency state Full
RTR_B#
RTR_B#
```

The table explains the fields for each ospf virtual-links entry.

Table 96. show ipv6 ospf virtual-links output details

Field	Description
Virtual Link	Virtual link name, the router ID to which it is connected, and the state of the link.
Transit area	Transit area ID, the interface it uses, and its instance ID – an Instance ID should default to 0. It is only necessary to assign a value other than 0 on those links that will contain multiple separate communities of OSPF routers.
Local address	The local IPV6 address and subnet mask.
Remote address	The remote IPv6 address and subnet mask.
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 1 to 65535. The default is 1. The state is point-to-point.
Timer intervals configured	The configured values in seconds of the following timers: Hello, Dead, Wait, Retransmit.
Hello due in	A countdown timer that indicates when the next Hello packet should arrive.
Adjacency State	Whether the adjacency state is either up or down.

show ipv6 ospfv3 topology

Use this command to display information about OSPFv3 topology for each area.

Command Syntax

```
show ipv6 ospfv3 topology
show ipv6 ospfv3 WORD topology
show ipv6 ospfv3 topology area (A.B.C.D|<0-4294967295>)
show ipv6 ospfv3 WORD topology area (A.B.C.D|<0-4294967295>)
```

Parameters

WORD
Tag value to use as a “match” value for controlling redistribution via route maps.

area
OSPFv3 area ID

A.B.C.D
OSPFv3 Area ID in IPv4 address format.

<0-4294967295>
OSPFv3 Area ID as a decimal value.

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 ospfv3 topology
OSPFv3 paths to Area (0.0.0.0) routers
Router ID Bits Metric Next-Hop Interface
1.2.3.4 --
5.6.7.8 E 10 5.6.7.8 eth0
```

Example

```
#show ipv6 ospfv3 topology

OSPFv3 paths to Area (0.0.0.0) routers
Router ID        Bits  Metric     Next-Hop            Interface
1.2.3.4                                             --
5.6.7.8          E     10         5.6.7.8             eth0
```

The following table explains the fields for each ospfv3 topology entry.

Table 97. show ipv6 ospfv3 topology output details

Field	Description
OSPFv3 path to Area	Area ID in IPv4 format.
Router ID	ID in IPv4 format,
Bits	Bits appended to packets: • V-bit Indicates whether the advertising router is an endpoint of a virtual link. • E-bit Indicates whether the advertising router is an Autonomous System Border Router (ASBR). • B-bit Indicates whether the advertising router is an Area Border Router (ABR). • W-bit When set, the router is a wild-card multicast receiver.
Metric	The value of ospfv3 metric.
Next-Hop	The next-hop identifier.
Interface	The interface name through which the virtual link extends.

© 2026 IP Infusion Inc. Proprietary

show ipv6 route fast-reroute

Use this command to display loop-free alternate routes with alternate next hops.

Command Syntax

```
show ipv6 route fast-reroute
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Usage

```
# show ipv6 route fast-reroute
```

© 2026 IP Infusion Inc. Proprietary

show ipv6 vrf

Use this command to list information about VRFs.

Command Syntax

```
show ipv6 vrf (WORD|)
```

Parameter

WORD
VPN Routing/Forwarding instance name.

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is a sample output of the `show ipv6 vrf` command displaying VRF information:

```
#show ipv6 vrf
Name             Interfaces

qa               eth0
you              eth1
myVRF            eth2
```

The table explains the fields.

Table 98. show ipv6 vrf output details

Field	Description
Name	Name of the interface.
Interfaces	Type of an interface.

shutdown

Use this command to temporarily shut down a protocol in the least disruptive manner and to notify its neighbors that it is going away.

Use the `no` parameter of this command, not to temporarily shut a protocol.

Command Syntax

```
shutdown
no shutdown
```

Parameter

None

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#shutdown

#configure terminal
(config)#router ipv6 ospf
(config-router)#no shutdown
```

© 2026 IP Infusion Inc. Proprietary

snmp restart ospf6

Use this command restart SNMP in OSPFv3

Command Syntax

```
snmp restart ospf6
```

Parameter

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart ospf6
```

© 2026 IP Infusion Inc. Proprietary

summary-address

Use this command to summarize or suppress external routes with the specified address range.

An address range is a pairing of a starting address and a mask that is almost the same as IP network number. For example:

- If the specified IPV6 address range is 2020:100:100:2000::/53, it matches 2020:100:100:2222::/64, 2020:100:100:2666::/64 and so on.
- If the specified IPV4 address range is 192.168.0.0/255.255.240.0, it matches 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This minimizes the size of the OSPF link state database.

Use the `no` form this command to remove summary addresses.

Command Syntax

```
summary-address X:X::X:X/M (not-advertise|(all-tag (<0-4294967295> ))| ) (translate-tag (<0-
4294967295>) | )
summary-address A.B.C.D/M (not-advertise|tag <0-4294967295>|)
no summary-address A.B.C.D/M
no summary-address X:X::X:X/M (not-advertise|all-tag|translate-tag)
no summary-address A.B.C.D/M (not-advertise|tag)
```

Parameters

X:X::X:X/M
The range of addresses given as IPv6 starting address and a mask.

A.B.C.D/M
The range of addresses given as IPv4 starting address and a mask.

not-advertise
Suppress routes that match the range.

tag
Tag value to use as a “match” value for controlling redistribution via route maps.

<0-4294967295>
Set a tag value. The default is 0.

all-tag
Set tag for all summarized type-5, translated type5 and type-7 LSA.

translate-tag
Set tag only for summarized translated type-5 LSA.

Default

Zero

Command Mode

Router mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example uses the `summary-address` command to aggregate external LSAs that match the network 172.16.0.0/24 and assign a tag value of 3.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#summary-address 2020:100:100:2000::/53 all-tag 3
```

© 2026 IP Infusion Inc. Proprietary

timers spf exp

Use this command to set the Shortest-Path First (SPF) best-path schedule minimum and maximum delay between receiving a change to SPF calculation in milliseconds.

Use `no` parameter of this command to unset the SPF best-path schedule.

Command Syntax

```
timers spf exp <0-2147483647> <0-2147483647>
no timers spf exp
```

Parameters

<0-2147483647>
The minimum delay in milliseconds between receiving a change to SPF calculation.

<0-2147483647>
The maximum delay in milliseconds between receiving a change to SPF calculation.

Default

Minimum delay: 500 milliseconds

Maximum delay: 50000 milliseconds (50 seconds)

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#timers spf exp 300 300
```

© 2026 IP Infusion Inc. Proprietary

OSPF VPN Commands

This section provides an alphabetized reference of the OSPF VPN commands. It includes the following commands:

capability vrf-lite 2647
domain-id 2648
router ospf vrf 2650

© 2026 IP Infusion Inc. Proprietary

capability vrf-lite

Use this command to enable the `vrf-lite` capability for an OSPF instance.

Use the `no` parameter with this command to disable the same for an OSPF instance.

Command Syntax

```
capability vrf-lite
no capability vrf-lite
```

Parameters

None

Default

By default, VRF lite capability for an OSPF instance is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ospf 100
(config-router)#capability vrf-lite
(config)#router ospf 100
(config-router)#no capability vrf-lite
```

© 2026 IP Infusion Inc. Proprietary

domain-id

Use this command to specify the domain ID for a OSPF bound to VRF.

The routes sent from OSPF to the VPN cloud are sent along with the domain ID. In this way, the domain ID acts as an

identification for the route received from each OSPF domain.

Use the `no` form of this command to remove a domain ID.

Command Syntax

```
domain-id ((A.B.C.D (secondary|)) | (type (type-as|type-as4|type-back-comp) value
HEX_DATA (secondary|)))
no domain-id ((A.B.C.D (secondary|)) | (type (type-as|type-as4|type-back-comp)
value HEX_DATA (secondary|)))
```

Parameters

A.B.C.D
Domain ID in IP address format.

secondary
Domain ID is secondary. If not specified the domain ID is primary.

type
Domain type:

type-as
AS format. Hexadecimal value is 0x0005.

type-as4
AS4 format. Hexadecimal value is 0x0205.

type-back-comp
Used for backward compatibility. Hexadecimal value is 0x8000.

value
Domain ID.

HEX_DATA
Domain ID in hexadecimal.

secondary
Domain ID is secondary. If not specified the domain ID is primary

Default

No domain ID is defined.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Example

The following example shows configuring a primary domain ID in IP address format.

```
#configure terminal
(config)#router ospf 100 vrf
(config-router)#domain-id 12.12.12.12
```

The following example shows configuring a secondary domain ID in IP address format.

```
#configure terminal
(config)#router ospf 100 vrf
(config-router)#domain-id 13.13.13.13 secondary
```

The following example shows configuring a primary domain ID in AS type format.

```
#configure terminal
(config)#router ospf 100 vrf
(config-router)#domain-id type type-as value 123456abcdef
```

© 2026 IP Infusion Inc. Proprietary

router ospf vrf

Use this command to specify a VRF instance in OSPF. To use this command, you must first create a VRF Name in the NSM using the `ip vrf` command. Associate the same name with the OSPF instance using this command.

Command Syntax

```
router ospf <1-65535> WORD
```

Parameters

<1-65535>
Routing process ID; should be unique for each routing process.

WORD
Name of the VRF to associate with this OSPF instance.

Default

By default, router ospf vrf is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100 myVRF
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

CSPF-TE Commands

This section is a reference for Constrained Shortest Path First Traffic Engineering (CSPF-TE) commands:

cspf default-retry-interval 2652
cspf disable-better-protection 2653
cspf enable-better-protection 2654
cspf enable-resource-constraint-crankback 2655
cspf tie-break 2656

© 2026 IP Infusion Inc. Proprietary

cspf default-retry-interval

Use this command to set the default route computation retry interval for an OSPFv2 instance. This value is used for route recomputation (in the case of computation failures) and no retry interval is specified for a given LSP.

Use the `no` parameter with this command to unset default route computation retry interval.

Command Syntax

```
cspf default-retry-interval <1-3600>
no cspf default-retry-interval
```

Parameter

<1-3600>
The retry interval in seconds. The default is 10 seconds.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#cspf default-retry-interval 720
```

© 2026 IP Infusion Inc. Proprietary

cspf disable-better-protection

Use this command to disable better protection (Default).

Command Syntax

```
cspf disable-better-protection
```

Parameter

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#cspf disable-better-protection
```

© 2026 IP Infusion Inc. Proprietary

cspf enable-better-protection

Use this command to enable better protection.

Command Syntax

```
cspf enable-better-protection
```

Parameter

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#cspf enable-better-protection
```

© 2026 IP Infusion Inc. Proprietary

cspf enable-resource-constraint-crankback

Use this command to enable resource constraint checking for crank back when the selected path does not meet the requirements.

Use cspf disable-resource-constraint-crankback to disable resource constraint checking for crank back when the selected path does not meet the requirements.

Command Syntax

```
cspf enable-resource-constraint-crankback
cspf disable-resource-constraint-crankback
```

Parameter

None

Default

cspf disable-resource-constraint-crankback

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# cspf enable-resource-constraint-crankback
```

© 2026 IP Infusion Inc. Proprietary

cspf tie-break

Use this command to set the tie-break method for an OSPFv2 instance. This selects a link (during route computation) when more than one candidate link satisfies all the route constraints and the associated cost and hop limit link attributes are equal.

Use the `no` parameter with this command to unset tie-break method.

Command Syntax

```
cspf tie-break (random|least-fill|most-fill)
no cspf tie-break
```

Parameters

`random`
Pick any path at random. This method places an equal number of LSPs on each link without taking into account the available bandwidth ratio. This is the default tie-break method.

`least-fill`
Pick the path with the largest minimum available bandwidth ratio. This method equalizes the reservation on each link.

`most-fill`
Pick the path with the smallest minimum available bandwidth ratio. This method uses one link until it is completely full and then uses the next link.

Default

By default, the tie-break method is set to `random`.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#cspf tie-break least-fill
```

Router Information Protocol Configuration

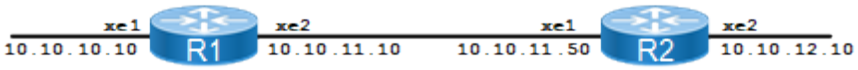
This section contains basic Router Information Protocol (RIP) configuration examples.

Enable RIP

This example shows the minimum configuration required to enable RIP on an interface. R1 and R2 are two routers connecting to network 10.10.11.0/24. R1 and R2 are also connected to networks 10.10.10.0/24 and 10.10.12.0/24, respectively. To enable RIP, first define the RIP routing process, then associate a network with the routing process.

Topology

Figure 183. Enable RIP Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24` `(config-router)#network 10.10.11.0/24`	Associate networks with the RIP process.
`(config-router)#exit`	Exit router mode and return to configure mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.11.0/24` `(config-router)#network 10.10.12.0/24`	Associate networks with the RIP process.
`(config-router)#exit`	Exit router mode and return to configure mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

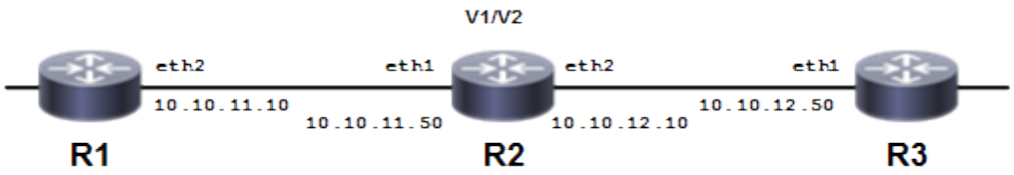
Specify RIP Version

Configure a router to receive and send specific versions of packets on an interface. In this example, router R2 is configured to receive and send RIP version 1 and version 2 information on both eth1 and eth2 interfaces.

Topology

Figure 184. RIP Version Topology



R2

`#configure terminal`	Enter configure mode
`(config)#router rip`	Enable the RIP routing process

(config-router)#exit	Exit router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip rip send version 1 2	Send RIP version 1 and version 2 packets out this interface
(config-if)#ip rip receive version 1 2	Receive RIP version 1 and version 2 packets from this interface
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration
(config)#interface eth2	Enter interface mode
(config-if)#ip rip send version 1 2	Send RIP version 1 and version 2 packets out this interface
(config-if)#ip rip receive version 1 2	Receive RIP version 1 and version 2 packets from this interface
(config-if)#exit	Exit router mode and return to configure mode.
(config)#commit	Commit the candidate configuration to the running configuration

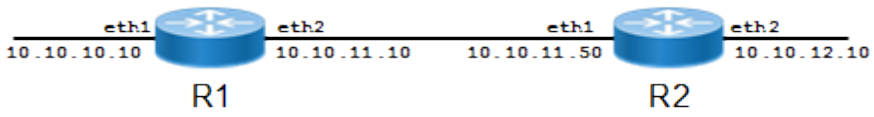
Authentication with a Single Key

OcNOS RIP provides a choice of configuring authentication with a single key or with multiple keys. This example shows authenticating routing information exchange using a single key.

Topology

Routers R1 and R2 are running RIP and exchanging routing updates. To configure single-key authentication on R1, specify an interface, then define a key or password for that interface. Next, specify an authentication mode. Any receiving RIP packet on this specified interface should have the same string as the password. For an exchange of updates between R1 and R2, define the same password and authentication mode on R2.

Figure 185. Single-key Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

`(config)#interface eth1`	Specify the interface (`eth1`) for authentication.
`(config-if)#ip rip authentication string ABC`	Specify the authentication string (`ABC`) for this interface.
`(config-if)#ip rip authentication mode md5`	Specify the authentication mode to be MD5.
`(config-if)#exit`	Exit router mode and return to configure mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.11.0/24`	Associate network `10.10.11.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface eth2`	Specify the interface (`eth2`) for authentication.
`(config-if)#ip rip authentication string ABC`	Specify the authentication string (`ABC`) on this interface.
`(config-if)#ip rip authentication mode md5`	Specify the authentication mode to be MD5.
`(config-if)#exit`	Exit router mode and return to configure mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Text Authentication with Multiple Keys

This example illustrates text authentication of the routing information exchange process for RIP using multiple keys.

Topology

Routers R1 and R2 are running RIP, and exchanging routing updates. To configure authentication on R1, define a key chain, specify keys in the key chain, then define the authentication string or passwords to use by the keys. Set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or set of keys) that will be used for authentication on each interface, and the authentication mode to use.

R1 receives all packets that contain any key string that matches one of the key strings included in the specified key chain (within the accept lifetime) on that interface. The key ID is not considered for matching. For additional security, the accept lifetime and send lifetime are configured such that every fifth day, the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap. This will accommodate different time setup on machines. However, the send lifetime is not required to overlap, and IP Infusion Inc. recommends configuring no overlapping for the send lifetime.

`#configure terminal`	Enter configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#key chain SUN`	Enter Keychain management mode to add keys to the key chain `SUN`.
`(config-keychain)#key-id 10`	Add authentication key ID (`10`) to the key chain `SUN`.
`(config-keychain-key)#key-string ABC`	Specify a password (`ABC`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 27 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be received. In this case, key string `ABC` can be received from 7 PM of Aug 27 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 27 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `ABC` can be sent from 7 PM of Aug 27 to 11 PM Aug 31, 2024.
`(config-keychain-key)#exit`	Exit Keychain-Key mode, and return to Keychain mode.
`(config-keychain)#commit`	Commit the candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

`(config-keychain)#key-id 20`	Add another authentication key (`20`) to the key chain `SUN`.
`(config-keychain-key)#key-string Earth`	Specify a password (`Earth`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `Earth` can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#commit`	Commit the candidate configuration to the running configuration
`(config-keychain-key)#exit`	Exit Keychain-Key mode.
`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify interface `eth1` as the interface you want to configure.
`(config-if)#ip address 10.10.10.10/24`	Assign the IP address to an interface `eth1`.
`(config-if)#ip rip authentication key-chain SUN`	Enable RIPv2 authentication on `eth1` interface and specify the key-chain `SUN` to use for authentication.
`(config-if)#ip rip authentication mode text`	Specify text authentication mode to use for RIP packets. This step is optional, because text is the default mode.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface eth2`	Specify interface `eth2` as the interface you want to configure.
`(config-if)#ip address 44.4.4.4/24`	Assign the IP address to an interface `eth2`.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

R2

`#configure terminal`	Enter configure mode.

`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#key chain MOON`	Enter Keychain management mode to add keys to the key chain `MOON`.
`(config-keychain)#key-id 30`	Add authentication key ID (`30`) to the key chain `MOON`.
`(config-keychain-key)#key-string ABC`	Specify a password (`ABC`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which authentication key string `ABC` can be received. In this case, key string `ABC` can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `ABC` can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#exit`	Exit Keychain-Key mode, and return to Keychain mode.
`(config-keychain)#commit`	Commit the candidate configuration to the running configuration
`(config-keychain)#key-id 40`	Add another authentication key (`40`) to the key chain `MOON`.
`(config-keychain-key)#key-string Earth`	Specify a password (`Earth`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `Earth` can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#commit`	Commit the candidate configuration to the

	running configuration
`(config-keychain-key)#exit`	Exit Keychain-Key mode.
`#configure terminal`	Enter configure mode.
`(config)#interface eth2`	Specify interface `eth2` as the interface you want to configure.
`(config-if)#ip address 10.10.10.50/24`	Assign the IP address to an interface `eth2`.
`(config-if)#ip rip authentication key-chain MOON`	Enable RIPv2 authentication on the `eth2` interface, and specify the key-chain `MOON` to use for authentication.
`(config-if)#ip rip authentication mode text`	Specify the authentication mode to use for RIP packets. This step is optional, because text is the default mode.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface eth1`	Specify interface `eth1` as the interface you want to configure.
`(config-if)#ip address 55.5.5.5/24`	Assign the IP address to an interface `eth1`.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

MD5 Authentication with Multiple Keys

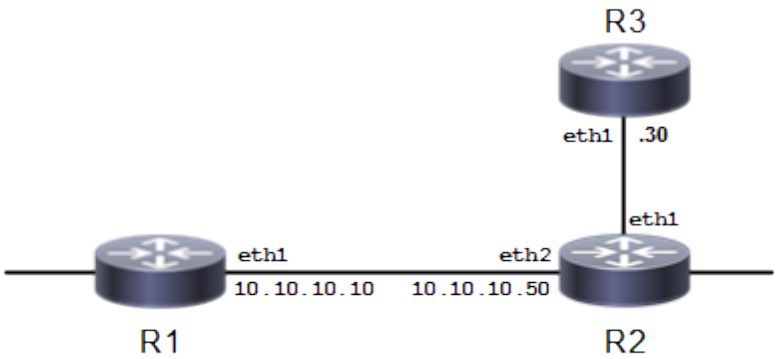
This example illustrates the MD5 authentication of the routing information exchange process for RIP using multiple keys.

Topology

Routers R1 and R2 are running RIP, and exchanging routing updates. To configure authentication on R1, define a key chain, specify keys in the key chain, then define the authentication string or passwords to use by the keys. Then, set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or the set of keys) that will be used for authentication on the interface, and the authentication mode to use. Configure R2 and R3 to have the same key ID and key string as R1 for the time that updates are to be exchanged.

In MD5 authentication, both the key ID and key string are matched for authentication. R1 will receive only packets that match both the key ID and the key string in the specified key chain (within the accept lifetime) on that interface. In the following example, R2 has the same key ID and key string as R1. For additional security, the accept lifetime and send lifetime are configured such that every fifth day, the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap; however, the send lifetime should not overlap.

Figure 187. MD5 Multiple-key Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

`(config)#key chain SUN`	Enter Keychain management mode to add keys to the key chain `SUN`.
`(config-keychain)#key-id 1`	Add authentication key ID (`1`) to the key chain `SUN`.
`(config-keychain-key)#key-string ABC`	Specify a password (`ABC`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which authentication key string `ABC` can be received. In this case, key string `ABC` can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `ABC` can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#exit`	Exit Keychain-Key mode, and return to Keychain mode.
`(config-keychain)#commit`	Commit the candidate configuration to the running configuration
`(config-keychain)#key-id 2`	Add another authentication key (`2`) to the key chain `SUN`.
`(config-keychain-key)#key-string Earth`	Specify a password (`Earth`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `Earth` can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#commit`	Commit the candidate configuration to the running configuration
`(config-keychain-key)#exit`	Exit Keychain-Key mode.
`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify interface `eth1` as the interface you want to configure.
`(config-if)#ip address 10.10.10.10/24`	Assign the IP address to an interface `eth1`.
`(config-if)#ip rip authentication key-chain SUN`	Enable RIPv2 authentication on the `eth1` interface, and specify the key chain `SUN` to use

	for authentication.
(config-if)#ip rip authentication mode md5	Specify MD5 authentication mode to use for RIP packets.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#interface eth2	Specify interface eth2 as the interface you want to configure.
(config-if)#ip address 44.4.4.4/24	Assign the IP address to an interface eth2.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration

R2

#configure terminal	Enter configure mode.
(config)#router rip	Define a RIP routing process, and enter Router mode.
(config-router)#network 10.10.10.0/24	Associate network 10.10.10.0/24 with the RIP process.
(config-router)#redistribute connected	Enable redistributing from connected routes.
(config-router)#exit	Exit router mode.
(config)#commit	Commit the candidate configuration to the running configuration
(config)#key chain MOON	Enter Keychain management mode to add keys to the key chain MOON.
(config-keychain)#key-id 1	Add authentication key ID (1) to the key chain MOON.
(config-keychain-key)#key-string ABC	Specify a password (ABC) to use by the specified key.
(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024	Specify the time period during which authentication key string ABC can be received. In this case, key string ABC can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024	Specify the time period during which the authentication key can be sent. In this case, key string ABC can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
(config-keychain-key)#exit	Exit Keychain-Key mode, and return to

© 2026 IP Infusion Inc. Proprietary

	Keychain mode.
`(config-keychain)#commit`	Commit the candidate configuration to the running configuration
`(config-keychain)#key-id 2`	Add another authentication key (`2`) to the key chain `MOON`.
`(config-keychain-key)#key-string Earth`	Specify a password (`Earth`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#send-lifetime 19:00:00 Aug 02 2024 23:00:00 Aug 31 2024`	Specify the time period during which the authentication key can be sent. In this case, key string `Earth` can be sent from 7 PM of Aug 02 to 11 PM Aug 31, 2024.
`(config-keychain-key)#commit`	Commit the candidate configuration to the running configuration
`(config-keychain-key)#end`	Enter Privileged Exec mode.
`#configure terminal`	Enter configure mode.
`(config)#interface eth2`	Specify interface `eth2` as the interface you want to configure.
`(config-if)#ip address 10.10.10.50/24`	Assign the IP address to an interface `eth2`.
`(config-if)#ip rip authentication key-chain MOON`	Enable RIPv2 authentication on the `eth1` interface, and specify the key chain `MOON` to use for authentication.
`(config-if)#ip rip authentication mode md5`	Specify the authentication mode to use for RIP packets.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#interface eth1`	Specify interface `eth1` as the interface you want to configure.
`(config-if)#ip address 55.5.5.5/24`	Assign the IP address to an interface `eth1`.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

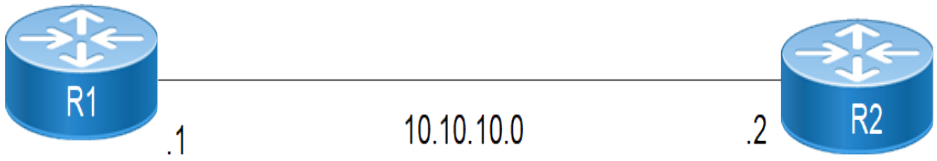
RIPV2 VRF Configuration

RIPV2 can be configured along with VRF between two nodes and also between PE-CE nodes.

Topology

Figure 188. RIPV2 VRF Topology



RIPV2 VRF Configuration

This document captures requirements to use RIPv2 with VRF between two nodes.

R1

`#configure terminal`	Enter configuration mode.
`(config)#ip vrf ripv2`	Configure ip vrf
`(config-vrf)#rd 1:1`	Configure rd
`(config-vrf)#route-target both 1:100`	Configure rt value
`(config-vrf)#int xe48`	Enter in to interface
`(config-if)#ip vrf forwarding ripv2`	Enable ip vrf forwarding
`(config-if)#ip address 10.10.10.1/24`	Configure ip address
`(config-if)#router rip`	Enter in to router rip
`(config-router)#address-family ipv4 vrf ripv2`	Address family ipv4 with vrf name
`(config-router-af)#network 10.10.10.0/24`	Configure network command
`(config-router-af)#redistribute static`	Configure Redistribute static
`(config-router-af)#redistribute connected`	Configure Redistribute connected
`(config-router-af)#commit`	Commit the transactions
`(config)#ip route vrf ripv2 191.1.1.10/32 xe48`	Configure static route with vrf
`(config)#commit`	Commit the transaction

R2

`#configure terminal`	Enter configuration mode.
`(config)#ip vrf ripv2`	Configure ip vrf
`(config-vrf)#rd 1:1`	Configure rd
`(config-vrf)#route-target both 1:100`	Configure rt value
`(config-vrf)#int xe10`	Enter in to interface
`(config-if)#ip vrf forwarding ripv2`	Enable ip vrf forwarding
`(config-if)#ip address 10.10.10.2/24`	Configure ip address
`(config-if)#router rip`	Enter in to router rip

© 2026 IP Infusion Inc. Proprietary

`(config-router)#address-family ipv4 vrf ripv2`	Address family ipv4 with vrf name
`(config-router-af)#network 10.10.10.0/24`	Configure network command
`(config-router-af)#redistribute static`	Configure Redistribute static
`(config-router-af)#redistribute connected`	Configure Redistribute connected
`(config-router-af)#commit`	Commit the transactions

RIPng

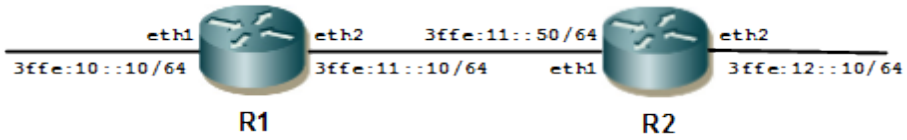
This section contains a basic RIPng configuration example.

For details about the commands used in these examples, see the *Routing Information Protocol Command Reference (page 2689)*.

Topology

The diagram shows the minimum configuration required to enable RIPng on an interface. R1 and R2 are two routers connected to network 3ffe:11::/64. To enable RIPng, first define the RIPng routing process, then enable RIPng on each interface.

Figure 189. RIPng Topology



Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ipv6 router rip`	Enable RIPng routing on interface `eth1`.
`(config-if)#exit`	Exit Interface mode, and enter Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ipv6 router rip`	Enable RIPng routing on interface `eth2`.
`(config-if)#exit`	Exit Interface mode, and enter Configure mode.
`(config)#router ipv6 rip`	Define a RIPng routing process, and enter Router mode.
`(config)# commit`	Commit the transaction.

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ipv6 router rip`	Enable RIPng routing on interface `eth1`.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit Interface mode, and enter Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ipv6 router rip`	Enable RIPng routing on interface `eth2`.
`(config-if)#exit`	Exit Interface mode, and enter Configure mode.
`(config)#router ipv6 rip`	Define a RIPng routing process, and enter Router mode.
`(config)# commit`	Commit the transaction.

Validation

R1

```
R1#show ipv6 rip

accept-lifetime

Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the no option with this command to disable it.

See Appendix A, *Routing Information Protocol Authentication* for information on how this command is related to the other authentication commands.

Command Syntax

```
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> HH:MM:SS MONTH <01-31> <1993-
2035>
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> infinite
accept-lifetime HH:MM:SS MONTH <01-31> <1993-2035> duration <1-2147483646>
no accept-lifetime
```

Parameter

HH:MM:SS
Specify the start time of accept-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to start. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to start as the first three letters of the month with first letter in upper case, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to start.

HH:MM:SS
Specify the time when accept-lifetime expires in hours, minutes and seconds.

<01-31>
Specify the day of the month to end. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to end as the first three letters of the month with first letter in caps, for example, Jan. (case sensitive).

<1993-2035>
Specify the year to expire.

duration
Specify the duration of the key in seconds <1-2147483646>.

infinite
Specify the end time to never expire.

Default

None

© 2026 IP Infusion Inc. Proprietary

Command Mode

Keychain-key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of accept-lifetime for `key-id 1` on the key chain named `mychain`.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#accept-lifetime 03:03:01 Dec 30 2004 04:04:02 Oct 06
2006
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#no accept-lifetime
```

© 2026 IP Infusion Inc. Proprietary

cisco-metric-behavior

Use this command to enable the metric update consistent with Cisco.

Use either the `no` or `disable` parameter with this command to disable this feature.

Command Syntax

```
cisco-metric-behavior (enable|disable)
no cisco-metric-behavior
```

Parameters

`enable`
Enable updating the metric consistent with Cisco.

`disable`
Disable updating the metric consistent with Cisco.

Default

By default, the Cisco metric-behavior is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to enable the metric update behavior to be consistent with Cisco in the Router mode.

```
#configure terminal
(config)#router rip
(config-router)#cisco-metric-behavior enable
```

© 2026 IP Infusion Inc. Proprietary

clear ip rip route

Use this command to clear specific data from the RIP routing tables.

Using this command with the `all` parameter, clears the RIP table of all the routes. If you do not want that your RIP network to be deleted, use the `redistribute connected` command and make the RIP network a connected route. To delete the RIP routes learned from neighbor and also keep the RIP network intact, use the `rip` (`clear ip rip route rip`) parameter with this command.

Command Syntax

```
clear ip rip route (A.B.C.D/M|rip|kernel|connected|static|ospf|isis|bgp|all)
```

Parameters

A.B.C.D/M
Removes entries which exactly match this destination address from RIP routing table.

bgp
Removes only BGP routes from the RIP routing table.

connected
Removes entries for connected routes from the RIP routing table.

isis
Removes only IS-IS routes from the RIP routing table

kernel
Removes kernel entries from the RIP routing table.

ospf
Removes only OSPF routes from the RIP routing table.

rip
Removes only RIP routes from the RIP routing table.

static
Removes static entries from the RIP routing table.

all
Removes the entire RIP routing table.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#clear ip rip route 10.0.0.0/8
#clear ip rip route ospf
```

© 2026 IP Infusion Inc. Proprietary

clear ip rip route vrf NAME

Use this command to clear all IPv4 RIP VRF route or any specific prefix RIP VRF route of any particular VRF name.

Command Syntax

```
clear ip rip route vrf NAME (*|A.B.C.D/M)
```

Parameters

A.B.C.D/M
Removes entries with the prefix specified.

*****
Removes all routes

NAME
VPN Routing or Forwarding instance name

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip rip route vrf myVRF *
```

© 2026 IP Infusion Inc. Proprietary

clear ip rip statistics

Use this command to clear an IPv4 RIP statistics.

Command Syntax

```
clear ip rip statistics (IFNAME |)
```

Parameters

IFNAME
Removes entries from the interface.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip rip statistics
```

© 2026 IP Infusion Inc. Proprietary

debug rip

Use this command to specify the options for the displayed debugging information for RIP events, RIP packets and RIP NSM.

Use the no parameter with this command to disable all debugging.

Command Syntax

```
debug rip (all|events|packet (recv|send|)|packet detail|nsm|rib|bfd|)
no debug rip (all|events|packet (recv|send|)|packet detail|nsm|rib|bfd|)
```

Parameters

all
Debug all RIP information.

bfd
Debug all RIP and BFD information.

events
Debug RIP events.

nsm
Debug RIP and NSM communications.

packet
Debug RIP packets, only

recv
Debug received packets.

rib
Debug RIP and RIB communications.

send
Debug sent packets.

detail
Display detailed information for the sent or received packet.

Default

Disabled

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Examples

The following example specifies the options for the displayed debugging information in `Configure` mode prompt.

© 2026 IP Infusion Inc. Proprietary

```
#configure terminal
(config)#debug rip events
(config)#debug rip packet send detail
(config)#debug rip nsm
```

© 2026 IP Infusion Inc. Proprietary

default-information originate

Use this command to add default routes to the RIP updates.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
default-information originate (always|) (route-map WORD|)
no default-information originate
```

Parameters

always
Always advertise default route

route map
Route map reference

WORD
Pointer to route-map entries

Default

Disabled

Command Mode*

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#default-information originate route-map pmap
```

© 2026 IP Infusion Inc. Proprietary

default-metric

Use this command to specify the metrics to be assigned to redistributed routers.

This command is used in conjunction with the `redistribute` command to make the routing protocol use the specified metric value for all redistributed routes. A default metric is useful in redistributing routes with incompatible metrics. Every protocol has different metrics and can not be compared directly. Default metric provides the standard to compare. All routes that are redistributed will use the default metric.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
default-metric <1-15>
no default-metric
```

Parameter

<1-15>
Specify the default metric.

Default

By default, the metric value is set to 1.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example assigns the cost of 10 to the OSPF routes which are redistributed into RIP.

```
#configure terminal
(config)#router rip
(config-router)#redistribute ospf
(config-router)#default-metric 10
```

© 2026 IP Infusion Inc. Proprietary

distance

Use this command to set the administrative distance. The administrative distance is a feature used by the routers to select the path when there are two or more different routes to the same destination from two different routing protocols. A smaller administrative distance indicating a more reliable protocol.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
distance <1-255>distance <1-255> A.B.C.D/M (WORD|)
no distance
no distance  A.B.C.D/M
```

Parameters

<1-255>
Specify the administrative distance value.

A.B.C.D./M
Specify the network prefix and length

WORD
Specify the access list name.

Default

By default, the administrative distance is 120.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Examples

```
#configure terminal
(config)#router rip
(config-router)#distance 8 10.0.0.0/8 mylist
```

© 2026 IP Infusion Inc. Proprietary

distribute-list

Use this command to filter incoming or outgoing route updates using an access list or a prefix list. You can filter out incoming or outgoing route updates using an access list or a prefix list. If you do not specify the name of the interface, the filter will be applied to all the interfaces.

Use the no parameter with this command to disable this feature.

Command Syntax

```
distribute-list WORD (in|out) (IFNAME|)
distribute-list prefix WORD (in|out) (IFNAME|)
no distribute-list (in|out) (IFNAME|)
no distribute-list prefix (in|out) (IFNAME|)
```

Parameters

WORD
Specify the IPv4 access-list number or name to use.

prefix
Filter prefixes in routing updates.

WORD
Specify the name of the IPv4 prefix-list to use.

in
Filter incoming routing updates.

out
Filter outgoing routing updates.

IFNAME
Specify the name of the interface on which distribute-list applies.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#router rip
(config-router)#distribute-list prefix myfilter in eth0
```

© 2026 IP Infusion Inc. Proprietary

ip rip authentication key-chain

Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used. If you do not configure a key chain results in no authentication.

Use the `no` parameter with this command to disable this function.

for information on how this command is related to the other authentication commands.

Command Syntax

```
ip rip authentication key-chain LINE
no ip rip authentication key-chain (LINE|)
```

Parameters

`LINE`

Specify the name of the key chain.

Default

If you do not configure a key chain, authentication is not used.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, interface eth0 is configured key-chain authentication and the name is specified as `mykey`. This name is used to enter the key-chain mode to specify the password. See the `key` command.

```
#configure terminal
(config)#interface eth0
(config-if)#ip rip authentication key-chain mykey
```

© 2026 IP Infusion Inc. Proprietary

ip rip authentication mode

Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the no parameter with this command to restore clear text authentication.

for information on how this command is related to the other authentication commands.

Command Syntax

```
ip rip authentication mode md5
ip rip authentication mode text
no ip rip authentication mode
```

Parameters

md5
Uses the keyed MD5 authentication algorithm.

text
Specify the clear text or simple password authentication.

Default

No authentication mode is enabled by default. But, when any authentication key (string or key-chain) is configured, text authentication mode is enabled by default.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows `md5` authentication configured on the `eth1` interface, ensuring authentication of RIP packets received.

```
#configure terminal
(config)#interface eth1
(config-if)#ip rip authentication mode md5
```

© 2026 IP Infusion Inc. Proprietary

ip rip authentication string

Use this command to specify the authentication string or password used by a key.

You can configure authentication for a single key or multiple keys at different times. Use this command to specify password for a single key on an interface.

Use the `no` parameter with this command to disable this feature.

for how this command is related to the other authentication commands.

Command Syntax

```
ip rip authentication string LINE
no ip rip authentication string
```

Parameters

`LINE`
Specify the authentication string or password used by a key.

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, the interface `eth1` is configured to have an authentication string as `guest`, any receiving RIP packet in that interface should have the same string as password.

```
#configure terminal
(config)#interface eth1
(config-if)#ip rip authentication string guest
```

© 2026 IP Infusion Inc. Proprietary

ip rip receive-packet

Use this command to configure the interface to enable the reception of RIP packets.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
ip rip receive-packet
no ip rip receive-packet
```

Parameters

None

Default

Receive-packet is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows packet receiving being turned on for interface `eth0`.

```
#configure terminal
(config)#interface eth0
(config-if)#ip rip receive-packet
```

© 2026 IP Infusion Inc. Proprietary

ip rip receive version

Use this command to receive specified version of RIP packets on an interface basis using version control, and override the setting of the version command.

Use the `no` form of this command to use the setting established by the version command.

Command Syntax

```
ip rip receive version (1|2)
ip rip receive version 1 2
no ip rip receive version
```

Parameters

1
Specify acceptance of RIP version 1 packets on the interface.

2
Specify acceptance of RIP version 2 packets on the interface.

1 2
Specify acceptance of RIP version 1 and version 2 packets on the interface.

Default

Version 2

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Examples

In the following example, interface eth1 in configured to receive both RIP version 1 and 2 packets.

```
#configure terminal
(config)#interface eth1
(config-if)#ip rip receive version 1 2
```

© 2026 IP Infusion Inc. Proprietary

ip rip send-packet

Use this command to enable sending RIP packets through the current interface.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
ip rip send-packet
no ip rip send-packet
```

Parameters

None

Default

Send packet is enabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows packet sending being turned on for interface `eth0`.

