Fundamental Layer 3 Command Reference 276

Fundamental Layer 3 Commands 279
automatic-router-id-selection enable 280
Command Syntax 280
Parameters 280
Default 280
Command Mode 280
Applicability 280
Examples 280
clear ip route 281
Command Syntax 281
Parameters 281
Command Mode 281
Applicability 281
Example 281

clear ip route kernel 282
Command Syntax 282
Parameters 282
Command Mode 282
Applicability 282
Example 282
clear ip route vrf 283
Command Syntax 283
Parameters 283
Command Mode 283
Applicability 283
Example 283
clear router-id 284
Command Syntax 284
Parameters 284
Command Mode 284
Applicability 284
Examples 284
debug rib 285
Command Syntax 285
Parameters 285
Disabled 286
Command Mode 286
Applicability 286
Example 286
description 287
Command Syntax 287
Parameters 287
Disabled 287
Command Mode 287
Applicability 287
Examples 287
fib retain 288
Command Syntax 288
Parameters 288
Default 288
Command Mode 288
Applicability 288
Examples 289
ip route 290
Command Syntax 290
Parameters 290
Default 291
Command Mode 291
Applicability 291
Examples 291
ip route vrf 293

Command Syntax 293
Parameters 293
Command Mode 293
Applicability 293
Example 293
ip urpf allow-default 294
Command Syntax 294
Parameter 294
Default 294
Command Mode 294
Applicability 294
Examples 294
ip urpf enable 295
Command Syntax 295
Parameter 295
Default 295
Command Mode 295
Applicability 295
Examples 295
ip verify unicast source reachable-via 296
Command Syntax 296
Parameters 296
Default 296
Command Mode 296
Applicability 296
Examples 296
ip vrf 297
Command Syntax 297
Parameter 297
Default 297
Command Mode 297
Applicability 297
Example 297
ipv6 route 298
Command Syntax 298
Parameters 298
Default 299
Command Mode 299
Applicability 299
Example 299
max-static-routes 300
Command Syntax 300
Parameters 300
Default 300
Command Mode 300
Applicability 300

Example 308
show rib txlist 310
Command Syntax 310
Parameters 310
Default 310
Command Mode 310
Applicability 310
Example 310
show router-id 312
Command Syntax 312
Parameters 312
Default 312
Command Mode 312
Applicability 312
Example 312
show running-config router 313
Command Syntax 313
Parameters 313
Default 313
Command Mode 313
Applicability 313
Example 313
show running-config router-id 314
Command Syntax 314
Parameters 314
Default 314
Command Mode 314
Applicability 314
Example 314
show running-config urpf 315
Command Syntax 315
Parameters 315
Default 315
Command Mode 315
Applicability 315
Example 315
show running-config vrf 316
Command Syntax 316
Parameters 316
Command Mode 316
Applicability 316
Example 316
snmp restart rib 317
Command Syntax 317
Parameters 317
Default 317
Command Mode 317

Applicability 317
Examples 317
IP Service Level Agreements Commands 318
clear ip sla statistics 319
Command Syntax 319
Parameters 319
Default 319
Command Mode 319
Applicability 319
Example 319
frequency 320
Command Syntax 320
Parameters 320
Default 320
Command Mode 320
Applicability 320
Example 320
icmp-echo 321
Command Syntax 321
Parameters 321
Default 321
Command Mode 321
Applicability 321
Example 321
ip sla 322
Command Syntax 322
Parameters 322
Default 322
Command Mode 322
Applicability 322
Example 322
ip sla schedule 323
Command Syntax 323
Parameters 323
Default 323
Command Mode 323
Applicability 323
Example 323
show ip sla statistics 324
Command Syntax 324
Parameters 324
Default 324
Command Mode 324
Applicability 324
Example 324
show ip sla summary 326
Command Syntax 326

Parameters 326
Default 326
Command Mode 326
Applicability 326
Example 326
show running-config ip sla 327
Command Syntax 327
Parameters 327
Default 327
Command Mode 327
Applicability 327
Example 327
threshold 328
Command Syntax 328
Parameters 328
Default 328
Command Mode 328
Applicability 328
Example 328
timeout 329
Command Syntax 329
Parameters 329
Default 329
Command Mode 329
Applicability 329
Example 329
Object Tracking Commands 330
delay up down 331
Command Syntax 331
Parameters 331
Default 331
Command Mode 331
Applicability 331
Example 331
object-tracking 332
Command Syntax 332
Parameters 332
Default 332
Command Mode 332
Applicability 332
Example 332
show running-config track 334
Command Syntax 334
Parameters 334
Default 334
Command Mode 334
Applicability 334

Example 334
show track 335
Command Syntax 335
Parameters 335
Default 335
Command Mode 335
Applicability 335
Example 335
show track <1-500> 336
Command Syntax 336
Parameters 336
Default 336
Command Mode 336
Applicability 336
Example 336
show track summary 337
Command Syntax 337
Parameters 337
Default 337
Command Mode 337
Applicability 337
Example 337
track ip sla reachability 338
Command Syntax 338
Parameters 338
Command Mode 338
Applicability 338
Example 338
Route-Map Commands 339
continue 341
Continue clause with match Clauses 341
Continue clause with set Clauses 341
Command Syntax 341
Parameter 341
Default 341
Command Mode 342
Applicability 342
Example 342
match as-path 343
Command Syntax 343
Parameter 343
Default 343
Command Mode 343
Applicability 343
Example 343
match community 344
Command Syntax 344