```
#configure terminal
(config)#interface eth0
(config-if)#ip rip send-packet
```

ip rip send version

Use this command to send RIP packets on an interface using version control. In addition to version 1 and version 2, compatible version packets can be specified. With the parameter 1-compatible, a version 2 RIP interface will broadcast the packets instead of multicasting them.

This command applies to a specific interface and overrides any the version specified by the `version` command.

Use the `no` parameter with this command to use the global RIP version control rules.

Command Syntax

```
ip rip send version (1|2|1-compatible)
ip rip send version 1 2
ino ip rip send version
```

Parameters

1
Specify sending RIP version 1 packets out of an interface.

2
Specify sending RIP version 2 packets out of an interface.

1 2
Specify acceptance of RIP version 1 and version 2 packets on the interface.

1-compatible
Specify sending RIP version 1 compatible packets from a version 2 RIP interface.

Default

Version 2

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Examples

In the following example, interface eth1 is configured to send both RIP version 1 and 2 packets.

```
#configure terminal
(config)#interface eth1
(config-if)#ip rip send version 1 2
```

© 2026 IP Infusion Inc. Proprietary

ip rip split-horizon

Use this command to perform the split-horizon action on the interface

This command helps avoid including routes in updates sent to the same gateway from which they were learned. Using the split horizon command omits routes learned from one neighbor, in updates sent to that neighbor. Using the poisoned parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

Use the no parameter with this command to disable this function.

Command Syntax

```
ip rip split-horizon
ip rip split-horizon poisoned
no ip rip split-horizon
```

Parameter

poisoned
Performs split-horizon with poisoned reverse.

Default

Split horizon poisoned

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip rip split-horizon poisoned
```

© 2026 IP Infusion Inc. Proprietary

key chain

Use this command to enter the key chain management mode and to configure a key chain with a key chain name. This command allows you to enter the keychain mode to specify keys on this key chain.

Use the no option with this command to disable this feature.

See Appendix A, Routing Information Protocol Authentication (page 2774) for information on how this command is related to the other authentication commands.

Command Syntax

```
key chain WORD
no key chain WORD
```

Parameters

WORD
Specify the name of the key chain to manage.

Default

None

Command Mode

Configure mode and Key-chain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the creation of a key chain named `mychain` and the change into `keychain` mode prompt.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#
```

The following example shows the creation of a key chain named `mykeychain3` in the keychain mode and the addition of an authentication key `key-id 10` in the same mode.

```
(config-keychain)#key chain mykeychain3
(config-keychain)#key-id 10
(config-keychain-key)#
```

© 2026 IP Infusion Inc. Proprietary

key-id

Use this command to manage, add or delete authentication keys in a key-chain. This command allows you to enter the

Keychain-key mode to set a password for the key.

Use the no option with this command to disable this feature.

See Appendix A, *Routing Information Protocol Authentication* for information on how this command is related to the other authentication commands.

Command Syntax

```
key-id <0-2147483647>
no key-id <0-2147483647>
```

Parameters

<0-2147483647>
Specify a key identifier.

Default

By default, RIP uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Keychain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, the password for `key-id 1` in the key chain named `mychain` is set to `prime`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string prime
(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

key-string

Use this command to define a password in plain-text to be used by a key.

The password is stored as encrypted, and is displayed in encrypted text when show running-config command is executed.

Use the `no` parameter with this command to disable this feature.

See Appendix A, *Routing Information Protocol Authentication* for information on how this command is related to the other authentication commands.

Command Syntax

```
key-string WORD
no key-string
```

Parameters

WORD
Specify a string of characters to be used as a password by the key.

Default

Disabled

Command Mode

Keychain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, the password for `key-id 1` in the key chain named `mychain` is set to prime:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string prime

(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

key-string encrypted

Use this command to define a password in its encrypted format to be used by a key.

Use the `no` parameter with this command to disable this feature

Command Syntax

```
key-string encrypted WORD
no key-string encrypted
```

Parameters

WORD

Specify the encrypted string of characters to be used as a passoword by the key. The length of this string should be between 18-162 characters.

Default

By default, password is not configured.

Command Mode

Key-chain mode and Key-chain key mode

Applicability

This command was introduced in OcNOS version 4.1.

Example

In the following example, the encrypted password for key-id 1 in the key chain named mykeychain is set to 0xd6c50b442de47f70 (equivalent to "mychain" in plain-text):

```
#configure terminal
(config)#key chain mykeychain
(config-keychain)#key-id 1
(config-keychain-key)#key-string encrypted 0xd6c50b442de47f70
(config-keychain)#key-id 1
(config-keychain-key)#no key-string
```

© 2026 IP Infusion Inc. Proprietary

maximum-prefix

Use this command to configure the maximum prefix.

Use the no parameter with this command to disable the limiting of the number of RIP routes in the routing table.

Command Syntax

```
maximum-prefix <1-65535> (<1-100>|)
no maximum-prefix
```

Parameters

<1-65535>
The maximum number of RIP routes allowed.

<1-100>
Percentage of maximum routes to generate a warning. The default threshold is 75%.

Default

The default maximum-prefix threshold is 75%.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#maximum-prefix 150
```

© 2026 IP Infusion Inc. Proprietary

neighbor

Use this command to specify a neighbor router. It is used for each connected point-to-point link. This command to exchanges non-broadcast routing information. It can be used multiple times for additional neighbors.

`Passive-interface` command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the `passive-interface` command to send routing updates to specific neighbors .

Use the `no` parameter with this command to disable the specific router.

Command Syntax

```
neighbor A.B.C.D
no neighbor A.B.C.D
```

Parameter

`A.B.C.D`
An IP address of a neighboring router with which the routing information will be exchanged.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#neighbor 10.7.1.12
```

© 2026 IP Infusion Inc. Proprietary

network

Use this command to specify a network as one that runs RIP. This command specifies the networks to which routing updates will be sent and received. If a network is not specified, the interfaces in that network will not be advertised in any RIP update.

Use the `no` parameter with this command to remove the specified network as one that runs RIP.

Command Syntax

```
network A.B.C.D/M
network IFNAME
no network A.B.C.D/M
no network IFNAME
```

Parameters

A.B.C.D/M
The IP address prefix and length of this IP network.

IFNAME
Alphanumeric string that defines the interface name.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#network 10.0.0.0/8
(config-router)#network eth0
```

© 2026 IP Infusion Inc. Proprietary

offset-list

Use this command to add an offset to in and out metrics to routes learned through RIP. This command specifies the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

Use the `no` parameter with this command to remove the offset list.

Command Syntax

```
offset-list WORD (in|out) (IFNAME|)no offset-list WORD (in|out) (IFNAME|)
```

Parameters

`WORD`
Specify the access-list number or names to apply.

`in`
Indicates the access list will be used for metrics of incoming advertised routes.

`out`
Indicates the access list will be used for metrics of outgoing advertised routes.

`IFNAME`
An alphanumeric string that specifies the interface to match.

Default

The default `offset value` is the interface metric value which is defined by the operating system.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Examples

In this example the router examines the RIP updates being sent out from interface eth0 and adds 16 hops to the routes matching the ip addresses specified in the access list `accesslist1`.

```
#configure terminal
(config)#router rip
(config-router)#offset-list accesslist1 in eth0
```

© 2026 IP Infusion Inc. Proprietary

passive-interface

Use this command to block RIP broadcast on the interface.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
passive-interface IFNAME
no passive-interface IFNAME
```

Parameters

IFNAME

Specify the interface name.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#passive-interface eth0
```

© 2026 IP Infusion Inc. Proprietary

recv-buffer-size

Use this command to run-time configure the RIP UDP receive-buffer size.

Use the `no` parameter with this command to return to the default value.

Command Syntax

```
recv-buffer-size <8192-2147483647>
no recv-buffer-size
```

Parameters

<8192-2147483647>
Specify the RIP UDP receive buffer size value.

Default

The default value of the RIP UDP receive-buffer size is 32768.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#recv-buffer-size 150000
```

© 2026 IP Infusion Inc. Proprietary

redistribute

Use this command to redistribute information from other routing protocols.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
redistribute (kernel|connected|static|ospf|isis|bgp)
redistribute (kernel|connected|static|ospf|isis|bgp) metric <0-16>
redistribute (kernel|connected|static|ospf|isis|bgp) route-map WORD
redistribute (kernel|connected|static|ospf|isis|bgp) metric <0-16> route-map WORD
no redistribute (kernel|connected|static|ospf|isis|bgp)
no redistribute (kernel|connected|static|ospf|isis|bgp) metric <0-16>
no redistribute (kernel|connected|static|ospf|isis|bgp) route-map WORD
no redistribute (kernel|connected|static|ospf|isis|bgp) metric <0-16> route-map WORD
```

Parameters

bgp
Redistribute from BGP routes

connected
Redistribute from connected routes

isis
Redistribute from ISO IS-IS routes

ospf
Redistribute from OSPFv3 routes

static
Redistribute from static routes

metric
Metric value

<0–16>
Specify a metric value

route-map
Route map reference

WORD
Specify name of the route-map

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#router rip
(config-router)#redistribute connected

#configure terminal
(config)#router rip
(config-router)#redistribute connected route-map myroutemap
```

© 2026 IP Infusion Inc. Proprietary

route

Use this command to configure static RIP routes.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
route A.B.C.D/M
no route A.B.C.D/M
```

Parameter

A.B.C.D/M
Specify the IP address prefix and length.

Default

No route is added.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

Use this command to add a static RIP route. This command is used most often for debugging purposes and does not show up in the kernel routing table. After adding the RIP route, it can be checked in the RIP routing table.

```
#configure terminal
(config)#router rip
(config-router)#version 1
(config-router)#network 10.10.10.0/24
(config-router)#network 10.10.11.0/24
(config-router)#neighbor 10.10.10.10
(config-router)#route 10.10.10.0/24

(config-router)#version 1
(config-router)#network 10.10.10.0/24
(config-router)#network 10.10.11.0/24
(config-router)#no route 10.10.10.0/24
```

© 2026 IP Infusion Inc. Proprietary

router rip

Use this global command to enable a RIP routing process.

Use the `no` parameter with this command to disable RIP routing.

Command Syntax

```
router rip
no router rip
```

Parameter

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This command is used to begin the RIP routing process.

```
#configure terminal
(config)#router rip
(config-router)#version 1
(config-router)#network 10.10.10.0/24
(config-router)#network 10.10.11.0/24
(config-router)#neighbor 10.10.10.10
```

© 2026 IP Infusion Inc. Proprietary

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Use the `no` parameter with this command to negate this command.

Command Syntax

```
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> HH:MM:SS MONTH <01-31> <1993-2035>
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> infinite
send-lifetime HH:MM:SS MONTH <01-31> <1993-2035> duration <1-2147483646>
no send-lifetime
```

Parameters

HH:MM:SS
Specify the start time of send-lifetime in hours, minutes and seconds.

<01-31>
Specify the day of the month to start. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to start as the first three letters of the month with first letter in upper case, for example, Jan. (case sensitive)

<1993-2035>
Specify the year to start.

HH:MM:SS
Specify the time when send-lifetime expires in hours, minutes and seconds.

<01-31>
Specify the day of the month to end. If the day is a single-digit, the leading 0 must be added, example: 01, 02, 03, etc.

MONTH
Specify the month of the year to end as the first three letters of the month with first letter in caps, for example, Jan. (case sensitive)

<1993-2035>
Specify the year to expire.

duration
Specify the duration of the key in seconds <1-2147483646>.

infinite
Specify the end time to never expire.

Default

Disabled

Command Mode

Keychain-key mode

© 2026 IP Infusion Inc. Proprietary

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of `send-lifetime` for `key-id 1` on the key chain named `mychain`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key-id 1
(config-keychain-key)#send-lifetime 03:03:01 Jan 03 2004 04:04:02 Dec 06 2006
```

© 2026 IP Infusion Inc. Proprietary

show debugging rip

Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

Command Syntax

```
show debugging rip
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging rip
R2#show debugging rip
RIP debugging status:
RIP event debugging is on
RIP packet detail debugging is on
RIP RIB debugging is on
RIP NSM debugging is on
RIP BFD debugging is on

R2#
```

© 2026 IP Infusion Inc. Proprietary

show ip protocols rip

Use this command to display RIP process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols rip
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is an example of the output from the `show ip protocols rip` command:

```
#show ip protocols rip
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12 seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface        Send  Recv   Key-chain
     eth0               2   2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
Distance: (default is 120)
#
```

Table 99 Explains the show command output details.

Table 99. Show ip protocols output details

Field	Description
Routing Protocol is "rip"	Specifies the routing protocol used.
Sending updates every 30 seconds	Specifies the time between sending updates.

Next due in 12 seconds	Precisely when the next update is due to be sent.
Timeout after 180 seconds	Specifies the value of the timeout parameter.
Redistributing	Lists the protocol that is being redistributed.
Routing for Networks	Specifies the networks for which the routing process is currently injecting routes.
Routing Information Sources	Lists all the routing sources the IP Infusion software is using to build its routing table.

© 2026 IP Infusion Inc. Proprietary

show ip rip

Use this command to show RIP routes.

Command Syntax

```
show ip rip (database|)
```

Parameters

database
Specify to display information about the IP RIP database.

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following output displays the RIP routing table with the destination network, nexthop and metric to reach it.

```
#show ip rip
Codes: R - RIP, K - Kernel, C - Connected, S - Static, O - OSPF, I - IS-IS,
B - BGP
Network Next Hop Metric From If Time
K 0.0.0.0/0 10.0.1.1 16 eth1 01:58
C 10.0.1.0/24 1 eth1
S 10.10.10.0/24 1 eth0
C 10.10.11.0/24 1 eth0
S 192.168.101.0/24 1 eth0
R 192.192.192.0/24 1 --
```

Table 100 shows the status codes displayed at the start of a route entry.

Table 100. Status codes

Status Code	Meaning	Description
R	RIP	RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from source to destination.
K	Kernel	Kernel is central component of operating system.
C	Connected	Redistribute from locally connected networks.
S	Static	Connections in a static network are fixed links, while connections in a dynamic network are established on the fly as needed.

© 2026 IP Infusion Inc. Proprietary

O	OSPF	Open Shortest Path First (OSPF) is a routing protocol for Internet Protocol (IP) networks.
I	IS-IS	Intermediate System to Intermediate System (IS-IS) is a routing protocol designed to move information efficiently within a host network.
B	BGP	BGP makes routing decisions based on paths, rules or network policies configured by a network administrator.

© 2026 IP Infusion Inc. Proprietary

show ip rip interface

Use this command to display information about RIP interfaces. You can specify an interface name to display information about a specific interface.

Command Syntax

```
show ip rip interface (IFNAME|)
```

Parameters

IFNAME

Name of the interface for which information is to be displayed.

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following output displays the RIP routing table with the destination network, nexthop and metric to reach it.

```
#show ip rip interface
lo is up, line protocol is up
RIP is not enabled on this interface
eth0 is up, line protocol is up
RIP is not enabled on this interface
eth1 is down, line protocol is down
RIP is not enabled on this interface
eth2 is up, line protocol is up
Routing Protocol: RIP
Receive RIP packets
Send RIPv1 Compatible
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
10.10.1.1/24
10.10.2.1/24
```

Table 101 Explains the show command output details.

Table 101. Show ip rip interface output details

Field	Description
Network	IP address of a network entity.
Nexthop	IP address of the next system that is used when forwarding a packet to the

© 2026 IP Infusion Inc. Proprietary

	destination network.
Metric	If shown, the value of the inter-autonomous system metric.
Routing Protocol	Specifies the routing protocol used.
Passive Interface	Used in all routing protocols to disable sending updates out from a specific interface.
Split horizon	the routing switch does not advertise a route on the same interface as the one on which the routing switch learned the route.
IP Interface address	IP address of the RIP peer neighbor.

© 2026 IP Infusion Inc. Proprietary

show ip rip statistics

Use this command to display information about RIP statistics. You can specify an interface name to display information about a specific interface.

Command Syntax

```
show ip rip statistics (IFNAME|)
```

Parameters

IFNAME

Name of the interface for which information is to be displayed.

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following output displays the RIP routing table with the destination network, nexthop and metric to reach it.

```
#show ip rip statistics eth1
Interface Name : eth1
  Sent Multicast Updates  : 3
  Sent Multicast Requests : 1
  Sent Unicast Updates    : 0
  Sent Unicast Requests   : 0
  Recv Multicast Updates  : 3
  Recv Multicast Requests : 0
  Recv Unicast Updates    : 1
  Recv Unicast Requests   : 0
  Recv Bad Packets        : 0
  Recv Bad Routes         : 0
```

Table 102 Explains the show command output details.

Table 102. Show ip rip statistics output details

Field	Description
Network	IP address of a network entity.
Nexthop	IP address of the next system that is used when forwarding a packet to the destination network.

© 2026 IP Infusion Inc. Proprietary

Metric	If shown, the value of the inter autonomous system metric.
Sent updates	Number of RIP routing updates that have been sent on Multicast/Unicast interface.
Sent Request	Number of RIP routing request that have been sent on Multicast/Unicast interface.
Recv updates	Number of RIP routing updates that have been received on Multicast/Unicast interface.
Recv Request	Number of RIP routing request that have been received on Multicast/Unicast interface.
Recv Bad Packets	Number of packets that were received on this interface and were not processed for any reason.
Recv Bad Routes	Number of route entries that were received on this interface and were not processed for any reason.

© 2026 IP Infusion Inc. Proprietary

snmp restart rip

Use this command to restart SNMP in Routing Information Protocol (RIP)

Command Syntax

```
snmp restart rip
```

Parameters

None

Default

By default, snmp restart is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# snmp restart rip
```

© 2026 IP Infusion Inc. Proprietary

timers basic

Use this command to adjust routing network timers.

This command adjusts the RIP timing parameters. Every 30 seconds, an update is sent out containing the complete routing table to every neighboring router. When the time specified by the timeout parameter expires, the route is no longer valid. However, it is retained in the routing table for a short time so that neighbors are notified that the route has been dropped. When the time specified by the garbage parameter expires, the route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All routers in the network must have the same timers to allow RIP to execute a distributed and asynchronous routing algorithms. The timers should not be synchronized as it might lead to unnecessary collisions on the network.

Use the `no` parameter with this command to restore the default routing network timers.

Command Syntax

```
timers basic <5-2147483647> <5-2147483647> <5-2147483647>
no timers basic
```

Parameters

<5-2147483647>
Specify the routing table update timer in seconds. The default is 30 seconds.

<5-2147483647>
Specify the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.

<5-2147483647>
Specify the routing garbage collection timer in seconds. The default is 120 seconds.

Default

The default routing table update time is 30 seconds.

The default routing information timeout time is 180 seconds.

The default routing garbage collection time is 120 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#timers basic 30 180 120

(config)#router rip
(config-router)#no timers basic
```

version

Use this command to specify a RIP version used globally by the router. RIP can be run in version 1 as well as version 2 mode. Version 2 has more features than version 1 including authentication. Once the rip version is set, rip packets of that version will be received and sent on all the rip-enabled interfaces.

Use the `no` parameter with this command to restore the default version.

Note: The `ip rip receive version` command and the `ip rip send version` command override the value set by the `version` command.

Command Syntax

```
version <1-2>
no version
```

Parameters

<1-2>
Specify the version of RIP processing.

Default

Version 2

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router rip
(config-router)#version 1
(config-router)#network 10.10.10.0/24
(config-router)#network 10.10.11.0/24
```

© 2026 IP Infusion Inc. Proprietary

RIPng Commands

This section provides an alphabetized reference for each of the Routing Information Protocol next generation (RIPng) commands, which support IPv6. It includes the following commands:

aggregate-address 2743
cisco-metric-behavior 2744
clear ipv6 rip route 2745
debug ipv6 rip 2746
default-information originate 2747
default-metric 2748
distance 2749
distribute-list 2750
ipv6 rip metric-offset 2751
ipv6 rip split-horizon 2752
ipv6 router rip 2753
neighbor 2754
offset-list 2755
passive-interface 2756
recv-buffer-size 2757
redistribute 2758
route 2760
route-map 2761
router ipv6 rip 2762
show debugging ipv6 rip 2763
show ipv6 protocols rip 2764
show ipv6 rip 2765
show ipv6 rip interface 2766
timers basic 2767

© 2026 IP Infusion Inc. Proprietary

aggregate-address

Use this command to set an aggregate RIPng route announcement.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
aggregate-address X:X::X:X/M
no aggregate-address X:X::X:X/M
```

Parameter

X:X::X:X/M
Specify an aggregate network (IPv6 address prefix and length).

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#aggregate-address 3ffe:8088::/32

(config)#router ipv6 rip
(config-router)#no aggregate-address 3ffe:8088::/32
```

© 2026 IP Infusion Inc. Proprietary

cisco-metric-behavior

Use this command to enable or disable the metric update as Cisco.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
cisco-metric-behavior (enable|disable)
no cisco-metric-behavior
```

Parameters

`enable`
Enable updating the metric consistent with Cisco.

`disable`
Disable updating the metric consistent with Cisco.

Default

By default, the Cisco metric-behavior is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to enable the metric update behavior to be consistent with Cisco in the Router mode.

```
#configure terminal
(config)#router ipv6 rip
(config-router)#cisco-metric-behavior enable
```

© 2026 IP Infusion Inc. Proprietary

clear ipv6 rip route

Use this command to clear specific data from the RIPng routing table.

Command Syntax

```
clear ipv6 rip route (X:X::X:X/M|rip|kernel|connected|static|ospf6|isis|bgp|all)
```

Parameters

X:X::X:X/M
Removes entries which exactly match this destination address from the RIPng routing table.

bgp
Removes only BGP routes from the RIP routing table.

connected
Removes entries for connected routes from the RIP routing table.

isis
Removes only IS-IS routes from the RIP routing table

kernel
Removes kernel entries from the RIP routing table.

ospf
Removes only OSPF routes from the RIP routing table.

static
Removes static entries from the RIP routing table.

all
Removes the entire RIP routing table.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ipv6 rip route isis
#clear ipv6 rip route 3ffe:ffff::/16
```

© 2026 IP Infusion Inc. Proprietary

debug ipv6 rip

Use this command to specify the options for the displayed debugging information for RIPng events, RIPng packets and RIPng NSM communications.

Use the `no` option with this command to turn off debugging options for RIPng.

Command Syntax

```
debug ipv6 rip (all|events|packet send|packet recv|packet|packet detail|nsm|rib|)
no debug ipv6 rip (all|events|packet send|packet recv|packet|packet detail|nsm|rib|)
```

Parameters

`all`
Debug all RIP information.

`events`
Debug RIP events.

`nsm`
Debug RIP and NSM communications.

`rib`
Debug RIP and RIB communications.

`packet`
Debug RIP packets, only Routing Information Protocol

`recv`
Debug received packets.

`send`
Debug sent packets.

`detail`
Display detailed information for the sent or received packet.

Default

Disabled

Command Mode

Privileged execution mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example specifies the options for the displayed debugging information in `Configure` mode prompt.

```
#configure terminal
(config)#debug ipv6 rip events
(config)#debug ipv6 rip packet send detail
(config)#debug ipv6 rip nsm
```

© 2026 IP Infusion Inc. Proprietary

default-information originate

Use this command to generate a default route into the RIPng.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
default-information originate
no default-information originate
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#default-information originate
```

© 2026 IP Infusion Inc. Proprietary

default-metric

Use this command to specify the metrics to be assigned to redistributed routes.

Use the `no` parameter with this command to disable this feature.

For more details about this command, see the IPv4 version of this command (default-metric (page 2703)).

Command Syntax

```
default-metric <1-15>
no default-metric
```

Parameter

<1-15>
Specify the default metric.

Default

By default, the metric value is set to 1.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#default-metric 8
```

© 2026 IP Infusion Inc. Proprietary

distance

Use this command to set the administrative distance for RIP.

Use the no option with this command to disable this function.

For more details about this command, see the IPv4 version of this command (distance (page 2704)).

Command Syntax

```
distance <1-255>
no distance
```

Parameter

<1-255>

Specify the administrative distance value.

Default

By default, the administrative distance is 120.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ipv6 rip
(config-router)#distance 100
```

© 2026 IP Infusion Inc. Proprietary

distribute-list

Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list. You can filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all the interfaces.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
distribute-list WORD (in|out) (IFNAME|)
distribute-list prefix WORD (in|out) (IFNAME|)
no distribute-list (in|out) (IFNAME|)
no distribute-list prefix (in|out) (IFNAME|)
```

Parameters

WORD
Specify the IPv6 access-list number or name to use.

prefix
Filter prefixes in routing updates.

WORD
Specify the name of the IPv6 prefix-list to use.

in
Filter incoming routing updates.

out
Filter outgoing routing updates.

IFNAME
Specify the name of the interface on which distribute-list applies.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Example

```
#configure terminal
(config)#router ipv6 rip
(config-router)#distribute-list prefix myfilter in eth0
```

© 2026 IP Infusion Inc. Proprietary

ipv6 rip metric-offset

Use this command to set RIP metric offset.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
ipv6 rip metric-offset <1-16>
no ipv6 rip metric-offset
```

Parameter

<1-16>
Set a me tric value

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 rip metric-offset 1

(config)#interface eth0
(config-if)#no ipv6 rip metric-offset
```

© 2026 IP Infusion Inc. Proprietary

ipv6 rip split-horizon

Use this command to perform the split-horizon action on the interface.

Use the no parameter with this command to disable this function.

For more details about this command, see the IPv4 version of this command (ip rip split-horizon (page 2713)).

Command Syntax

```
ipv6 rip split-horizon
ipv6 rip split-horizon poisoned
no ipv6 rip split-horizon
```

Parameter

poisoned
Performs split-horizon with poisoned reverse.

Default

By default, Split horizon poisoned is enabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 rip split-horizon

(config)#interface eth1
(config-if)#no ipv6 rip split-horizon
```

© 2026 IP Infusion Inc. Proprietary

ipv6 router rip

Use this command to enable RIPng routing on the interface.

Use the `no` parameter with this command to disable RIPng routing.

Command Syntax

```
ipv6 router rip
no ipv6 router rip
```

Parameters

None

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 router rip
```

© 2026 IP Infusion Inc. Proprietary

neighbor

Use this command to specify a neighbor router.

Use the `no` parameter with this command to disable the specific router.

For more details about this command, see the IPv4 version of this command (neighbor (page 2719)).

Command Syntax

```
neighbor X:X::X:X IFNAME
no neighbor X:X::X:X IFNAME
```

Parameters

X:X::X:X

Specify a link-local address of the peer router with which the routing information is exchanged.

IFNAME

Specify the name of the interface.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ipv6 rip
(config-router)#neighbor fe80::5054:ff:fece:30cd eth1
(config-router)#end
#show running-config ripng
!
router ipv6 rip
neighbor fe80::5054:ff:fece:30cd eth1
!
#

#show ipv6 interface brief
Interface            IPv6-Address                                    Admin-Status
eth0                 fe80::5054:ff:fe4e:22d3                         [up/up]
eth1                 2001:2001::1:2
                         fe80::5054:ff:fe5c:6a4f                         [up/up]
eth2                 fe80::5054:ff:fe16:8339                         [up/up]
eth3                 fe80::5054:ff:feb9:bc7c                         [up/up]
lo                   ::1                                             [up/up]
```

offset-list

Use this command to add an offset to in and out metrics to routes learned through RIPng.

Use the `no` parameter with this command to remove this function.

For more details about this command, see the IPv4 version of this command (offset-list (page 2721)).

Command Syntax

```
offset-list WORD (in|out) (IFNAME|)
no offset-list in|out (IFNAME|)
```

Parameters

WORD
Specify the access-list number or names to apply.

in
Indicates the access list will be used for metrics of incoming advertised routes.

out
Indicates the access list will be used for metrics of outgoing advertised routes.

IFNAME
An alphanumeric string that specifies the interface to match.

Default

The default offset value is the metric value of the interface which is defined by the operating system.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.1.0.

Examples

In this example the router examines the RIP updates being sent out from interface eth0 and adds 16 hops to the routes matching the ip addresses specified in the access list `accesslist1`.

```
#configure terminal
(config)#router ipv6 rip
(config-router)#offset-list accesslist1 in eth0
```

© 2026 IP Infusion Inc. Proprietary

passive-interface

Use this command to suppress routing updates on an interface.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
passive-interface IFNAME
no passive-interface IFNAME
```

Parameters

IFNAME

Specify the interface name.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#passive-interface eth0
```

© 2026 IP Infusion Inc. Proprietary

recv-buffer-size

Use this command to run-time configure the RIPng UDP receive-buffer size.

Use the `no` parameter with this command to return to the default value.

Command Syntax

```
recv-buffer-size <8192-2147483647>
no recv-buffer-size
```

Parameters

<8192-2147483647>

Specify the RIP UDP receive buffer size value.

Default

The default value of the RIP UDP receive-buffer size is 8192.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#recv-buffer-size 150000
```

© 2026 IP Infusion Inc. Proprietary

redistribute

Use this command to redistribute information from other routing protocols.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
redistribute (kernel|connected|static|ospf|isis|bgp)
redistribute (connected|static|ospf|isis|bgp) metric <0-16>
redistribute (connected|static|ospf|isis|bgp) route-map WORD
redistribute (connected|static|ospf|isis|bgp) metric <0-16> route-map WORD
no redistribute (connected|static|ospf|isis|bgp)
no redistribute (connected|static|ospf|isis|bgp) metric <0-16>
no redistribute (connected|static|ospf|isis|bgp) route-map WORD
no redistribute (connected|static|ospf|isis|bgp) metric <0-16> route-map WORD
```

Parameters

bgp
Redistribute from BGP routes

connected
Redistribute from connected routes

isis
Redistribute from ISO IS-IS routes

ospf
Redistribute from OSPF routes (version 3)

static
Redistribute from static routes

metric
Metric value

<0–16>
Specify a metric value

route-map
Route map reference

WORD
Specify name of the route-map

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
```

```
(config-router)#redistribute connected route-map mymap
(config-router)#redistribute connected metric 8
```

route

Use this command to debug the specified route advertisement. Use this command to configure static RIPng routes. Use the `no` parameter with this command to disable this function.

Command Syntax

```
route X:X::X:X/M
no route X:X::X:X/M
```

Parameter

`X:X::X:X/M`
Specify the IPv6 address prefix and length.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#route 3ffe:1234:5678::1/64
```

© 2026 IP Infusion Inc. Proprietary

route-map

Use this command to set a route map for input or output filtering on a specified interface.

Use the no parameter with this command to disable this function.

Command Syntax

```
route-map WORD (in|out) IFNAME
no route-map (in|out) IFNAME
```

Parameters

WORD
Specify a route map name

in
Specify to set the route map for input filtering

out
Specify to set the route map for output filtering

IFNAME
Specify an interface name to which to associate the route map

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#route-map myRM in eth1
```

© 2026 IP Infusion Inc. Proprietary

router ipv6 rip

Use this global command to enable a RIPng routing process.

Use the `no` parameter with this command to disable the RIPng routing process.

Command Syntax

```
router ipv6 rip
no router ipv6 rip
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

show debugging ipv6 rip

Use this command to display the RIPng debugging status for RIPng NSM, RIPng events, and RIPng packets.

Command Syntax

```
show debugging ipv6 rip
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging ipv6 rip
 RIPng packet debugging is on
```

show ipv6 protocols rip

Use this command to display RIPng process parameters and statistics.

Command Syntax

```
show ipv6 protocols rip
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ipv6 protocols rip` command.

```
#show ipv6 protocols rip
Routing Protocol is "ripng"
  Sending updates every 30 seconds with +/-50%, next due in 10 seconds
  Timeout after 180 seconds, garbage collect after 120 seconds
  Outgoing update filter list for all interface is not set
  Incoming update filter list for all interface is not set
  Default redistribute metric is 1
  Redistributing: connected
  Routing for Networks:
    3ffe:1::/64
#
```

© 2026 IP Infusion Inc. Proprietary

show ipv6 rip

Use this command to show RIP routes.

Command Syntax

```
show ipv6 rip (database|)
```

Parameters

database
Specify to display information about the IPv6 RIP database.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the show ipv6 rip database command.

```
#show ipv6 rip database
Codes: R - RIP, K - Kernel, C - Connected, S - Static, O - OSPF, I - IS-IS,
B - BGP, a - aggregate, s - suppressed
Network Next Hop If Met Tag Time
R 3ffe:1234:5678::/64 fe80::3 eth1 3 0 02:28
C 3ffe:ffff:1::/64 :: eth0 1 0
Ra 3ffe:ffff:2::/48 -- 1 0
Rs 3ffe:ffff:2::/48 fe80::3 eth1 3 0 02:32
Cs 3ffe:ffff:2::/64 :: eth1 1 0
R 3ffe:ffff:ffff:ffff::/64 fe80::3 eth1 3 0 02:28
```

© 2026 IP Infusion Inc. Proprietary

show ipv6 rip interface

Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

Command Syntax

```
show ipv6 rip interface (IFNAME|)
```

Parameters

IFNAME

Name of the interface for which information is to be displayed.

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ipv6 rip interface` command.

```
#show ipv6 rip interface
lo is up, line protocol is up
RIPng is not enabled on this interface
eth0 is up, line protocol is up
RIPng is not enabled on this interface
eth1 is down, line protocol is down
RIPng is not enabled on this interface
eth2 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
3ffe:ffff::1/64
3ffe:fffe::1/64
```

© 2026 IP Infusion Inc. Proprietary

timers basic

Use this command to adjust routing network timers.

Use the `no` parameter with this command to restore the defaults.

For more details about this command, see the IPv4 version of this command (timers basic (page 2740)).

Command Syntax

```
timers basic <5-2147483647> <5-2147483647> <5-2147483647>
no timers basic
```

Parameters

<5-2147483647>

Specify the routing table update timer in seconds. The default is 30 seconds.

<5-2147483647>

Specify the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.

<5-2147483647>

Specify the routing garbage collection timer in seconds. The default is 120 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 rip
(config-router)#timers basic 30 180 120

(config)#router ipv6 rip
(config-router)#no timers basic
```

Routing Information Protocol VPN Commands

This section provides information about RIP VPN commands. These commands are available when the RIP Provider Edge (PE) and Customer Edge (CE) feature is supported. Using these commands, VPN you can use RIP to receive information which the CE-router places into the connected Virtual Routing and Forwarding (VRF) from the receiving interface. The information is then advertised across the MPLS/VPN backbone between PE-routers.

To provide a VPN service, the PE-router needs to be configured so that any routing information learned from a VPN customer interface can be associated with a particular VRF. This is achieved using any standard routing protocol process (RIP, OSPF, BGP or static routes etc).

This section contains the following commands:

show ip rip interface vrf 2769
show ip rip vrf 2771
show ip vrf 2773

© 2026 IP Infusion Inc. Proprietary

show ip rip interface vrf

Use this command to display VRF information. This command is supported in RIP (IPv4).

Command Syntax

```
show ip rip interface vrf WORD (IFNAME|)
```

Parameters

WORD
Specify the name for the VRF instance.

IFNAME
Specify name for the interface.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip rip interface vrf myVRF

eth1 is up, line protocol is up
  Routing Protocol: RIP
    VPN Routing/Forwarding: myVRF
    Receive RIP packets
    Send RIP packets
    Passive interface: Disabled
    Split horizon: Enabled with Poisoned Reversed
    IP interface address:
      1.1.1.92/24
eth3 is up, line protocol is up
  RIP is not enabled on this interface
```

The following Explains the show command output details.

Table 103. Show ip rip interface vrf output details

Field	Description
Routing Protocol	Specifies the routing protocol used.
VPN Routing/Forwarding	Specifies the name of the virtual routing and forwarding (VRF) instance.
Receive RIP packets	Number of RIP packets that were received on this interface.

© 2026 IP Infusion Inc. Proprietary

Send RIP packets	Number of RIP packets that were send on this interface.
Passive Interface	Used in all routing protocols to disable sending updates out from a specific interface.
Split horizon	the routing switch does not advertise a route on the same interface as the one on which the routing switch learned the route.
IP Interface address	IP address of the RIP peer neighbor.

© 2026 IP Infusion Inc. Proprietary

show ip rip vrf

Use this command to display VRF information. This command is supported in RIP (IPv4).

Command Syntax

```
show ip rip (database) vrf WORD
```

Parameters

database
Specify to display information about the IP RIP database.

WORD
Specify the name for the VRF instance.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip rip database vrf myVRF
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

   Network            Next Hop         Metric From            If     Time
Rc 1.1.1.0/24                            1                    eth1
S  72.72.75.0/24      98.98.8.2          1                    eth3
```

The following table shows the status codes displayed at the start of a route entry.

Table 104. Status codes

Status Code	Meaning	Description
R	RIP	RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from source to destination.
Rc	RIP Connected	Redistribute from locally RIP connected networks.
Rs	RIP Static	Connections in a RIP static network are fixed links, while connections in a dynamic network are established on the fly as needed.

© 2026 IP Infusion Inc. Proprietary

K	Kernel	Kernel is central component of operating system.
C	Connected	Redistribute from locally connected networks.
Rs	RIP Static	Connections in a RIP static network are fixed links, while connections in a dynamic network are established on the fly as needed.
O	OSPF	Open Shortest Path First (OSPF) is a routing protocol for Internet Protocol (IP) networks.
I	IS-IS	Intermediate System to Intermediate System (IS-IS) is a routing protocol designed to move information efficiently within a host network.
B	BGP	BGP makes routing decisions based on paths, rules or network policies configured by a network administrator.
	Network	IP address of a network entity.
	Nexthop	IP address of the next system that is used when forwarding a packet to the destination network.
	Metric	If shown, the value of the inter-autonomous system metric.

The following table Explains the show command output details.

Table 105. Show ip rip vrf output details

Field	Description
Network	IP address of a network entity.
Nexthop	IP address of the next system that is used when forwarding a packet to the destination network.
Metric From	If shown, the value of the inter-autonomous system metric.
If	Ethernet interface.
Time	Specifies the time between forwarding packets.

© 2026 IP Infusion Inc. Proprietary

show ip vrf

Use this command to display the routing information of the VRF, such as interface, route distinguisher, route-target, and so on.

Command Syntax

```
show ip vrf
show ip vrf WORD
```

Parameter

WORD
VRF name

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip vrf VRF_A
VRF VRF_A; (table=1)
```

Routing Information Protocol Authentication

To support RIPv2 message authentication, you can choose plain text or MD5 authentication, with the option for a single key or multiple keys in different modes and stages.

Single Key Authentication

Use the following steps to configure route to enable RIPv2 authentication using a single key or password:

1. Define the authentication string or password

In the Interface mode, specify the authentication string or password used by the key using the following command:

```
ip rip authentication string LINE
```

where `LINE` is the authentication string or password

2. Specify mode of authentication for the interface

In the Interface mode, specify either text or MD5 authentication using the following command:

```
ip rip authentication mode md5|text
```

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip rip authentication string mykey
(config-if)#ip rip authentication mode md5
```

Multiple Keys Authentication

Use the following steps to configure route to enable RIPv2 authentication using multiple keys at different times:

1. Define a key chain

In the Configure mode, identify a key chain with a key chain name using the following command:

```
key chain KEYNAME
```

where `KEYNAME` is the name of the chain to manage.

2. Define the key(s)

In the Keychain mode, specify a key on this key chain using the following command:

```
key-id KEYID
```

where `KEYID` = `<0-2147483647>` Key Identifier number

3. Define the authentication string or password

In the Keychain-key mode, define the password used by a key, using the following command:

```
key-string WORD
```

where `WORD` is a string of characters to be used as a password by the key.

4. Set key management options

© 2026 IP Infusion Inc. Proprietary

This step can be performed at this stage or later when multiple keys are used. The options are configured in the `keychain-key` command mode.

- Set the time period during which the authentication key on a key chain is received as valid, using the following command:

```
accept-lifetime START END
```

where `START` and `END` are the beginning and end of the time period.

- Set the time period during which the authentication key on a key chain can be sent using the following command:

```
send-lifetime START END
```

where `START` and `END` are the beginning and end of the time period.

5. Enable authentication on an interface

In the Interface mode, enable authentication on an interface and specify the key chain to be used, using the following command:

```
ip rip authentication key-chain CHAINNAME
```

where `CHAINNAME` is a set of valid authentication keys

6. Specify mode of authentication for the interface

In the Interface mode, specify either text or MD5 authentication using the following command:

```
ip rip authentication mode md5|text
```

Example

In the following example, a password `toyota` is set for a `key-id 1` in a key chain `cars`. On Interface `eth0` authentication is enabled and the authentication mode is set as `MD5`.

```
#configure terminal
(config)#key chain cars
(config-keychain)#key-id 1
(config-keychain-key)#key-string toyota
(config-keychain-key)#accept-lifetime 10:00:00 Oct 08 2002 duration 43200
(config-keychain-key)#send-lifetime 10:00:00 Oct 08 2002 duration 43200
(config-keychain-key)#exit
(config-keychain)#exit
(config)#interface eth0
(config-if)#ip rip authentication key-chain cars
(config-if)#ip rip authentication mode md5
(config-if)#exit
```

Two-way Active Measurement Protocol

Overview

Two-way Active Measurement Protocol (TWAMP) is an open protocol for measuring network performance between any two devices.

In OcNOS, TWAMP measurement is configured under the interface mode using using the “delay-measurement dynamic twamp” command. When the command is configured, the measurement is started on the corresponding interface and using the configuration data in the delay-measurement command. The measurement is stopped by unconfiguring the “delay-measurement” command on the interface.

The TWAMP hardware profile filter should be enabled so that the timestamps used in the TWAMP protocol calculations are obtained accurately from the DNX hardware.

After the measurement is done, the result can be checked by the user using the OcNOS cli or netconf. The result is also advertised to IGP TE. There are 2 modes of advertisement, periodic and accelerated. Both periodic and accelerated advertisements can be enabled in parallel.

Periodic Advertisement

Periodic advertisement is enabled by default. In this case, the link delay metrics are calculated at a periodic “computation” interval. The calculated minimum delay for a link is compared with the minimum delay value advertised previously:

- The delay metrics for the link are advertised only if the variation in values is beyond any of the configured periodic thresholds.
- If the variation in values is within configured periodic thresholds, the delay metrics for the link are not advertised.

Accelerated Advertisement

Accelerated advertisement is disabled by default. In this case, the link delay metrics are calculated after receiving every burst of data. The calculated minimum delay for a link is compared with the minimum delay value advertised previously:

- The delay metrics for the link are advertised only if the variation in values is beyond any of the configured accelerated thresholds.
- If the variation in values is within configured accelerated thresholds, the delay metrics for the link are not advertised.

Limitation and Assumptions

- To verify delay, loss and bandwidth measurement with IGP_TE, the pre-requisites are that the ISIS and OSPF sessions should be up and running. (Check OSPF and ISIS configuration in corresponding sections).
- The a-bit-threshold configures the Anomalous (A) bit. The A bit is set when the measured value of this parameter exceeds its configured maximum threshold. The A bit is cleared when the measured value falls below its configured reuse threshold.
- The “test-session-name” command is no longer supported and should not be used. The “delay-measurement” command under interface mode should be used instead.

© 2026 IP Infusion Inc. Proprietary

- On 9600-56DX boards, if TWAMP and VXLAN are used simultaneously, the hardware profile for NVO VXLAN should be configured last.

Topology

Figure 190. TWAMP topology

Configuration

Configuration TWAMP Measurement on ROUTER

Configure the router R1 to send TWAMP measurement packets on interface xe1 towards the reflector on R2.

R1

`#configure terminal`	Enter configure mode.
`(config)# hardware-profile filter twamp-ipv4 enable`	Enable the hardware profile filter for TWAMP ipv4 so that HW timestamps can be retrieved in the DNX hardware for IPv4.
`(config)# hardware-profile filter twamp-ipv6 enable`	Enable the hardware profile filter for TWAMP ipv6 so that HW timestamps can be retrieved in the DNX hardware for IPv6.
`(config)#twamp-light control`	Enter to Twamp-Light control mode.
`(config-twamp-light-ctrl)#control-admin-state enable`	Enable the Twamp-light sender framework.
`(config-twamp-light-ctrl)#exit`	Exit the Twamp-light control mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 23.1.1.1/24`	Configure ipv4 address.
`(config-if)#ipv6 address 222::1/64`	Configure ipv6 address.
`(config-if)# delay-measurement dynamic twamp reflector-ip 23.1.1.2 reflector-port 1235 sender-ip 23.1.1.1 sender-port 1234 dscp 56`	Configure the TWAMP delay measurement.
`(config-if)#commit`	Commit the candidate configuration to running configuration.

Configure the router R2 to receive and reflect TWAMP measurement packets on interface xe2.

R2

`#configure terminal`	Enter configure mode.
`(config)# hardware-profile filter twamp-ipv4`	Enable the hardware profile filter for TWAMP ipv4 so

`enable`	that HW timestamps can be retrieved in the DNX hardware for IPv4.
`(config)# hardware-profile filter twamp-ipv6 enable`	Enable the hardware profile filter for TWAMP ipv4 so that HW timestamps can be retrieved in the DNX hardware for IPv6.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 23.1.1.2/24`	Configure ipv4 address.
`(config-if)#ipv6 address 222::2/64`	Configure ipv6 address.
`(config-if)#exit`	Exit interface mode
`(config)#twamp-light reflector`	Enter to Twamp-Light reflector mode
`(config-twamp-light-ref)#reflector-admin-state enable`	Enable the Twamp-light reflector framework
`(config-twamp-light-ref)#reflector-name r1 reflector-ip 23.1.1.2 reflector-port 1235 sender-ip 23.1.1.1 sender-port 1234`	Create a reflector instance
`(config-twamp-light-ref)#commit`	Commit the candidate configuration to the running configuration
`(config-twamp-light-ref)#exit`	Exit Twamp-Light reflector mode

Configuring TWAMP Delay Profiles

The delay profile “interfaces” configures the way the TWAMP packets are sent (burst, interval…) and the way the data is advertised after the measurement data is collected

R1

`#configure terminal`	Enter configure mode.
`(config)# delay-profile interfaces`	Enter in to delay profile mode
`(config-dp-int)#burst interval 3000`	To config the burst interval for TWAMP packets in milliseconds(default value is 3000 milliseconds).
`(config-dp-int)#burst count 10`	To set the number of packets to be sent at each burst interval (default=10).
`(config-dp-int)#interval 30`	To set the computation interval for TWAMP packets in seconds. (Default=30 sec).
`(config-dp-int)#interval 120`	To set the computation interval of TWAMP packets for advertisement periodic mode.
`(config-dp-int)# advertisement periodic threshold 10`	Config threshold value inside advertisement periodic mode for TWAMP packets.
`(config-dp-int)# advertisement periodic minimum-change 1000`	Config minimum change value inside advertisement periodic mode for TWAMP packets.
`(config-dp-int)# advertisement accelerated`	Enable advertisement accelerated in delay profile mode.
`(config-dp-int)# advertisement accelerated threshold 20`	Config advertisement accelerated minimum change value inside delay profile mode for TWAMP packets.

© 2026 IP Infusion Inc. Proprietary

`(config-dp-int)# advertisement accelerated minimum-change 2000`	Config advertisement accelerated minimum change value inside delay profile mode for TWAMP packets.
`(config--dp-int)#commit`	Commit the candidate configuration to running configuration

Configuring Loss Measurement

Loss measurement is disabled by default and should be configured separately after the delay-measurement has been configured.

R1

`#configure terminal`	Enter configure mode
`(config)#interface xe1`	Enter interface mode
`(config-if)#delay-measurement dynamic twamp reflector-ip 23.1.1.2 reflector-port 1235 sender-ip 23.1.1.1 sender port 1234 dscp 56`	Configure delay measurement
`(config-if)#loss-measurement dynamic`	Configure loss measurement after delay measurement is already configured
`(config-if)#commit`	Commit the candidate configuration to running configuration
`(config-if)#exit`	Exit interface mode

Un-Configuring/Stopping TWAMP Measurement

R1

`#configure terminal`	Enter configure mode
`(config)# hardware-profile filter twamp-ipv4 disable`	Disable hardware profile filter for TWAMP ipv4.
`(config)# hardware-profile filter twamp-ipv6 disable`	Disable hardware profile filter for TWAMP ipv6.
`(config)#interface xe1`	Enter interface mode
`(config-if)# no delay-measurement dynamic twamp reflector-ip 23.1.1.2`	Unconfigure delay measurement.
`(config-if)#no loss-measurement dynamic`	Unconfigure loss measurement.
`(config-if)#commit`	Commit the candidate configuration to running configuration.
`(config-if)#exit`	Exit interface mode.

Un-Configuring TWAMP Delay profile

R1

`#configure terminal`	Enter configure mode
`(config)# delay-profile interfaces`	Enter in to delay profile mode.

(config-dp-int)#no burst interval	Un-Configure burst interval value inside delay profile mode.
(config-dp-int)#no burst count	Un-Configure burst count value inside delay profile mode.
(config-dp-int)#no interval	Un-Configure interval value inside delay profile mode.
(config-dp-int)#no sender-port	Un-Configure sender port value inside delay profile mode.
(config-dp-int)#no advertisement periodic	Disable advertisement periodic mode.
config-dp-int)#no interval	Un-Configure interval value inside for advertisement periodic mode.
(config-dp-int)#no advertisement periodic threshold	Un-Configure threshold value inside advertisement periodic mode
(config-dp-int)# no advertisement periodic minimum-change	Un-Configure minimum change value inside advertisement periodic mode
(config-dp-int)#no advertisement accelerated	Un-Configure accelerated inside advertisement mode
(config-dp-int)#no advertisement accelerated minimum-change	Un-Configure advertisement accelerated minimum change value inside delay profile mode
(config-dp-int)# no advertisement accelerated threshold	Un-Config advertisement accelerated threshold value inside delay profile mode

Clearing TWAMP Statistics

R1

Router1# clear twamp measurement interface xe1	This command will restart the measurement on the specified interface, resetting the collected stats.
Router1# clear twamp measurement interface all	This command will restart the measurement on all the interfaces, resetting all the collected stats. If there are any non-applied configuration changes to the delay profile, they will be applied when this command is issued.

End-to-End Measurement

When a reflector is multiple hops away from the sender and there are multiple paths available to the reflector, End-to-End measurement ensures that the TWAMP packets should go out of only the interface with the configured Sender IP/Reflector IP on sender and reflector side respectively.

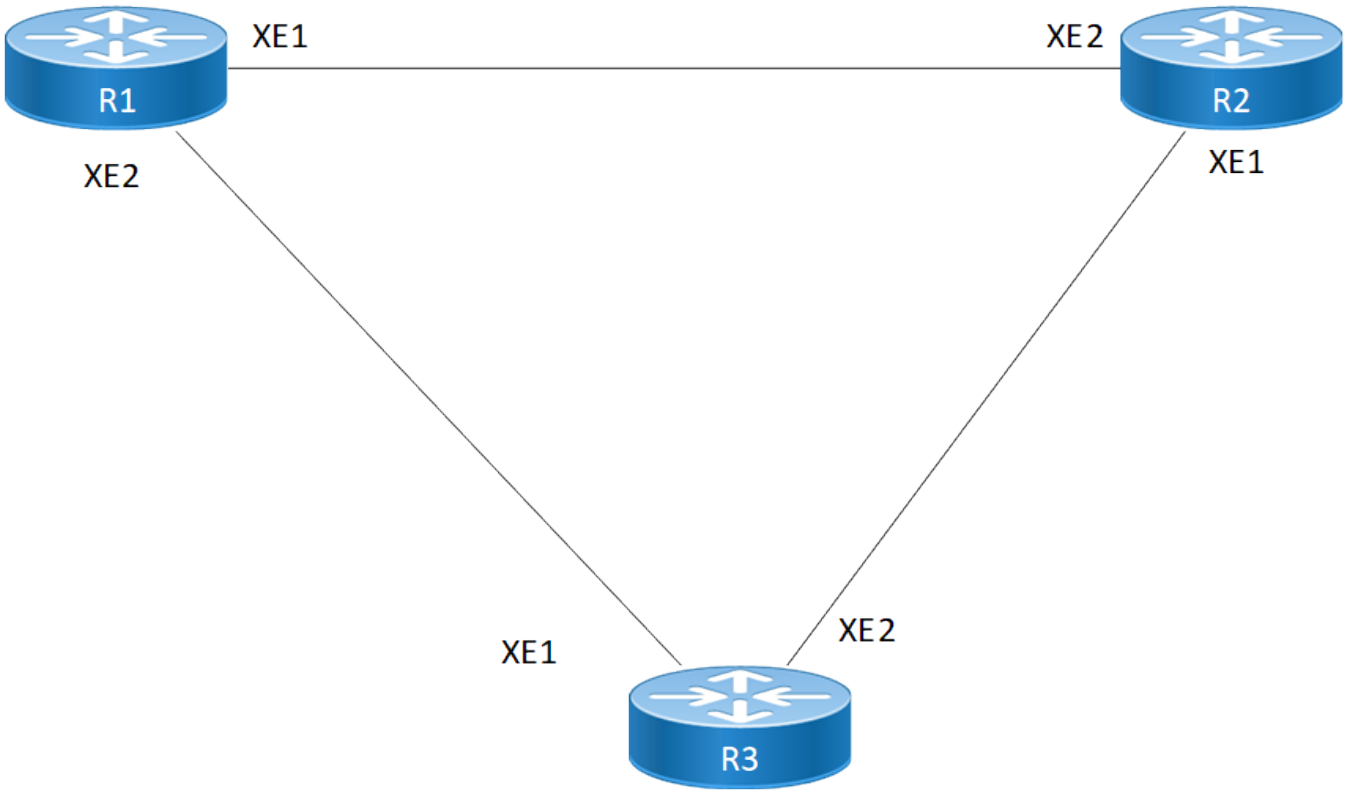
Topology

Figure 191. TWAMP topology



Configuration

R1 - Sender

`#configure terminal`	Enter configure mode.
`(config)# hardware-profile filter twamp-ipv4 enable`	Enable the hardware profile filter for TWAMP ipv4 so that HW timestamps can be retrieved in the DNX hardware for IPv4.
`(config)#twamp-light control`	Enter the Twamp-Light control mode.
`(config-twamp-light-ctrl)#control-admin-state enable`	Enable the Twamp-light sender framework.
`(config-twamp-light-ctrl)#exit`	Exit the Twamp-light Control mode.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure ipv4 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure ipv4 address.
`(config-if)# delay-measurement dynamic twamp sender-ip 20.20.20.1 reflector-ip 30.30.30.2 reflector-port 1234`	Configuring delay measurement. Since it is applied on interface xe2, it will force the packets to go out from

	xe2 even if others paths are available.
(config-if)#commit	Commit the candidate configuration to running configuration.
(config-if)#exit	Exit interface mode
(config)#ip route 30.30.30.0/24 20.20.20.2	Set static route to reflector.
(config)#commit	Commit the candidate configuration to running configuration.

R2 - Reflector

#configure terminal	Enter configure mode.
(config)# hardware-profile filter twamp-ipv4 enable	Enable the hardware profile filter for TWAMP ipv4 so that HW timestamps can be retrieved in the DNX hardware for IPv4.
(config)#interface xe1	Enter interface mode.
(config-if)#ip address 30.30.30.2/24	Configure ipv4 address.
(config)#interface xe2	Enter interface mode.
(config-if)#ip address 10.10.10.2/24	Configure ipv4 address.
(config-if)#exit	Exit interface mode.
(config)#twamp-light reflector	Enter the Twamp-Light reflector mode.
(config-twamp-light-ref)#reflector-admin-state enable	Enabling the Twamp-light reflector framework.
(config-twamp-light-ref)#reflector-name r1 reflector-ip 30.30.30.2 reflector-port 1234 sender-ip 20.20.20.1	Configuring the reflector instance with reflector ip and port number. Specifying explicitly the sender-ip in the reflector command will force the reflector to reply from the interface where the reflector-ip is configured.
(config-twamp-light-ref)#commit	Commit the candidate configuration to the running configuration.
(config-twamp-light-ref)#exit	Exit Twamp-light reflector framework mode.
(config-if)#ip route20.20.20.0/24 30.30.30.1	Set static route to reflector.
(config)#commit	Commit the candidate configuration to running configuration.

R3 - Intermediate

(config-twamp-light-ref)#reflector-admin-state enable	Enabling the Twamp-light reflector framework.
(config)#interface xe1	Enter xe1 interface mode
(config-if)#ip address 20.20.20.2/24	Configure ipv4 address
(config)#interface xe2	Enter xe2 interface mode
(config-if)#ip address 30.30.30.1/24	Configure ipv4 address
(config)#commit	Commit

TWAMP for Client and Server with SNMP

Overview

The Two-Way Active Measurement Protocol (TWAMP) provides a standardized method for actively measuring IP network performance. It designed to evaluate metrics such as latency, jitter, and packet loss in a controlled, repeatable manner. By leveraging a client-server model, TWAMP delivers bidirectional insights that help validate service levels and troubleshoot issues proactively.

TWAMP sessions are initiated by a client, which sends control and test packets to a server (also called a reflector). The server, in turn, responds to these probes, allowing the client to calculate round-trip performance statistics.

TWAMP Client

The TWAMP client acts as the test originator. It's responsible for setting up control connections, launching measurement sessions, and collecting performance data. Each session defines sender and receiver addresses, ports, and various probe parameters, such as packet count and interval timing.

Client Feature Characteristics

Feature characteristics of the client include:

- Initiating multiple test sessions across different server addresses.
- Supporting both IPv4 and IPv6 traffic.
- Defining control parameters such as sender/receiver ports and DSCP markings.
- Starting and stopping sessions based on test scenarios.

TWAMP Server

The TWAMP server in OcNOS operates as a reflector. It listens for incoming control connections from external TWAMP clients and responds to test packets once a session is active. The server tracks connection and session details throughout the lifecycle of each test.

You can configure the server to enforce limits on active connections, sessions per connection, and per-client usage. It also supports session inactivity timeouts. By using the listen-vrf option, you can enable the server to operate across multiple VRFs, allowing performance measurements in segmented routing environments.

OcNOS version 6.1.0adds SNMP integration, allowing external systems to monitor TWAMP server activity in real time.

Server Feature Characteristics

Feature characteristics of the server include:

- Accepts TWAMP control connections and test sessions without initiating communication.
- Supports multiple VRFs using listen-vrf, allowing measurement across isolated routing domains.
- Configurable Resource Limits:
  - Maximum number of concurrent connections

© 2026 IP Infusion Inc. Proprietary

- Maximum sessions per connection
- Per-client session and connection limits
- Session inactivity timeouts

- Allows configuration of the listening port (default 862, configurable within the TCP dynamic port range).

SNMP for TWAMP

OcNOS version 6.1.0introduces the SNMP feature provides real-time visibility into TWAMP activity through trap notifications and MIB access. You can monitor events such as session starts, client timeouts, and threshold violations using standard SNMP tools.

SNMP Feature Characteristics

Feature characteristics of the SNMP include:

- **`snmpget`** and **`snmpwalk`** queries for TWAMP server data.
- SNMPv2-style traps for key operational events.
- NETCONF-based notifications for dynamic state changes.

Examples of trap-triggering events:

- A client establishing or disconnecting from a session.
- A session reaching its configured timeout.
- The server hitting its maximum connection or session limits.

All SNMP events follow a structured OID scheme under the IP Infusion enterprise MIB tree (.1.3.6.1.4.1.36673), ensuring compatibility with centralized network monitoring systems.

Benefits

The TWAMP Client Implementation has following benefits to network management and optimization:

- TWAMP clients adhere to standardized protocols, ensuring compatibility and interoperability with various TWAMP servers.
- SNMP traps provide immediate visibility into session events and performance issues.
- Automatic trap generation for connection limits, timeouts, and session states.
- Provides flexible deployment across virtual routing domains.

Prerequisites

Ensure that the TWAMP client has a stable and reliable network connection to the TWAMP server.

Topology

The network topology includes the interactions between TWAMP Server and TWAMP Client entities, highlighting the flow of control messages and test packets. The TWAMP Client initiates active measurement sessions by sending control messages to the TWAMP Server over the TWAMP Control Connection. The TWAMP Server, in response, configures the session and directs test packets to the TWAMP Session-Reflector, which ensures proper routing and measurement. The results of these measurements are then relayed back to the TWAMP Client for analysis.

© 2026 IP Infusion Inc. Proprietary

The following diagram example shows 2 nodes connected by a physical link through interfaces xe14 on each end. We will configure the first node as a TWAMP client. The second node must have a TWAMP server running.

Figure 192. TWAMP Client-Server

In the below example configurations, configure the Client for IPv4 and then for IPv6.

Server Configuration

Follow the steps below to configure the TWAMP server. These steps allow you to set up server parameters such as port number, session limits, timeouts, and VRF support.

1. Enter TWAMP server configuration mode.
```
server(config)# twamp server
```
2. Configure the listening port to define TCP port on which the TWAMP server listens for incoming connections.
```
server(config-twamp-server)# port 5555
```
3. Set Maximum Connection Duration to specify the maximum duration (in hours) that a connection remains active.
```
server(config-twamp-server)# max-connection-duration 3
```
4. Define maximum number of connections to set the total number of connections that the TWAMP server can accept concurrently.
```
server(config-twamp-server)# max-connections 17
```
5. Set maximum connections per client to limit the number of concurrent connections that a single client can establish.
```
server(config-twamp-server)# max-connections-per-client 3
```
6. Define maximum sessions to specify the total number of TWAMP sessions the server can support across all connections.
```
server(config-twamp-server)# maximum-sessions 25
```
7. Set maximum sessions per connection to limit the number of TWAMP sessions allowed per connection.
```
server(config-twamp-server)# maximum-sessions-per-connection 20
```
8. Configure inactivity timeout to specify the timeout period (in minutes) after which an inactive session will be terminated.
```
server(config-twamp-server)# inactivity-timeout 5
```
9. Add listening VRF for the active twamp server.
```
 server(config-twamp-server)# listen-vrf vrf123
```

Note: If no VRF is specified, the server runs in the default VRF.

10Enable the TWAMP Server with the configured parameters.

```
server(config-twamp-server)# server-admin-state enable
```

Configuration to Trigger TWAMP Traps

Prerequisites

For configurations using the server and client, the following settings are enabled:

- **hardware-profile filter twamp-ipv4 enable**
- **IPv6**
- **snmp-server enable traps twamp**

For configurations using the controller and reflector, the following settings are disabled:

- **hardware-profile filter twamp-ipv4 enable and IPv6**
- **snmp-server enable traps twamp**

Basic SNMP config are already present.

- OID for IGP-TE: 1.3.6.1.4.1.36673.1600
- OID for TWAMP: 1.3.6.1.4.1.36673.1601
- OID for TWAMP-CLIENT: 1.3.6.1.4.1.36673.1603

© 2026 IP Infusion Inc. Proprietary

Perform the following steps on the TWAMP server and client devices.

1. Configure the TWAMP Server

```
server(config)# twamp-light reflector
server(config-twamp-reflector)# reflector-admin-state enable
server(config-twamp-reflector)# reflector-name R1
server(config-twamp-reflector)# reflector-ip ipv4 192.168.2.1
server(config-twamp-reflector)# reflector-port 862
server(config-twamp-reflector)# commit
server(config-twamp-reflector)# exit
server(config)# twamp server
server(config-twamp-server)# port 862
server(config-twamp-server)# max-connections 2
server(config-twamp-server)# max-connections-per-client 2
server(config-twamp-server)# maximum-sessions 64
server(config-twamp-server)# maximum-sessions-per-connection 64
server(config-twamp-server)# inactivity-timeout 1
server(config-twamp-server)# listen-vrf default
server(config-twamp-server)# server-admin-state enable
server(config-twamp-server)# commit
server(config-twamp-server)# exit
```

2. Configure the TWAMP Client.

```
client# configure terminal
client(config)# twamp-light control
client(config-twamp-control)# control-admin-state enable
client(config-twamp-control)# exit
client(config)# twamp client
client(config-twamp-client)# maximum-connections 10
client(config-twamp-client)# maximum-sessions 10
client(config-twamp-client)# connection test1
client(config-twamp-connection)# server ipv4 192.168.2.1 port 862
client(config-twamp-connection)# session s1 sender-port 1025 receiver-   port 1025 \sender-
address ipv4 192.168.2.2 receiver-address ipv4 192.168.2.1
client(config-twamp-connection)# exit-connection
client(config-twamp-client)# commit
client(config-twamp-client)# exit
```

3. Perform reflector and controller configurations for delay and loss measurement:

   a. Enable TWAMP Light Control

```
client(config)# twamp-light control
client(config-twamp-light-ctrl)# control-admin-state enable
client(config-twamp-light-ctrl)# commit
client(config-twamp-light-ctrl)# end
```

   b. Configure Delay Profile Parameters

```
client(config)# delay-profile interfaces
client(config-dp-intf)# burst-interval 2000
client(config-dp-intf)# burst-count 5
client(config-dp-intf)# interval 60
client(config-dp-intf)# advertisement accelerated
client(config-dp-intf)# advertisement accelerated threshold 10
client(config-dp-intf)# advertisement accelerated minimum-change 1
client(config-dp-intf)# notification enabled
client(config-dp-intf)# notification threshold 1
client(config-dp-intf)# notification minimum-change 10
```

   c. Configure Interface for Delay and Loss Measurement

```
client(config)# interface xe16
client(config-if)# delay-measurement dynamic twamp reflecor-ip      10.1.1.2 sender-ip
10.1.1.1
client(config-if)# loss-measurement dynamic
client(config-if)# commit
```

© 2026 IP Infusion Inc. Proprietary

1. Reflector Configuration:

   a. Enable TWAMP light reflector

```
server(config)# twamp-light reflector
server(config-twamp-light-ref)# reflector-admin-state enable
```

   b. Configure Reflector Parameters:

```
server(config-twamp-light-ref)# reflector-name r1 reflector-ip ipv4      10.1.1.2 reflector-
port 862 sender-ip ipv4 10.1.1.1 sender-port 862
server(config-twamp-light-ref)# commit
server(config-twamp-light-ref)# end
```

2. Trigger the Desired Trap.

Trap Name/OID	Twamp Server Config	Twamp Client Config	Trigger
twamp-server-client-connected or iso.3.6.1.4.1.36673.1601.0.1	CONFIG FROM CLIENT AND SERVER	Config from client and server	When a TWAMP Client connects to the TWAMP Server, the trap is generated by the TWAMP Server.
twamp-server-client-disconnected or iso.3.6.1.4.1.36673.1601.0.2	Config from client and server	Config from client and server	When the TWAMP Client removes a connection. For example: CLIENT(config-twamp-client)# no connection TEST1 The trap is generated by the TWAMP Server.
twamp-server-client-accepted iso.3.6.1.4.1.36673.1601.0.3	Config from client and server	Config from client and server	When the TWAMP Client is accepted by the TWAMP Server. The trap is generated by the TWAMP Server
twamp-server-sessions-started or iso.3.6.1.4.1.36673.1601.0.4	Config from client and server	Config from client and server	When the TWAMP Client starts an TWAMP session that is in Accepted state. Example: CLIENT# twamp client start connection CONN The trap is generated by TWAMP Server.
twamp-server-sessions-stopped or iso.3.6.1.4.1.36673.1601.0.5	Config from client and server	Config from client and server	When the TWAMP Client stops an TWAMP session that is already running.

© 2026 IP Infusion Inc. Proprietary

Trap Name/OID	Twamp Server Config	Twamp Client Config	Trigger
			Example: CLIENT# twamp client stop connection CONN The trap is generated by TWAMP Server.
twamp-server-client-inactivity-timeout or iso.3.6.1.4.1.36673.1601.0.6	inactivity-timeout 1	Config from client and server	When the TWAMP Client is connected to the TWAMP Server, but TWAMP Client did not do anything else, such as starting a TWAMP session. After the 1 minute of inactivity, the trap is generated by the TWAMP Server. And the TWAMP Client is disconnected.
twamp-server-client-maximum-connection-duration-timeout iso.3.6.1.4.1.36673.1601.0.7	maximum-connection	Already config for two connection to server exists	When the TWAMP Client reached the maximum connection duration with the TWAMP Server. The trap is generated by the TWAMP Server.
twamp-server-maximum-connections-exceeded or iso.3.6.1.4.1.36673.1601.0.8	max-connections 2	Already config for two connection to server exists	When the TWAMP Client creates the third connection, the TWAMP Server will not accept it, and the TWAMP server will generate the trap.
twamp-server-maximum-sessions-exceeded or iso.3.6.1.4.1.36673.1601.0.9	maximum-sessions 2	Already config for two session to server exists	When the TWAMP Client creates the third session the TWAMP Server will not accept it, and the TWAMP server will generate the trap.
twamp-server-maximum-connections-per-client-exceeded or iso.3.6.1.4.1.36673.1601.0.10	max-connections-per-client 2	Already two connection to sever exists	When the TWAMP Client creates the third connection, the TWAMP Server will not accept it, and the TWAMP server will generate the trap.
twamp-server-maximum-sessions-	maximum-sessions-	Already 1 session to	When the TWAMP Client

Trap Name/OID	Twamp Server Config	Twamp Client Config	Trigger
per-connection-exceeded or iso.3.6.1.4.1.36673.1601.0.11	per-connection 1	server exists	creates the third connection, the TWAMP Server will not accept it, and the TWAMP server will generate the trap.
twamp-delay-threshold-breached or.1.3.6.1.4.1.36673.1601.0.12	Config from controller and reflector	Config from controller and reflector	When the TWAMP Client creates the second session the TWAMP Server will not accept it, and the TWAMP server will generate the trap. These traps are generated by the TWAMP Client.
twamp-client-session-accepted or 1.3.6.1.4.1.36673.1603.0.1	Config from client and server	Config from client and server	When a Session is accepted by the TWAMP Server to the TWAMP Client. So, The TWAMP Client can get to know when the acceptance as been done, since the accept may not be synchronous. These traps are generated by the TWAMP Client.
twamp-client-sessions-started or .1.3.6.1.4.1.36673.1603.0.2	Config from client and server	Config from client and server	When a Session is started with the Twamp Server, the trap is generated to inform the TWAMP Client side that it has started. These traps are generated by the TWAMP Client.
twamp-client-sessions-stopped or .1.3.6.1.4.1.36673.1603.0.3	Config from client and server	Config from client and server	When a Session is stopped with the Twamp Server, the trap is

Glossary

The following provides definitions for key terms used throughout this document.

TWAMP	Two-Way Active Measurement Protocol, a standardized protocol for measuring network performance in a bidirectional manner.
Client	In the context of TWAMP, the client is a device or software component responsible for initiating TWAMP test sessions and measuring network performance.
Session	A measurement session in TWAMP involves the exchange of test packets between the client and the server to assess network performance.
Server	The counterpart to the client, the server in TWAMP receives test packets, conducts measurements, and provides results to the client.
Test Packets	Data packets exchanged between the client and server to measure network performance, including metrics like latency, jitter, and packet loss.
Initiate	The action of starting a TWAMP test session from the client to the server.
Latency	The time it takes for data packets to travel from the client to the server and back, often measured in milliseconds.

TWAMP for VPN Inter-Access Interface

Overview

The Two-Way Active Measurement Protocol (TWAMP), defined by RFC 5357, measures end-to-end network performance metrics, such as one-way or two-way latency (delay) and packet loss, between two network endpoints. Service providers and enterprises commonly use TWAMP to verify Service Level Agreements (SLAs) and diagnose network performance issues.The TWAMP for VPN Inter-Access Interface feature extends TWAMP functionality to multi-VPN or multi-VRF environments. It enables end-to-end performance measurements across access interfaces of network endpoints. This capability is particularly valuable in service provider networks, where multiple customers or internal groups operate within isolated, logically separated virtual private networks (VPNs), yet require cross-boundary performance metrics.

Feature Characteristics

When configured for VPN Inter-Access Interfaces (for example, PE1 interface xe4 and PE2 interface xe14), TWAMP test packets traverse the specified path, adhering to configured Quality of Service (QoS) policies, queuing mechanisms, and other interface settings. This ensures that measurements accurately reflect the actual user-experienced delay between access interfaces.

Benefits

TWAMP for VPN Inter-Access Interface has following benefits to network management and optimization:

- Enables delay measurements across VPN Inter-Access Interfaces to verify network SLAs.
- Supports troubleshooting of performance issues in multi-VPN environments.

Prerequisites

- To enable TWAMP measurements on VPN Inter-Access Interfaces, configure the following hardware-profile filters:

```
OcNOS(config)# hardware-profile filter egress-ipv4 enable
OcNOS(config)# hardware-profile filter twamp-ipv4 enable
```

Note: A system reboot is required to apply these hardware filters.

Limitations

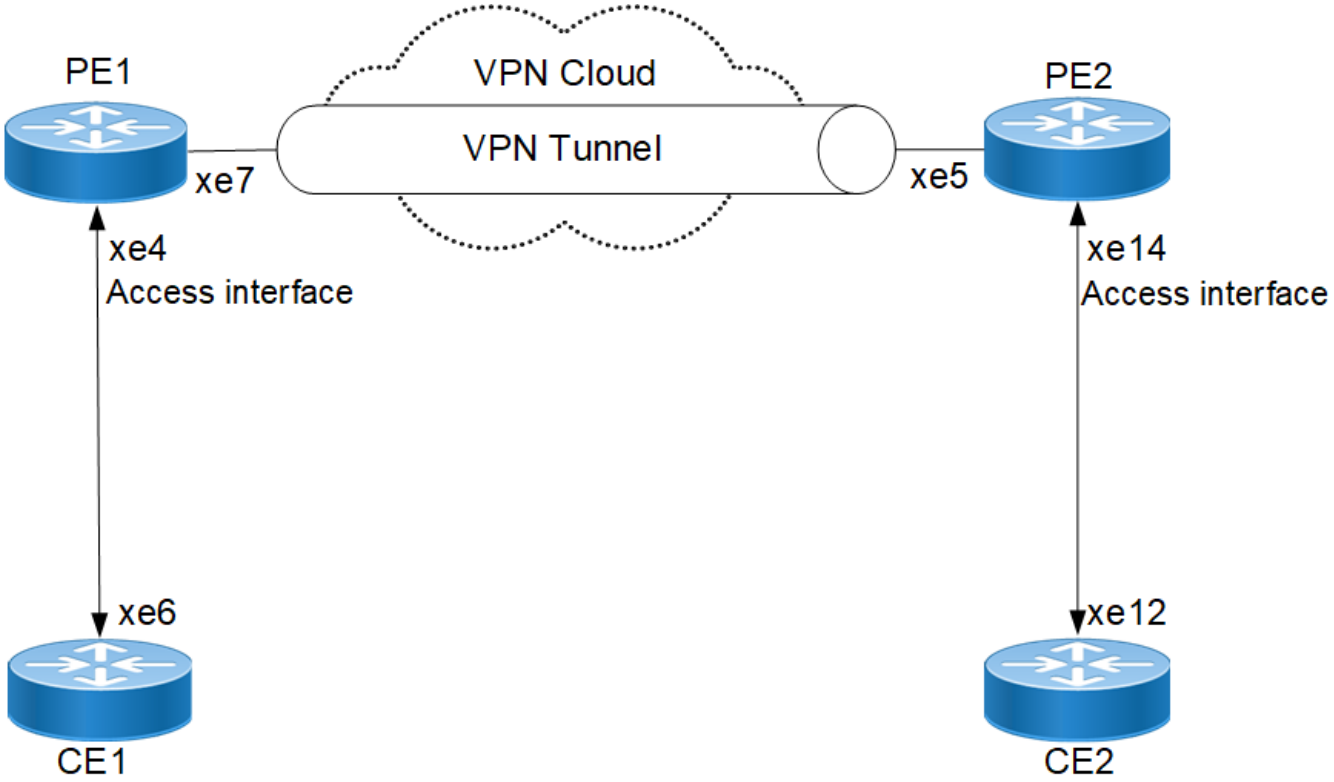
- The inter-access VPN TWAMP session does not support multi-path scenarios when traffic flows through an interface other than the vpn-net-interface. If TWAMP packets are received on a different interface, the system treats them as invalid, which increases the packet loss rate.
- Inter-access VPN TWAMP is a Layer 3 feature and is not designed to operate on LAG member interfaces.

© 2026 IP Infusion Inc. Proprietary

Topology

The topology includes two Customer Edge (CE) devices, each connected to a Provider Edge (PE) device (PE1 and PE2). The PEs are interconnected through an MPLS core that supports Layer 3 VPN (L3VPN) services with a VPN tunnel. For simplicity, the VPN cloud is not shown, and PE1 and PE2 are depicted as directly connected.

Figure 193. TWAMP for VPN inter-access interface



Configurations

PE1

1. Enter Configuration Mode

   a. Access the configuration terminal to begin modifying the router settings.

   ```
   OcNOS#configure terminal
   ```

   b. Configure VRF for VPN (vrf101):
   Set up a Virtual Routing and Forwarding (VRF) instance named vrf101, assign a Route Distinguisher (RD), and Route Target (RT).

   ```
   (config)#ip vrf vrf101
   (config-vrf)#rd 1.1.1.1:101
   (config-vrf)#route-target both 65010:101
   (config-vrf)#exit
   (config)#commit
   ```

   c. Configure LDP
   Enter Label Distribution Protocol (LDP) mode and set the transport address to the loopback IP.

© 2026 IP Infusion Inc. Proprietary

```
(config)#router ldp
(config-router-ldp)#transport-address ipv4 1.1.1.1
(config-router-ldp)#exit
```

d. Configure Loop-back Interfaces
Set up loop-back interfaces for global and VRF contexts with primary and secondary IP addresses.

```
(config)#interface lo
(config-if)#ip address 1.1.1.1/32 secondary
(config-if)#exit
```

e. Configure Access Interface (xe4)
Bind the access interface to vrf101 and assign an IP address for connectivity to the CE device.

```
(config)#interface xe4
(config-if)#ip vrf forwarding vrf101
(config-if)#ip address 103.1.1.1/24
(config-if)#description ACCESS-INTERFACE
(config-if)#exit
```

f. Configure Transport Interface (xe7)
Configure the transport interface with an IP address, enable label switching, and activate LDP for MPLS.

```
(config)# interface xe7
(config-if)# ip address 11.1.1.1/24
(config-if)# label-switching
(config-if)# enable-ldp ipv4
(config-if)# description TRANSPORT-INTERFACE
(config-if)# exit
(config)# commit
```

g. Configure OSPF
Set up OSPF for underlay routing, specifying the router ID and networks to participate in OSPF area 0.

```
(config)# router ospf 1
(config-router-ospf)# ospf router-id 1.1.1.1
(config-router-ospf)# network 1.1.1.1/32 area 0.0.0.0
(config-router-ospf)# network 11.1.1.0/24 area 0.0.0.0
(config-router-ospf)# exit
(config)# commit
```

h. Configure BGP
Set up BGP for overlay routing, including iBGP peering with PE2 and EVPN and VRF address families.

```
(config)# router bgp 65010
(config-router-bgp)# bgp router-id 1.1.1.1
(config-router-bgp)# neighbor 3.3.3.3 remote-as 65010
(config-router-bgp)# neighbor 3.3.3.3 update-source lo

(config-router-bgp)# address-family vpnv4 unicast
(config-router-bgp-af)# neighbor 3.3.3.3 activate
(config-router-bgp-af)# neighbor 3.3.3.3 next-hop-self
(config-router-bgp-af)# exit-address-family

(config-router-bgp)# address-family ipv4 vrf vrf101
(config-router-bgp-vrf)# redistribute connected
(config-router-bgp-vrf)# exit-address-family

(config-router-bgp)# exit
(config)# commit
```

i. Enable TWAMP-Light Control
Enable the TWAMP-light administrative state to allow TWAMP operations.