Parameters 344
Default 344
Command Mode 344
Applicability 344
Examples 344
match extcommunity 345
Command Syntax 345
Parameters 345
Default 345
Command Mode 345
Applicability 345
Example 345
match interface 346
Command Syntax 346
Parameter 346
Default 346
Command Mode 346
Applicability 346
Example 346
match ip address 347
Command Syntax 347
Parameters 347
Default 347
Command Mode 347
Applicability 347
Example 347
match ip address prefix-list 348
Command Syntax 348
Parameter 348
Default 348
Command Mode 348
Applicability 348
Examples 348
match ip next-hop 349
Command Syntax 349
Parameters 349
Default 349
Command Mode 349
Applicability 349
Examples 349
match ip next-hop prefix-list 350
Command Syntax 350
Parameter 350
Default 350
Command Mode 350
Applicability 350
Examples 350

Command Syntax 1314
Parameters 1314
Command Mode 1314
Applicability 1314
Examples 1314
debug bgp 1315
Command Syntax 1315
Parameters 1315
Command Mode 1316
Applicability 1316
Examples 1316
distance 1317
Command Syntax 1317
Parameters 1317
Default 1317
Command Mode 1317
Applicability 1317
Example 1318

exit-address-family 1319
Command Syntax 1319
Parameters 1319
Default 1319
Command Mode 1319
Applicability 1319
Examples 1319
ip as-path access-list 1320
Command Syntax 1320
Parameters 1320
Default 1320
Command Mode 1320
Applicability 1320
Examples 1320
ip community-list <1-99> 1321
Command Syntax 1321
Parameters 1321
Default 1321
Command Mode 1321
Applicability 1321
Examples 1321
ip community-list <100-500> 1322
Command Syntax 1322
Parameters 1322
Default 1322
Command Mode 1322
Applicability 1322
Examples 1322
ip community-list expanded 1323
Command Syntax 1323
Parameters 1323
Default 1323
Command Mode 1323
Applicability 1323
Examples 1323
ip community-list standard 1324
Command Syntax 1324
Parameters 1324
Default 1324
Command Mode 1324
Applicability 1325
Examples 1325
ip community-list WORD 1326
Command Syntax 1326
Parameters 1326
Default 1326
Command Mode 1326

Applicability 1326
Examples 1327
ip extcommunity-list <1-99> 1328
Command Syntax 1328
Parameters 1328
Default 1328
Command Mode 1328
Applicability 1328
Examples 1328
ip extcommunity-list <100-500> 1329
Command Syntax 1329
Parameters 1329
Default 1329
Command Mode 1329
Applicability 1329
Examples 1329
ip extcommunity-list expanded 1330
Command Syntax 1330
Parameters 1330
Default 1330
Command Mode 1330
Applicability 1330
Examples 1330
ip extcommunity-list standard 1331
Command Syntax 1331
Parameters 1331
Default 1331
Command Mode 1331
Applicability 1331
Examples 1331
l2vpn-unnumbered-mode 1333
Command Syntax 1333
Parameters 1333
Applicability 1333
Command Mode 1333
Applicability 1333
Examples 1333
match ip peer 1334
Command Syntax 1334
Parameters 1334
Default 1334
Command Mode 1334
Applicability 1334
Examples 1334
max-paths 1335
Command Syntax 1335
Parameters 1335

Default 1335
Command Mode 1335
Applicability 1335
Examples 1335
max-paths eigbp 1336
Command Syntax 1336
Parameters 1336
Default 1336
Command Mode 1336
Applicability 1336
Example 1336
neighbor activate 1338
Command Syntax 1338
Parameters 1338
Default 1338
Command Mode 1338
Applicability 1338
Examples 1338
neighbor advertisement-interval 1339
Command Syntax 1339
Parameters 1339
Default 1339
Command Mode 1339
Applicability 1339
Example 1339
neighbor allowas-in 1340
Command Syntax 1340
Parameters 1340
Default 1340
Command Mode 1341
Applicability 1341
Example 1341
neighbor as-origination-interval 1342
Command Syntax 1342
Parameters 1342
Default 1342
Command Mode 1342
Applicability 1342
Example 1342
neighbor attribute-unchanged 1343
Command Syntax 1343
Parameters 1343
Default 1343
Command Mode 1343
Applicability 1343
Example 1343
neighbor authentication-key 1345

Command Syntax 1345
Parameters 1345
Default 1345
Command Mode 1345
Applicability 1345
Example 1345
neighbor capability graceful-restart 1347
Command Syntax 1347
Parameters 1347
Default 1347
Command Mode 1347
Applicability 1347
Examples 1347
neighbor capability orf prefix-list 1348
Command Syntax 1348
Parameters 1348
Default 1348
Command Mode 1348
Applicability 1349
Examples 1349
neighbor collide-established 1350
Command Syntax 1350
Parameters 1350
Default 1350
Command Mode 1350
Applicability 1350
Example 1350
neighbor de-activate 1352
Command Syntax 1352
Parameters 1352
Default 1352
Command Mode 1352
Applicability 1352
Examples 1352
neighbor default-originate 1354
Command Syntax 1354
Parameters 1354
Default 1354
Command Mode 1354
Applicability 1354
Examples 1354
neighbor description 1356
Command Syntax 1356
Parameters 1356
Default 1356
Command Mode 1356
Applicability 1356