```
(config)# twamp-light control
(config-twamp-light-ctrl)# control-admin-state enable
(config-twamp-light-ctrl)# exit
```

© 2026 IP Infusion Inc. Proprietary

```
(config)# commit
```

j. Reload the System
Save the configuration and reload the system to apply hardware filter changes.

```
(config)# exit
OcNOS# reload
The system has unsaved changes.
Would you like to save them now? (y/n): y
Are you sure you would like to reset the system? (y/n): y
```

k. TWAMP Session
Create a TWAMP session for VPN inter-access interface measurement.

```
OcNOS# configure terminal
(config)# twamp session PE1-SESSION
(config-twamp-session)# sender-ip 103.1.1.1
(config-twamp-session)# sender-port 862
(config-twamp-session)# reflector-ip 203.1.1.1
(config-twamp-session)# reflector-port 862
(config-twamp-session)# vrf-name vrf101
(config-twamp-session)# vpn-net-interface xe7
(config-twamp-session)# description TWAMP VPN Inter-Acc-Intf
(config-twamp-session)# dscp 0
(config-twamp-session)# burst-interval 2000
(config-twamp-session)# burst-count 2
(config-twamp-session)# interval 35
(config-twamp-session)# notification enabled
(config-twamp-session)# notification threshold 80
(config-twamp-session)# notification minimum-change 80
(config-twamp-session)# no shut
(config-twamp-session)# exit
(config)# commit
```

PE2

1. Enter Configuration Mode

a. Access the configuration terminal to begin modifying the router settings.

```
OcNOS# configure terminal
```

b. Configure VRF for VPN (vrf101)
Create a VRF instance named vrf101, assign an RD, and RT.

```
(config)# ip vrf vrf101
(config-vrf)# rd 3.3.3.3:101
(config-vrf)# route-target both 65010:101
(config-vrf)# exit
(config)# commit
```

c. Configure LDP
Enter LDP mode and set the transport address to the loopback IP.

```
(config)# router ldp
(config-router-ldp)# transport-address ipv4 3.3.3.3
(config-router-ldp)# exit
```

d. Configure Loop-back Interfaces
Set up loopback interfaces for global and VRF contexts with primary and secondary IP addresses.

```
(config)# interface lo
(config-if)# ip address 3.3.3.3/32 secondary
(config-if)# exit
```

e. Configure Access Interface (xe14)
Bind the access interface to vrf101 and assign an IP address.

© 2026 IP Infusion Inc. Proprietary

```
(config)# interface xe14
(config-if)# ip vrf forwarding vrf101
(config-if)# ip address 203.1.1.1/24
(config-if)# description ACCESS-INTERFACE
(config-if)# exit
```

f. Configure Transport Interface (xe5)
Configure the transport interface with an IP address, enable label switching, and activate LDP for MPLS.

```
(config)# interface xe5
(config-if)# ip address 11.1.1.2/24
(config-if)# label-switching
(config-if)# enable-ldp ipv4
(config-if)# description NETWORK-INTERFACE
(config-if)# exit
(config)# commit
```

g. Configure OSPF
Set up OSPF for underlay routing, specifying the router ID and networks to participate in OSPF area 0.

```
(config)# router ospf 1
(config-router-ospf)# ospf router-id 3.3.3.3
(config-router-ospf)# network 3.3.3.3/32 area 0.0.0.0
(config-router-ospf)# network 11.1.1.0/24 area 0.0.0.0
(config-router-ospf)# exit
(config)# commit
```

h. Configure BGP
Set up BGP for overlay routing, including iBGP peering with PE1 and EVPN and VRF address families.

```
(config)# router bgp 65010
(config-router-bgp)# bgp router-id 3.3.3.3
(config-router-bgp)# neighbor 1.1.1.1 remote-as 65010
(config-router-bgp)# neighbor 1.1.1.1 update-source lo

(config-router-bgp)# address-family vpnv4 unicast
(config-router-bgp-af)# neighbor 1.1.1.1 activate
(config-router-bgp-af)# neighbor 1.1.1.1 next-hop-self
(config-router-bgp-af)# exit-address-family

(config-router-bgp)# address-family ipv4 vrf vrf101
(config-router-bgp-vrf)# redistribute connected
(config-router-bgp-vrf)# exit-address-family

(config-router-bgp)# exit
(config)# commit
```

i. Configure TWAMP-Light Reflector
Configure TWAMP reflectors for VPN inter-access interface measurement.

```
(config)# router bgp 65010
(config-router-bgp)# bgp router-id 3.3.3.3
(config-router-bgp)# neighbor 1.1.1.1 remote-as 65010
(config-router-bgp)# neighbor 1.1.1.1 update-source lo

(config-router-bgp)# address-family vpnv4 unicast
(config-router-bgp-af)# neighbor 1.1.1.1 activate
(config-router-bgp-af)# neighbor 1.1.1.1 next-hop-self
(config-router-bgp-af)# exit-address-family

(config-router-bgp)# address-family ipv4 vrf vrf101
(config-router-bgp-vrf)# redistribute connected
(config-router-bgp-vrf)# exit-address-family

(config-router-bgp)# exit
(config)# commit
```

j. Reload the System
Save the configuration and reload the system to apply hardware filter changes.

```
(config)# exit
OcNOS# reload
The system has unsaved changes.
Would you like to save them now? (y/n): y
Are you sure you would like to reset the system? (y/n): y
```

Validation

For validation and comparison, the TWAMP link measurement was configured on the interface xe7 on PE1 and the reflector on PE2 running at interface xe5. Thus, it is possible to compare the VPN Tunnel measurements and the Access to Access measurements as shown below:

To verify the TWAMP configuration on PE1, use the following commands to check the running configuration and session status:

- Check TWAMP Configuration

```
#show running-config twamp
twamp session PE1-SESSION
sender-ip 103.1.1.1
sender-port 862
reflector-ip 203.1.1.1
reflector-port 862
vrf-name vrf101
vpn-net-interface xe7
description TWAMP VPN Inter-Acc-Intf
dscp 0
burst-interval 2000
burst-count 2
interval 35
notification enabled
notification threshold 80
notification minimum-change 80
no shut
```

- Verify TWAMP Session Status

```
#show twamp-session all
=======================================

```

To verify the TWAMP configuration on PE2, use the following command to check the reflector configuration:

- Check TWAMP Reflector Configuration

```
#show running-config twamp
twamp-light reflector
  reflector-admin-state enable
  reflector-name R4 reflector-ip ipv4 203.1.1.1
reflector-port 862 sender-ip
ipv4 103.1.1.1 sender-port 862 vrf vrf101 vpn-net-interface
xe5
```

CLI Commands

This section describes the CLI commands used to configure TWAMP over VPN Inter-Access Interfaces.

© 2026 IP Infusion Inc. Proprietary

twamp session

Use this command to configure a TWAMP session for end-to-end performance measurement across VPN inter-access interfaces.

Command Syntax

```
twamp session WORD
no twamp session WORD
```

Parameters

WORD
Set TWAMP Session name

Default

None

Command Mode

None

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the creation of a TWAMP Session and the change into `twamp-session` mode prompt.

```
OcNOS#configure terminal
OcNOS(config)#twamp session PE1-SESSION
OcNOS(twamp-session)#
```

© 2026 IP Infusion Inc. Proprietary

no twamp session all

Use this command to remove all configured TWAMP sessions in a single command. Requires all sessions to be in shut mode; otherwise, the command fails and displays an error.

Command Syntax

```
no twamp session all
```

Parameters

None

Default

None

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the deletion of all TWAMP Sessions via the single-command running on configure-mode.

```
OcNOS#configure terminal
OcNOS(config)# no twamp session all
```

shut

Use this command to shut a configured TWAMP Session. It will stop the TWAMP Session execution and measurement.

Command Syntax

```
shut
```

Parameters

None

Default

Enabled

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the TWAMP Session being set to shut, which will then stop the TWAMP Session named PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)#twamp session PE1-SESSION
OcNOS(twamp-session)#shut
```

© 2026 IP Infusion Inc. Proprietary

no shut

Use this command to unshut a configured TWAMP Session. It will validate the configuration and start the TWAMP Session execution and measurement when the configuration is correct. Otherwise, the respective error is thrown related to the configuration validation that caused the error.

Command Syntax

```
no shut
```

Parameters

None

Default

Disable

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the TWAMP Session being set to no shut, which will then validate and start the TWAMP Session named PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)#twamp session PE1-SESSION
OcNOS(twamp-session)# no shut
```

© 2026 IP Infusion Inc. Proprietary

reflector-ip

Use this command to set the IP of the TWAMP Reflector so that this TWAMP Session will send the test packets.

Command Syntax

```
reflector-ip (A.B.C.D|HOSTNAME)
```

Parameters

A.B.C.D
IPv4 address of the TWAMP Reflector

HOSTNAME
The hostname of the TWAMP Reflector

Default

Mandatory attribute

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the Reflector IP being configured in the TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# reflector-ip 203.1.1.1
```

© 2026 IP Infusion Inc. Proprietary

reflector-port

Use this command to set the UDP port of the TWAMP Reflector so that this TWAMP Session will send the test packets.

Command Syntax

```
reflector-port (862|<1025-65535>)
```

Parameters

862
Default UDP port for TWAMP

<1025-65535>
The UDP port to be configured

Default

862

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the reflector-port UDP port being configured in the TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# reflector-port 862
```

© 2026 IP Infusion Inc. Proprietary

sender-ip

Use this command to set the IP of the TWAMP Sender so that this TWAMP Session will send the test packets. The TWAMP Sender is expected to be the IP from the Access Interface in which the TWAMP test packets are going to be sent.

Command Syntax

```
sender-ip (A.B.C.D|HOSTNAME)
```

Parameters

A.B.C.D
IPv4 address of the TWAMP Sender

HOSTNAME
The hostname of the TWAMP Sender

Default

Mandatory attribute

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the Sender IP being configured in the TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# sender-ip 101.1.1.1
```

© 2026 IP Infusion Inc. Proprietary

sender-port

Use this command to set the UDP port of the TWAMP Sender so that this TWAMP Session will send the test packets.

Command Syntax

```
sender-port (862|<1025-65535>)
```

Parameters

862
Default UDP port for TWAMP

<1025-65535>
The UDP port to be configured

Default

862

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1

Example

The following example shows the sender-port UDP port being configured in the TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# sender-port 862
```

© 2026 IP Infusion Inc. Proprietary

dscp

Use this command to set the DSCP (Differentiated Services Code Point) of the TWAMP test packets.

Command Syntax

```
dscp WORD
```

Parameters

WORD

Value can be 0-63 or type well-known names (af11| af12| af13| af21| af22| af23| af31| af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5| cs6| cs7| default| ef).

Default

Default

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the dscp being configured in the TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# dscp af23
```

© 2026 IP Infusion Inc. Proprietary

vrf-name

Use this command to set the VRF to be used when sending test packets over the TWAMP Reflector IP, which is the Access interface.

Command Syntax

```
vrf-name WORD
```

Parameters

WORD
VRF name

Default

default

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1

Example

The following example shows the VRF being configured, assigned to interface xe4 and being configured in the TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# ip vrf vrf101
OcNOS(config-if)# interface xe4.101
OcNOS(config-if)# ip vrf forwarding vrf101
OcNOS(config-if)# ip address 103.1.1.1/24
OcNOS(config-if)# exit
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# vrf-name vrf101
OcNOS(twamp-session)# sender-ip 103.1.1.1
```

© 2026 IP Infusion Inc. Proprietary

vpn-net-interface

When this attribute is configured, the TWAMP session will execute the inter-access measurement. Use this command to configure the physical network interface from which the test packets should go out.

Command Syntax

```
vpn-net-interface WORD
```

Parameters

WORD
Interface name

Default

Not applicable

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1

Example

The following example shows the vpn-net-interface being configured on TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# ip vrf vrf101
OcNOS(config-if)# interface xe4.101
OcNOS(config-if)# ip vrf forwarding vrf101
OcNOS(config-if)# ip address 103.1.1.1/24
OcNOS(config-if)# exit
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# vrf-name vrf101
OcNOS(twamp-session)# sender-ip 103.1.1.1
OcNOS(twamp-session)# vpn-net-interface xe7
```

© 2026 IP Infusion Inc. Proprietary

description

Use this command to configure a description in the TWAMP Session.

Command Syntax

```
description WORD
```

Parameters

WORD
Description to be added

Default

None

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1

Example

The following example shows the description being set in TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# description TWAMP VPN Inter-Acc-Intf
```

© 2026 IP Infusion Inc. Proprietary

burst-interval

Use this command to configure the burst interval between test packets sent to TWAMP Reflector.

Command Syntax

```
burst-interval <1000-15000>
```

Parameters

<1000-15000>
The burst interval (in seconds) between test packets

Default

3000

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1

Example

The following example shows how to configure the burst-interval in TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# burst-interval 10000
```

© 2026 IP Infusion Inc. Proprietary

burst-count

Use this command to configure the number of test packets to be sent in a burst.

Command Syntax

```
burst-count <1-10>
```

Parameters

<1-10>

Set the number of packets to be sent at each burst interval. The default value is 3.

Note: The limit **<1-10>** is applicable only on Qumran2 (Q2) series platforms. For Qumran1 (Q1) series platforms it is llimited to **<1-5>**.

Default

3

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1. The burst count limit has been increased from on <1-5> to <1-10> on Qumran2 (Q2) series platformsin OcNOS version 7.0.0.

Example

The following example shows how to configure the burst-interval in TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# burst-count 4
```

© 2026 IP Infusion Inc. Proprietary

interval

Use this command to configure the computation interval of test packets. The computation interval is the interval where the measurement statistics are calculated periodically.

Command Syntax

```
interval <30-3600>
```

Parameters

<30-3600>
The computation interval where the measurement statistics are calculated.

Default

3

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows how to configure the burst-interval in TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# burst-count 4
```

© 2026 IP Infusion Inc. Proprietary

notification enabled

Use this command to enable the generation of notifications for TWAMP Session when the average delay crosses the configured threshold or any packet-loss is seen. The generated notification for each event is sent over NETCONF Notification and SNMP Trap.

For threshold crossing, please check the other notification commands: "`notification threshold`" and "`notification minimum-change`" for more details on how to finely adjust the generation of the notifications.

For the packet-loss, there is no fine adjustment. Once a packet loss is detected, the notification is generated.

Command Syntax

```
notification enabled
```

Parameters

None

Default

Disabled

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows how to configure the notification in TWAMP Session PE1-SESSION.

```
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# notification enabled
```

© 2026 IP Infusion Inc. Proprietary

notification threshold

Use this command to configure the notification threshold, which will trigger the notification in case the average delay crosses the configured threshold. The threshold is a percentage value with respect to the average delay. Thus, if the average delay changes above or below the configured threshold, then the NETCONF Notification and SNMP Trap are generated to inform that the threshold has been crossed.

Note: If notification minimum-change is used together with the notification threshold, then the one that crosses the threshold first will trigger the NETCONF Notification and SNMP Trap.

Command Syntax

```
notification threshold <1-100>
```

Parameters

<1-100>
The percentile threshold with respect to the average delay calculated

Default

30

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows how to configure the notification in TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# notification enabled
OcNOS(twamp-session)# notification threshold 80
```

© 2026 IP Infusion Inc. Proprietary

notification minimum-change

Use this command to configure the notification minimum-change threshold. The minimum-change threshold unit is in microseconds and is related to the average delay. Thus, if the average delay changes above or below the minimum-change threshold, then the NETCONF Notification and SNMP Trap are generated to inform that the threshold has been crossed.

Observation: If notification minimum-change is used together with the notification threshold, then the one that crosses the threshold first will trigger the NETCONF Notification and SNMP Trap.

Command Syntax

```
notification minimum-change <0-10000>
```

Parameters

<1-10000>
The threshold in microseconds with respect to the average delay calculated

Default

5000

Command Mode

TWAMP-SESSION mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows how to configure the notification in TWAMP Session PE1-SESSION.

```
OcNOS#configure terminal
OcNOS(config)# twamp session PE1-SESSION
OcNOS(twamp-session)# notification enabled
OcNOS(twamp-session)# notification threshold 80
OcNOS(twamp-session)# notification minimum-change 80
```

© 2026 IP Infusion Inc. Proprietary

show twamp-sessions

Use this command to show a summary of the last calculated statistics of the running TWAMP Sessions. These statistics are related to the computation interval configured.

Command Syntax

```
show twamp-sessions
```

Parameters

None

Default

None

Command Mode

Execution modeand Privilege mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the TWAMP sessions summary .

```
#show twamp-session
Session-Name  Net-Intf Delay(us) Min(us) Max(us) Var(us) Loss(%)   State
PE1-SESSION     xe7      22        20      23      0       0.00    Running
```

Table 106. Table 1-1: show twamp-sessions fields

Field	Description
Session-Name	TWAMP Session session name
Net-Intf	Network Interface where this TWAMP Session is
Delay(us)	Average Round-Trip Delay
Min(us)	Average Minimum Round-Trip Delay
Max(us)	Average Maximum Round-Trip-Delay
Var(us)	Average Round-Trip Delay Variation
Loss(%)	Percentage of packet-loss

show twamp-sessions WORD

Use this command to show detailed statistics of the running TWAMP Session. These statistics are related to the computation interval configured.

Command Syntax

```
show twamp-sessions WORD
```

Parameters

WORD
The TWAMP Session session name

Default

Not Applicable

Command Mode

Execution mode and Privileged Execution mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the detailed statistics of TWAMP session.

```
#show twamp-session PE1-SESSION
Session Name      : PE1-SESSION
VPN Network Interface name    : xe7
State             : Running
Sender IP         : 103.1.1.1
Sender Port       : 862
DSCP value        : default
Vrf-Name          : vrf101
Reflector IP      : 203.1.1.1
Reflector port    : 862
Execution Status  : Running
Last Calculated stats:
Time: 2025-06-12 12:04:22
  Average delay          : 22
  Minimum delay          : 20
  Maximum delay          : 23
  Average delay variation: 0
  Minimum delay variation: 0
  Maximum delay variation: 0
  Packets sent           : 30
  Packets received       : 30
  Packets timeout        : 0
Packet Loss : 0.00
Notification stats:
  Notification : Enabled
  Threshold (%): 80
  Minimum-change (usec): 80
  Last Notified Packet Loss:
    Time: 2025-06-12 12:12:12
    Packet Loss: 30.00
  Last Notified Average Delay:
```

```
    Time: -
    Average Delay (usec):
```

Table 107. Table 1-1: show twamp-sessions WORD fields

Field	Description
VPN Network Interface name	TAMP Session session name
Sender IP	Network Interface where this TWAMP Session is
Sender Port	Average Round-Trip Delay
DSCP Value	Average Minimum Round-Trip Delay
Vrf-Name	Average Maximum Round-Trip-Delay
Reflector IP	Average Round-Trip Delay Variation
Reflector Port	Percentage of packet-loss
Execution status	Shows if session is running or not
HW Status	Indicate if Hardware filters are configured
Last Calculated stats	Statistics related to the last calculated values
Time	When the last calculation was done. This is related to the calculation interval configuration.
Average delay	Average delay last calculated.
Minimum delay	Minimum delay last calculated.
Maximum delay	Maximum delay last calculated.
Average delay variation	Average delay variation last calculated.
Minimum delay variation	Minimum delay variation last calculated.
Maximum delay variation	Maximum delay variation last calculated.
Packets sent	How many packets were sent
Packets received	How many packets were received
Packets	How many packets were timed out

show twamp-sessions all

Use this command to show detailed statistics of all the running TWAMP Sessions. These statistics are related to the computation interval configured.

Command Syntax

```
show twamp-sessions all
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command is introduced in OcNOS version 6.6.1.

Example

The following example shows the detailed statistics of all the TWAMP sessions configured .

```
OcNOS#configure terminal
PE1#sh twamp-sessions all
Session Name      : PE1-SESSION
VPN Network Interface name    : xe7
State             : Running
Sender IP         : 103.1.1.1
Sender Port       : 862
DSCP value        : default
Vrf-Name          : vrf101
Reflector IP      : 203.1.1.1
Reflector port    : 862
Execution Status  : Running
Last Calculated stats:
Time: 2025-06-12 12:04:22
  Average delay          : 22
  Minimum delay          : 20
  Maximum delay          : 23
  Average delay variation: 0
  Minimum delay variation: 0
  Maximum delay variation: 0
  Packets sent           : 30
  Packets received       : 30
  Packets timeout        : 0
Packet Loss : 0.00
Notification stats:
  Notification : Enabled
  Threshold (%): 80
  Minimum-change (usec): 80
  Last Notified Packet Loss:
    Time: 2025-06-12 12:12:12
    Packet Loss: 30.00
  Last Notified Average Delay:
    Time: -
```

```
    Average Delay (usec): -
```

Table 108. Table 1-1: show twamp-sessions WORD fields

Field	Description
Session Name	TWAMP Session session name
VPN Network Interface name	VPN Network interface name
Start Time	When the TWAMP Session started
Elapsed time (milli sec)	Elapsed time
Packets Sent	How many packets sent
Packets Received	How many packets received
Packet Loss (%)	Percentage of packet loss
Round Trip Delay(usec)	Round Trip Delay calculations
Minimum	Round Trip Delay Minimum
Maximum	Round Trip Delay Maximum
Average	Round Trip Delay Average
Forward Delay(usec)	Forward Delay calculations

show twamp packet-rate

Use this command to display the overall TWAMP packet transmission rate in packets per second (pps) for both client and server operations.

Command Syntax

```
show twamp  packet-rate
```

Parameters

None

Default

None

Command Mode

Execution modeand Privilege mode

Applicability

This command is introduced in OcNOS version 7.0.0.

Example

The following example shows the TWAMP packet-rate summary .

```
ocnos#show twamp  packet-rate
! [execution timestamp : 2025 Oct 24 13:42:04]
TWAMP packet sending rate: 2996 pps
             senders rate: 2996 pps
          reflectors rate: 0 pps
Maximum supported sending rate: 5120 pps
```

Table 109. Table 1-1: show twamp packet-rate fields

Field	Description
TWAMP packet sending rate	Shows the total number of TWAMP test packets transmitted per second (pps) by all active TWAMP sessions on the device.
senders rate	Indicates the cumulative packet sending rate from all TWAMP clients (senders) currently transmitting measurement packets.
reflectors rate	Displays the packet response rate from TWAMP reflectors (servers). A value of 0 pps means no active reflector sessions are responding at this time.
Maximum supported sending rate	Defines the maximum TWAMP packet transmission rate (in pps) that the device can support. This limit ensures session and traffic control within hardware or software capacity.

© 2026 IP Infusion Inc. Proprietary

show twamp session count

Use this command to display the total number of active TWAMP sessions that are currently established.

Command Syntax

```
show twamp session-count
```

Parameters

None

Default

None

Command Mode

Execution modeand Privilege mode

Applicability

This command is introduced in OcNOS version 7.0.0.

Example

The following example shows the TWAMP session summary .

```
ocnos#show twamp session-count
! [execution timestamp : 2025 Oct 24 13:26:31]
TWAMP session count:
  Link measurement sessions: 500

  End to End sessions      : 1000
    Running          : 1000
    Not Running      : 0

  Reflector sessions       : 0

  Configure Client sessions: 500
    Idle             : 499
    Accepted         : 0
    Not Accepted     : 0
    Started          : 0
    Stopped          : 0

  Accepted Server sessions : 0

TOTAL                      : 2000 sessions
```

Table 110. Table 1-1: show twamp session-countfields

Field	Description
Link measurement sessions	Number of TWAMP sessions used for measuring link-level performance.
End to End sessions	Number of TWAMP sessions configured for end-to-end performance measurement (multi-hop tests).

Table 110. show twamp session-countfields (continued)

Field	Description
Running	Number of end-to-end TWAMP sessions that are currently active and transmitting test packets.
Not Running	Number of end-to-end TWAMP sessions that are configured but not currently active.
Reflector sessions	Number of TWAMP reflector (server-side) sessions currently active on the device.
Configure Client sessions	Number of TWAMP client sessions configured on the device.
Idle	Number of configured client sessions that are inactive or waiting for initiation.
Accepted	Number of TWAMP client sessions that have been accepted by the server.
Not Accepted	Number of TWAMP client sessions that were not accepted by the server (possibly due to configuration mismatch or policy restrictions).
Started	Number of TWAMP client sessions that have been successfully started and are transmitting traffic.
Stopped	Number of TWAMP client sessions that were previously active but have been stopped.
Accepted Server sessions	Number of TWAMP sessions accepted by the device when acting as a TWAMP server.
TOTAL	The total number of TWAMP sessions, summing up all session categories (link measurement + end-to-end + client/server).

TWAMP Commands

This section describes the commands used to manage the Two-Way Active Measurement Protocol (TWAMP).

Notes:

- The implementation of TWAMP measurement relies on software timestamps collected at the application layer. The measured packet path in this case is longer than the actual link path and thus the timestamps used in the delay measurement are less accurate.
- On Qumran-UX (QUX) series platforms, where resources are limited, activate TWAMP hardware profiles only when necessary, as other profiles may require the same board resources. For more details, refer to the "`hardware-profile filter`" commands in the **System Configure Mode Commands** section of the *OcNOS System Management document*.

This section describes the commands for TWAMP.

control-admin-state

Use this command to enable or disable the TWAMP sender framework. The sender framework needs to be enabled before configuring any TWAMP sessions.

Command Syntax

```
control-admin-state (enable | disable)
```

Parameters

enable
Enable the TWAMP sender framework.

disable
Disable the TWAMP sender framework.

Default

Disable

Command Mode

TWAMP light control mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
(config)#twamp-light control
(config-twamp-light-ctrl)#control-admin-state enable
```

© 2026 IP Infusion Inc. Proprietary

reflector-admin-state

Use this command to enable or disable the TWAMP reflector framework. The reflector framework needs to be enabled before configuring any reflector session.

Command Syntax

```
reflector-admin-state (enable | disable)
```

Parameters

enable
Enable the TWAMP reflector framework.

disable
Disable the TWAMP reflector framework.

Default

Disabled

Command Mode

TWAMP light reflector mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
(config)#twamp-light reflector
(config-twamp-light-ctrl)#reflector-admin-state enable
```

© 2026 IP Infusion Inc. Proprietary

twamp stop-test-session (Deprecated)

This command is not supported anymore. The “delay-measurement dynamic twamp” command under interface mode should be used to start/stop twamp measurement instead.

Use this command to stop the TWAMP test session.

Command Syntax

```
twamp stop test-session WORD
```

Parameters

WORD

TWAMP test session name.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#twamp stop test-session s1
```

© 2026 IP Infusion Inc. Proprietary

reflector-name

Use this command to configure a TWAMP light reflector session.

Command Syntax

```
reflector-name WORD reflector-ip (ipv4 A.B.C.D|ipv6 X:X::X:X|HOSTNAME) (reflector-port (862|<1025-
65535>)|) (vrf NAME|) (sender-ip (ipv4 A.B.C.D|ipv6 X:X::X:X|HOSTNAME)|) (sender-port (862|<1025-
65535>)|)(vpn-net-interface IFNAME|)
```

Parameters

WORD
Set TWAMP Light reflector session name

X:X::X:X
TWAMP Reflector IP address in IPv6 format.

A.B.C.D
TWAMP Reflector IP address in IPv4 format.

HOSTNAME
The hostname of the TWAMP reflector

vrf NAME
Set TWAMP Light reflector session VRF name

reflector-port
Set the TWAMP Reflector UDP port number where the reflector will be listening

sender-ip
Set the sender IP from which the reflector will accept the TWAMP packets. If the source of the TWAMP packet does not match this address, the packet will be ignored. In case not set, the reflector will not discriminate on the sender IP value.

sender-port
Set the sender UDP port from which the reflector will accept the TWAMP packets. In case not set, the reflector will not discriminate on the sender UDP port value.

vpn-net-interface
Set the VPN Network Interface from which the TWAMP test packets must go out. This parameter is needed only in case of VPN Inter-Access Interface.

Default

862 for reflector-port

0 for the sender-port (interpreted as no filtering on sender port)

Command Mode

TWAMP light reflector mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS version 5.1.

© 2026 IP Infusion Inc. Proprietary

The sender-IP and sender-port parameters were added in OcNOS version 6.0.0

Example

```
(config)#twamp-light reflector
(config-twamp-light-ref)# reflector-name R11 reflector-ip 23.1.1.1 vrf vrf1
(config-twamp-light-ref)# reflector-name R12 reflector-ip 24.1.1.1 vrf vrf2
(config-twamp-light-ref)# reflector-name R12 reflector-ip 24.1.1.1 sender-ip 24.1.1.2 vrf vrf2
(config-twamp-light-ref)# reflector-name R12 reflector-ip 24.1.1.1 sender-ip 24.1.1.2 sender-port
1555 vrf vrf2
(config-twamp-light-ref)# reflector-name R15 reflector-ip 10.1.11.1 vrf vrf2 vpn-net-interface xe4
```

© 2026 IP Infusion Inc. Proprietary

show debugging twamp

Use this command to display the status of debug information of the TWAMP.

Command Syntax

```
show debugging twamp
```

Parameters

None

Default

Off

Config Mode

Execution mode and Privilege mode

Applicability

This command was introduced in OcNOS version 6.1.0.

Examples

```
OcNOS#show debugging twamp
TWAMP debugging status: OFF
```

show running-config twamp

Use this command to display TWAMP running configuration alone.

Command Syntax

```
show running-config twamp
```

Parameters

None

Command Mode

Execution modeand Privileged execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

Reflector:

```
#show running-config twamp
twamp-light reflector
reflector-admin-state enable
reflector-ip 10.0.0.1 reflector-port 1234
```

Control or Sender:

```
#show running-config twamp
twamp-light control
 control-admin-state enable
 test-session-name s1 sender-ip 10.0.0.1 sender-port 1234 reflector-ip 10.0.0.1 reflector-port 1234
```

© 2026 IP Infusion Inc. Proprietary

Show twamp server connections information

Show the existing connections information.

Command Syntax

```
show twamp server connection (WORD|)
```

Parameters

WORD
The connection ID

Default

None

Command mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS#  show twamp server connectionConnection ID Client Address   Client
Port            1      100.1.0.1         59807           2      100.1.0.2         59808           3
      100.1.0.3         59809           4      100.1.0.4         59810
OcNOS#  show twamp server connection 2Connection ID              : 2Client Address             :

show twamp server status

Show the general status of the TWAMP server

Command Syntax

```
show twamp server status
```

Parameters

None

Default

None

Command mode

Exec mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Examples

```
OcNOS#show twamp server statusStatus                    : EnabledListening Port            :
862Server VRF list           : management default vrf1Number of connections     : 3Number of
sessions        : 15Number of running sessions: 5
OcNOS#
```

© 2026 IP Infusion Inc. Proprietary

show twamp statistics

Use this command to display TWAMP test session.

Command Syntax

```
show twamp-statistics (WORD|)
```

Parameters

WORD
TWAMP test session name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#show twamp statistics
=======================================
      TWAMP Test-Session Statistics
=======================================
  Test-Session Name        : s1
  Start Time               : 2019 Aug 05 08:40:12
  Elapsed time(milli sec)  : 4004
  Packets Sent             : 4
  Packets Received         : 4
  Packet Loss(%)           : 0.0000
  Round Trip Delay(usec)

Table 111. show twamp statistics fields

Field	Description
Test-Session Name	TWAMP test session name
Start Time	TWAMP test start time
Elapsed time (milli sec)	Time taken to complete the test in milliseconds
Packets Sent	Number of packet sent
Packets Received	Number of packet received
Packet Loss (%)	Packet lost in percentage
Round Trip Delay(usec)	Round trip delay between TWAMP sender and reflector. Displayed Minimum, Maximum and Average round trip delay in micro-seconds
Forward Delay(usec)	Forward delay between TWAMP sender and reflector. Displayed Minimum, Maximum and Average forward delay in micro-seconds In case the clocks on the sender and reflector are not in sync, a (*) will be displayed here.
Reverse Delay(usec)	Reverse delay between TWAMP reflector and sender. Displayed Minimum, Maximum and Average reverse delay in micro-seconds In case the clocks on the sender and reflector are not in sync, a (*) will be displayed here.
Round Trip Delay Variation (usec)	Round trip delay variation between TWAMP sender and reflector. Displayed Minimum, Maximum and Average round trip delay variation in micro-seconds
Forward Delay Variation (usec)	Forward delay variation between TWAMP sender and reflector. Displayed Minimum, Maximum and Average forward delay variation in micro-seconds In case the clocks on the sender and reflector are not in sync, a (*) will be displayed here.
Reverse Delay Variation (usec)	Reverse delay variation between TWAMP reflector and sender. Displayed Minimum, Maximum and Average reverse delay variation in micro-seconds In case the clocks on the sender and reflector are not in sync, a (*) will be displayed here.

twamp client

Use this command to enable and configure the TWAMP client.

Command Syntax

```
twamp client
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#
OcNOS(config)#twamp client
OcNOS(config-twamp-client)#
```

twamp client reset connection

Use this command to reset the TWAMP client sessions on a connection.

Command Syntax

```
twamp client reset connection NAME (session NAME|) (vrf WORD|)
```

Parameters

NAME
Specifies the name of the connection where the sessions will be reset.

NAME
Specifies the name of the session to be reset. If not specified, all sessions on the connection will be reset.

WORD
Specifies the name of the vrf where the connection is operating. If not specified, the default vrf will be used.

Default

None

Command mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS#twamp client reset connection test_ipv6 vrf vrf1
```

© 2026 IP Infusion Inc. Proprietary

twamp client start connection

Use this command to start the sessions already requested from the server and accepted by the server over the specified connection.

Command Syntax

```
twamp client start connection (NAME) packet-count (0-1000000) (vrf NAME)
```

Parameters

NAME
Specifies the name of the TWAMP client connection to be used for the session.

0-1000000
Specifies the number of packets to be used in the session. It can be any value between 0 and 1,000,000.

vrf NAME
Specifies the a Virtual Routing and Forwarding (VRF) context for the TWAMP client session (optional).

Default

None

Command mode

exec mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#twamp client
OcNOS(config-twamp-client)#twamp client start connection MyConnection packet-count 1000 vrf VRF1
OcNOS(config-twamp-client)#commit
```

© 2026 IP Infusion Inc. Proprietary

twamp client stop connection

Use this command to stop the sessions already requested from the server and accepted by the server over the specified connection.

This command is only effective if the packet-count specified in the start command is not elapsed. In case the packet-count is elapsed, the sessions are stopped automatically, and this command would not have any effect.

Command Syntax

```
twamp client stop connection (NAME)(vrf NAME)
```

Parameters

NAME
Specifies the name of the TWAMP client connection to be stopped.

vrf NAME
Specifies the a VRFcontext for the TWAMP client session (optional).

Default

None

Command mode

Execution mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#twamp client
OcNOS(config-twamp-client)#twamp client stop connection MyConnection vrf VRF1
OcNOS(config-twamp-client)#commit
```

© 2026 IP Infusion Inc. Proprietary

twamp connection

Use this command to create a connection between the server and the client.

Multiple connections can be specified. The user can issue the same command multiple times, once for each VRF.

Only clients in the configured VRFs are allowed to connect to the server and only sessions to IPs in the configured VRFs are allowed to be established.

Use the no form of this command to remove the connection.

Command Syntax

```
connection NAME (vrf-name NAME)
no connection NAME (vrf-name NAME)
```

Parameters

NAME

Specifies the connection name to add to the client.

NAME

Specifies the VRF name.

Default

None

Command mode

twamp-client mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#twamp client
OcNOS(config-twamp-client)#connection Connection1 vrf VRF1
OcNOS(config-twamp-client)#commit
OcNOS(config-twamp-client)#
OcNOS(config-twamp-client)#no connection Connection1 vrf VRF1
OcNOS(config-twamp-client)#commit
```

© 2026 IP Infusion Inc. Proprietary

twamp server

Use this command to change to the twamp server mode.

Command Syntax

```
twamp server
```

Parameters

None

Default

None

Command mode

Configure mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#
```

twamp server inactivity-timeout

Use this command to set the inactivity timeout in minutes. In case the server does not receive any control packet from the client during this timeout, the connection to the client is dropped and any session started by this client will be stopped.

The default value of this flag is 0. In this case the server does not check for inactivity from the client.

Use the no form of this command to set the value to the default value 0.

Command Syntax

```
inactivity-timeout <0-30>
```

Parameters

<0-30>
Set the inactivity timeout to a value between 0 and 30 in minutes.

Default

Zero

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#inactivity-timeout 22
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no inactivity-timeout
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp server listen-vrf

Use this command to a dd custom VRFs to the list of VRFs where the TWAMP server is running. If no listen-vrf is specified, the TWAMP server is started in the default VRF only.

Multiple VRFs can be specified. The user can issue the same command multiple times, once for each VRF.

Only clients in the configured VRFs are allowed to connect to the server and only sessions to IPs in the configured VRFs are allowed to be established.

Use the no form of this command to delete a listen-vrf.

Command Syntax

```
listen-vrf <NAME>
no listen-vrf <NAME>
```

Parameters

NAME

VRF name to add to the server.

Default

Default

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#listen-vrf default
OcNOS(config-twamp-server)#listen-vrf management
OcNOS(config-twamp-server)#listen-vrf vrf1
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
OcNOS(config-twamp-server)#no listen-vrf management
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp server max-connection-duration

Use this command to set the maximum connection duration that a client can establish with the server in hours. The default value of this flag is 0, which means that there is no limit for the connection duration.

Use the no form of this command to set the value to the default value 0.

Command Syntax

```
max-connection-duration <0-120>
```

Parameters

<0-120>
Set the maximum connection duration value between 0 and 120 hours.

Default

Zero

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#max-connection-duration 5
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no max-connection-duration
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp server max-connections

Use this command to set the maximum number of connections that the server can simultaneously handle. The default value of this flag is 16.

Use the no form of this command to set the value to the default value 16.

Command Syntax

```
max-connections <1-32>
```

Parameters

<1-32>

Set the maximum number of connections value between 1 and 32.

Default

16

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#max-connections 12
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no max-connections
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp server maximum-sessions-per-connection

Use this command to set the maximum number of sessions that the server can simultaneously accept on the same connection. The default value of this flag is 1.

Use the no form of this command to set the value to the default value 1.

Command Syntax

```
maximum-sessions-per-connection <1-2000>
```

Parameters

1-2000

Set the maximum number of sessions per connection between 1 and 2000.

Notes: The maximum number of TWAMP server sessions varies by hardware platform:

- Q2C, J2C+, and Q2C+ boards: 1–2000
- Q2U and Q2A boards: 1–1000
- Q1 boards: Channels 1–64

Default

1

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#maximum-sessions-per-connection 26
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no maximum-sessions-per-connection
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp client maximum-connections

Use this command to set the maximum number of connections that the client can create. The default value of this flag is 64.Use the no form of this command to set the value to the default value 64.

Command Syntax

```
max-connections (<1-64>)
```

Parameters

1-64
Set the maximum number of connections value between 1 and 64.

Default

64

Command mode

twamp-client mode

Applicability

This command was introduced in OcNOS version 6.4.1

Examples

```
OcNOS(config)#twamp client
OcNOS(config-twamp-client)# maximum-connections 10
OcNOS(config-twamp-client)#commit
OcNOS(config-twamp-client)#no max-connections
OcNOS(config-twamp-client)#commit
```

© 2026 IP Infusion Inc. Proprietary

twamp client maximum-sessions

Use this command to set the maximum number of test sessions that the client can simultaneously handle.

Use the no form of this command to set the value to the default value 64.

Command Syntax

```
maximum-sessions (1-2000)
```

Parameters

1-2000

Set the maximum number of sessions between 1 and 2000.

Notes: The maximum number of TWAMP client sessions varies by hardware platform:

- Q2C, J2C+, and Q2C+ boards: 1–2000
- Q2U and Q2A boards: 1–1000
- Q1 boards: Channels 1–64

Default

64

Command mode

twamp-client mode

Applicability

This command was introduced in OcNOS version 6.4.1

Examples

```
OcNOS(config)#twamp client
OcNOS(config-twamp-client )#maximum-sessions 44
OcNOS(config-twamp-client)#commit
OcNOS(config-twamp-client )#no maximum-sessions
OcNOS(config-twamp-client )#commit
OcNOS(config-twamp-client )#
```

© 2026 IP Infusion Inc. Proprietary

twamp client maximum-sessions-per-connection

Use this command to set the maximum number of test sessions that the client can simultaneously create on the same connection. The default value of this flag is 1.

Use the no form of this command to set the value to the default value 1.

Command Syntax

```
maximum-sessions-per-connection (1-2000)
```

Parameters

1-2000

Set the maximum number of sessions per connection between 1 and 2000.

Notes: The maximum number of TWAMP client sessions varies by hardware platform:

- Q2C, J2C+, and Q2C+ boards: 1–2000
- Q2U and Q2A boards: 1–1000
- Q1 boards: Channels 1–64

Default

1

Command mode

twamp-client mode

Applicability

This command was introduced in OcNOS version 6.4.1

Examples

```
OcNOS(config)#twamp client
OcNOS(config-twamp-client )#maximum-sessions-per-connection 26
OcNOS(config-twamp-client )#commit
OcNOS(config-twamp-client )#no maximum-sessions-per-connection
OcNOS(config-twamp-client)#commit
OcNOS(config-twamp-client)#
```

© 2026 IP Infusion Inc. Proprietary

twamp client server

Use this command to configure the server ip address(ipv4/ipv6), hostname, and port number.

Command Syntax

```
server (ipv4 A.B.C.D|ipv6 X:X::X:X|HOSTNAME) (port (862|<1025-65535>)|)
```

Parameters

ipv4 A.B.C.D
Specifies the target server's IPv4 address

ipv6 X:X::X:X
Specifies the target server's IPv6 address

HOSTNAME
Specifies the target server's hostname

port (862|<1025-65535>
Specifies the port number on which the TWAMP server is listening for control connections. 862 is the default port.

Default

None

Command mode

twamp-client connection mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#twamp client
OcNOS(config_twamp_client)#connection con4
OcNOS(config-twamp-connection)#server ipv4 192.168.1.100 port 862
OcNOS(config-twamp-connection)#commit

OcNOS(config)#twamp client
OcNOS(config_twamp_client)#connection con6
OcNOS(config-twamp-connection)#server ipv6 2001:0db8:85a3:0000:0000:8a2e:0370:7334 port 5000
OcNOS(config-twamp-connection)#commit

OcNOS(config)#twamp client
OcNOS(config_twamp_client)#connection conhost
OcNOS(config-twamp-connection)#server pe1-host port 5100
OcNOS(config-twamp-connection)#commit
```

© 2026 IP Infusion Inc. Proprietary

twamp client session

Use this command to request a session from the server.

Command Syntax

```
session (session-name) sender-port (port) receiver-port (port) (sender-address
<address>|) (receiver-address (address)|) (start-time (TIME)|) (interface
(IFNAME)|)
```

Parameters

session-name
Specifies the name of the TWAMP client session.

port
Specifies the sender and receiver port numbers to be used in the session.

address
Specifies the sender and receiver addresses(optional).

In case the receiver-address is not specified, the configured server address used for the connection is used for this session.

In case the sender address is not specified, the client address used for the connection is used for this session.

TIME
Defines the start time of the session (optional).

IFNAME
Specifies the interface to be associated with the session (optional).

Default

None

Command mode

twamp-client-connection mode

Applicability

This command was introduced in OcNOS version 6.4.1.

Examples

```
OcNOS(config)#twamp client
OcNOS(config_twamp_client)#connection testipv6
OcNOS(config-twamp-connection)#server ipv6 2001:67c:2468::122:e:5 port 862 OcNOS(config-twamp-
connection)#session session_IPV6 sender-port 5666 receiver-port 5666 sender-address ipv6
2001:67c:2468::122:e:5 receiver-address ipv6 2001:67c:2468::122:e:4

OcNOS(config)# twamp client
OcNOS(config_twamp_client)#connection test_ipv4 vrf-name vrf1
OcNOS(config_twamp_connection)#server ipv4 24.1.1.2 port 862
OcNOS(config-twamp-connection)#session session_IPV4 sender-port 5666 receiver-port 5666 sender-
address ipv4 24.1.1.1 receiver-address ipv4 24.1.1.2
```

© 2026 IP Infusion Inc. Proprietary

twamp-light control

Use this command to initialize the TWAMP light Control or Sender Session.

Use the `no` form of this command to un-initialize and to remove the configured TWAMP light control configurations.

Command Syntax

```
twamp-light control
no twamp-light control
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#configure terminal
(config)#twamp-light control
```

twamp-light reflector

Use this command to initialize the TWAMP reflector.

Use the `no` form of this command to un-initialize and to remove the configured TWAMP light refelctor configurations.

Command Syntax

```
twamp-light reflector
no twamp-light reflector
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#configure terminal
(config)#twamp-light reflector
```

© 2026 IP Infusion Inc. Proprietary

twamp server admin state

Use this command to Start/Stop the TWAMP server with the above configured parameters.

In case any of the twamp server parameters are modified after the server is started, the modification will be applied after the server is stopped and started again.

Command Syntax

```
server-admin-state (enable|disable)
```

Parameters

enable
Start the TWAMP server

disable
Stop the TWAMP server

Default

Disable

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#server-admin-state enable
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#server-admin-state disable
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#a
```

© 2026 IP Infusion Inc. Proprietary

twamp server max-connections-per-client

Use this command to set the maximum number of connections that the server can simultaneously handle from the same client (same IP). The default value of this flag is 1.

Use the no form of this command to set the value to the default value 1.

Command Syntax

```
maximum-connections-per-client <1-4>
```

Parameters

<1-4>

Set the maximum number of connections per client value between 1 and 4.

Default

Default value is 1

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#max-connections-per-client 3
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no max-connections-per-client
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp server maximum-sessions

Use this command to set the maximum number of sessions that the server can simultaneously handle. The default value of this flag is 64.

Use the no form of this command to set the value to the default value 64.

Command Syntax

```
maximum-sessions <1-2000>
```

Parameters

1-2000

Set the maximum number of sessions between 1 and 2000.

Notes: The maximum number of TWAMP server sessions varies by hardware platform:

- Q2C, J2C+, and Q2C+ boards: 1–2000
- Q2U and Q2A boards: 1–1000
- Q1 boards: Channels 1–64

Default

Default value is 64

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#maximum-sessions 44
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no max
OcNOS(config-twamp-server)#no maximum-sessions
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

© 2026 IP Infusion Inc. Proprietary

twamp server port

Use this command to set the twamp server mode TCP listen port.

Use the no form of this command to reset the port value to the default value 862.

Command Syntax

```
port (862|<1025-65535>)
```

Parameters

<1025-65535>

Set the TCP port value where the twamp server will be listening. It could be either the default value 862, or in the range 1025-65535.

Default

862

Command mode

twamp-server mode

Applicability

This command was introduced in OcNOS version 6.2.0.

Examples

```
OcNOS(config)#twamp server
OcNOS(config-twamp-server)#port 2555
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#no port
OcNOS(config-twamp-server)#commit
OcNOS(config-twamp-server)#
```

twamp start-test-session (Deprecated)

This command is not supported anymore. The “delay-measurement dynamic twamp” command under interface mode should be used to start twamp measurement instead.

Use this command to start the TWAMP test session.

Command Syntax

```
twamp start test-session WORD packet-count <1-65535> (interval <500-10000>|) (delay-threshold <0-
1000000|)
```

Parameters

WORD
TWAMP test session name.

<1-65535>
Number packed to send for test.

<500-10000>
Interval to send each packet in milliseconds.

<0-1000000>
Delay threshold, in microseconds (default = 0). A notification is sent when the average delay crosses this value during the measurement. However, no checking is carried on the delay value when it is set to 0, hence, no notification is sent.

Default

1000 for interval

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Examples

```
#twamp start test-session s1 packet-count 10 interval 500 delay-threshold 100
```

© 2026 IP Infusion Inc. Proprietary

test-session-name (Deprecated)

This command is not supported anymore. The “delay-measurement dynamic twamp” command under interface mode should be used to start twamp measurement instead.

Use this command to configure the TWAMP test sessions.

Use the `no` form of this command to un-configure or remove the configured TWAMP test sessions.

Notes:

- The dscp-to-queue mapping is performed for egress only when the sender port has the default value 862. Otherwise, Queue-6 will always be used.
- The dscp-to-queue mapping is done based on the first 3 bits of the `dscp` value.
- If `dscp` is not supplied (value 0), Queue-6 will always be used.

Command Syntax

```
test-session-name WORD sender-ip (A.B.C.D|X:X::X:X|HOSTNAME) (sender-port (862|<1025-65535>)|)
reflector-ip (A.B.C.D|X:X::X:X|HOSTNAME) (reflector-port (862|<1025-65535>)|)(dscp
(default|cs1|af11|af12|af13|cs2|af21|af22|af23|cs3|af31|af32|af33|cs4|af41|af42|af43|cs5|ef|cs6|cs7|<
0-63>)|)
no test-session-name WORD
```

Parameters

WORD
TWAMP test session name.

X:X::X:X
TWAMP Sender or Reflector IP address in IPv6 format.

A.B.C.D
TWAMP Sender or Reflector IP address in IPv4 format.

<1025-65535>
TWAMP Sender or Reflector UDP port number.

dscp
The DSCP value to used by the sender for TWAMP messages. This can be an explicit value 0-63, or it can be a well-known name:

`(af11| af12| af13| af21| af22| af23| af31| af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5| cs6| cs7| default| ef)`

Default

The `sender-port` and `reflector-port` default values are 862.

The `dscp` default value is 0.

Command Mode

TWAMP light control mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS version 3.0. The `dscp` parameter was added in OcNOS version 5.0.

© 2026 IP Infusion Inc. Proprietary

Examples

To configure:

```
(config)#twamp-light control
(config-twamp-light-ctrl)# test-session-name s1 sender-ip 10.0.0.1 sender-port 1234 reflector-ip
10.0.0.1 reflector-port 1234 dscp af23
```

To un-configure:

```
(config)#twamp-light control
(config-twamp-light-ctrl)# no test-session-name s1
```

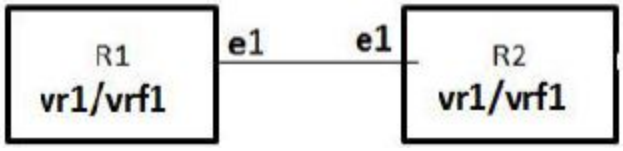
RIP Configuration

The Routing Information Protocol (RIP) is a distance-vector routing protocol which uses the hop count as a routing metric. RIP prevents routing loops by limiting the number of hops allowed — (15) in a path from the source to a destination. This hop limit, however, also limits the size of networks that RIP can support. A hop count of 16 is considered an infinite distance and used to indicate inaccessible, inoperable, or otherwise undesirable routes in the selection process.

Note: This chapter covers RIP configuration in non-default VR and non-default VRF.

Topology

Figure 194. RIP topology for VR/VRF



Configuration IPv4 VRF

R1

`#configure terminal`	Enter configure mode.
`(config)#virtual-router VR1`	Create virtual router VR1.
`(config-vr)#load rip`	Load the RIP module in VR1.
`(config)#exit`	Exit VR mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#virtual-router forwarding VR1`	Associate eth1 to VR1.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit configure mode.
`#login virtual-router VR1`	Log in to virtual-router VR1.
`>en`	Enter privileged exec mode.
`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrf1`	Create vrf1 .
`(config-vrf)#exit`	Exit VRF mode.
`(config)#router rip`	Enter router mode.
`(config-router)#version 2`	Specify RIP version 2.
`(config-router)#address-family ipv4 vrf vrf1`	Enter address family mode for vrf1

© 2026 IP Infusion Inc. Proprietary

`(config-router-af)#network 2.2.2.0/24`	Advertise the connected network under rip.
`(config-router-af)#exit`	Exit address-family mode.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Exit interface mode.
`(config-if)ip vrf forwarding vrf1`	Associate the interface to vrf1.
`(config-if)#ip address 2.2.2.1/24`	Configure the IP address 2.2.2.1 to eth1.

R1

`#configure terminal`	Enter configure mode.
`(config)#virtual-router VR1`	Create virtual router VR1.
`(config-vr)#load rip`	Load the RIP module in VR1.
`(config)#exit`	Exit VR mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#virtual-router forwarding VR1`	Associate eth1 to VR1.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit configure mode.
`#login virtual-router VR1`	Log in to virtual-router VR1.
`>en`	Enter privileged exec mode.
`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrf1`	Create vrf1 .
`(config-vrf)#exit`	Exit VRF mode.
`(config)#router rip`	Enter router mode.
`(config-router)#version 2`	Specify RIP version 2.
`(config-router)#address-family ipv4 vrf vrf1`	Enter address family mode for vrf1
`(config-router-af)#network 2.2.2.0/24`	Advertise the connected network under rip.
`(config-router-af)#exit`	Exit address-family mode.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Exit interface mode.
`(config-if)ip vrf forwarding vrf1`	Associate the interface to vrf1.
`(config-if)#ip address 2.2.2.2/24`	Configure the IP address 2.2.2.2 to eth1.

Validation

Verify the routing table in R1:

```
#show ip route vrf vrf1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
```

© 2026 IP Infusion Inc. Proprietary

```
             area
       * - candidate default
IP Route Table for VRF "vrf1"
C       2.2.2.0/24 is directly connected, eth1
Gateway of last resort is not set
```

Verify RIP database in R1:

```
#show ip rip database vrf vrf1
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
   Network            Next Hop         Metric  From            If     Time
  Rc 2.2.2.0/24
```

Verify the routing table in R2:

```
#show ip route vrf vrf1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
       area
       * - candidate default
IP Route Table for VRF "vrf1"
C       2.2.2.0/24 is directly connected, eth1
Gateway of last resort is not set
```

Verify RIP database in R2:

```
#show ip rip database vrf vrf1
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
   Network            Next Hop         Metric From            If     Time
  Rc 2.2.2.0/24
```

Configuration IPv6 VRF

R1

`#configure terminal`	Enter configure mode.
`(config)#virtual-router VR1`	Create virtual router VR1.
`(config-vr)#load ipv6 rip`	Load the RIPng module to be used in VR1.
`(config)#exit`	Exit VR mode.
`(config)#interface eth1`	switch to interface mode.
`(config-if)#virtual-router forwarding VR1`	Associate eth1 to VR1.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit configure mode.
`#login virtual-router VR1`	Log in to virtual-router VR1.
`>en`	Enter privileged exec mode.
`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrf1`	Create vrf1 .

© 2026 IP Infusion Inc. Proprietary

(config-vrf)#exit	Exit VRF mode.
(config)#router ipv6 rip	Enable ipv6 rip
(config-router)#version 2	Specify RIP version 2.
(config-router)#address-family ipv4 vrf vrf1	Enter address family mode for vrf1
(config-router-af)#aggregate-address 2222::/48	Configure the ipv6 aggregate-address
(config-router-af)#exit	Exit address-family mode.
(config-router)#exit	Exit router mode.
(config)#interface eth1	Exit interface mode.
(config-if)ip vrf forwarding vrf1	Associate the interface to vrf1.
(config-if)#ip address 2.2.2.1/24	Configure the IP address 2.2.2.1 to eth1.
(config-if)#ipv6 address 2222::1/48	Configure the ipv6 address.
(config-if)#ipv6 address fe80::1/48	Configure the link local address
(config-if)#ipv6 router rip	Associate interface eth1 to ipv6 rip

R2

#configure terminal	Enter configure mode.
(config)#virtual-router VR1	Create virtual router VR1.
(config-vr)#load ipv6 rip	Load the RIPng module to be used in VR1.
(config)#exit	Exit VR mode.
(config)#interface eth1	switch to interface mode.
(config-if)#virtual-router forwarding VR1	Associate eth1 to VR1.
(config-if)#exit	Exit interface mode.
(config)#exit	Exit configure mode.
#login virtual-router VR1	Log in to virtual-router VR1.
>en	Enter privileged exec mode.
#configure terminal	Enter configure mode.
(config)#ip vrf vrf1	Create vrf1 .
(config-vrf)#exit	Exit VRF mode.
(config)#router ipv6 rip	Enable ipv6 rip
(config-router)#version 2	Specify RIP version 2.
(config-router)#address-family ipv4 vrf vrf1	Enter address family mode for vrf1
(config-router-af)#aggregate-address 2222::/48	Configure the ipv6 aggregate-address
(config-router-af)#exit	Exit address-family mode.
(config-router)#exit	Exit router mode.
(config)#interface eth1	Exit interface mode.
(config-if)ip vrf forwarding vrf1	Associate the interface to vrf1.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip address 2.2.2.2/24`	Configure the IP address 2.2.2.2 to eth1.
`(config-if)#ipv6 address 2222::1/48`	Configure the ipv6 address.
`(config-if)#ipv6 address fe80::1/48`	Configure the link local address
`(config-if)#ipv6 router rip`	Associate interface eth1 to ipv6 rip

Validation

```
rtr1#show ipv6 route vrf vrf1

      2222::1/48
      fe80::1/48
eth2 is up, line protocol is up
  RIPng is not enabled on this interface
```

VRF Configuration

Overview

Virtual routing and forwarding (VRF) is a technology that allows multiple instances of a routing table to co-exist within the same router at the same time. Because the routing instances are independent, the same or overlapping IP addresses can be used without conflicting with each other. VRF may be implemented in a network device by distinct routing tables known as forwarding information bases – one per routing instance.

Topology

Figure 195. Device topology

Default VRF

`#con t`	Enter the router configuration mode
`(config)#interface eth1`	Switch to interface eth1
`(config-if)#ip address 3.3.3.2/24`	Configure the ip address 3.3.3.2 to eth1
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.

Adding a Static Route

`#con t`	Enter the router configuration mode
`(config)#ip route 20.20.20.0/24 eth1`	Add static route with eth1 as exit interface
`(config-if)#commit`	Commit the candidate configuration to the running configuration

User-Defined VRF

`#con t`	Enter configuration mode.
`(config)#ip vrf vrf1`	Create vrf1. Use no ip vrf vrf1 to delete the created vrf

© 2026 IP Infusion Inc. Proprietary

(config)#exit	Exit configure mode.
(config)#interface eth1	Enter interface mode
(config-if)#ip vrf forwarding vrf1	Associate eth1 to vrf1. Use no ip vrf forwarding vrf1 for un-configuration
(config-if)#ip address 3.3.3.2/24	Configure the IP address 3.3.3.2 to eth1
(config-if)#commit	Commit the candidate configuration to the running configuration
(config-if)#exit	Exit interface mode.

Adding a Static Route

#con t	Enter the router configuration mode
(config)# ip route vrf vrf1 20.20.20.0/24 eth1	Add static route in vrf1 with eth1 as exit interface
(config-if)#commit	Commit the candidate configuration to the running configuration

Validation

```
#show ip route vrf all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C     127.0.0.0/8 is directly connected, lo, 00:14:59
C     192.168.52.0/24 is directly connected, eth0, 00:14:55
IP Route Table for VRF "management"
IP Route Table for VRF "vrf1"
C     3.3.3.0/24 is directly connected, eth1, 00:00:44
S     20.20.20.0/24 [1/0] is directly connected, eth1, 00:00:08

Gateway of last resort is not set
```

To display the IP routing table associated with a VRF, use the show ip route vrf vrf-name command

```
#sh ip route vrf vrf1
      Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
             O - OSPF, IA - OSPF inter area
             N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
             E1 - OSPF external type 1, E2 - OSPF external type 2
             i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
             ia - IS-IS inter area, E - EVPN,
             v - vrf leaked
             * - candidate default

      IP Route Table for VRF "vrf1"
      C            3.3.3.0/24 is directly connected, eth1, 00:01:22
      S            20.20.20.0/24 [1/0] is directly connected, eth1, 00:00:13

      Gateway of last resort is not set
```

Use this show command to display the static routes configured.

```
#sh ip route vrf  vrf1 static
     IP Route Table for VRF "vrf1"
     S            20.20.20.0/24 [1/0] is directly connected, eth1, 00:01:13

     Gateway of last resort is not set
```

BGP VRF Configuration

Overview

Border Gateway Protocol (BGP) makes core routing decisions on the Internet using a table of IP networks or “prefixes” which designate network reachability among autonomous systems (AS). BGP is a path vector protocol or a variant of a distance-vector routing protocol. BGP does not involve traditional Interior Gateway Protocol (IGP) metrics, but routing decisions are made based on path, network policies, and/or rule sets. For this reason, it is more appropriately termed a reachability protocol rather than routing protocol.

Note: Enabling dynamic capability on the specific BGP peer will prevent BGP session to reset.

Configurations

Note: Users can configure up to 128 export route-targets under "IP VRF mode”.

Topology

Figure 196. BGP topology for VRF

R1

`#configure terminal`	Enter Configure mode.
`(config)#ip vrf vrf1`	`Create vrf1`
`(config-vrf)#rd 800:1`	Specify the route distinguisher in the VRF
`(config-vrf)#route-target import 800:1`	Specify the import route target
`(config-vrf)#route-target export 800:1`	Specify the export route target
`(config-vrf)#exit`	Exit VRF mode
`(config)#router bgp 200`	Enter the bgp configuration mode
`(config-router)#address-family ipv4 vrf vrf1`	Enter address family mode for vrf1
`(config-router-af)#neighbor 2.2.2.2 remote-as 100`	Specify the BGP neighbor and remote-AS.
`(config-router-af)#exit`	Exit address family mode.
`(config-router)#ex`	Exit router mode
`(config)#interface eth1`	Enter interface mode

© 2026 IP Infusion Inc. Proprietary

(config-if)#ip vrf forwarding vrf1	Associate the interface to vrf1
(config-if)#ip address 2.2.2.1/24	Configure the IP address 2.2.2.1 to eth1

R2

#configure terminal	Enter Configure mode.
(config)#ip vrf vrf1	Create vrf1
(config-vrf)#rd 800:1	Specify the route distinguisher in the VRF
(config-vrf)#route-target import 800:1	Specify the import route target
(config-vrf)#route-target export 800:1	Specify the export route target
(config-vrf)#exit	Exit vrf mode
(config)#router bgp 100	Enter router mode.
(config-router)#address-family ipv4 vrf vrf1	Enter address family mode for vrf1
(config-router-af)#neighbour 2.2.2.1 remote-as 200	Specify the BGP neighbor and remote-as.
(config-router-af)#exit	Exit address family mode.
(config-router)#ex	Exit router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip vrf forwarding vrf1	Associate the interface to vrf1
(config-if)#ip address 2.2.2.2/24	Configure the IP address 2.2.2.1 to eth1

Validation

R1

Verify the routing table in R1.

```
#show ip bgp neighbors
BGP neighbor is 2.2.2.2, vrf vrf1, remote AS 100, local AS 200, external link
  BGP version 4, local router ID 2.2.2.1, remote router ID 2.2.2.2
  BGP state = Established, up for 00:00:14
  Last read 00:00:14, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 2 messages, 0 notifications, 0 in queue
  Sent 3 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (standard)
  0 accepted prefixes

Static Inter-VRF Route Leaking Configuration

Overview

Inter-VRF route leaking allows the leaking of routes from one VRF (the source VRF) to another VRF (the destination VRF) on the same router. Inter-VRF routes can exist in any VRF (including the default and management VRF) on the system. Route-Leaking between two non-default VRF is achieved using MP-BGP (RT and RD). This section covers leaking between the Default VRF and any Non-default VRF using Statically.

Topology

Note: By default, eth0 is in management VRF.

Figure 197. Device topology

IPv4 Inter-VRF Route Leaking Configuration

R1 Configuration

`#configure terminal`	Enter the router configuration mode
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#interface eth1`	Switch to interface eth1
`(config-if)#ip address 20.1.1.1/24`	Assign the IP address 20.1.1.1 to eth1
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Switch to interface eth2.
`(config-if)#ip vrf forwarding vrf1`	Associate eth1 to vrf1. Use `no ip vrf forwarding vrf1` for un-configuration.
`(config-if)#ip address 10.1.1.1/24`	Assign the IP address 10.1.1.1 to eth2 in vrf1.
`(config-if)#exit`	Exit interface mode.
`(config)#ip route 10.1.1.0/24 eth2`	Leaking non-default VRF's connected route into default VRF.
`(config)#ip route vrf management 30.1.1.0/24 20.1.1.2 eth1 global`	Leaking a route from the Default VRF into the "management" VRF statically.
`(config)#ip route vrf vrf1 20.1.1.0/24 20.1.1.2 eth1`	Leaking a route from the Default VRF into VRF

© 2026 IP Infusion Inc. Proprietary

`global`	"vrf1" statically.
`(config)#ip route vrf vrf1 30.1.1.0/24 20.1.1.2 eth1 global`	Leaking a route from the Default VRF into VRF "vrf1" statically.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode

R2 Configuration

`#configure terminal`	Enter the router configuration mode
`(config)#interface eth1`	Switch to interface eth1
`(config-if)#ip address 20.1.1.2/24`	Assign the IP address 20.1.1.2 to eth1 in vrf1
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Switch to interface eth2
`(config-if)#ip address 30.1.1.1/24`	Assign the IP address 30.1.1.1 to eth2 in vrf1
`(config-if)#exit`	Exit interface mode.
`(config)# ip route 10.1.1.0/24 20.1.1.1`	Configuring static route to non-default VRF.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode

IPv6 Inter-VRF Route Leaking Configuration

IPv6 Statically Routes can be leaked between the Default VRF and Private VRF and vice-versa.

Note: IPv6 Leaking between "management" VRF and the default VRF is not supported.

R1 Configuration

`#con t`	Enter the router configuration mode
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#interface eth1`	Switch to interface eth1
`(config-if)#ipv6 address 2001::1/64`	Assign the IPv6 address 2001::1 to eth1
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Switch to interface eth2.
`(config-if)#ip vrf forwarding vrf1`	Associate eth1 to vrf1. Use no ip vrf forwarding vrf1 for un-configuration.
`(config-if)#ipv6 address 3001::1/64`	Assign the IPv6 address 3001::1 to eth2 in vrf1
`(config-if)#exit`	Exit interface mode.
`(config)# ipv6 route 3001::/64 eth2`	Leaking non-default VRF's connected route into default VRF.

© 2026 IP Infusion Inc. Proprietary

`OcNOS(config)#ipv6 route 3333::2/128 fe80::da9e:f3ff:fea2:6ce6 eth2`	Leaking non-default VRF's non-connected route into default VRF
`OcNOS(config)#ipv6 route vrf vrf1 2001::/64 eth1 global`	Leaking a connected route from the Default VRF into VRF "vrf1" statically.
`OcNOS(config)#ipv6 route vrf vrf1 2222::1/128 fe80::da9e:f3ff:fec9:65a4 eth1 global`	Leaking a route from the Default VRF into the "vrf1" VRF statically
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode

Validation

OSPF VRF Configuration

Overview

Open Shortest Path First (OSPF) is an interior routing protocol operating within a single autonomous system (AS) that uses a link state routing algorithm. OSPF gathers link state information from available routers and constructs a topology map of the network. The topology determines the routing table presented to the Internet layer which makes routing decisions based solely on the destination IP address in IP packets.

This chapter covers OSPF configuration in non-default VRF.

Topology

Figure 198. OSPF topology for VRF

Configuration IPv4 VRF

R1

`#con t`	Enter the router config mode.
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#router ospf 1 vrf1`	Associate the ospf process with vrf1.
`(config-router)#network 2.2.2.0/24 area 0`	Specify the network type and area 0.
`(config-router)#ex`	Exit the OSPF configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Associate eth1 to vrf1.
`(config-if)#ip address 2.2.2.1/24`	Assign the IP address 2.2.2.1 to eth1 in vrf1
`(config-if)#commit`	Commit the candidate configuration to the running configuration

R2

`#con t`	Enter the router config mode
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#router ospf 1 vrf1`	Associate the ospf process with vrf1
`(config-router)#network 2.2.2.0/24 area`	Specify the network type and area 0.

IS-IS VRF Configuration

Overview

Intermediate System to Intermediate System (IS-IS) is an interior routing protocol operating within a single administrative domain.It is a link-state routing protocol, operating by reliably flooding link state information throughout a network of routers. Each IS-IS router independently builds a database of the network's topology, aggregating the flooded network information. IS-IS uses Dijkstra's algorithm for computing the best path through the network. Packets (datagrams) are then forwarded, based on the computed ideal path, through the network to the destination.

Topology

Maximum Allowed VRF FIB Routes in BGP/MPLS L3VPN Configuration

Overview

Virtual Routing and Forwarding (VRF) in BGP/MPLS L3VPN enables multiple isolated routing tables within a single physical router, ensuring secure and independent routing for different customers. VRF instances maintain routing and forwarding information by importing routes from connected Customer Edge (CE) devices and remote VPN sites via MP-BGP PE routers. Each VRF can run its own routing protocols, such as OSPF, IS-IS, or E-BGP, enhancing isolation.

To optimize routing resources, a maximum route limit can be configured per VRF. This provides ability to control the number of imported dynamic routes that appear in the forwarding information base (FIB). When this limit is reached, new dynamic routes remain pending, while static and connected routes continue contributing to the total count. A threshold-based NetConf notification and syslog warning message can notify administrators when the route count approaches the limit, ensuring efficient resource management and maintaining network stability.

Feature Characteristics

This feature enhances BGP/MPLS L3VPN scalability by allowing per-VRF route limits, ensuring independent routing tables for each VPN instance. It applies limits only to dynamic routes while accounting for static and connected routes in the total count. A threshold-based NetConf notification and syslog warning message notifies administrators when the route count nears the limit and clears once it drops below, ensuring efficient resource management.

- Per-VRF Route Limit Configuration: Allows administrators to set a maximum number of dynamic routes that can be installed in the VRF FIB.
- Isolation of Routing Tables: Ensures that each VRF instance maintains its own independent routing table without interference from other VPN instances.
- Support for Dynamic, Static, and Connected Routes: The maximum route limit applies only to dynamic routes, while static and connected routes contribute to the total route count.
- Threshold-Based NetConf Notification and Syslog Warning Message: Generates a NetConf notification and syslog warning message when the number of installed routes reaches a configurable percentage of the maximum limit. The NetConf notification and syslog warning message clears once the count drops below the threshold.

Benefits

- Optimized Resource Utilization: Prevents a single VRF from consuming excessive hardware routing table space, ensuring fair allocation across multiple VPN instances.
- Enhanced Network Stability: Enforces a configurable route limit to prevent routing table exhaustion and unexpected failures.
- Improved Scalability: Supports large-scale multi-tenant deployments by efficiently managing routing resources.

© 2026 IP Infusion Inc. Proprietary

- Proactive Monitoring: Provides configurable threshold alerts, allowing administrators to take preventive actions before reaching critical limits.
- Better Control Over Dynamic Routes: Ensures only necessary routes are installed in the VRF FIB while maintaining seamless routing protocol operations.
- Reliable and Predictable Network Performance: Helps maintain a well-balanced network infrastructure with controlled resource usage.
- Streaming telemetry support enables continuous monitoring of the current utilization percentage and threshold exceedance status for the VRF FIB route limit, allowing administrators to take proactive actions.

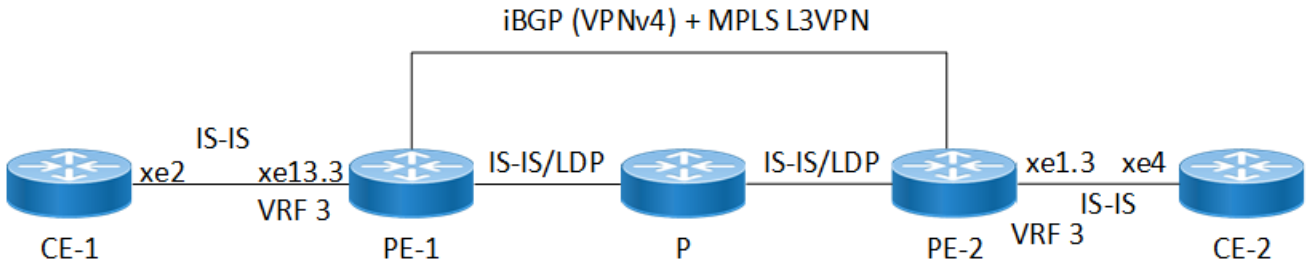
Configuration

Configure the maximum number of VRF FIB routes on a networking device.

Topology

This topology represents a basic MPLS Layer 3 VPN (L3VPN) setup using VRF instances and IS-IS as the Interior Gateway Protocol (IGP). The topology consists of two Customer Edge (CE) routers, CE1 and CE2, connected to a single Provider Edge (PE1) router via different virtual routing instances. CE1 is connected to PE1 through interface xe13.3, which is associated with VRF3, while CE2 connects via xe1.3, mapped to VRF3.

Figure 201. Max VRF FIB Routes Topology



The following configuration on the PE1 router defines a VRF instance (VRF3) with a maximum limit of 10 dynamic IPv4 FIB routes, applying a stop-install policy when the limit is reached and setting an 70% threshold for early warnings. It also configures interface xe13.3 with VLAN encapsulation and an IP address, ensuring proper traffic segmentation and routing within the VRF. Follow the steps below to configure the maximum number of VRF FIB routes on a networking device.

Notes:

- The limit applies only to dynamic routes and does not apply to static or connected routes.
- If recursive routes exist and the configured limit is lower than the current route count in the FIB, the resolved route information for recursive routes may be incomplete in the "`show ip route`" command output.
- Execute `clear ip route <vrf-name>` or `clear ipv6 route <vrf-name>` when the FIB route count already exceeds the configured limit.

Configure PE1 router as follows:

1. To enter into config mode, execute the following command in the configure mode.

```
PE1# configure terminal
```

2. Create a VRF.

```
PE1 (config)#ip vrf VRF3
PE1 (config-vrf)#rd 11.11.11.3:3
PE1 (config-vrf)#route-target both 100:3
```

3. Set the maximum limit of 10 IPv4 FIB routes to stop installing new routes after reaching the limit.

```
 PE1 (config-vrf) #maximum-fib-routes ipv4 10 stop-install
```

4. It triggers a warning log once the limit is reached.

```
PE1 (config-vrf) #maximum-fib-routes ipv4 10 warning-only
```

5. Set a threshold of 70% for IPv4 FIB routes.

```
PE1 (config-vrf) #maximum-fib-routes ipv4 threshold 70
```

6. Set the maximum limit of 10 IPv6 FIB routes to stop installing new routes after reaching the limit.

```
PE1 (config-vrf) #maximum-fib-routes ipv6 10 stop-install
```

7. It triggers a warning log once the limit is reached.

```
 PE1 (config-vrf) #maximum-fib-routes ipv6 10 warning-only
```

8. Set a threshold of 70% for IPv6 FIB routes.

```
PE1 (config-vrf) #maximum-fib-routes ipv6 threshold 70
```

9. Commit the changes and exit.

```
 PE1 (config-vrf)#commit
 PE1 (config-vrf)#exit
```

10 Enter the interface xe13.3 to be configured and assign the Interface to a VRF.

```
PE1(config)#interface xe13.3
PE1(config-if)#ip vrf forwarding VRF3
```

11 Enable VLAN Encapsulation (Dot1Q).

```
PE1(config-if)#encapsulation dot1q 3
```

12 Configure an IP address to the interface.

```
PE1(config-if)#i p address 10.1.13.1/24
```

13 Commit the changes and exit.

```
PE1(config-if)# commit
PE1(config-if)# exit
```

Running Configuration on PE1 Router

The running configuration on PE1 sets VRF3 with a 10-route FIB limit, an 80% threshold warning, and assigns VLAN encapsulation and an IP to interface xe13.3.

```
ip vrf VRF3
 rd 11.11.11.3:3
 route-target both 100:3
 maximum-fib-routes ipv4 10 stop-install
 maximum-fib-routes ipv4 threshold 70
 maximum-fib-routes ipv6 10 stop-install
 maximum-fib-routes ipv6 threshold 70

Validation for PE1

Validation ensures that the Max VRF FIB Routes Implementation functions as expected by verifying route limits, isolation, and NetConf notification and syslog warning message, preventing resource exhaustion and ensuring efficient routing operations.

To Check BGP VPNv4 Peering between PE1--PE2

```

```

Configure PE2 router as follows:

1. To enter into config mode, execute the following command in the configure mode.

   ```
   PE2# configure terminal
   ```

2. Create a VRF.

```
PE2 (config)#ip vrf VRF3
PE2 (config-vrf)#rd 11.11.11.3:3
PE2 (config-vrf)#route-target both 100:3
```

3. Set the maximum limit of 10 IPv4 FIB routes to stop installing new routes after reaching the limit.

```
PE2 (config-vrf) #maximum-fib-routes ipv4 10 stop-install
```

4. It triggers a warning log once the limit is reached.

```
PE2 (config-vrf) #maximum-fib-routes ipv4 10 warning-only
```

5. Set a threshold of 70% for IPv4 FIB routes.

```
PE2 (config-vrf) #maximum-fib-routes ipv4 threshold 70
```

6. Set the maximum limit of 10 IPv6 FIB routes to stop installing new routes after reaching the limit.

```
PE2 (config-vrf) #maximum-fib-routes ipv6 10 stop-install
```

7. Set a threshold of 70% for IPv6 FIB routes.

```
PE2 (config-vrf) #maximum-fib-routes ipv6 threshold 70
```

8. It triggers a warning log once the limit is reached.

```
PE2 (config-vrf) #maximum-fib-routes ipv6 10 warning-only
```

9. Commit the changes and exit.

```
PE2( config-vrf)#commit
PE2 (config-vrf)#exit
```

10 Enter the interface xe1.3 to be configured and assign the Interface to a VRF.

```
PE2(config)#interface xe1.3
PE2(config-if)#ip vrf forwarding VRF3
```

11 Enable VLAN Encapsulation (Dot1Q).

```
PE2(config-if)#encapsulation dot1q 3
```

12 Configure an IP address to the interface.

```
PE2(config-if)#i p address 10.1.13.1/24
```

13 Commit the changes and exit.

```
PE2(config-if)# commit
PE2(config-if)# exit
```

Running Configuration on PE2 Router

The running configuration on PE2 sets VRF3 with a 10-route FIB limit, an 70% threshold warning, and assigns VLAN encapsulation and an IP to interface xe13.3.

Maximum FIB Routes Commands

The VRF FIB introduces the following configuration commands in OcNOS.

© 2026 IP Infusion Inc. Proprietary

maximum-fib-routes threshold

Use this command to set a route limit in a VRF FIB and optionally configure a threshold percentage using the threshold keyword.

Note: This generates a warning when the current route count exceeds the threshold. The threshold can only be configured if a route limit is set.

Use the **no** form of the command with threshold keyword to remove configured threshold percentage for the route limit.

Command Syntax

```
maximum-fib-routes (ipv4|ipv6) threshold <1-100>
no maximum-fib-routes (ipv4|ipv6) threshold
```

Parameters

ipv4|ipv6

Configures the maximum route limit for the specified address family (IPv4 or IPv6).

`threshold<1 - 100>`

Triggers a NetConf notification and syslog warning message when the route count exceeds the specified percentage of the maximum limit.

Default

80%.

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.6.1.

Example

```
(config)#ip vrf VRF_A
(config-vrf)# maximum-fib-routes ipv4 10000 stop-install
(config-vrf)# maximum-fib-routes ipv4 threshold 90
(config)#ip vrf VRF_B
(config-vrf)# maximum-fib-routes ipv4 5000 warning-only
```

© 2026 IP Infusion Inc. Proprietary

maximum-fib-routes

Use this command to set a limit on the number of dynamic routes installed in a VRF FIB, excluding static and connected routes.