© 2026 IP Infusion Inc. Proprietary

Examples 1356
neighbor disallow-infinite-holdtime 1358
Command Syntax 1358
Parameters 1358
Default 1358
Command Mode 1358
Applicability 1358
Examples 1358
neighbor distribute-list 1359
Command Syntax 1359
Parameters 1359
Default 1359
Command Mode 1359
Applicability 1359
Examples 1360
neighbor ebgp-multihop 1361
Command Syntax 1361
Parameters 1361
Default 1361
Command Mode 1361
Applicability 1361
Examples 1361
neighbor enforce-multihop 1363
Command Syntax 1363
Parameters 1363
Default 1363
Command Mode 1363
Applicability 1363
Examples 1363
neighbor extended-optional-param 1364
Command Syntax 1364
Parameters 1364
Default 1364
Command Mode 1364
Applicability 1364
Example 1364
neighbor fall-over bfd 1365
Command Syntax 1365
Parameters 1365
Default 1365
Command Mode 1365
Applicability 1365
Example 1365
neighbor filter-list 1366
Command Syntax 1366
Parameters 1366
Default 1366

Command Mode 1366
Applicability 1366
Examples 1366
neighbor g-shut 1368
Command Syntax 1368
Parameters 1368
Default 1368
Command Mode 1368
Applicability 1368
Examples 1368
neighbor g-shut-timer 1369
Command Syntax 1369
Parameters 1369
Default 1369
Command Mode 1369
Applicability 1369
Examples 1369
neighbor limit 1370
Command Syntax 1370
Parameters 1370
Default 1370
Command Mode 1370
Applicability 1370
Example 1370
neighbor local-as 1371
Command Syntax 1371
Parameters 1371
Default 1371
Command Mode 1371
Applicability 1372
Example 1372
neighbor maximum-prefix 1373
Command Syntax 1373
Parameters 1373
Default 1373
Command Mode 1373
Applicability 1373
Examples 1374
neighbor next-hop-self 1375
Command Syntax 1375
Parameters 1375
Default 1375
Command Mode 1375
Applicability 1375
Examples 1375
neighbor optional-as 1376
Command Syntax 1376

Parameters 1376
Default 1376
Command Mode 1376
Applicability 1376
Examples 1376
neighbor override-capability 1377
Command Syntax 1377
Parameters 1377
Default 1377
Command Mode 1377
Applicability 1377
Examples 1377
neighbor passive 1378
Command Syntax 1378
Parameters 1378
Default 1378
Command Mode 1378
Applicability 1378
Examples 1378
neighbor peer-group 1379
Command Syntax 1379
Parameters 1379
Default 1379
Command Mode 1379
Applicability 1379
Example 1380
neighbor WORD peer-group range 1383
Command Syntax 1383
Parameters 1383
Default 1383
Command Mode 1383
Applicability 1383
Example 1383
neighbor port 1384
Command Syntax 1384
Parameters 1384
Default 1384
Command Mode 1384
Applicability 1384
Examples 1384
neighbor prefix-list 1385
Command Syntax 1385
Parameters 1385
Default 1385
Command Mode 1385
Applicability 1385
Examples 1386

neighbor remote-as 1387
Command Syntax 1387
Parameters 1387
Default 1387
Command Mode 1387
Applicability 1387
Example 1388
neighbor remove-private-AS 1389
Command Syntax 1389
Parameters 1389
Default 1389
Command Mode 1389
Applicability 1389
Example 1389
neighbor restart-time 1390
Command Syntax 1390
Parameters 1390
Default 1390
Command Mode 1390
Applicability 1390
Example 1390
neighbor route-map 1391
Command Syntax 1391
Parameters 1391
Default 1391
Command Mode 1391
Applicability 1392
Examples 1392
neighbor route-reflector-client 1393
Command Syntax 1393
Parameters 1393
Default 1393
Command Mode 1393
Applicability 1393
Examples 1393
neighbor route-server-client 1395
Command Syntax 1395
Parameters 1395
Default 1395
Command Mode 1395
Applicability 1395
Example 1395
neighbor send-community 1396
Command Syntax 1396
Parameters 1396
Default 1396
Command Mode 1396

© 2026 IP Infusion Inc. Proprietary

Applicability 1396
Examples 1397
neighbor send-community large 1398
Command Syntax 1398
Parameters 1398
Default 1398
Command Mode 1398
Applicability 1398
Examples 1398
neighbor shutdown 1399
Command Syntax 1399
Parameters 1399
Default 1399
Command Mode 1399
Applicability 1399
Examples 1399
neighbor strict-capability-match 1401
Command Syntax 1401
Parameters 1401
Default 1401
Command Mode 1401
Applicability 1401
Examples 1401
neighbor timers 1402
Command Syntax 1402
Parameters 1402
Defaults 1402
Command Mode 1402
Applicability 1403
Examples 1403
neighbor unsuppress-map 1404
Command Syntax 1404
Parameters 1404
Default 1404
Command Mode 1404
Applicability 1404
Example 1404
neighbor update-source 1406
Command Syntax 1406
Parameters 1406
Default 1406
Command Mode 1406
Applicability 1406
Examples 1406
neighbor version 1407
Command Syntax 1407
Parameters 1407

Default 1407
Command Mode 1407
Applicability 1407
Examples 1407
neighbor weight 1409
Command Syntax 1409
Parameters 1409
Default 1409
Command Mode 1409
Applicability 1409
Examples 1410
neighbor WORD peer-group 1411
Command Syntax 1411
Parameters 1411
Default 1411
Command Mode 1411
Applicability 1411
Example 1411
network 1412
Command Syntax 1412
Parameters 1412
Default 1412
Command Mode 1413
Applicability 1413
Examples 1413
network synchronization 1414
Command Syntax 1414
Parameters 1414
Default 1414
Command Mode 1414
Applicability 1414
Examples 1414
redistribute 1415
Command Syntax 1415
Parameters 1415
Default 1415
Command Mode 1415
Applicability 1415
Examples 1416
restart bgp graceful 1417
Command Syntax 1417
Parameters 1417
Default 1417
Command Mode 1417
Applicability 1417
Examples 1417
router bgp 1418

Command Syntax 1418
Parameters 1418
Default 1418
Command Mode 1418
Applicability 1418
Examples 1418
snmp restart bgp 1419
Command Syntax 1419
Parameters 1419
Default 1419
Command Mode 1419
Applicability 1419
Examples 1419
synchronization 1420
Command Syntax 1420
Parameters 1420
Default 1420
Command Mode 1420
Applicability 1420
Examples 1420
timers bgp 1421
Command Syntax 1421
Parameters 1421
Default 1421
Command Mode 1421
Applicability 1421
Examples 1421
v4-unnumbered-mode 1422
Command Syntax 1422
Parameters 1422
Applicability 1422
Command Mode 1422
Applicability 1422
Examples 1422
BGP4+ Commands 1423
address-family ipv6 1424
Command Syntax 1424
Parameters 1424
Applicability 1424
Command Mode 1424
Applicability 1424
Examples 1425
aggregate-address X:X::X:X/M 1426
Command Syntax 1426
Parameters 1426
Command Mode 1426
Default 1426

Applicability 1426
Examples 1426
clear bgp * ipv6 1428
Command Syntax 1428
Parameters 1428
Command Mode 1429
Applicability 1429
Examples 1429
clear bgp ipv6 (A.B.C.D|X:X::X:X) 1430
Command Syntax 1430
Parameters 1430
Command Mode 1430
Applicability 1430
Example 1430
clear bgp ipv6 <1-4294967295> 1431
Command Syntax 1431
Parameters 1431
Command Mode 1431
Applicability 1431
Example 1431
clear bgp ipv6 external 1432
Command Syntax 1432
Parameters 1432
Command Mode 1432
Applicability 1432
Example 1432
clear bgp ipv6 peer-group 1433
Command Syntax 1433
Parameters 1433
Command Mode 1433
Applicability 1433
Examples 1433
clear bgp ipv6 unicast flap-statistics 1434
Command Syntax 1434
Parameters 1434
Command Mode 1434
Applicability 1434
Examples 1434
clear ipv6 bgp * vrf 1435
Command Syntax 1435
Parameters 1435
Command Mode 1435
Applicability 1435
Examples 1435
clear ipv6 bgp X:X::X:X vrf 1436
Command Syntax 1436
Parameters 1436

Command Mode 1436
Applicability 1436
Examples 1436
clear ip bpg ipv6 unicast table-map 1437
Command Syntax 1437
Parameters 1437
Command Mode 1437
Applicability 1437
Examples 1437
network X:X::X:X 1438
Command Syntax 1438
Parameters 1438
Default 1438
Command Mode 1438
Applicability 1438
Examples 1438
BGP Flowspec Commands 1440
address-family 1441
Command Syntax 1441
Parameters 1441
Default 1441
Command Mode 1441
Applicability 1441
Examples 1441
address-family ipv4 flowspec vrf 1442
Command Syntax 1442
Parameters 1442
Default 1442
Command Mode 1442
Applicability 1442
Examples 1442
class-map type traffic match-all 1443
Command Syntax 1443
Parameters 1443
Default 1443
Command Mode 1443
Applicability 1443
Examples 1443
drop 1444
Command Syntax 1444
Parameters 1444
Default 1444
Command Mode 1444
Applicability 1444
Examples 1444
flowspec 1445
Command Syntax 1445

Parameters 1445
Default 1445
Command Mode 1445
Applicability 1445
Examples 1445
hardware filter ipv4-bgp-flowspec 1446
Command Syntax 1446
Parameters 1446
Default 1446
Command Mode 1446
Applicability 1446
Examples 1446
ipv4 flowspec-disable 1447
Command Syntax 1447
Parameters 1447
Default 1447
Command Mode 1447
Applicability 1447
Examples 1447
local-install 1451
Command Syntax 1451
Parameters 1451
Default 1451
Command Mode 1451
Applicability 1451
Examples 1451
match destination-address 1452
Command Syntax 1452
Parameters 1452
Default 1452
Command Mode 1452
Applicability 1452
Examples 1452
match destination-port 1453
Command Syntax 1453
Parameters 1453
Default 1453
Command Mode 1453
Applicability 1453
Examples 1453
match dscp 1454
Command Syntax 1454
Parameters 1454
Default 1454
Command Mode 1454