Notes:

- The limit applies only to dynamic routes and does not apply to static or connected routes.
- If recursive routes exist and the configured limit is lower than the current route count in the FIB, the resolved route information for recursive routes may be incomplete in the "`show ip route`" command output.
- Execute `clear ip route <vrf-name>` or `clear ipv6 route <vrf-name>` when the FIB route count already exceeds the configured limit.

Use the `no` form of this command without the threshold keyword to disable the maximum routes limit for a VRF.

Command Syntax

```
maximum-fib-routes (ipv4|ipv6) <1 - 2147483647> (stop-install | warning-only)
no maximum-fib-routes (ipv4|ipv6)
```

Parameters

ipv4 <1 - 2147483647>
Specify the IPv4 address family for which to set the maximum route limit in the VRF FIB.

ipv6 <1 - 2147483647>
Specify the IPv6 address family for which to set the maximum route limit in the VRF FIB.

stop-install
Block the installation of additional dynamic routes in the VRF FIB once the configured maximum limit is reached.

warning-only
Defines the maximum routes limit only as an advisory guideline. An advisory limit triggers a warning when the number of routes in the VRF FIB reaches the maximum limit but does not reject additional routes.

Default

Disabled

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 6.6.1.

Example

```
(config)#ip vrf VRF_A
(config-vrf)# maximum-fib-routes ipv4 10000 stop-install
(config)#ip vrf VRF_B
(config-vrf)# maximum-fib-routes ipv4 5000 warning-only
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Table 112. Glossary

Key Terms/Acronym	Description
MPLS	Multiprotocol Label Switching (MPLS): A high-performance network routing technique that directs data using labels rather than network addresses, improving speed and efficiency.
L3VPN	Layer 3 Virtual Private Network (L3VPN): A VPN that operates at the network layer, using MPLS to connect multiple customer sites while maintaining routing separation.
VRF	Virtual Routing and Forwarding (VRF): A technology that enables multiple isolated routing tables on a single router, allowing separate VPN instances.
PE	Provider Edge (PE) - A router at the network edge that connects customer sites to the service provider's MPLS backbone.
CE	Customer Edge (CE): A router at the customer site that connects to the PE router and exchanges routing information.
FIB	Forwarding Information Base (FIB) - A routing table used by routers to forward packets efficiently.
EBGP	External Border Gateway Protocol (EBGP): A routing protocol used for communication between different autonomous systems, commonly used between PE and CE routers.
IGP	Interior Gateway Protocol (IGP) - A routing protocol used within a single network, such as OSPF or IS-IS, to manage routes in the MPLS backbone.

VRRP Configuration

This section provides an overview of Virtual Router Redundancy Protocol (VRRP) and its implementation with OcNOS. VRRP eliminates the risk of a single point of failure inherent in a static default routing environment. It specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. One of the major advantages of VRRP is that it makes default path available without requiring configuration of dynamic routing on every end-host.

OcNOS only supports VRRP protocol version 3.

For complete information about MC-LAG configuration with Intra-domain-Link (IDL) and Intra-domain-peer (IDP), refer to the OcNOS Layer 2 document.

Terminology

Terms related to VRRP configuration are defined in the table below.

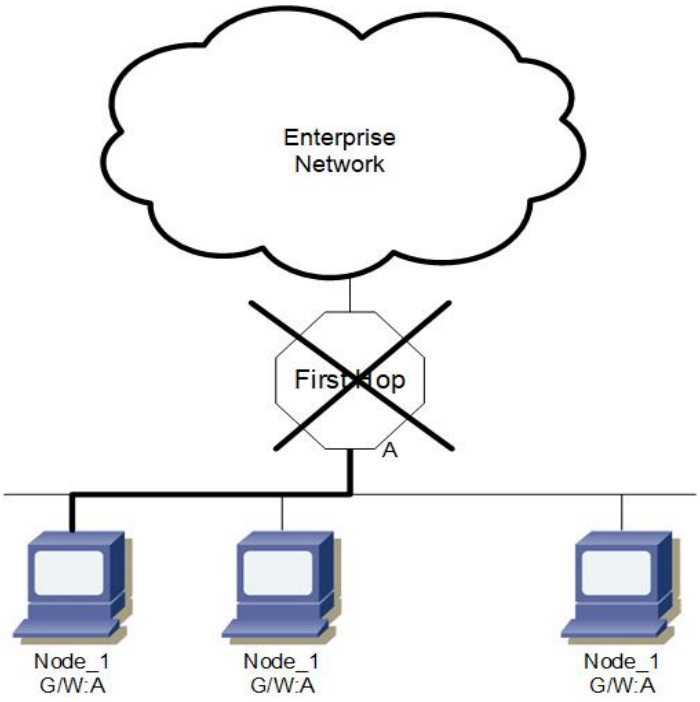
Backup Router	The VRRP router that is backing up an IP address. It assumes forwarding responsibility for the virtual IP address if the Master fails.
Critical IP	The IP address that a VRRP router sends/receives messages on for a particular session.
IP Address Owner	The VRRP Router that has the virtual router's IP address(es) as real interface address (es). This is the router that, when up, will respond to packets addressed to one of these IP addresses for ICMP pings, TCP connections, and so on
Master Router	The VRRP router that owns the IP address (i.e., is being backed up), and which is the default router for forwarding for that IP address.
Virtual IP	The IP address that is being backed up by a VRRP session.
Virtual Router	A router managed by VRRP that acts as a default router for hosts on a shared LAN. It consists of a Virtual Router Identifier and a set of associated IP addresses across a common LAN. A VRRP Router might backup one or more virtual routers.
VRRPv2 Router	A router running the Virtual Router Redundancy Protocol version 2. It might participate in one or more virtual routers.
VRRPv3 Router	A router running the Virtual Router Redundancy Protocol version 3. It might participate in one or more virtual routers.

VRRP Process

Typically, end hosts are connected to the enterprise network through a single router (first-hop router) that is in the same Local Area Network (LAN) segment. The most popular method of configuration is for the end hosts to configure statically this router as their default gateway. This minimizes configuration and processing overhead. As shown in Figure 202, the problem with this configuration is that it produces a single point of failure if this first-hop router fails.

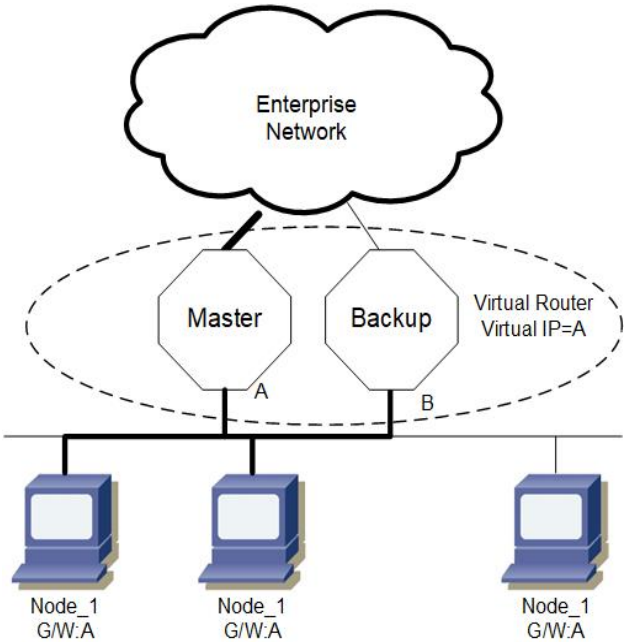
© 2026 IP Infusion Inc. Proprietary

Figure 202. VRRP Process - First-Hop Not Reachable



The Virtual Router Redundancy Protocol attempts to solve this problem by introducing the concept of a virtual router, composed of two or more VRRP routers on the same subnet as shown in Figure 203. The concept of a virtual IP address is also introduced, which is the address that end hosts configure as their default gateway. One of the routers called the “Master” forwards packets on behalf of this IP address.

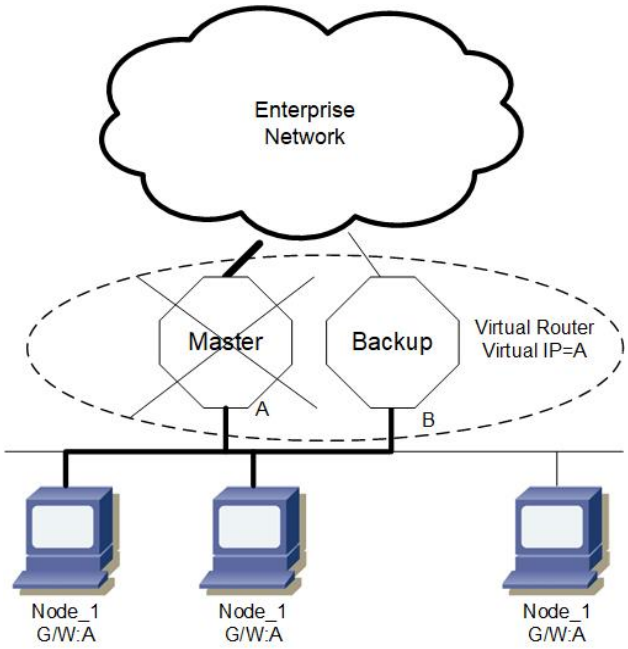
Figure 203. VRRP Process - Master and Backup VR



As shown in Figure 204, if the Master router fails, one of the other routers (Backup) assumes forwarding responsibility for it.

© 2026 IP Infusion Inc. Proprietary

Figure 204. VRRP Process - Master Down and Backup Takeover



At first glance, the configuration in might not seem very useful, as it doubles the cost, and leaves one router idle at all times. This, however, can be avoided by creating two virtual routers and splitting the traffic between them.

Note: Adding a default route in the kernel on the interface that is used for VRRP might cause loss of network connectivity. According to the VRRP guidelines, when the VRRP session changes, the MAC address for the machine that attains the master state also changes. The change causes the default route from the kernel to disappear and leads to loss of connectivity. To avoid this situation, add the default route in the NSM and not in the kernel. This ensures that the default route remains on the machine across changes in the VRRP state.

To add default route through NSM, run the following command in NSM:

```
ip route 0.0.0.0/0 <IPADDRESS>
```

where `<IPADDRESS>` is the IP address of the default gateway.

One Virtual Router

In this configuration, the end-hosts install a default route to the IP address of virtual router 1(VRID = 1), and both routers R1 and R2 run VRRP. R1 is configured to be the Owner for virtual router 1 (VRID = 1) and R2 as a Backup for virtual router 1. If R1 fails, R2 will take over virtual router 1 and its IP addresses, and provide uninterrupted service for the hosts. Configuring only one virtual router doubles the cost, and leaves R2 idle at all times.

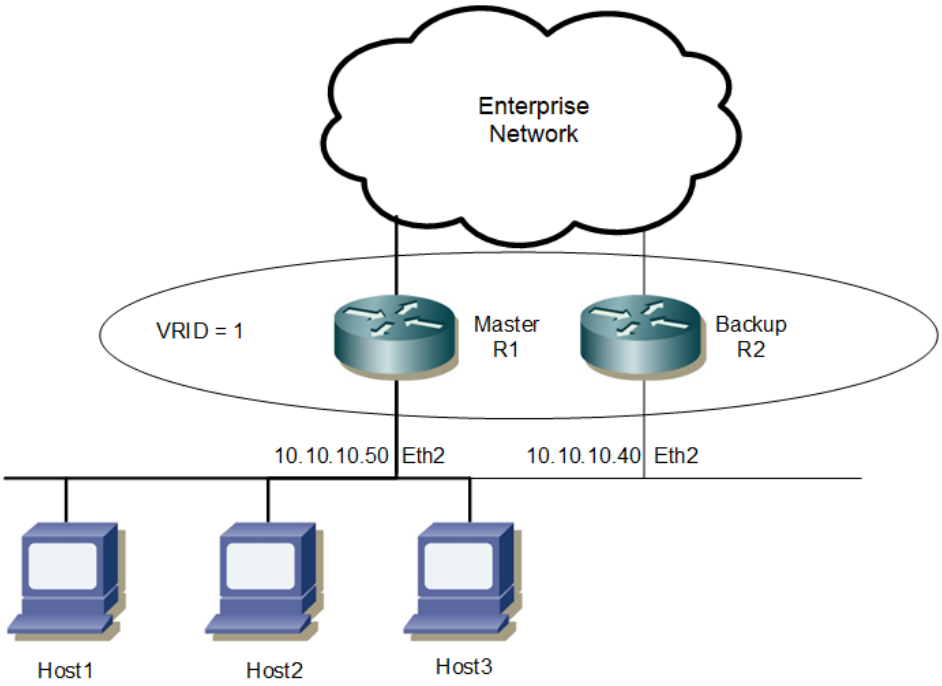
Topology

Figure 205. VRRP with One Virtual Router



Configuration

R1

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 10.10.10.50 owner`	Set the virtual IP address for the VRRP session. Define the default state (owner) of the VRRP router within the virtual router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode.

© 2026 IP Infusion Inc. Proprietary

R2

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 10.10.10.50`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 200`	Configure the priority to 200 (less than 255), because R2 is the Backup router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode.

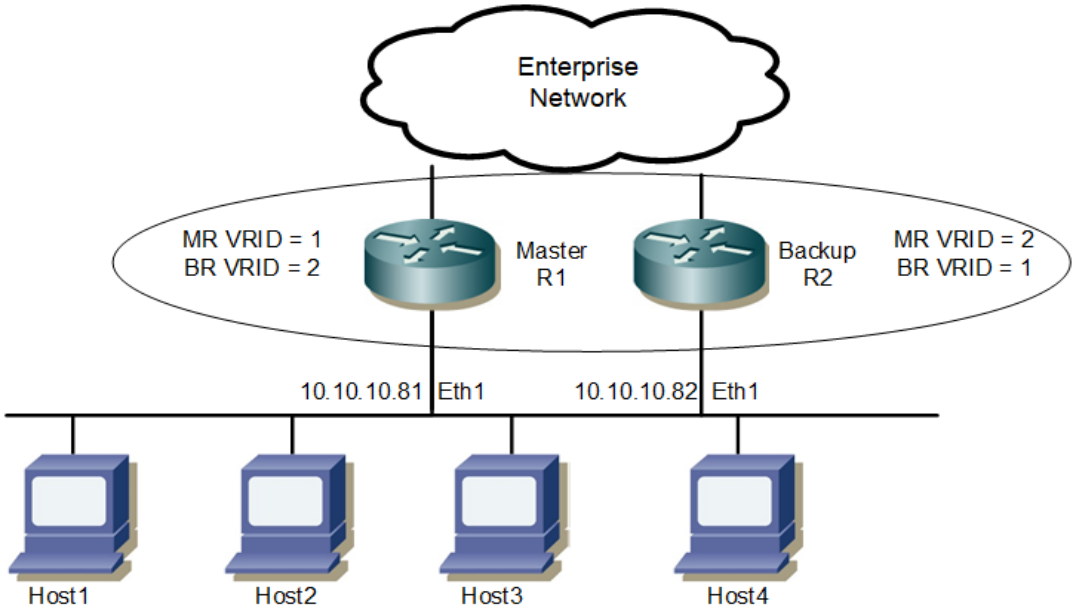
Two Virtual Routers

In the previous, one virtual router example, R2 is not backed up by R1. This example illustrates how to back up R2 by configuring a second virtual router. In this configuration, R1 and R2 are two virtual routers, and the hosts split their traffic between R1 and R2. R1and R2 functions as backups for each other.

Topology

Figure 206. Configuring VRRP with Two Virtual Routers



Configuration

R1

`#configure terminal`	Enter the `Configure` mode.

`(config)#router vrrp 1 xe1`	Create a VRRP instance for interface xe1.
`(config-router)#virtual-ip 10.10.10.81 owner`	Set the virtual IP address for the VRRP session. Define the default state (owner) of the VRRP router within the virtual router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session 1 on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit `Router` mode and enter the `Configure` mode.
`(config)#router vrrp 2 xe1`	Create a VRRP instance for interface xe1.
`(config-router)#virtual-ip 10.10.10.82`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 200`	Configure the priority to 200 (less than 255), because R2 is the Backup router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session two on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode.

R2

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 xe1`	Create a VRRP instance for interface xe1.
`(config-router)#virtual-ip 10.10.10.81`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 200`	Configure the priority to 200 (less than 255),

© 2026 IP Infusion Inc. Proprietary

	because R2 is the Backup router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session 1 on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit the `Router` mode and enter the `Configure` mode.
`(config)#router vrrp 2 xe1`	Create a VRRP instance for interface xe1
`(config-router)#virtual-ip 10.10.10.82 owner`	Set the virtual IP address for the VRRP session. Define the default state (owner) of the VRRP rou ter within the virtual router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session two on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode.

Validation

The following outputs on R1and R2 display the complete configuration for each session on R1 and R2. In session one, R1 is the master router, and in session two R2 is the master router.

```

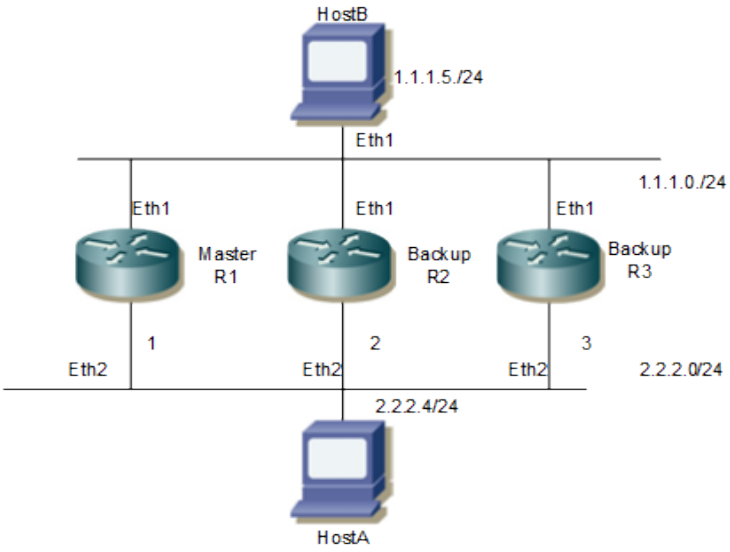
Two Backup Routers

In this configuration, Host B could be a gateway router. As such, interface eth1 on Routers R1, R2, and R3, and the gateway router, would run the IGP protocol.

Topology

Figure 207. Configuring VRRP with Two Backup Routers



Configuration

R1

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth2`	Enter interface mode for eth2.
`(config-if)#ip address 2.2.2.1/24`	Configure the IP address for interface eth2 to be in network 0.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode for eth1.
`(config-if)#ip address 1.1.1.1/24`	Configure the IP address for interface eth1 to be in network 1.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 2.2.2.1 owner`	Configure R1 as the owner.
`(config-router)#advertisement-interval 100`	Configure the default value for the advertisement interval. The configurable range is 5 to 4095 centi seconds (value must be a multiple of 5).
`(config-router)#preempt-mode true`	Set `true` as the default value for the field.
`(config-router)# v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable the VRRP session on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit Router mode.

R2

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth2`	Enter interface mode for eth2.
`(config-if)#ip address 2.2.2.2/24`	Configure the IP address for interface eth2 to be in network 0.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode for eth1.
`(config-if)#ip address 1.1.1.2/24`	Configure the IP address for interface eth1 to be in network 1.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit interface mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 2.2.2.1`	Configure R2 as the backup.
`(config-router)#advertisement-interval 100`	Configure the default value for the advertisement interval. The configurable range is 5 to 4095 centi seconds (value must be a multiple of 5).
`(config-router)#priority 100`	Set the default value for the backup router.
`(config-router)#preempt-mode true`	Set `true` as the default value for the field.

(config-router)# v2-compatible	Enable the v2-compatible
(config-router)#authentication text abcd	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
(config-router)#enable	Enable the VRRP session on the router.
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit Router mode.

R3

#configure terminal	Enter the Configure mode.
(config)#interface eth2	Enter interface mode for eth2.
(config-if)#ip address 2.2.2.3/24	Configure the IP address for interface eth2 to be in network 0.
(config-if)#commit	Commit the candidate configuration to the running configuration.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ip address 1.1.1.3/24	Configure the IP address for interface eth1 to be in network 1.
(config-if)#commit	Commit the candidate configuration to the running configuration.
(config-if)#exit	Exit interface mode.
(config)#router vrrp 1 eth2	Create a VRRP instance for interface eth2.
(config-router)#virtual-ip 2.2.2.1	Configure R3 as the backup.
(config-router)#advertisement-interval 100	Configure the default value for the advertisement interval. The configurable range is 5 to 4095 centi seconds (value must be a multiple of 5).
(config-router)#priority 254	Configure the priority for R3. The configurable range is 1-255.
(config-router)#preempt-mode true	Set true as the default value for the field.
(config-router)# v2-compatible	Enable the v2-compatible
(config-router)#authentication text abcd	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
(config-router)#enable	Enable the VRRP session on the router.
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit Router mode.

Interface Tracking

The need for VRRP Interface Tracking arose because VRRPv3 was unable to track the gateway interface status. The VRRP Interface Tracking feature provides dynamic failover of an entire circuit, in the event that one member of the group fails. It introduces the concept of a circuit, where two or more Virtual Routers on a single system can be grouped. In the event that a failure occurs, and one of the Virtual Routers performs the Master to Backup transition, the other Virtual Routers in the group are notified, and are forced into the Master to Backup transition, so that both incoming and outgoing packets are routed through the same gateway router, eliminating the problem for Firewall/NAT environments.

Note: VRRP Interface Tracking feature allows you to track the state of an upstream Interface and update the VRRP router priority accordingly. Up to 5 interfaces can be tracked per VRRP session for upstream interfaces and Interface tracking will be disabled when the session is the owner of the VIP.

To configure VRRP Interface Tracking, each circuit is configured to have a corresponding priority-delta value, which is passed to VRRP when a failure occurs. The priority of each Virtual Router on the circuit is decremented by the priority-delta value, causing the VR Master to VR Backup transition.

In this example, two routers, R1 and R2, are configured as backup routers with different priorities. The priority-delta value is configured to be greater than the difference of both the priorities. R1 is configured to have a priority of 150, and R2 has a priority of 50. R1, with a greater priority, is the Virtual Router Master. The priority-delta value is 110, greater than 100 (150 minus 50). On R1, when the external interface xe41, xe50/1 and xe50/2 fails, the priority of R1 becomes 40 (150 minus 110). Since R2 has a greater priority (50) than R1, R2 becomes the VR Master, and routing of packages continues without interruption. When this VR Backup (R1) is up again, it regains its original priority (150), and becomes the VR Master again.

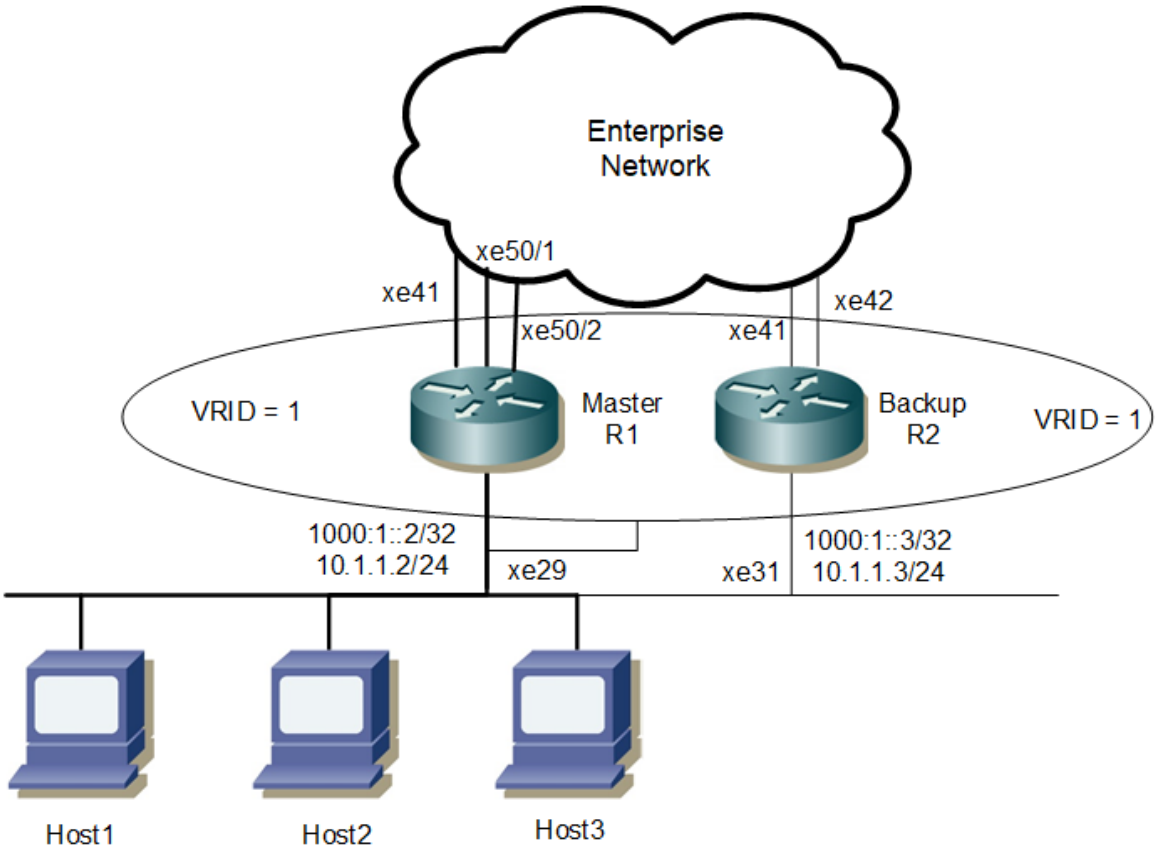
Topology

Figure 208. VRRP Interface Tracking



Configuration

R1

`(config)#configure terminal`	Enter the `Configure` mode.
`(config)#bridge 1 protocol rstp vlan-bridge`	Create a RSTP VLAN aware bridge.
`(config)#vlan 1001-1002 bridge 1`	Create VLAN 1001,1002 and map it to bridge 1.
`(config)#interface xe29`	Enter interface mode.
`(config-if)#switchport`	Configure switch port.
`(config-if)#bridge-group 1 spanning-tree disable`	Configure bridge group to l2 interface with spanning-tree Disable.
`(config-if)#switchport mode trunk`	Configure switch port mode as trunk.
`(config-if)#switchport trunk allowed vlan add 1001,1002`	Allow vlan 1001 ,1002 on the interface.
`(config-if)#interface vlan1.1001`	Enter the vlan interface
`(config-if)#ip address 10.1.1.2/24`	Configure ipv4 address
`(config-if)#ipv6 address 1000:1::2/32`	Configure ipv6 address

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ipv6 router ospf area 0.0.0.0`	Tag ospfv3 instance on interface with area 0
`(config-if)#exit`	Exit the interface mode
`(config)#router vrrp 1 vlan1.1001`	Create a new ipv4 VRRP instance for interface vlan1.1001
`(config-router)#virtual-ip 10.1.1.1`	Set the virtual IP address for the VRRP session
`(config-router)#priority 150`	Configure the priority to 150
`(config-router)#circuit-failover xe41 70`	Configure the priority-delta value to be 70. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#circuit-failover xe50/1 10`	Configure the priority-delta value to be 10. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#circuit-failover xe50/2 30`	Configure the priority-delta value to be 10. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters.
`(config-router)#enable`	Enable the VRRP session on the router.
`(config-router)#commit`	Commit the configuration on the node
`(config-router)#exit`	Exit the router mode.
`(config)#router ipv6 vrrp 1 vlan1.1001`	Create a new ipv6 VRRP instance for interface vlan1.1001.
`(config-router)#virtual-ipv6 fe80::1`	Set the virtual IPv6 address for the VRRP session.
`(config-router)#priority 150`	Configure the priority to 150
`(config-router)#circuit-failover xe41 70`	Configure the priority-delta value to be 70. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#circuit-failover xe50/1 10`	Configure the priority-delta value to be 10. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#circuit-failover xe50/2 30`	Configure the priority-delta value to be 10. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#enable`	Enable the VRRP session on the router.
`(config-router)#commit`	Commit the configuration on the node
`(config-router)#exit`	Exit the router mode
`(config)#interface xe50/1`	Enter interface mode

© 2026 IP Infusion Inc. Proprietary

(config-if)#ip address 20.1.1.1/24	Configure ipv4 address
(config-if)#ipv6 address 2000::1/64	Configure ipv6 address
(config-if)#ipv6 router ospf area 0.0.0.0	Tag ospfv3 instance on interface with area 0
(config-if)#interface xe50/2	Enter interface mode
(config-if)#ip address 30.1.1.1/24	Configure ipv4 address
(config-if)#ipv6 address 3000::1/64	Configure ipv6 address
(config-if)#ipv6 router ospf area 0.0.0.0	Tag ospfv3 instance on interface with area 0
(config-if)#interface xe41	Enter interface mode
(config-if)#ip address 60.1.1.1/24	Configure ipv4 address
(config-if)#ipv6 address 6000::1/64	Configure ipv6 address
(config-if)#ipv6 router ospf area 0.0.0.0	Tag ospfv3 instance on interface with area 0
(config-if)#commit	Commit the configuration on the node
(config-if)#exit	Exit interface and configure mode

R2

(config)#bridge 1 protocol rstp vlan-bridge	Create a RSTP VLAN aware bridge with bridge-id.
(config)#vlan 1001-1002 bridge 1	Create VLAN 1001,1002 and map it to bridge 1
(config)#interface xe31	Enter interface mode
(config-if)#switchport	Configure switch port
(config-if)#bridge-group 1 spanning-tree disable	Configure bridge group to l2 interface with spanning-tree Disable
(config-if)#switchport mode trunk	Configure switch port mode as trunk
(config-if)#switchport trunk allowed vlan add 1001,1002	Allow vlan 1001 ,1002 on the interface
(config-if)#interface vlan1.1001	Enter the vlan interface
(config-if)#ip address 10.1.1.3/24	Configure ipv4 address
(config-if)#ipv6 address 1000:1::3/32	Configure ipv6 address
(config-if)#ipv6 router ospf area 0.0.0.0	Tag ospfv3 instance on interface with area 0
(config-if)#commit	Commit the configuration on the node
(config-if)#exit	Exit interface mode
(config)#router vrrp 1 vlan1.1001	Create a router ipv4 VRRP instance for interface vlan1.1001.
(config-router)#virtual-ip 10.1.1.1	Set the virtual IP address for the VRRP session.
(config-router)#priority 50	Configure the priority to 50 (less than 150), because R2 is the VR Backup router.
(config-router)#v2-compatible	Enable the v2-compatible

© 2026 IP Infusion Inc. Proprietary

(config-router)#authentication text abcd	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters.
(config-router)#enable	Enable the VRRP session
(config-router)#commit	Commit the configuration on the node
(config-router)#exit	Exit the router mode
(config)#router ipv6 vrrp 1 vlan1.1001	Create a router ipv6 VRRP ipv6 instance for interface vlan1.1001.
(config-router)#virtual-ipv6 fe80::1	Set the virtual IPv6 address for the VRRP session.
(config-router)#priority 50	Configure the priority to 50 (less than 150), because R2 is the VR Backup router.
(config-router)#commit	Commit the configuration on the node
(config-router)#exit	Exit the router mode
(config)#interface xe41	Enter interface mode
(config-if)#ip address 80.1.1.1/24	Configure ipv4 address
(config-if)#ipv6 address 8000::1/64	Configure ipv6 address
(config-if)#ipv6 router ospf area 0.0.0.0	Tag ospfv3 instance on interface with area 0
(config-if)#interface xe42	Enter interface mode
(config-if)#ip address 90.1.1.1/24	Enter the tracked interface
(config-if)#ipv6 address 9000::1/64	Configure ipv6 address
(config-if)#ipv6 router ospf area 0.0.0.0	Tag ospfv3 instance on interface with area 0
(config-if)#commit	Commit the configuration on the node
(config-if)#exit	Exit interface and configure mode

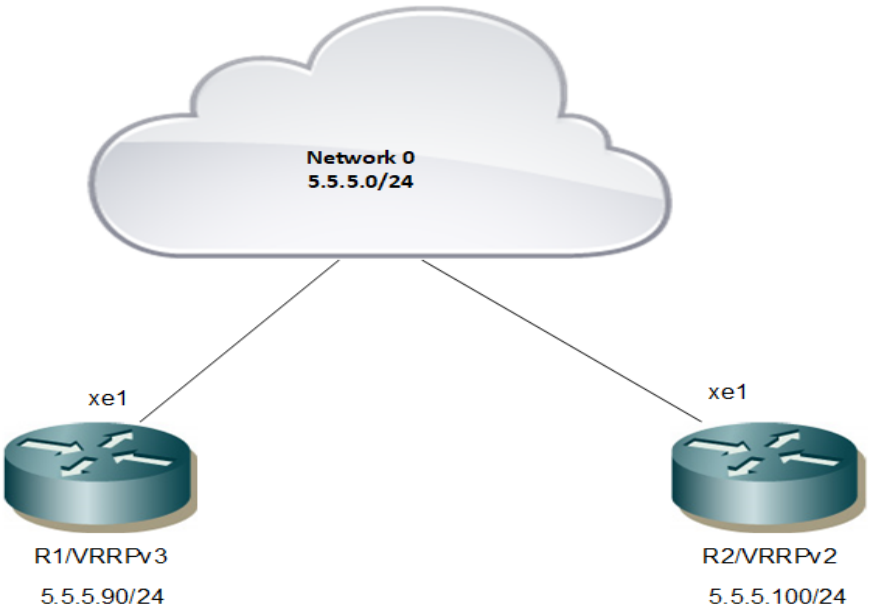
VRRP-Backward Compatibility

This section contains VRRP Backward Compatibility configuration examples.

The backward compatibility feature which implements version 3 of VRRP protocol recognizes the presence of VRRP version 2 compatible routers in the network and performs all operations normally. This support is intended for upgrade scenarios and is not recommended for permanent deployments. This should only occur when a router is transitioning from VRRPv2 to VRRPv3.

VRRP Backward Compatibility is applicable only for VRRP IPv4.

Topology



Configuration

R1

`#configure terminal`	Enter the Configure mode.
`(config)#interface xe1`	Enter Interface configuration mode.
`(config-if)#ip address 5.5.5.90/24`	Configure IP address on the interface.
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit Router mode.
`(config)#router vrrp 1 xe1`	Configure VRRP on the router with Virtual router Identifier as 1 on the interface xe1.
`(config-router)#virtual-ip 5.5.5.190`	Configure Virtual-IP address as the interface IP address of Owner which is not actually present in the LAN.
`(config-router)#v2-compatible`	Enable the v2-compatible
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
`(config-router)#enable`	Enable VRRP session on the router.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

(config-router)#exit	Exit Router mode.
(config)#vrrp compatible-v2 enable	Enable VRRP-Backward compatibility feature on a VRRPv3 running router.
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit Router mode.

R2

#configure terminal	Enter the Configure mode.
(config)# interface xe1	Enter Interface configuration mode.
(config-if)#ip address 5.5.5.100/24	Configure IP address on the interface.
(config-if)#commit	Commit the candidate configuration to the running configuration.
(config-if)#exit	Exit Router mode.
(config)#router vrrp 1 xe1	Configure VRRP on the router with Virtual router Identifier as 1 on the interface xe1.
(config-router)#virtual-ip 5.5.5.190	Configure Virtual-IP address as the interface IP address of Owner which is not actually present in the LAN.
(config-router)#v2-compatible	Enable the v2-compatible
(config-router)#authentication text abcd	Configure the authentication text to specify that as simple text for vrrpv2 packets, accept only 8 characters
(config-router)#enable	Enable VRRP session on the router.
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit Router mode.

Validation

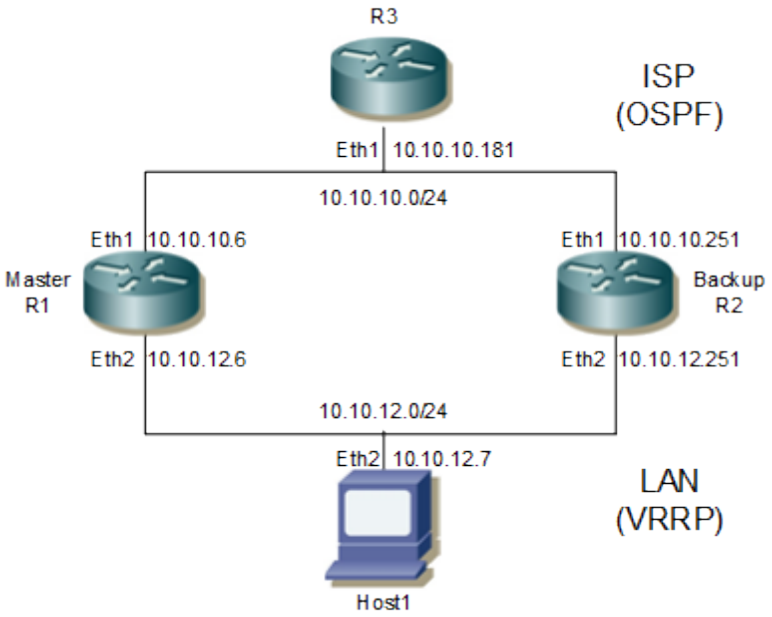
Redundancy Using VRRP and OSPF: Two Virtual Routers

This example illustrates a configuration of two routers between two end-hosts. R1 and R2 are two virtual routers functioning as backups for each other, with VRRP running on the 10.10.12.0/24 network (LAN), and OSPF running on the 10.10.10.0/24 network (ISP).

Topology

Figure 209. Redundancy Using VRRP and OSPF



In the above figure:

- R3 is an OSPF router representing an OSPF network to an ISP.
- R1 is the VRRP Master/OSPF router.
- R2 is the VRRP Backup/OSPF router.
- Host 1 is an end-host.

VRRP handles any failure of the Master's link to the LAN. Failures in the OSPF network that could cause the Master to lose routing information would cause packets from Host 1 that are targeted for R3 to be dropped. Running VRRP on the OSPF network to create redundancy is undesirable, because doing so would cause erroneous VRRP packets to be sent to the ISP.