Applicability 1514
Example 1514
show bgp dampening dampened-paths 1515
Command Syntax 1515
Parameters 1515
Command Mode 1515
Applicability 1515
Example 1515
show bgp dampening flap-statistics 1517
Command Syntax 1517
Parameters 1517
Command Mode 1517
Applicability 1517
Examples 1517
show bgp dampening parameters 1519
Command Syntax 1519
Parameters 1519
Command Mode 1519
Applicability 1519
Examples 1519
show bgp filter-list 1521
Command Syntax 1521
Parameters 1521
Command Mode 1521
Applicability 1521
Example 1522
show bgp inconsistent-as 1523
Command Syntax 1523
Parameters 1523

Command Mode 1523
Applicability 1523
Examples 1523
show bgp ipv6 1524
Command Syntax 1524
Parameters 1524
Command Mode 1524
Applicability 1524
Example: iBGP and eBGP Routes 1524
Example: IPv6 Prefix Routes 1526
show bgp ipv6 peer-group 1527
Command Syntax 1527
Parameters 1527
Command Mode 1527
Applicability 1527
Example 1527
show bgp l2vpn vpls 1528
Command Syntax 1528
Parameters 1528
Command Mode 1528
Applicability 1528
Example 1528
show bgp label-pool 1531
Command Syntax 1531
Parameters 1531
Command Mode 1531
Applicability 1531
Example 1531
show bgp neighbors 1532
Command Syntax 1532
Parameters 1532
Command Mode 1533
Applicability 1533
Examples 1533
show bgp neighbors advertised-routes 1536
Command Syntax 1536
Parameters 1536
Command Mode 1536
Applicability 1536
Example 1536
show bgp neighbors received prefix-filter 1537
Command Syntax 1537
Parameters 1537
Command Mode 1537
Applicability 1537
Example 1537
show bgp neighbors received-routes 1538

Command Syntax 1538
Parameters 1538
Command Mode 1538
Applicability 1538
Example 1538
show bgp neighbors routes 1540
Command Syntax 1540
Parameters 1540
Command Mode 1540
Applicability 1540
Example 1540
show bgp nexthop-tracking 1542
Command Syntax 1542
Parameters 1542
Command Mode 1542
Applicability 1542
Example 1542
show bgp nexthop-tree-details 1544
Command Syntax 1544
Parameters 1544
Command Mode 1544
Applicability 1544
Example 1544
show bgp paths 1545
Command Syntax 1545
Parameters 1545
Command Mode 1545
Applicability 1545
Example 1545
show bgp prefix-list 1546
Command Syntax 1546
Parameters 1546
Command Mode 1546
Applicability 1546
Example 1546
show bgp quote-regexp 1548
Command Syntax 1548
Parameters 1548
Command Mode 1548
Applicability 1548
Example 1548
show bgp regexp 1549
Command Syntax 1549
Parameters 1549
Command Mode 1549
Applicability 1549
Example 1549

show bgp route-map 1550
Command Syntax 1550
Parameters 1550
Command Mode 1550
Applicability 1550
Example 1550
show bgp statistics 1552
Command Syntax 1552
Parameters 1552
Command Mode 1552
Applicability 1552
Examples 1552
show bgp summary 1554
Command Syntax 1554
Parameters 1554
Command Mode 1554
Applicability 1554
Example 1554
show bgp X:X::X:X 1557
Command Syntax 1557
Parameters 1557
Command Mode 1557
Applicability 1557
Example 1557
show bgp X:X::X:X/M longer prefixes 1558
Command Syntax 1558
Parameters 1558
Command Mode 1558
Applicability 1558
Examples 1558
show debugging bgp 1559
Command Syntax 1559
Parameters 1559
Command Mode 1559
Applicability 1559
Example 1559
show ip bgp 1560
Command Syntax 1560
Parameters 1560
Command Mode 1560
Applicability 1560
Examples 1560
show ip bgp cidr-only 1563
Command Syntax 1563
Parameters 1563
Command Mode 1563
Applicability 1563

Example 1563
show ip bgp community-info 1564
Command Syntax 1564
Parameters 1564
Command Mode 1564
Applicability 1564
Example 1564
show ip bgp peer-group 1565
Command Syntax 1565
Parameters 1565
Command Mode 1565
Applicability 1565
Example 1565
show ip bgp peer-group vrf all 1566
Command Syntax 1566
Parameters 1566
Command Mode 1566
Applicability 1566
Example 1566
show ip bgp rtfilter all 1567
Command Syntax 1567
Parameters 1567
Command Mode 1567
Applicability 1567
Example 1567
show ip bgp rtfilter neighbors 1570
Command Syntax 1570
Parameters 1570
Command Mode 1570
Applicability 1570
Example 1570
show ip bgp scan 1572
Command Syntax 1572
Parameters 1572
Command Mode 1572
Applicability 1572
Example 1572
show ip bgp vpnv4 1573
Command Syntax 1573
Parameters 1573
Command Mode 1574
Applicability 1574
Example 1574
show ip bgp vpnv6 all neighbors 1579
Command Syntax 1579
Parameters 1579
Command Mode 1579

Applicability 1579
Example 1579
show ip bgp vpnv6 rd neighbors 1582
Command Syntax 1582
Parameters 1582
Command Mode 1582
Applicability 1582
Example 1582
show ip extcommunity-list 1584
Command Syntax 1584
Parameters 1584
Command Mode 1584
Applicability 1584
Example 1584
show ip protocols 1585
Command Syntax 1585
Parameters 1585
Command Mode 1585
Applicability 1585
Example 1585
show ip vrf 1586
Command Syntax 1586
Parameters 1586
Default 1586
Command Mode 1586
Applicability 1586
Example 1586
show running-config as-path access-list 1587
Command Syntax 1587
Parameters 1587
Command Mode 1587
Applicability 1587
Example 1587
show running-config bgp 1588
Command Syntax 1588
Parameters 1588
Command Mode 1588
Applicability 1588
Example 1588
show running-config community-list 1589
Command Syntax 1589
Parameters 1589
Command Mode 1589
Applicability 1589
Example 1589
show running-config vrf 1590
Command Syntax 1590

Parameters 1590
Command Mode 1590
Applicability 1590
Example 1590
show running-config ip vrf 1591
Command Syntax 1591
Parameters 1591
Command Mode 1591
Applicability 1591
Example 1591
show running-config mac vrf 1592
Command Syntax 1592
Parameters 1592
Command Mode 1592
Applicability 1592
Example 1592
show running-config vrf word 1593
Command Syntax 1593
Parameters 1593
Command Mode 1593
Applicability 1593
Example 1593
BGP Additional Paths Commands 1594
bgp additional-paths 1595
Command Syntax 1595
Parameters 1595
Default 1595
Command Mode 1595
Applicability 1595
Examples 1595
bgp additional-paths install 1596
Command Syntax 1596
Parameters 1596
Default 1596
Command Mode 1596
Applicability 1596
Examples 1596
neighbor additional-paths 1597
Command Syntax 1597
Parameters 1597
Default 1597
Command Mode 1597
Applicability 1597
Examples 1597
neighbor advertise additional-paths 1598
Command Syntax 1598
Parameters 1598

Default 1598
Command Mode 1598
Applicability 1598
Examples 1598
BGP Graceful Restart Commands 1599
bgp g-shut 1600
Command Syntax 1600
Parameters 1600
Default 1600
Command Mode 1600
Applicability 1600
Examples 1600
bgp g-shut-capable 1601
Command Syntax 1601
Parameters 1601
Default 1601
Command Mode 1601
Applicability 1601
Examples 1601
bgp g-shut-local-preference 1602
Command Syntax 1602
Parameters 1602
Default 1602
Command Mode 1602
Applicability 1602
Examples 1602
bgp graceful-restart 1603
Command Syntax 1603
Parameters 1603
Default 1603
Command Mode 1603
Applicability 1603
Examples 1603
bgp update-delay 1605
Command Syntax 1605
Parameters 1605
Default 1605
Command Mode 1605
Applicability 1605
Example 1605
neighbor capability graceful-restart 1606
Command Syntax 1606
Parameters 1606
Default 1606
Command Mode 1606
Applicability 1606
Examples 1606

Bidirectional Forwarding Detection Command Reference 1676

Bidirectional Forwarding Commands 1678
accept-lifetime 1679
Command Syntax 1679
Parameters 1679
Default 1679
Command Mode 1679
Applicability 1680
Examples 1680
bfd auth type 1681
Command Syntax 1681
Parameters 1681
Command Mode 1681
Applicability 1681
Example 1682
bfd 1683
Command Syntax 1683
Parameters 1683
Command Mode 1683
Applicability 1683

Example 1683
bfd echo 1684
Command Syntax 1684
Parameters 1684
Default 1684
Command Mode 1684
Applicability 1684
Example 1684
bfd echo interval 1685
Command Syntax 1685
Parameter 1685
Default 1685
Command Mode 1685
Applicability 1685
Example 1685
bfd echo ipv4 source 1686
Command Syntax 1686
Parameter 1686
Command Mode 1686
Applicability 1686
Example 1686
bfd interval 1687
Command Syntax 1687
Parameters 1687
Defaults 1687
Command Mode 1687
Applicability 1687
Example 1687
bfd multihop-peer 1688
Command Syntax 1688
Parameters 1688
Command Mode 1688
Applicability 1689
Example 1689
bfd multihop-peer A.B.C.D interval 1690
Command Syntax 1690
Parameters 1690
Command Mode 1690
Default 1690
Applicability 1690
Example 1690
bfd multihop-peer interval 1691
Command Syntax 1691
Parameters 1691
Command Mode 1691
Default 1691
Applicability 1691

Command Syntax 1952
Parameters 1952
Default 1952
Command Mode 1952
Applicability 1952
Examples 1952
distance (IPv6) 1954
Command Syntax 1954
Parameters 1954
Default 1954
Command Mode 1954
Applicability 1954
Examples 1954
domain password 1956
Command Syntax 1956
Parameters 1956
Default 1956
Command Mode 1956
Applicability 1956
Examples 1956
dynamic-hostname 1958
Command Syntax 1958
Parameters 1958
Default 1958
Command Mode 1958
Example 1958
fast-reroute per-prefix 1959

Command Syntax 1959
Parameters 1959
Command Mode 1959
Applicability 1959
Examples 1959
fast-reroute per-prefix remote-lfa 1960
Command Syntax 1960
Parameters 1960
Default 1960
Command Mode 1960
Applicability 1960
Examples 1960
fast-reroute terminate-hold-on interval 1961
Command Syntax 1961
Parameters 1961
Default 1961
Command Mode 1961
Applicability 1961
Examples 1961
fast-reroute tie-break 1962
Command Syntax 1962
Parameters 1962
Defaults 1963
Command Mode 1963
Applicability 1963
Examples 1963
ignore-lsp-errors 1964
Command Syntax 1964
Parameters 1964
Default 1964
Command Mode 1964
Applicability 1964
Example 1964
ip route high-priority tag 1965
Command Syntax 1965
Parameters 1965
Default 1965
Command Mode 1965
Applicability 1965
Example 1965
ip router isis 1966
Command Syntax 1966
Parameters 1966
Default 1966
Command Mode 1966