An alternative method to achieve redundancy is to run OSPF on the LAN side. By running OSPF on the LAN, any routing information lost by the Master would be regained from the Backup on the LAN interface, resulting in ICMP redirects to R2 for traffic received from Host 1. To reduce OSPF control traffic, R1 and R2 are configured as Area Border Routers (ABR), and the LAN is configured as a stub network to reduce LSA advertisement traffic on the LAN. Before enabling OSPF on the LAN, verify that VRRP is running with R1 as the Master and R2 as the Backup.

```
R1#sh vrrp
VRRP Version: 3
VMAC enabled
Backward Compatibility disabled

Address family IPv4
VRRP Id: 1 on interface: vlan1.1000
State: AdminUp   - Master
Virtual IP address: 10.1.1.2 (Owner)
Virtual MAC address is 0000.5e00.0101
Operational primary IP address: 10.1.1.2
Operational master IP address: 10.1.1.2
Priority is 255
Advertisement interval: 100 centi sec
Master Advertisement interval: 100 centi sec
Virtual router uptime: 0 hours 1 minutes 11 seconds (7100 centi sec)
Master uptime: 0 hours 1 minutes 11 seconds (7100 centi sec)
```

R2#sh vrrp
VRRP Version: 3
VMAC enabled
Backward Compatibility disabled

Address family IPv4
VRRP Id: 1 on interface: vlan1.1000
State: AdminUp   - Backup
Virtual IP address: 10.1.1.2 (Not-owner)
Virtual MAC address is 0000.5e00.0101
Operational primary IP address: 10.1.1.3
Operational master IP address: 10.1.1.2
Priority is 100
Advertisement interval: 100 centi sec
Master Advertisement interval: 100 centi sec
Virtual router uptime: 0 hours 0 minutes 38 seconds (3800 centi sec)
Skew time: 60 centi sec
Master Down Interval: 360 centi sec
Accept mode: TRUE
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan1.1000: JOINED
V2-Compatible: FALSE
```

Steps to configure OSPF on the LAN are given below.

Configuration

R3

`#configure terminal`	Enter the Configure mode.
`(config)#router ospf 1`	Configure the routing process and specify the process ID (`1`). The process ID should be a unique integer.
`(config-router)#ospf router-id 10.10.10.181`	Specify the OSPF router ID.
`(config-router)#timers spf exp 0 0`	Set timers to minimum time for quick convergence.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (0).
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#exit`	Exit router VRRP mode.

R1

`#configure terminal`	Enter the Configure mode.
`(config)#router ospf 1`	Configure the routing process and specify the process ID (`1`). The process ID should be a unique integer.
`(config-router)#ospf router-id 10.10.12.6`	Specify the OSPF router ID.

(config-router)#area 1 stub	Define area 1 as a stub network.
(config-router)#network 10.10.10.0/24 area 0	Define one interface (10.10.10.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 10.10.12.0/24 area 1	Define the other interface (10.10.12.0/24) on which OSPF runs and associate the area ID (1)
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit router VRRP mode.

R2

#configure terminal	Enter the Configure mode.
(config)#router ospf 1	Configure the routing process, and specify the process ID (1). The process ID should be a unique integer
(config-router)#ospf router-id 10.10.12.251	Specify the OSPF router ID.
(config-router)#area 1 stub	Define area 1 as a stub network.
(config-router)#network 10.10.10.0/24 area 0	Define one interface (10.10.10.0/24) on which OSPF runs and associate the area ID (0).
(config-router)#network 10.10.12.0/24 area 1	Define the other interface (10.12.10.0/24) on which OSPF runs and associate the area ID (1)
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router)#exit	Exit router VRRP mode.

Verification

1. Set gateway on the end-host (statically):

```
(root@host1)#route add -net 10.10.10.0 netmask 255.255.255.0 gw 10.10.12.6
```

2. Verify end-host reachability via traceroute:

```
(root@host1)#traceroute 10.10.10.181
traceroute to 10.10.10.181 (10.10.10.181), 30 hops max, 38 byte packets
1 10.10.12.6 (10.10.12.6) 0.835 ms 0.350 ms 0.341 ms
2 10.10.10.181 (10.10.10.181) 9.557 ms 0.572 ms 0.545 ms
```

3. Bring down eth2 of R1:

```
[root@r1 sbin]#ifconfig eth2 down
```

4. Verify end-host reachability via traceroute:

```
(root@host1)#traceroute 10.10.10.181
traceroute to 10.10.10.181 (10.10.10.181), 30 hops max, 38 byte packets
1 10.10.12.6 (10.10.12.6) 0.461 ms 0.352 ms 0.334 ms
2 10.10.12.251 (10.10.12.251) 0.425 ms 0.432 ms 0.410 ms
3 10.10.10.181 (10.10.10.181) 0.691 ms 0.639 ms 0.607 ms
```

5. Bring up eth2 of R1:

```
[root@r1 sbin]#ifconfig eth2 up
```

© 2026 IP Infusion Inc. Proprietary

6. Verify end-host reachability via traceroute:

```
(root@host1)#traceroute 10.10.10.181
traceroute to 10.10.10.181 (10.10.10.181), 30 hops max, 38 byte packets
1 10.10.12.6 (10.10.12.6) 0.457 ms 0.356 ms 0.443 ms
2 10.10.10.181 (10.10.10.181) 0.698 ms 0.642 ms 0.618 ms
```

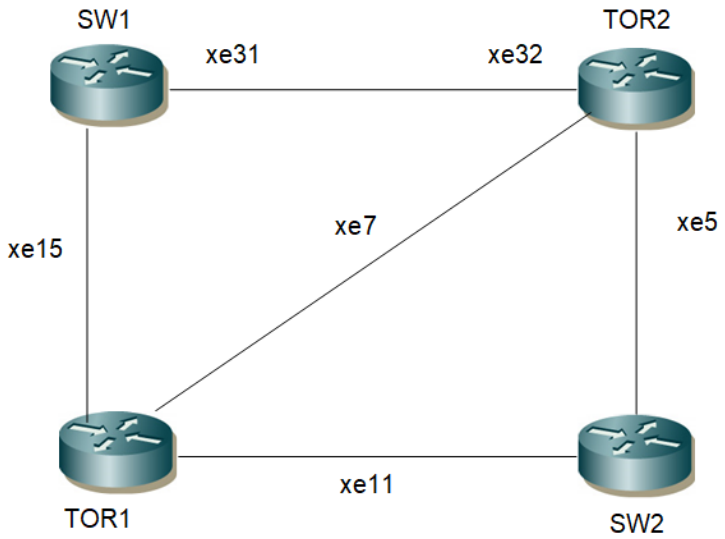
VRRP Over MLAG

This section contains VRRP over MLAG configuration examples.

In this configuration TOR1 and TOR2 forms the VRRP master/backup relationship over MLAG interface.

Topology

Figure 210. VRRP over MLAG



Configuration

SW1

`#config terminal`	Enter the Configure mode.
`(config)#hostname SW1`	Assign the hostname for the router.
`SW1(config)# bridge 1 protocol rstp vlan-bridge`	Create bridge
`SW1(config)#vlan database`	Enter to VLAN database
`SW1(config-vlan)#vlan 2-1002 bridge 1 state enable`	Create VLANs
`SW1(config-vlan)#exit`	Exit the VLAN database mode
`SW1(config)# int po1`	Enter the interface mode
`SW1(config-if)#switchport`	Configure the interface as Layer 2

© 2026 IP Infusion Inc. Proprietary

`SW1(config-if)# bridge-group 1`	Assign the bridge to the interface.
`SW1(config-if)#switchport mode trunk`	Configure the interface as trunk mode
`SW1(config-if)#switchport trunk allowed vlan all`	Configure the interface to allow all VLAN IDs
`(config-if)#commit`	Commit the candidate configuration to the running configuration.
`SW1(config-if)#exit`	Exit the interface mode
`SW1(config)# int xe15`	Enter the interface mode
`SW1(config-if)# channel-group 1 mode active`	Add the interface as member of LAG interface
`SW1(config-if)# int xe31`	Enter the interface mode
`SW1(config-if)# channel-group 1 mode active`	Add the interface as member of LAG interface
`SW1(config-if)# int xe36`	Enter the interface mode
`SW1(config-if)#switchport`	Configure the interface as Layer 2
`SW1(config-if)# bridge-group 1`	Assign the bridge to the interface.
`SW1(config-if)#switchport mode trunk`	Configure the interface as trunk mode
`SW1(config-if)#switchport trunk allowed vlan all`	Configure the interface to allow all VLAN IDs
`SW1(config-if)#exit`	Exit the interface mode
`SW1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`SW1(config-if)#exit`	Exit the interface mode.

TOR1

`#config terminal`	Enter the Config terminal
`(config)#hostname TOR1`	Assign the hostname to the router
`TOR1(config)# bridge 1 protocol rstp vlan-bridge`	Configure the bridge
`TOR1(config)#vlan database`	Enter the VLAN database
`TOR1(config-vlan)#vlan 2-1002 bridge 1 state enable`	Configure VLANs
`TOR1(config-vlan)#commit`	Commit the candidate configuration to the running configuration.
`TOR1(config-vlan)#exit`	Exit the VLAN database
`TOR1(config)# int po1`	Enter the interface mode
`TOR1(config-if)#switchport`	Configure the interface as L2
`TOR1(config-if)# bridge-group 1`	Assign the bridge to the interface
`TOR1(config-if)#switchport mode trunk`	Configure the interface as trunk mode
`TOR1(config-if)#switchport trunk allowed vlan all`	Configure to allow all the VLANs
`TOR1(config-if)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

`TOR1(config-if)#exit`	Exit the interface mode
`TOR1(config)# int xe15`	Enter the interface mode
`TOR1(config-if)# channel-group 1 mode active`	Assign the interface as member of LAG interface
`TOR1(config-if)#exit`	Exit the interface mode
`TOR1(config)#interface xe7`	Enter interface mode.
`TOR1(config)#switchport`	Configure as switchport L2 interface.
`TOR1(config)#mcec domain configuration`	Enter the MCEC mode
`TOR1(config-mcec-domain)#domain-system-number 1`	Assign the domain system number for MLAG interface.
`TOR1(config-mcec-domain)#domain-address 1111.2222.3333`	Assign the domain address
`TOR1(config-mcec-domain)#domain-hello-timeout short`	Assign the domain hello timeout
`TOR1(config-mcec-domain)#intra-domain-link xe7`	Assign the interface as IDL
`TOR1(config-mcec-domain)#commit`	Commit the candidate configuration to the running configuration.
`TOR1(config-mcec-domain)#exit`	Exit the MCEC domain
`TOR1(config)#interface lo`	Enter the interface mode
`TOR1(config-if)#ip add 1.1.1.1/32 secondary`	Assign IP address to the interface
`TOR1(config-if)#int xe11`	Enter the interface mode
`TOR1(config-if)#ip add 20.20.20.1/24`	Assign IP address to the interface
`TOR1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`TOR1(config-if)#exit`	Exit the interface mode
`TOR1(config)#router ospf 100`	Configure the routing process and specify the process ID (`100`). The process ID should be a unique integer.
`TOR1(config-router)#network 20.20.20.1/24 area 0`	Add the network to the OSPF process
`TOR1(config-router)#network 1.1.1.1/32 area 0`	Define one interface (`1.1.1.1/32`) on which OSPF runs and associate the area ID (0).
`TOR1(config-router)#redistribute connected`	Redistribute the connected routes
`TOR1(config-router)#commit`	Commit the candidate configuration to the running configuration
`TOR1(config-router)#exit`	Exit the OSPF process
`TOR1(config)#interface mlag1`	Enter mlag1 interface
`TOR1(config)#switchport`	Configure as switchport L2 interface
`TOR1(config)#bridge-group 1`	Assign the bridge to the interface
`TOR1(config)#switchport mode trunk`	Make the interface trunk mode

© 2026 IP Infusion Inc. Proprietary

TOR1(config)#switchport trunk allowed vlan all	Configure to allow all vlans
TOR1(config)#int po1	Enter the interface mode
TOR1(config-if)#mlag 1	Redistribute the connected routes
TOR1(config-if)#exit	Exit the interface mode
TOR1(config)#int vlan1.2	Enter interface mode
TOR1(config-if)#ip address 10.10.10.1/24	Assign IP address
TOR1(config-if)#exit	Exit the interface mode
TOR1(config)#router vrrp 1 vlan1.2	Create the VRRP process
TOR1(config-router)# virtual-ip 10.10.10.1 owner	Assign the virtual IP address to VRRP
TOR1(config-router)#enable	Enable the VRRP process
TOR1(config-router)#commit	Commit the candidate configuration to the running configuration.
TOR1(config-router)#exit	Exit the VRRP mode

TOR2

#config terminal	Enter the Config terminal
(config)#hostname TOR2	Assign the hostname to the router
TOR2(config)# bridge 1 protocol rstp vlan-bridge	Configure the bridge
TOR2(config)#vlan database	Enter the VLAN database
TOR2(config-vlan)#vlan 2-1002 bridge 1 state enable	Configure VLANs
TOR2(config-vlan)#commit	Commit the candidate configuration to the running configuration.
TOR2(config-vlan)#exit	Exit the VLAN database
TOR2(config)# int po1	Enter the interface mode
TOR2(config-if)#switchport	Configure the interface as L2
TOR2(config-if)# bridge-group 1	Assign the bridge to the interface
TOR2(config-if)#switchport mode trunk	Configure the interface as trunk mode
TOR2(config-if)#switchport trunk allowed vlan add 2	Configure to add the VLAN 2 to the receiving packet.
TOR2(config-if)#commit	Commit the candidate configuration to the running configuration.
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)# int xe32	Enter the interface mode
TOR2(config-if)# channel-group 1 mode active	Assign the interface as member of LAG interface
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)#interface xe7	Enter interface mode

© 2026 IP Infusion Inc. Proprietary

`TOR2(config)#switchport`	Configure as switchport L2 interface
`TOR2(config)#mcec domain configuration`	Enter the MCEC mode
`TOR2(config-mcec-domain)#domain-system-number 2`	Assign the domain system number for MLAG interface.
`TOR2(config-mcec-domain)#domain-address 1111.2222.3333`	Assign the domain address
`TOR2(config-mcec-domain)#domain-hello-timeout short`	Assign the domain hello timeout
`TOR2(config-mcec-domain)#intra-domain-link xe7`	Assign the interface as IDL
`TOR2(config-mcec-domain)#commit`	Commit the candidate configuration to the running configuration.
`TOR2(config-mcec-domain)#exit`	Exit the MCEC domain
`TOR2(config)#interface mlag1`	Enter mlag1 interface
`TOR2(config)#switchport`	Configure as switchport L2 interface
`TOR2(config)#bridge-group 1`	Assign the bridge to the interface
`TOR2(config)#switchport mode trunk`	Make the interface trunk mode
`TOR2(config)#switchport trunk allowed vlan all`	Configure to allow all vlans
`TOR2(config)# int po1`	Enter the interface mode
`TOR2(config-if)# mlag 1`	Create the MLAG interface.
`TOR2(config-if)#commit`	Commit the candidate configuration to the running configuration.
`TOR2(config-if)#exit`	Exit the interface mode
`TOR2(config)#interface lo`	Enter the interface mode
`TOR2(config-if)#ip add 2.2.2.2/32 secondary`	Assign IP address to the interface
`TOR2(config-if)#int xe5`	Enter the interface mode
`TOR2(config-if)#ip add 30.30.30.1/24`	Assign IP address to the interface
`TOR2(config-if)#commit`	Commit the candidate configuration to the running configuration.
`TOR2(config-if)#exit`	Exit the interface mode
`TOR2(config)#router ospf 100`	Enter the OSPF router mode
`TOR2(config-router)#network 30.30.30.1/24 area 0`	Add the network to the OSPF process
`TOR2(config-router)#network 2.2.2.2/32 area 0`	Add the network to the OSPF process
`TOR2(config-router)#redistribute connected`	Redistribute the connected routes
`TOR2(config-router)#commit`	Commit the candidate configuration to the running configuration.
`TOR2(config-router)#exit`	Exit the OSPF process
`TOR2(config)#int vlan1.2`	Enter interface mode
`TOR2(config-if)#ip address 10.10.10.2/24`	Assign IP address

© 2026 IP Infusion Inc. Proprietary

TOR2(config-if)#exit	Exit the interface mode
TOR2(config)#router vrrp 1 vlan1.2	Create the VRRP process
TOR2(config-router)# virtual-ip 10.10.10.1	Assign the virtual IP address to VRRP
TOR2(config-router)#enable	Enable the VRRP process
TOR2(config-router)#commit	Commit the candidate configuration to the running configuration.
TOR2(config-router)#exit	Exit the VRRP mode

SW2

#config terminal	Enter the Config terminal
(config)#hostname SW2	Assign the hostname to the router
SW2(config)# bridge 1 protocol rstp vlan-bridge	Configure the bridge
SW2(config)#vlan database	Enter the VLAN database
SW2(config-vlan)#vlan 2-1002 bridge 1 state enable	Configure VLANs
SW2(config-vlan)#commit	Commit the candidate configuration to the running configuration.
SW2(config-vlan)#exit	Exit the VLAN database
SW2(config)# int xe11	Enter the interface mode
SW2(config-if)#ip address 20.20.20.2/24	Assign IP address to the interface
SW2(config-if)# int xe5	Enter the interface mode
SW2(config-if)#ip address 30.30.30.2/24	Assign IP address to the interface
SW2(config-if)#commit	Commit the candidate configuration to the running configuration.
SW2(config-if)# int xe46	Enter the interface mode
SW2(config-if)#ip address 40.40.40.1/24	Assign IP address to the interface
SW2(config-if)#int lo	Enter the interface mode
SW2(config-if)#ip add 3.3.3.3/32 secondary	Assign IP address to the interface
SW2(config-if)#int xe32	Enter the interface mode
SW2(config-if)#ip add 50.50.50.2/24	Assign IP address to the interface
SW2(config-if)#exit	Exit interface mode
SW2(config)# router ospf 100	Enter OSPF router
SW2(config-router)# network 3.3.3.3/32 area 0	Add the IP address to the OSPF process
SW2(config-router)# network 20.20.20.0/24 area 0	Add the IP address to the OSPF process
SW2(config-router)# network 30.30.30.0/24 area 0	Add the IP address to the OSPF process
SW2(config-router)#network 50.50.50.2/24 area 0	Add the IP address to the OSPF process
SW2(config-router)#commit	Commit the candidate configuration to the running configuration.
SW2(config-router)#exit	Exit the OSPF mode

Custom VRF Configuration

This section shows how to configure VRRP over MLAG with Custom VRF.

Topology

For topology, refer to Figure 210. VRRP over MLAG (page 2954).

Configuration

Configure the below configuration on TOR1 and TOR2.

TOR1

`TOR1#config terminal`	Enter the config terminal.
`TOR1(config)#ip vrf vrf1`	Configure `VRF1`.
`TOR1(config-vrf)#rd 1:1`	Configure `rd 1:1`.
`TOR1(config-vrf)#route-target both 1:1`	Configure the route target.
`TOR1(config-vrf)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

`TOR1(config-vrf)#end`	Returns to privilege mode.

TOR2

`TOR2#config terminal`	Enter the config terminal.
`TOR2(config)#ip vrf vrf1`	Configure `VRF1`.
`TOR2(config-vrf)#rd 1:1`	Configure `rd 1:1`.
`TOR2(config-vrf)#route-target both 1:1`	Configure the route target.
`TOR2(config-vrf)#commit`	Commit the candidate configuration to the running configuration.
`TOR2(config-vrf)#end`	Returns to privilege mode.

Validation

The below shows the running output for TOR1 and TOR2:

TOR1 and TOR2

Object Tracking Using IP SLA

Overview

Object Tracking using IP SLA feature tracks the state of an object for reachability using IP SLA. A client process, such as Virtual Router Redundancy Protocol (VRRP) or RIB, registers itself to track objects and receives notifications when a state change occurs.

IP SLA (Service-Level Assurance Protocol) is a Performance Measurement protocol used to analyze IP service levels for IP applications and services. IP SLA employs active traffic-monitoring technology to monitor network traffic continuously.

IP SLA utilizes Internet Control Message Protocol (ICMP) pings to identify link failures and notify registered clients responsible for tracking.

The Object Tracking feature offers complete separation between tracked objects and the actions taken by clients when a tracked object's state changes. Multiple clients, such as VRRP or RIB, can register their interest in the tracking process, monitor the same object, and take different actions when the object changes state. The Tracking feature is present in Object-Action Mapping Database (OAMD).

Each tracked object is identified by a unique number specified in the tracking CLI. Client processes use this number to monitor a specific object.

The tracking process monitors events from the tracked objects, notes any changes in value, and communicates these changes to interested client processes immediately or after a specified delay. The object values are reported as either `up` or `down`.

To configure VRRP Object Tracking, the object is set to have a priority-delta value, which is passed to VRRP when a failure occurs. This decrement in the priority of the Virtual Router on the circuit triggers a transition from VR Master to VR Backup. The VRRP Object tracking is VRF independent.

Note: When both BFD and Track are enabled for a static route, the route is not installed if either BFD or the tracked object is down.

Object Tracking Using IP SLA Configuration

Topology

In this example, two routers, ROUTER-1 (R1) and ROUTER-2 (R2), are configured as Master and backup routers, each with different priorities. The priority-delta value is set to be greater than the difference between both priorities.

R1 is configured with a priority of 150, while R2 is assigned a priority of 100. Since R1 has the higher priority, it initially serves as the Virtual Router Master. The priority-delta value is set to 60, which is greater than the difference between their priorities (150 minus 100).

When the external interface xe41 on R1 fails, the Track state changes to `DOWN`, and R1's priority decreases to 90 (150 minus 60). However, as R2 still maintains a higher priority (100), it assumes the role of VR Master, ensuring uninterrupted packet routing.

Subsequently, when the track state returns to `UP`, the VR Backup (R1) regains its original priority of 150, reclaiming the position of VR Master. This transition allows for seamless failover and network continuity.

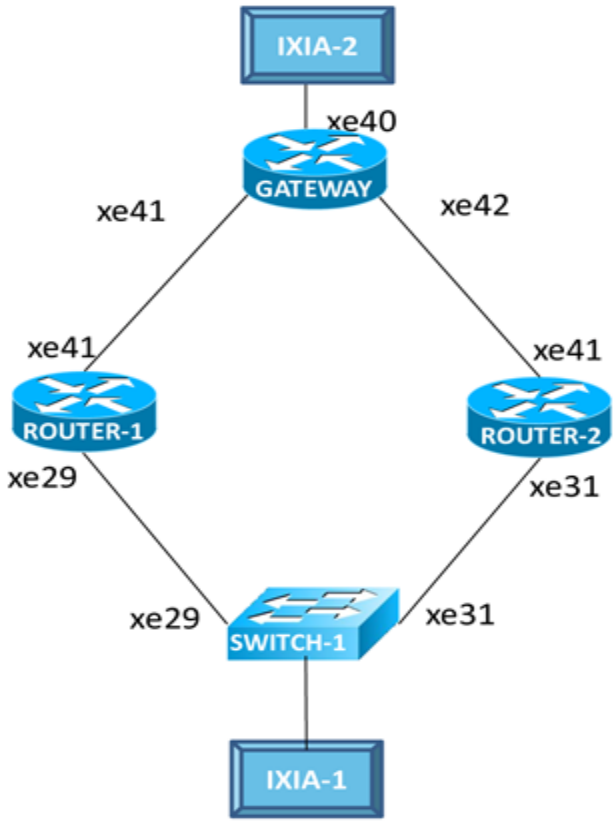
Figure 211. VRRP Object Tracking



R1 Configuration

`(config)#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol rstp vlan-bridge`	Create a RSTP VLAN aware bridge with bridge-id.
`(config)#vlan 1001-1002 bridge 1`	Create VLAN 1001,1002 and map it to bridge 1.
`(config)#interface xe29`	Enter interface mode.
`(config-if)#switchport`	Configure switch port.
`(config-if)#bridge-group 1 spanning-tree disable`	Configure bridge group to L2 interface with spanning-tree disabled.
`(config-if)#switchport mode trunk`	Configure switchport mode as trunk.
`(config-if)#switchport trunk allowed vlan add 1001,1002`	Allow VLAN 1001, and 1002 on the interface.
`(config-if)#interface vlan1.1001`	Enter the VLAN interface.
`(config-if)#ip address 10.1.1.2/24`	Configure IPv4 address.
`(config-if)#ipv6 address 1000:1::2/32`	Configure IPv6 address.
`(config-if)#ipv6 router ospf area 0.0.0.0`	Tag OSPFv3 instance on the interface with area 0.
`(config-if)#exit`	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

`(config)#ip sla 1`	Configure IP SLA .
`(config-ip-sla)#icmp-echo ipv4 4.4.4.4 source-interface xe41`	Configure ICMP-echo with a destination IPv4/IPv6 address.
`(config-ip-sla-echo)#exit`	Exit IP SLA echo mode.
`(config)#time-range tr1`	Configure a time-range.
`(config-tr)#start-time now`	Configure a start-time.
`(config-tr)#commit`	Commit the candidate configuration to the running configuration.
`(config-tr)#end-time after 200`	Configure end-time.
`(config-tr)#exit`	Exit time-range mode.
`(config)#track 1 ip sla 1 reachability`	Configure the track ID for IP SLA.
`(config-object-track)#exit`	Exit object track mode.
`(config)#router vrrp 1 vlan1.1001`	Create a router IPv4 VRRP instance for interface vlan1.1001.
`(config-router)#virtual-ip 10.1.1.1`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 150`	Configure the priority to 150.
`(config-router)#track 1 decrement 60`	Configure the priority-delta value to be 60. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#v2-compatible`	Enable the v2-compatible.
`(config-router)#enable`	Enable the VRRP session.
`(config-router)#commit`	Commit the configuration on the node.
`(config-router)#exit`	Exit the router mode.
`(config)#router ipv6 vrrp 1 vlan1.1001`	Create a router IPv6 VRRP IPv6 instance for interface vlan1.1001.
`(config-router)#virtual-ipv6 fe80::1`	Set the virtual IPv6 address for the VRRP session.
`(config-router)#priority 150`	Configure the priority to 150.
`(config-router)#track 1 decrement 60`	Configure the priority-delta value to be 60. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#enable`	Enable the VRRP session.
`(config-router)#commit`	Commit the configuration on the node
`(config-router)#exit`	Exit the router mode
`(config)#interface xe41`	Enter interface mode
`(config-if)#ip address 60.1.1.1/24`	Configure IPv4 address.
`(config-if)#ipv6 address 6000::1/64`	Configure IPv6 address.
`(config-if)#ipv6 router ospf area 0.0.0.0`	Tag OSPFv3 instance on the interface with area 0.
`(config-if)#commit`	Commit the configuration on the node.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit configure mode.

R2 Configuration

`(config)#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol rstp vlan-bridge`	Create a RSTP VLAN aware bridge with bridge-id.
`(config)#vlan 1001-1002 bridge 1`	Create VLAN 1001,1002 and map it to bridge 1.
`(config)#interface xe31`	Enter interface mode.
`(config-if)#switchport`	Configure switchport.
`(config-if)#bridge-group 1 spanning-tree disable`	Configure bridge group to L2 interface with spanning-tree disabled.
`(config-if)#switchport mode trunk`	Configure switchport mode as trunk.
`(config-if)#switchport trunk allowed vlan add 1001,1002`	Allow VLAN 1001,1002 on the interface.
`(config-if)#interface vlan1.1001`	Enter the VLAN interface.
`(config-if)#ip address 10.1.1.3/24`	Configure IPv4 address.
`(config-if)#ipv6 address 1000:1::3/32`	Configure IPv6 address.
`(config-if)#ipv6 router ospf area 0.0.0.0`	Tag OSPFv3 instance on interface with area 0.
`(config-if)#commit`	Commit the configuration on the node.
`(config-if)#exit`	Exit interface mode.
`(config)#router vrrp 1 vlan1.1001`	Create a router IPv4 VRRP instance for interface vlan1.1001.
`(config-router)#virtual-ip 10.1.1.1`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 50`	Configure the priority to 50 (less than 150), because R2 is the VR Backup router.
`(config-router)#v2-compatible`	Enable the v2-compatible.
`(config-router)#authentication text abcd`	Configure the authentication text to specify that as simple text for VRRPv2 packets, accept only 8 characters.
`(config-router)#enable`	Enable the VRRP session.
`(config-router)#commit`	Commit the configuration on the node.
`(config-router)#exit`	Exit the router mode.
`(config)#router ipv6 vrrp 1 vlan1.1001`	Create a router IPv6 VRRP IPv6 instance for interface vlan1.1001.
`(config-router)#virtual-ipv6 fe80::1`	Set the virtual IPv6 address for the VRRP session.
`(config-router)#priority 50`	Configure the priority to 50 (less than 150), because R2 is the VR Backup router.
`(config-router)#commit`	Commit the configuration on the node

© 2026 IP Infusion Inc. Proprietary

`(config-router)#exit`	Exit the router mode
`(config)#interface xe41`	Enter interface mode
`(config-if)#ip address 80.1.1.1/24`	Configure IPv4 address.
`(config-if)#ipv6 address 8000::1/64`	Configure IPv6 address.
`(config-if)#ipv6 router ospf area 0.0.0.0`	Tag OSPFv3 instance on interface with area 0.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit configure mode.

VRRP IPv6 Configuration

This section contains a Virtual Router Redundancy Protocol IPv6 (VRRPv6) configuration example.

VRRPv6 eliminates the risk of a single point of failure inherent in a static default routing environment. It specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRPv6 routers on a LAN. In this sample, OSPFv3 is enabled on Router 1 (R1), the master router, and the backup router. In R1, the connected routes are redistributed.

Note: IPv6 VRRP can be configured using link local address along with additional global ipv6 address as Virtual IP.

Topology

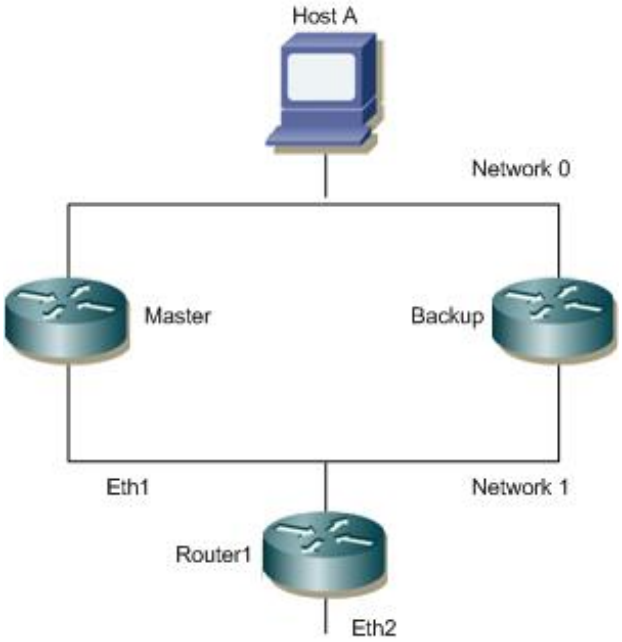

Figure 212. Topology

Configuration

Owner/Master Router

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth0`	Enter the Interface mode for eth0.
`(config-if)#ipv6 address fe80::3037:3aff:fe3a:3a32/64`	Configure the IPv6 address for interface eth0 to be in network 0.
`(config-if)#exit`	Exit the Interface mode.
`(config)#interface eth1`	Enter the Interface mode for eth1.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ipv6 address fe80::3037:a0ff:fea4:3539/64`	Configure the IPv6 address for interface eth1 to be in network 1.
`(config-if)#exit`	Exit the Interface mode.
`(config)#router ipv6 vrrp 1 eth0`	Create a VRRPv6 instance for interface eth0.
`(config-router)#virtual-ipv6 fe80::3037:3aff:fe3a:3a32 owner`	Configure R1 as the owner.
`(config-router)#advertisement-interval 100`	Configure the default value for the advertisement interval. The configurable range is <5-4095> (value must be a multiple of 5).
`(config-router)#preempt-mode true`	Set true as the default value for the field.
`(config-router)#enable`	Enable the VRRPv6 session on the router.
`(config-router)#exit`	Exit Router mode.

Backup Router

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth0`	Enter the Interface mode for eth0.
`(config-if)#ipv6 address fe80::3037:3aff:fe3a:3b45/64`	Configure the IPv6 address for interface eth0 to be in network 0.
`(config-if)#exit`	Exit the Interface mode.
`(config)#interface eth1`	Enter the Interface mode for eth1.
`(config-if)#ipv6 address fe80::3037:a0ff:fea4:3a40/64`	Configure the IPv6 address for interface eth1 to be in network 1.
`(config-if)#exit`	Exit the Interface mode.
`(config)#router ipv6 vrrp 1 eth0`	Create a VRRPv6 instance for interface eth0.
`(config-router)#virtual-ipv6 fe80::3037:3aff:fe3a:3a32`	Configure Router 2 (R2) as the backup.
`(config-router)#advertisement-interval 100`	Configure the default value for the advertisement interval. The configurable range is <5-4095> (value must be a multiple of 5).
`(config-router)#priority 100`	Set the default value for the backup router.
`(config-router)#preempt-mode true`	Set true as the default value for the field.
`(config-router)#enable`	Enable the VRRPv6 session on the router.
`(config-router)#exit`	Exit Router mode.

Host A

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth0`	Enter the Interface mode for eth0.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ipv6 address fe80::3037:3aff:fe3a:3a11/64`	Configure the IPv6 address for interface eth0 to be in network 0.
`(config-if)#exit`	Exit the Interface mode.
`(config)#ipv6 route 5ffe:14:14:14::/64 fe80::3037:3aff:fe3a:3a32`	Configure a static route to reach interface eth2 of R1 through the virtual IPv6 address.

Router 1

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth1`	Enter the Interface mode for eth1.
`(config-if)#ipv6 address fe80::3037:a0ff:fea4:1111/64`	Configure the IPv6 address for interface eth1 to be in network 1.
`(config-if)#exit`	Exit the Interface mode.
`(config)#interface eth2`	Enter the Interface mode for eth2.
`(config-if)#ipv6 address fe80::3437:30ff:fe35:a6ac/64`	Configure the IPv6 address of interface eth2.

GLOBAL IPV6 SUPPORT FOR VRRP

Master Router

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth0`	Enter the Interface mode for eth0.
`(config-if)#ipv6 address 2001::1/64`	Configure global IPv6 address for interface eth0 to be in network 0.
`(config-if)#commit`	Commit the configurations.
`(config-if)#exit`	Exit the Interface mode.
`(config)#interface eth1`	Enter the Interface mode for eth1.
`(config-if)#ipv6 address 3000::1/64`	Configure global IPv6 address for interface eth1 to be in network 1.
`(config-if)#commit`	Commit the configurations.
`(config-if)#exit`	Exit the Interface mode.
`(config)#router ipv6 vrrp 1 eth0`	Create a VRRPv6 instance for interface eth0.
`(config-router)#virtual-ipv6 fe80::1`	Configure link local address as primary virtual-ip.
`(config-router)#virtual-ipv6 2001::3`	Configure global ipv6 address as additional virtual-ip.
`(config-router)#priority 250`	Set priority for master node as 250.
`(config-router)#enable`	Enable the VRRPv6 session on the router.
`(config-router)#commit`	Commit the configurations.
`(config-router)#exit`	Exit Router mode.
`(config)#ipv6 route 4000::/64 3000::2`	Configure static route to reach eth2 of router1.
`(config-router)#commit`	Commit the configurations.
`(config-router)#exit`	Exit Router mode.

Backup Router

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth0`	Enter the Interface mode for eth0.
`(config-if)#ipv6 address 2001::2/64`	Configure global IPv6 address for interface eth0 to be in network 0.
`(config-if)#commit`	Commit the configurations.

(config-if)#exit	Exit the Interface mode.
(config)#interface eth1	Enter the Interface mode for eth1.
(config-if)#ipv6 address 3001::1/64	Configure global IPv6 address for interface eth1 to be in network 1.
(config-if)#commit	Commit the configurations.
(config-if)#exit	Exit the Interface mode.
(config)#router ipv6 vrrp 1 eth0	Create a VRRPv6 instance for interface eth0.
(config-router)#virtual-ipv6 fe80::1	Configure link local address as primary virtual-ip.
(config-router)#virtual-ipv6 2001::3	Configure global ipv6 address as additional virtual-ip.
(config-router)#priority 100	Set the default value for the backup router.
(config-router)#enable	Enable the VRRPv6 session on the router.
(config-router)#commit	Commit the configurations.
(config-router)#exit	Exit Router mode.
(config)#ipv6 route 4000::/64 3001::2	Configure static route to reach eth2 of router1.
(config-router)#exit	Exit Router mode.

Host A

#configure terminal	Enter the Configure mode.
(config)#bridge 1 protocol rstp vlan-bridge	Create a RSTP VLAN aware bridge with bridge-id.
(config)#vlan 100 bridge 1	Create VLAN 100 and map it to bridge 1
(config)#interface eth0	Enter the Interface mode for eth0.
(config-if)#switchport	Configure switch port.
(config-if)#bridge-group 1 spanning-tree disable	Configure bridge group to l2 interface with spanning-tree Disable
(config-if)#switchport mode trunk	Configure switch port mode as trunk
(config-if)#switchport trunk allowed vlan add 100	Allow vlan 100 on the interface
(config-if)#commit	Commit the configurations.
(config-if)#exit	Exit the Interface mode
(config)#interface eth1	Enter the Interface mode for eth1.
(config-if)#switchport	Configure switch port.
(config-if)#bridge-group 1 spanning-tree disable	Configure bridge group to l2 interface with spanning-tree Disable

© 2026 IP Infusion Inc. Proprietary

(config-if)#switchport mode trunk	Configure switch port mode as trunk
(config-if)#switchport trunk allowed vlan add 100	Allow vlan 100 on the interface
(config-if)#commit	Commit the configurations.
(config-if)#exit	Exit the Interface mode.

Router 1

#configure terminal	Enter the Configure mode.
(config)#interface eth0	Enter the Interface mode for eth0.
(config-if)#ipv6 address 3000::2/64	Configure global IPv6 address for interface eth1 to be in network 1.
(config-if)#commit	Commit the configurations.
(config-if)#exit	Exit the Interface mode.
(config)#interface eth1	Enter the Interface mode for eth1.
(config-if)#ipv6 address 3001::2/64	Configure global IPv6 address for interface eth1 to be in network 1.
(config-if)#commit	Commit the configurations.
(config-if)#exit	Exit the Interface mode.
(config)#interface eth2	Enter the Interface mode for eth2.
(config-if)#ipv6 address 4000::1/64	Configure global ipv6 address for interface eth2.
(config-if)#commit	Commit the configurations.
(config-if)#exit	Exit the Interface mode.
(config)#ipv6 route 2001::/64 3001::1	Configure static route to reach eth2 of master.
(config)#ipv6 route 2001::/64 3001::1	Configure static route to reach eth2 of backup.
(config-if)#commit	Commit the configurations.
(config-if)# exit	Exit the Interface mode.

Validation

Master Router

```
OcNOS#sh vrrp
VRRP Version: 3
VMAC enabled
Backward Compatibility disabled

Address family IPv6
VRRP Id: 1 on interface: eth0

accept-mode

Use this command to enable/disable accept mode for the session.

Controls whether a VRRP master node will accept/respond to packets addressed to the Virtual-IP address as its own address if it is not the Virtual-IP Owner.

Command Syntax

```
accept-mode true
accept-mode false
```

Parameter

None

Default

Enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to set and unset the accept-mode.

```
#configure terminal
(config)#router vrrp 2 eth0
(config-router)#accept-mode false

# configure terminal
(config)#router vrrp 2 eth2
(config-router)#accept-mode True
```

© 2026 IP Infusion Inc. Proprietary

advertisement-interval

Use this command to configure the advertisement interval of a virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s). The master virtual router sends VRRP advertisements to other VRRP routers in the same group. The advertisements communicate the priority and state of the master virtual router. The VRRP advertisements are encapsulated in IP packets and sent to the multicast address assigned to the VRRP group (224.0.0.18). Advertisements are sent every second by default.

Note: Higher-priority master routers with slower transmission rates than their backup routers are unstable. This is because low-priority nodes configured to faster rates could come online and decide they should be masters before they have heard anything from the higher-priority master with a slower rate. When this happens, it is temporary: once the lower-priority node does hear from the higher-priority Mmaster, it will relinquish mastership.

Use the `no` parameter with this command to restore the default setting.

Command Syntax

```
advertisement-interval <5-4095>
no advertisement-interval
```

Parameter

`<5-4095>`
Specify the advertisement interval in centi-seconds (in multiples of 5) when VRRPv3 is enabled

Default

Advertisements are sent every second

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure an advertisement interval of 50 centi-seconds for the virtual router with VR ID 2 on interface eth0.

```
#configure terminal
(config)#router ip vrrp 2 eth0
(config-router)#advertisement-interval 50
```

© 2026 IP Infusion Inc. Proprietary

authentication text

Use this command to enable authentication of VRRPv2 packets received from other routers in the group.

If configured, all routers within the VRRP group must use the same authentication string.

Authentication is supported only for VRRPv2 packets. V2-compatibility must be enabled.

Use the `no` form of this command to remove text authentication.

Command Syntax

```
authentication text TEXT-STRING
no authentication text
```

Parameter

TEXT-STRING

Password, maximum eight alphanumeric characters

Default

Disabled.