Example 1973
isis csnp-interval 1974
Command Syntax 1974
Parameters 1974
Default 1974
Command Mode 1974
Applicability 1974
Example 1974
isis fast-reroute per-prefix candidate disable 1975
Command Syntax 1975
Parameters 1975
Command Mode 1975
Applicability 1975
Example 1975
isis hello-interval 1976
Command Syntax 1976
Parameters 1976
Default 1976
Command Mode 1976
Applicability 1976
Examples 1977
isis hello-multiplier 1978
Command Syntax 1978
Parameters 1978
Default 1978
Command Mode 1978
Applicability 1978
Example 1978
isis hello padding 1979
Command Syntax 1979
Parameters 1979
Default 1979
Command Mode 1979
Applicability 1979
Examples 1979
isis lsp-interval 1980
Command Syntax 1980
Parameters 1980
Default 1980
Command Mode 1980
Applicability 1980
Examples 1980
isis mesh-group 1981
Command Syntax 1981
Parameters 1981
Default 1981
Command Mode 1981

Command Syntax 2099
Parameters 2099
Command Mode 2099
Applicability 2099
clear ipv6 neighbors 2100
Command Syntax 2100
Parameters 2100
Command Mode 2100
Applicability 2100
Example 2100
debug ip arp 2101
Command Syntax 2101
Parameters 2101
Command Mode 2101
Applicability 2101
Example 2101
debug ipv6 nd 2102
Command Syntax 2102
Parameters 2102
Command Mode 2102
Applicability 2102
Example 2102
ip arp 2103
Command Syntax 2103
Parameters 2103
Default value 2103
Command Mode 2103
Applicability 2103
Example 2103
ip arp vrf 2104
Command Syntax 2104
Parameter 2104
Default value 2104
Command Mode 2104
Applicability 2104
Example 2104
ip proxy-arp 2105
Command Syntax 2105
Parameter 2105
Default value 2105
Command Mode 2105
Applicability 2105
Examples 2105
ipv6 nd current-hoplimit 2106
Command Syntax 2106
Parameter 2106
Default 2106

Command Mode 2106
Applicability 2106
Examples 2106
ipv6 nd link-mtu 2107
Command Syntax 2107
Parameters 2107
Default 2107
Command Mode 2107
Applicability 2107
Example 2107
ipv6 nd managed-config-flag 2108
Command Syntax 2108
Parameters 2108
Default 2108
Command Mode 2108
Applicability 2108
Examples 2108
ipv6 nd other-config-flag 2109
Command Syntax 2109
Parameters 2109
Default 2109
Command Mode 2109
Applicability 2109
Examples 2109
ipv6 nd prefix 2110
Command Syntax 2110
Parameters 2110
Default 2110
Command Mode 2110
Applicability 2110
Defaults 2110
Examples 2110
ipv6 nd ra-interval 2112
Command Syntax 2112
Parameter 2112
Default 2112
Command Mode 2112
Applicability 2112
Examples 2112
ipv6 nd ra-lifetime 2113
Command Syntax 2113
Parameter 2113
Default 2113
Command Mode 2113
Applicability 2113
Examples 2113
ipv6 nd reachable-time 2114

Command Syntax 2114
Parameter 2114
Default 2114
Command Mode 2114
Applicability 2114
Examples 2114
ipv6 nd retransmission-time 2115
Command Syntax 2115
Parameter 2115
Default 2115
Command Mode 2115
Applicability 2115
Examples 2115
ipv6 nd suppress-ra 2116
Command Syntax 2116
Parameters 2116
Default 2116
Command Mode 2116
Applicability 2116
Example 2116
ipv6 neighbor 2117
Command Syntax 2117
Parameter 2117
Default value 2117
Command Mode 2117
Applicability 2117
Examples 2117
nd-ageing-timeout 2118
Command Syntax 2118
Parameters 2118
Default value 2118
Command Mode 2118
Applicability 2118
Example 2118
nd-reachable-time 2119
Command Syntax 2119
Parameter 2119
Default value 2119
Command Mode 2119
Applicability 2119
Examples 2119
no debug all 2120
Command Syntax 2120
Parameters 2120
Command Mode 2120
Applicability 2120
Example 2120

Parameters 2461
Default 2461
Command Mode 2461
Applicability 2461
Examples 2461
ip ospf demand-circuit 2462
Command Syntax 2462
Parameters 2462
Command Mode 2462
Applicability 2462
Examples 2462
ip ospf disable 2463
Command Syntax 2463
Parameters 2463
Default 2463
Command Mode 2463
Applicability 2463
Example 2463
ip ospf fast-reroute per-prefix candidate disable 2464
Command Syntax 2464