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

```
(config)#
(config)#router vrrp 1 eth3
(config-router)#v2-compatible
(config-router)#authentication text abc_123
(config-router)#end
#

(config)#router vrrp 1 eth3
(config-router)#no authentication text
(config-router)#end
```

circuit-failover

Use this command to enable the VRRP circuit failover feature.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
circuit-failover [IFNAME] |<1-253>
no circuit-failover [IFNAME] |<1-253>
```

Parameters

IFNAME

Specify an interface of the router that is monitored by the virtual router. This is usually an upstream interface. Should the interface go down, another router, configured as backup within the VRRP group, may take over as a master.

<1-253>

Specify the delta value. The value by which the virtual router decrements its priority value during a circuit failover event. Configure this value to be greater than the difference of priorities between the master and backup routers.

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure circuit failover for the VRRP session with VR ID 1. Interface eth1 is considered the monitored interface.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#circuit-failover eth1 30
```

© 2026 IP Infusion Inc. Proprietary

debug vrrp

Use this command to specify debugging options for VRRP.

Use the `no` parameter with this command to disable debugging.

Command Syntax

```
debug vrrp (all|event|packet [send|recv|])
no debug vrrp (all|event|packet [send|recv|])
```

Parameters

all
Specify debugging options for all VRRP events.

event
Specify debugging options for VRRP event troubleshooting.

packet
Specify debugging options for VRRP packets

send
Specify the debug option set for sent packets.

recv
Specify the debug option set for received packets.

Command Mode

Configure mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to enable all VRRP debug options.

```
#configure terminal
(config)#debug vrrp all
```

The example below shows how to enable debugging options for VRRP events.

```
#configure terminal
(config)#debug vrrp events
```

The example below shows how to enable debug options for VRRP packets sent.

```
#configure terminal
(config)#debug vrrp packet send
```

The example below shows how to enable debug options for VRRP packets received.

```
#configure terminal
(config)#debug vrrp packet recv
```

© 2026 IP Infusion Inc. Proprietary

disable

Use this command to disable a VRRP session on the router (to stop the router from participating in virtual routing). When this command is configured, a backup Router assumes the Role of Master depending on its priority.

Command Syntax

```
disable
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to disable a VRRP session.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#disable
```

© 2026 IP Infusion Inc. Proprietary

enable

Use this command to enable a VRRP session on the router (to make it participate in virtual routing). To make any changes to the VRRP configuration, first disable the router from participating in virtual routing using the `disable` command.

Note: Configure the virtual IP address and define an interface for the VRRP session (using the `virtual-ip` and `interface` commands) before using this command.

Command Syntax

```
enable
```

Parameters

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to enable a VRRP session with VR ID 1 on interface eth0.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#enable
```

© 2026 IP Infusion Inc. Proprietary

ip pim redundancy

Use this command to set the priority for which a router is elected as the designated router (DR).

Note: This command should be applied to the all related VRRP routers with identical priority values.

Command Syntax

```
ip pim redundancy <1-255> vrrp dr-priority <0-4294967294>
no ip pim redundancy vrrp
```

Parameter

<1-255>
VRRP virtual router identifier

<0-4294967294>
DR priority

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim redundancy 1 vrrp dr-priority 900

(config)#interface eth0
(config-if)#no ip pim redundancy vrrp
```

© 2026 IP Infusion Inc. Proprietary

ipv4-exclude-pseudo-header

Use this command to exclude the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group in router mode to support IPv4 VRRPv3 interoperability.

Note: Use this command when checksum errors are observed with other vendors for VRRPv3.

Use the `no` form of this command to delete the VRRP IPv4 checksum pseudo-header exclude configuration from the VRRP group on the router.

Command Syntax

```
ipv4-exclude-pseudo-header
```

Parameter

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced in OcNOS-SP version 2.4.

Examples

```
#configure terminal
(config)#router vrrp 2 eth2
(config-router)#ipv4-exclude-pseudo-header

#configure terminal
(config)#router vrrp 2 eth2
(config-router)#no ipv4-exclude-pseudo-header
```

© 2026 IP Infusion Inc. Proprietary

operational-ip

Use this command to set the primary IPv4 address.

Use the no parameter with this command to remove a primary IPv4 address.

Command Syntax

```
operational-ip A.B.C.D
no operational-ip
```

Parameters

A.B.C.D
IPv4 address.

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)# operational-ip 1.2.3.4
```

© 2026 IP Infusion Inc. Proprietary

preempt-mode

Use this command to configure preempt mode. If set to true, the highest priority backup is always the master when the default master is unavailable. If set to false, a higher priority backup does not preempt a lower priority backup which is acting as master.

When the master router fails, the backup routers come online in priority order — highest to lowest. Preempt mode set to `true` allows a higher priority backup router to relieve a lower priority backup.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over for the backup virtual router that was elected to become master virtual router. This preemptive scheme can be disabled using the `preempt-mode false` command. If preemption is disabled, the backup virtual router that is currently elected as Master does not transition to backup again when the alternate backup router with higher priority becomes available.

Command Syntax

```
preempt-mode (true|false)
```

Parameters

`true`
Specify that preemption is enabled.

`false`
Specify that preemption is disabled.

Default

True

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to enable the preempt mode.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#preempt-mode false

#configure terminal
(config)#router vrrp 1 eth0
(config-router)#preempt-mode true
```

© 2026 IP Infusion Inc. Proprietary

priority

Use this command to configure the priority to use by this VRRP router in master election. The value of 255 (decimal) is reserved for the router that owns the IP address associated with the virtual router. The value of 0 (zero) is reserved for the master router to indicate it is releasing responsibility for the virtual router. Higher values indicate higher priorities.

Use the `no` parameter with this command to restore the default setting.

Command Syntax

```
priority <1-254>
no priority
```

Parameter

<1-254>
Priority of a virtual router.

Default

100 (non-owner)

255 (owner)

Command Mode

Router mode

Applicability

This command was introduced in OcNOS version 4.2.

Examples

The example below shows how to configure priority 50 for the virtual router with VR ID 2 on interface eth0.

```
#configure terminal
(config)#router ip vrrp 2 eth0
(config-router)#priority 50
```

© 2026 IP Infusion Inc. Proprietary

router vrrp

Use this command to enable a VRRP routing process.

Use the `no` form of this command to disable a VRRP routing process.

Command Syntax

```
router vrrp <1-255> IFNAME
no router vrrp <1-255> IFNAME
```

Parameters

<1-255>
Virtual router identifier

IFNAME
Interface name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router vrrp 1 eth0
```

© 2026 IP Infusion Inc. Proprietary

show debugging vrrp

Use this command to display the set VRRP debugging option.

Command Syntax

```
show debugging vrrp
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging vrrp
VVRRP debugging status:
VRRP event debugging is on
VRRP packet debugging is on
```

© 2026 IP Infusion Inc. Proprietary

show running-config router vrrp

Use this command to show the running configuration for VRRP.

Command Syntax

```
show running-config router vrrp
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows the running configuration of VRRP. Virtual Router is configured as Master and Owner of IP address.

```
#show running-config router vrrp
!
router vrrp 1 eth0
 virtual-ip 39.0.0.24 owner
 advertisement-interval 5
 preempt-mode false
 enable
!
```

© 2026 IP Infusion Inc. Proprietary

show running-config router ipv6 vrrp

Use this command to show the running configuration for VRRP.

Command Syntax

```
show running-config router ipv6 vrrp
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows the running configuration of IPv6 VRRP. Virtual Router is configured as Master and Owner of IP address.

```
#show running-config router ipv6 vrrp
!
router ipv6 vrrp 1 eth0
 virtual-ip fe80::202:b3ff:fed5:983e master
 circuit-failover eth1 30
 advertisement-interval 6
 preempt-mode false
 enable
!
```

© 2026 IP Infusion Inc. Proprietary

show vrrp

Use this command to display a list of virtual router identifiers that are configured on the router.

Command Syntax

```
show vrrp
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show vrrp

R1#show vrrp
VrId <1>
State is Master
Virtual IP is 10.10.12.6 (IP owner)
Interface is eth0
Priority is 255
Advertisement interval: 5 centi sec
Preempt mode is TRUE

R2#show vrrp
VrId <1>
State is Backup
Virtual IP is 10.10.12.6 (Not IP owner)
Interface is eth0
Priority is 100
Advertisement interval: 5 centi sec
Preempt mode is TRUE
```

The following table explains the show command output fields.

Field	Description
VrID	Type of vr identifier by the system on the interface.
State	VRRP State: Master — The interface is acting as the master router interface. Backup —The interface is acting as the backup router interface.
Virtual IP	List of virtual IP addresses configured on the interface.
Interface	Name of the logical interface.

© 2026 IP Infusion Inc. Proprietary

Field	Description
Priority	Configured VRRP priority for the interface.
Advertisement interval	Configured VRRP advertisement interval.
Preempt mode	Whether preemption is allowed on the interface.

© 2026 IP Infusion Inc. Proprietary

show vrrp (global | ipv4) statistics

Use this command to display VRRP global or ipv4 router statistics.

Command Syntax

```
show vrrp (global | ipv4 ) statistics
```

Parameters

global
Global (VRRP Router)

ipv4
VRRP IPv4 router

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.8.

Example

```
#show vrrp global statistics
VRRP Global Statistics
Checksum Errors  : 0
Version Errors   : 0
VRid Errors      : 0
Discontinuity Time: 00 hour, 00 min, 00 sec

#show vrrp ipv4 statistics
Address family IPv4
VRRP Id: 1 on interface: xe1
Master Transitions: 0
Advertisements Rcvd: 0
Pkts Rcvd with IP TTL Errors: 0
Pkts Rcvd with Zero Priority: 0
Pkts Sent with Zero Priority: 0
Pkts Rcvd with Invalid TYPE: 0
Pkts Rcvd with Packet Length Errors: 0
Pkts Rcvd with IP Count Mismatch: 0
Discontinuity Time: 00 hour, 00 min, 00 sec
Refresh Rate: 1000 ms
```

© 2026 IP Infusion Inc. Proprietary

show vrrp

Use this command to display VRRP information for a virtual router.

Command Syntax

```
show vrrp <1-255> IFNAME
```

Parameters

<1-255>
Virtual router identifier

IFNAME
Interface name

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show vrrp 7 eth0
```

© 2026 IP Infusion Inc. Proprietary

show vrrp summary

Use this command to display a brief list of virtual router identifiers that are configured on the router.

Command Syntax

```
show vrrp summary
```

Parameters

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 4.2.

Example

```
#show vrrp summary
VRRP Version: 3
VMAC enabled
Backward Compatibility disabled

Interface  Admin  IpVersion  VRGroup  VRState  Priority    VIP          InterfaceIp
eth3       Up     IPv4      255       Master   255        66.0.0.1      66.0.0.1
eth3       Up     IPv6        1       Master   250        fe80::1       fe80::2
Total Number of IPv4 VRRP group 1
Total Number of IPv6 VRRP group 1
```

The following table explains the show command output fields.

Table 113. show vrrp summary output fields

Field	Description
interface	Interface name on which vrrp session is active.
Admin	Administrative state of the session Up/Down.
IpVersion	Internet protocol version IPv4 or IPv6.
VRGroup	Vrrp Group the router is part of.
priority	Configured VRRP priority for the interface.
VRState	VRRP State: Master - The interface is acting as the master router interface. Backup -The interface is acting as the backup router interface.
VIP	List of virtual IP addresses configured on the interface.
InterfaceIp	Primary IP address on the interface.

© 2026 IP Infusion Inc. Proprietary

snmp restart vrrp

Use this command to restart SNMP in Virtual Routing Redundancy Protocol (VRRP).

Command Syntax

```
snmp restart vrrp
```

Parameters

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# snmp restart vrrp
```

© 2026 IP Infusion Inc. Proprietary

switch-back-delay

Use this command to set a switch-back delay timer for the master VRRP router. This feature prevents the original master VRRP router from transitioning back to the master state after coming back online until the configured delay timer has expired.

Command Syntax

```
switch-back-delay <1-500000>
no switch-back-delay
```

Parameters

<1-500000>
Specify a switch-back delay in milliseconds.

Command Mode

Router mode

Default

Zero

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to set a switch-back delay timer of 7000 milliseconds.

```
#configure terminal
(config)#router vrrp 5 eth1
(config-router)#switch-back-delay 7000
```

© 2026 IP Infusion Inc. Proprietary

track decrement

Use this command to decrement the priority value during a down event.

Use the no form of this command to not decrement the priority value during a down event.

Command Syntax

```
track <0-500> decrement <1-253>
no track <1-500>
```

Parameters

<1-500>

Identifier of the tracked object.

<1-253>

Priority delta value. The value by which the virtual router decrement its priority value during a down event. Configure this value to be greater than the difference of priorities between the master and backup routers.

Command Mode

VRRP router Mode

Applicability

This command was introduced in OcNOS version 5.1

Example

```
(config)#router vrrp 1 eth1
(config-router)#virtual-ip 11.0.0.5
(config-router)#track 1 decrement 30
```

© 2026 IP Infusion Inc. Proprietary

undebug vrrp

Use this command to disable debugging options for VRRP.

Command Syntax

```
undebug vrrp (all|event|packet [send|recv|])
no undebug vrrp (all|event|packet [send|recv|])
```

Parameters

all
Specify debugging options for all VRRP events.

event
Specify debugging options for VRRP event troubleshooting.

packet
Specify debugging options for VRRP packets

send
Specify the debug option set for sent packets.

recv
Specify the debug option set for received packets.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#undebug vrrp all
The example below shows how to disable debug options for VRRP events.
#undebug vrrp events
The example below shows how to disable debug options for VRRP packets sent.
#undebug vrrp packet send
The example below shows how to disable debug options for VRRP packets received.
#undebug vrrp packet recv
```

© 2026 IP Infusion Inc. Proprietary

virtual-ip

Use this command to set the Virtual Internet Protocol (VIP) for the VRRP virtual router as VRRP Owner. This is the IP address used by end hosts to address their default gateway.

The VRRP Owner of the VIP address only responds to packets destined to the VIP address (for example, ICMP packets destined to the VIP address).

Use the `no` parameter with this command to remove a virtual IP address assignment.

Note: When using VRRP over MLAG, it is recommended to keep the VIP address different from the interface addresses. Having the same VMAC on both routers would essentially mean that they are both acting as masters for the VRRP group, which can lead to inconsistent routing behaviors.

Command Syntax

```
virtual-ip A.B.C.D (owner|)
no virtual-ip (owner|)
```

Parameters

A.B.C.D
Virtual IP address of the interface that participates in virtual routing.

owner
IP address as the owner.

Default

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to configure the router as VRRP owner.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#virtual-ip 10.10.20.30 owner
```

The example below removes the virtual IP address assignment.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#no virtual-ip
```

© 2026 IP Infusion Inc. Proprietary

vrrp compatible-v2

Use this command to enable the backward-compatibility feature. When enabled, both VRRPv3 and VRRPv2 inter-operation are supported.

Command Syntax

```
vrrp compatible-v2 (enable| disable)
```

Parameters

enable
Enable VRRPv2 inter-operation

disable
Disable VRRPv2 inter-operation

Default

Enabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#vrrp compatible-v2 enable
```

© 2026 IP Infusion Inc. Proprietary

vrrp ipv4-exclude-pseudo-header

Use this command to excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP groups in configuration mode to support IPv4 VRRPv3 interoperability.

Note: Use this command when checksum errors are observed with other vendors for VRRPv3.

Command Syntax

```
vrrp ipv4-exclude-pseudo-header (enable| disable)
```

Parameters

enable
Enable ipv4-exclude-pseudo-header

disable
Disable ipv4-exclude-pseudo-header

Default

By default, VRRP includes the pseudo header in checksum calculation.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 2.4.

Examples

```
#configure terminal
(config)#vrrp ipv4-exclude-pseudo-header enable

#configure terminal
(config)#vrrp ipv4-exclude-pseudo-header disable
```

© 2026 IP Infusion Inc. Proprietary

vrrp vmac

Use this command to enable or disable Virtual MAC (VMAC).

This command affects all VRRP groups in a router. On a single network segment, multiple VRRP groups can be configured, each using a different VMAC. The use of VMAC addressing allows for faster switchover when a backup router assumes the master role. When this command is used to enable a VMAC, the virtual router forwards packets with a special-purpose multicast VMAC address (0:0:5e:0:01:<VR ID>). Otherwise, it forwards with is interface's physical address.

The VMAC address is assigned to a router interface at the time the VRRP group is enabled in the router.

Command Syntax

```
vrrp vmac (enable|disable)
```

Parameters

enable
Enable virtual MAC addressing.

disable
Disable virtual MAC addressing and use physical MAC addressing.

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to enable a virtual MAC address on the router.

```
#configure terminal
(config)#vrrp vmac enable
```

The example below shows how to disable a virtual MAC address on the router.

```
#configure terminal
(config)#vrrp vmac disable
```

VRRP v6 Commands

This section describes the commands for VRRP IPv6.

advertisement-interval 3014
circuit-failover 3015
disable 3016
enable 3017
preempt-mode 3018
priority 3019
router ipv6 vrrp 3020
router ipv6 vrrp vlan 3021
show running-config vrrpv6 3022
virtual-ipv6 3023

© 2026 IP Infusion Inc. Proprietary

advertisement-interval

Use this command to configure the advertisement interval of a virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s). The master virtual router sends VRRP advertisements to other VRRP routers in the same group. The IPV6 VRRP advertisements are sent to the multicast address assigned to the VRRP IPV6 group (FF02:0:0:0:0:0:XXXX:XXXX) and a backup virtual router has to join all multicast groups within this range. As a convenient assignment, OcNOS sends a VRRP advertisement to the multicast address FF02::12.The advertisements are sent every second by default.

Note: VRRP Master router and backup routers should be configured with the same advertisement interval. If there is a mismatch in the configuration, VRRP goes to the INIT state.

Use the `no` parameter with this command to restore the default setting.

Command Syntax

```
advertisement-interval <5-4095>
no advertisement-interval
```

Parameter

<5-4095>

Specify the advertisement interval in centi-seconds (multiples of 5) when VRRPv3 is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure an advertisement interval of 10 seconds for the virtual router with VR ID 3 on interface eth0.

```
#configure terminal
(config)#router ipv6 vrrp 3 eth0
(config-router)#advertisement-interval 10
```

© 2026 IP Infusion Inc. Proprietary

circuit-failover

Use this command to enable the VRRP circuit failover feature.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
circuit-failover IFNAME <1-253>
no circuit-failover IFNAME <1-253>
no circuit-failover (IFNAME|)
```

Parameters

IFNAME

Specify an interface of the router that is monitored by the virtual router. This is usually an upstream interface. Should the interface go down, another router, configured as backup within the VRRP group, may take over as a master.

<1-253>

Specify the delta value. The value by which the virtual router decrements its priority value during a circuit failover event. Configure this value to be greater than the difference of priorities between the master and backup routers.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure circuit failover for the VRRP session with VR ID 1. Interface eth1 is considered the monitored interface.

```
#configure terminal
(config)#router ipv6 vrrp 1 eth0
(config-router)#circuit-failover eth1 30
```

© 2026 IP Infusion Inc. Proprietary

disable

Use this command to disable a VRRP session on the router (to stop the router from participating in virtual routing). Refer to enable (page 3017) to enable a VRRP session on the router.

When this command is configured, a backup router assumes the role of master depending on its priority.

Command Syntax

```
disable
```

Parameters

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows to disable VRRP session.

```
#configure terminal
(config)#router ipv6 vrrp 1 eth0
(config-router)#disable
```

© 2026 IP Infusion Inc. Proprietary

enable

Use this command to enable a VRRP session on the router, so the router participates in virtual routing. To make any changes to the VRRP configuration, first disable the Router from participating in Virtual Routing using the `disable` command.

Note: Configure the virtual IP address and define an interface for the VRRP session (using the `virtual-ip` and `interface` commands) before using this command.

Command Syntax

```
enable
```

Parameters

None

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows to enable VRRP session with VR ID 1 on interface eth0

```
#configure terminal
(config)#router ipv6 vrrp 1 eth0
(config-router)#enable
```

© 2026 IP Infusion Inc. Proprietary

preempt-mode

Use this command to configure preempt mode. If set to true, the highest priority backup is always the master when the default master is unavailable. If set to false, a higher priority backup does not preempt a lower priority backup that is acting as master.

When the master router fails, the backup routers come online in priority order — highest to lowest. Preempt mode set to `true` allows a higher priority backup router to relieve a lower priority backup.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over for the backup virtual router that was elected to become master virtual router. This preemptive scheme can be disabled using the `preempt-mode false` command. If preemption is disabled, the backup virtual router that is currently elected as Master does not transition to backup again when the alternate backup router with higher priority becomes available.

Command Syntax

```
preempt-mode true
preempt-mode false
```

Parameters

`true`
Specify that preemption is enabled.

`false`
Specify that preemption is disabled.

Default

Default is `true`.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows to configure preempt mode as False.

```
#configure terminal
(config)#router ipv6 vrrp 1 eth0
(config-router)#preempt-mode false
```

© 2026 IP Infusion Inc. Proprietary

priority

Use this command to configure the VRRP router priority within the virtual router. Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the physical interface, this router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
priority <1-255>
no priority
```

Parameter

<1-255>

Specify a priority. For the master router, specify 255; otherwise use any number in the range <1-254>.

Default

Default values for priority are:

- master router = 255
- backup = 100

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows to set the priority

```
#configure terminal
(config)#router ipv6 vrrp 1 eth0
(config-router)#priority 101
```

© 2026 IP Infusion Inc. Proprietary

router ipv6 vrrp

Use this command to associate an IPv6 interface with a VRRP session. When issued, this command enters the `Router` mode.

Use the `no` parameter with this command to remove the IPv6 VRRP configuration. Disable the IPv6 VRRP session before using this command.

Command Syntax

```
router ipv6 vrrp <1-255> IFNAME
no router ipv6 vrrp <1-255> IFNAME
```

Parameters

<1-255>
Specify the ID of the virtual router session to create.

IFNAME
Specify the name of the IPv6 interface on which VRRP is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to enable an IPv6 VRRP session with VR ID 1 on interface eth0.

```
#configure terminal
(config)#router ipv6 vrrp 1 eth0
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

router ipv6 vrrp vlan

Use this command to associate a VLAN with a VRRP session. When issued, this command enters the `Router` mode.

Use the `no` parameter with this command to remove the IPv6 VRRP configuration. Disable the IPv6 VRRP session before using this command.

Command Syntax

```
router ipv6 vrrp <1-255> vlan <1-4094>
no router ipv6 vrrp <1-255> vlan <1-4094>
```

Parameters

<1-255>
Specify a virtual router identifier. Must be unique for each routing process.

<1-4094>
Specify the actual VLAN identifier

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows the use of the `router vrrp` command to enter router mode. Note the change in the prompt.

```
#configure terminal
(config)#router ipv6 vrrp 100 vlan 123
(config-router)#
```

© 2026 IP Infusion Inc. Proprietary

show running-config vrrpv6

Use this command to show the running configuration for VRRPv6.

Command Syntax

```
show running-config router vrrpv6
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 3.0.

Example

```
#show running-config vrrpv6
!
vrrp vmac disable
!
!
router ipv6 vrrp 1 eth1
virtual-ipv6 fe80::c0
enable
!
```

© 2026 IP Infusion Inc. Proprietary

virtual-ipv6

Use this command to set the virtual IPv6 address for the VRRP virtual router. This is the IPv6 address used by end hosts to address their default gateway. A maximum of one link-local and one global IPv6 address can be configured as virtual IP.

The VRRP Owner of the Virtual IPv6 address only responds to packets destined to the Virtual IPv6 address.

Use the no parameter with this command to remove a virtual IPv6 address assignment.

Command Syntax

```
virtual-ipv6 X:X::X:X (owner|)
no virtual-ip (X:X::X:X |)
```

Parameters

X:X::X:X
Virtual IPv6 address of the interface that participates in virtual routing.

owner
Specify the IPv6 address as the owner.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure a router as VRRP Owner:

```
#configure terminal
(config)#router ipv6 vrrp 1 eth1
(config-router)#virtual-ipv6 fe80::1 owner
(config-router)#virtual-ipv6 2001::10
```

The example below removes the virtual IP address assignment.

```
#configure terminal
(config)#router ipv6 vrrp 1 eth1
(config-router)#no virtual-ipv6
```

UNIDIRECTIONAL LINK DETECTION CONFIGURATION

Unidirectional Link Detection Configuration 3025
Topology 3025
Validation 3026
Enable UDLD under bridge-group 3027

© 2026 IP Infusion Inc. Proprietary

Unidirectional Link Detection Configuration

This section shows a complete configuration to enable UDLD in a simple network topolog y.

The purpose of Unidirectional Link Detection protocol (UDLD) is to monitor the physical links and detect when a unidirectional link exists. Upon detection user can either block the port or notify the link status based on the network administrator's configuration.

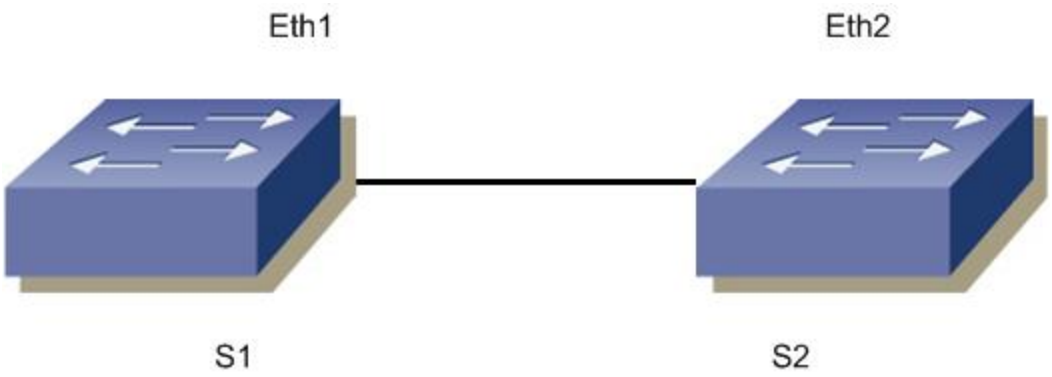
UDLD works in two different modes:

- Normal mode
- Aggressive mode

Topology

Figure 213 shows the topology of the UDLD configuration.

Figure 213. UDLD Configuration



S1

`#configure terminal`	Enter configure mode
`(config)#udld enable`	Enable UDLD globally
`(config)# udld message-time 7`	Configure message time for UDLD packets
`(config)#interface eth1`	Enter interface mode
`(config-if)#switchport`	Configure the interface as switch port
`(config-if)#udld state enable`	Enable UDLD on the interface
`(config-if)udld mode normal`	Configure udld mode as normal or aggressive
`(config-if)#commit`	Commit config.
`(config-if)#exit`	Exit from the interface mode

© 2026 IP Infusion Inc. Proprietary

S2

#configure terminal	Enter configure mode.
(config)#udld enable	Enable UDLD globally.
(config)#udld message-time 7	Configure message time for UDLD packets
(config)#interface eth2	Enter interface mode
(config-if)#switchport	Configure the interface as switch port.
(config-if)#udld state enable	Enable UDLD on the interface.
(config-if)udld mode normal	Configure udld mode as normal or aggressive
(config-if)#commit	Commit config.
(config-if)#exit	Exit from the interface mode

Validation

```
#show udld
UDLD   : Enable
Message Interval(sec) : 7

Port      UDLD Status         Mode         Link-Status
-----------------------------------------------
Eth1      Enable              Normal       Bi-directional
Eth2      Disable             Normal       Unknown
Eth3      Disable             Normal       Unknown
Eth4      Disable             Normal       Unknown
Eth5      Disable             Normal       Unknown
Eth6      Disable             Normal       Unknown
```

Once the links is made Uni-directional, the output of the command Show udld is as follows:

```
#show udld
UDLD   : Enable
Message Interval(sec) : 7

Port      UDLD Status         Mode          Link-Status
-----------------------------------------------
Eth1      Enable              Normal        Unidirectional
Eth2      Disable             Normal        Unknown
Eth3      Disable             Normal        Unknown
Eth4      Disable             Normal        Unknown
Eth5      Disable             Normal        Unknown
Eth6      Disable             Normal        Unknown

#sh running-config
udld Enable
udld message-time 7

#sh running-config in eth1
!
interface eth1
 switchport
 udld state Enable
!

#sh udld interface eth1
UDLD Status           : Enable
```

© 2026 IP Infusion Inc. Proprietary

```
UDLD Mode             : Normal
Link-State            : Unknown
```

For aggressive mode, udld output is as follows:

```
#show udld
    UDLD     : Enable
    Message Interval(sec) : 7

Port      UDLD Status        Mode           Link-Status
-----------------------------------------------
eth1      Enable             Aggressive     Bi-Directional

#sh running config
udld Enable
udld message-time 7

#sh running-config in eth1
  interface eth1
switchport
```

Enable UDLD under bridge-group

S1

`#configure terminal`	Enter configure mode
`(config)#bridge 1 protocol rstp`	Bridge 1 config
`(config)#udld enable`	Enable UDLD globally
`(config)#udld message-time 7`	Configure message time for UDLD packets
`(config-if)#commit`	Commit config.
`(config)#interface eth1`	Enter interface mode
`(config-if)#switchport`	Configure the interface as switch port
`(config-if)#bridge-group 1`	Bridge group 1
`(config-if)#udld state enable`	Enable UDLD on the interface
`(config-if)udld mode normal`	Configure udld mode as normal or aggressive
`(config-if)#commit`	Commit config.
`(config-if)#exit`	Exit from the interface mode

S2

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol rstp`	Bridge 1 config.
`(config)#udld enable`	Enable UDLD globally.
`(config)#udld message-time 7`	Configure message time for UDLD packets
`(config-if)#commit`	Commit config.

© 2026 IP Infusion Inc. Proprietary

`(config)#interface eth2`	Enter interface mode
`(config-if)#switchport`	Configure the interface as switch port.
`(config-if)#bridge-group 1`	Bridge group 1
`(config-if)#udld state enable`	Enable UDLD on the interface.
`(config-if)udld mode normal`	Configure udld mode as normal or aggressive
`(config-if)#commit`	Commit config.
`(config-if)#exit`	Exit from the interface mode

Validation

```
#sh running-config | i bridge 1
bridge 1 protocol rstp

#sh running-config in eth1
 interface eth1
 switchport
 bridge-group 1
 udld state Enable

#sh udld
UDLD                    : Enable
Message Interval(sec)   : 15

Port   UDLD Status    Mode           Link-Status
------------------------------------------------------
eth1    Enable         Normal     Bi-Directional
```

udld

Use this command to enable the UDLD feature globally.

Use `no` form of this command to disable the UDLD feature globally.

Command Syntax

```
udld  enable
no udld enable
```

Parameters

None

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#udld enable
(config)#no udld enable
```

© 2026 IP Infusion Inc. Proprietary

udld message-time

Use this command to set the UDLD message interval.

Command Syntax

```
udld message-time <7-90>
```

Parameters

<7-90>
Interval time in seconds

Default

15 seconds

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
config)# udld message-time 50
```

© 2026 IP Infusion Inc. Proprietary

udld mode

Use this command to configure UDLD mode as aggressive or normal.

Command Syntax

```
udld mode (aggressive | normal)
```

Parameters

aggressive
Aggressive mode

normal
Normal mode

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config-if)#udld mode aggressive
```

udld state

Use this command to enable or disable the UDLD feature for an interface.

Command Syntax

```
udld state (enable | disable)
```

Parameters

None

Default

Disabled

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
(config)#int xe7
(config-if)#udld state enable
```

© 2026 IP Infusion Inc. Proprietary

show udld

Use this command to display UDLD statistic for all interface.

Command Syntax

```
show udld
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show udld
UDLD                    : Enable
Message Interval(sec)   : 15
Port    UDLD Status     Mode           Link-Status
------------------------------------------------
xe7     Enable          Normal         Bi-Directional
```

Table 114 explains the output fields.

Table 114. show udld output fields

Field	Description
UDLD	Whether UDLD is enabled or disabled
Message Interval	Message interval in seconds
Port	Interface name
UDLD Status	Whether UDLD is enabled or disabled on the interface
Mode	Whether the mode is aggressive or normal
Link-Status	State of the link: Unknown Loop-Back Neighbor Mismatch Unidirectional Undetermined Bi-Directional

© 2026 IP Infusion Inc. Proprietary

show udld interface

Use this command to display UDLD settings for particular interface.

Command Syntax

```
show udld interface IFNAME
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Examples

```
#show udld interface xe14
UDLD Status           : Enable
UDLD Mode             : Aggressive
Link-State            : Bi-Directional
#
```

Table 115 explains the output fields.

Table 115. show udld interface output fields

Field	Description
UDLD Status	Whether UDLD is enabled or disabled
UDLD Mode	Whether the mode is aggressive or normal
Link-State	State of the link: Unknown Loop-Back Neighbor Mismatch Unidirectional Undetermined Bi-Directional

QoS and ACL over Bridge Virtual Interface (BVI)

Overview

A Bridge Virtual Interface (BVI) acts as a Layer 3 gateway for a bridged Layer 2 domain, such as a VLAN or a bridge domain. Applying Quality of Service (QoS) and Access Control Lists (ACLs) on a BVI interface allows for intelligent traffic control and filtering at the point where Layer 2 traffic transitions to Layer 3 routing.

Refer to Multi-Protocol Label Switching (MPLS) document for details:

- For BVI Over L3VPN, see the Bridge Virtual Interface (BVI) Over L3VPN section
- For BVI Over 6vPE, see the Bridge Virtual Interface (BVI) Over 6vPE section

Limitations

- Only Q1 and Q2-based platforms are supported.
- L2 subinterfaces support only pop and pop2-tag VLAN rewrite translations and for the purpose of bridge-domain support, all member L2 subinterfaces should have relevant rewrite configurations to make sure that all traffic for bridge-domain has uniform encapsulation.
- The dot1q and dot1ad encapsulations with range are not supported for the BVI.
- BVI is a generic L3 interface and allows users to configure any / all existing OcNOS features. However, only a few of these are supported in release 6.6.0 and those are IP address related, VRF2, any routing protocol specific commands (OSPF/IS-IS/BGP related), MTU, DHCP server/relay, Ingress/Egress ACL and QoS commands related to marking.
- L3 ACL applied at BVI is only relevant for routed traffic. Bridged traffic between L2 sub-interfaces will not be subjected to L3 ACL configured at BVI.
- No Interface counters are supported for BVI Interface.
- BVI can’t be used as a network interface for all transports in MPLS core network.
- For QoS, only marking, policing and rate limiting are supported. Other queuing features are not supported at BVI level. However, existing QoS scheduling and queuing features on other interfaces can be used in conjunction with the BVI interface.
- The following restrictions apply to Q1 based systems:
  - For L3 ACL for BVI only hardware profile ingress-ipv4-subif-ext is supported.
  - For L3 QOS for BVI only hardware profile qos-subif-ext and qos-subif-policer is supported.
  - L2 Mac ACLs are not supported for the BVI.
  - More than one L2 sub interfaces belonging to the same physical interface cannot be part of the same bridge-domain if BVI is configured for the bridge-domain.
- QoS features like shaping, queueing, policing, re-marking are not supported on the BVI interface associated to VPLS.
- BVI interface internally acts as a virtual L3 interface and ACL, QOS will use the same set of cli commands as applicable for a normal L3 interface. However because of some hardware limitations, not all acl and qos features can be supported in the box. Specific hardware profiles need to be enabled to support acl and qos features on bvi interface.

© 2026 IP Infusion Inc. Proprietary

Prerequisites

- After configuring the BVI, ensure that the end-to-end traffic flows without any loss.

Configuration

Topology

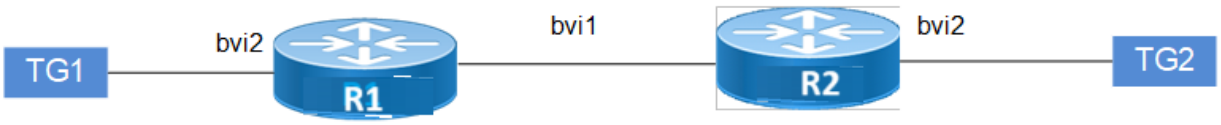

Figure 214. QoS and ACL on BVI Interface in Topology

Configure QoS and ACL on BVI Interface in R1 Router

1. Configure the L2 Subinterface:

```
R1 (config-if)#interface xe19.100 switchport
R1 (config-if)#encapsulation dot1q 100
R1 (config-if)#rewrite pop
R1 (config-if)#commit
R1 (config-if)#exit
```

2. Configure the BVI Interface:

```
R1 (config)#interface bvi1
R1 (config-if)#ip address 172.16.10.1/24
R1 (config-if)#commit
R1 (config-if)#exit
```

3. Map the BVI interface and subinterface into bridge-domain:

```
R1 (config)#bridge-domain 1
R1 (config-bridge-domain )#interface xe19.100
R1 (config-bridge-domain )#routed-interface bvi1
R1 (config-bridge-domain )#commit
R1 (config-bridge-domain )#exit
```

4. Enable QoS and Define Policy:

```
R1(config)#qos enable
R1(config)#qos statistics
R1(config)#commit
R1(config)#exit
R1(config)#class-map type qos match-any C2
R1(config-qos-match-any)#match dscp af11
R1(config-qos-match-any)#match cos 3
R1(config-qos-match-any)#commit
R1(config-qos-match-any)#exit
R1(config)#policy-map type qos P2
R1(config-pmap-qos)#class type qos C2
R1(config-pmap-qos)#police cir 200 mbps eir 200 mbps
R1(config-pmap-qos)#commit
R1(config-pmap-qos)#exit
```

5. ACL configuration:

```
R1(config)#ip access-list test1
R1(config-ip-acl)#10 deny any host 172.16.10.2 host 172.16.10.1
R1(config-ip-acl)#20 permit any any any
R1(config-ip-acl)#commit
R1(config-ip-acl)#exit
```

© 2026 IP Infusion Inc. Proprietary

6. Apply the ACL:

```
R1 (config)#interface bvi1
R1 (config-if)#ip access-group test1 in
R1 (config-if)#commit
R1 (config-if)#exit
```

7. Apply the QoS:

```
R1 (config)#interface bvi1
R1 (config-if)#service-policy type qos input P2
R1 (config-if)#commit
R1 (config-if)#exit
```

Configure QoS and ACL on BVI Interface in R2 Router

1. Configure the L2 Subinterface:

```
R2 (config-if)#interface xe19.100 switchport
R2 (config-if)#encapsulation dot1q 100
R2 (config-if)#rewrite pop
R2 (config-if)#load-interval 30
R2 (config-if)#commit
R2 (config-if)#exit
```

2. Configure the BVI Interface:

```
R2 (config)#interface bvi1
R2 (config-if)#ip address 172.16.10.2/24
R2 (config-if)#commit
R2 (config-if)#exit
```

3. Map the BVI interface and subinterface into bridge-domain:

```
R2 (config)#bridge-domain 1
R2 (config-bridge-domain )#interface xe19.100
R2 (config-bridge-domain )#routed-interface bvi1
R2 (config-bridge-domain )#commit
R2 (config-bridge-domain )#exit
```

4. Enable QoS and Define Policy:

```
R2(config)#qos enable
R2(config)#qos statistics
R2(config)#commit

R2(config)#class-map type qos match-any C2
R2(config-qos-match-any)#match dscp af11
R2(config-qos-match-any)#match cos 3
R2(config-qos-match-any)#commit
R2(config-qos-match-any)#exit

R2(config)#policy-map type qos P2
R2(config-pmap-qos)#police cir 50 mbps eir 50 mbps
R2(config-pmap-qos)#commit
R2(config-pmap-qos)#exit
```

5. ACL configuration:

```
R2(config)#ip access-list test1
R2(config-ip-acl)#10 deny any host 172.16.10.1 host 172.16.10.2
R2(config-ip-acl)#20 permit any any any
R2(config-ip-acl)#commit
R2(config-ip-acl)#exit
```

6. Apply the ACL:

```
R2 (config)#interface bvi1
```

© 2026 IP Infusion Inc. Proprietary

```
R2 (config-if)#ip access-group test1 in
R2 (config-if)#commit
R2 (config-if)#exit
```

7. Apply the QoS:

```
R2 (config)#interface bvi1
R2 (config-if)#service-policy type qos input P2
R2 (config-if)#commit
R2 (config-if)#exit
```