Parameters 2464
Default 2464
Command Mode 2464
Applicability 2464
Example 2464
ip ospf flood-reduction 2465
Command Syntax 2465
Parameters 2465
Default 2465
Command Mode 2465
Applicability 2465
Example 2465
ip ospf hello-interval 2466
Command Syntax 2466
Parameters 2466
Default 2466
Command Mode 2466
Applicability 2466
Examples 2466
ip ospf message-digest-key 2467
Command Syntax 2467
Parameters 2467
Default 2467
Command Mode 2467
Applicability 2467
Examples 2467
ip ospf mtu 2469
Command Syntax 2469
Parameters 2469
Default 2469
Command Mode 2469
Applicability 2469
Examples 2469
ip ospf mtu-ignore 2470
Command Syntax 2470
Parameters 2470
Default 2470
Command Mode 2470
Applicability 2470
Examples 2470
ip ospf multi-area 2471
Command Syntax 2471
Parameters 2471
Default 2471
Command Mode 2471
Applicability 2471
Examples 2471

ip ospf network 2473
Command Syntax 2473
Parameters 2473
Default 2473
Command Mode 2473
Applicability 2473
Examples 2473
ip ospf priority 2474
Command Syntax 2474
Parameters 2474
Default 2474
Command Mode 2474
Applicability 2474
Examples 2474
ip ospf resync-timeout 2475
Command Syntax 2475
Parameters 2475
Default 2475
Command Mode 2475
Applicability 2475
Examples 2475
ip ospf retransmit-interval 2476
Command Syntax 2476
Parameters 2476
Default 2476
Command Mode 2476
Applicability 2476
Examples 2476
ip ospf transmit-delay 2477
Command Syntax 2477
Parameters 2477
Default 2477
Command Mode 2477
Applicability 2477
Examples 2477
log-adjacency-changes 2478
Command Syntax 2478
Parameters 2478
Default 2478
Command Mode 2478
Applicability 2478
Examples 2478
max-concurrent-dd 2479
Command Syntax 2479
Parameters 2479
Default 2479
Command Mode 2479

Applicability 2479
Examples 2479
maximum-area 2480
Command Syntax 2480
Parameters 2480
Default 2480
Command Mode 2480
Applicability 2480
Examples 2480
max-metric 2481
Command Syntax 2481
Parameters 2481
Default 2481
Command Mode 2481
Applicability 2481
Examples 2481
neighbor 2483
Command Syntax 2483
Parameters 2483
Default 2483
Command Mode 2483
Applicability 2483
Examples 2483
network 2484
Command Syntax 2484
Parameters 2484
Default 2484
Command Mode 2484
Applicability 2484
Examples 2484
ospf abr-type 2486
Command Syntax 2486
Parameters 2486
Default 2486
Command Mode 2486
Applicability 2486
Examples 2486
ospf area-interface-config-mode 2487
Command Syntax 2487
Parameters 2487
Default 2487
Command Mode 2487
Applicability 2487
Examples 2487
ospf flood-reduction 2488
Command Syntax 2488
Parameters 2488

Default 2488
Command Mode 2488
Applicability 2488
Examples 2488
ospf point-point rfc-incompatible 2489
Command Syntax 2489
Parameters 2489
Default 2489
Command Mode 2489
Applicability 2489
Examples 2489
ospf router-id 2490
Command Syntax 2490
Parameters 2490
Default 2490
Command Mode 2490
Applicability 2490
Examples 2490
overflow database 2491
Command Syntax 2491
Parameters 2491
Default 2491
Command Mode 2491
Applicability 2491
Examples 2491
overflow database external 2492
Command Syntax 2492
Parameters 2492
Default 2492
Command Mode 2492
Applicability 2492
Examples 2492
passive-interface 2493
Command Syntax 2493
Parameters 2493
Default 2493
Command Mode 2493
Applicability 2493
Examples 2493
redistribute 2495
Command Syntax 2495
Parameters 2495
Default 2495
Command Mode 2496
Applicability 2496
Examples 2496
router ospf 2497

Command Syntax 2497
Parameters 2497
Default 2497
Command Mode 2497
Applicability 2497
Examples 2497
show cspf lsp 2497
Command Syntax 2498
Parameters 2498
Command Mode 2498
Applicability 2498
Example 2498
show cspf rsvp forwarding-timer 2500
Command Syntax 2500
Parameters 2500
Default 2500
Command Mode 2500
Applicability 2500
Example 2500
show debugging ospf 2501
Command Syntax 2501
Parameters 2501
Default 2501
Command Mode 2501
Applicability 2501
Example 2501
show ip ospf 2502
Command Syntax 2502
Parameters 2502
Default 2502
Command Mode 2502
Applicability 2502
Examples 2502
show ip ospf border-routers 2506
Command Syntax 2506
Parameters 2506
Default 2506
Command Mode 2506
Applicability 2506
Example 2506
show ip ospf database brief 2508
Command Syntax 2508
Parameters 2508
Default 2508
Command Mode 2508

Examples 2548
OSPFv2 Graceful Restart Commands 2549

action interface 2550
Command Syntax 2550
Parameters 2550
Command Mode 2550
Default 2550
Applicability 2550
Example 2550
capability restart 2551
Command Syntax 2551
Parameters 2551
Default 2551
Command Mode 2551
Applicability 2551
Examples 2551
event nbr 2552
Command Syntax 2552
Parameters 2552
Default 2552
Command Mode 2552
Applicability 2552
Example 2552
debug ip ospf graceful-restart 2553
Command Syntax 2553
Parameters 2553
Command Mode 2553
Applicability 2553
Examples 2553
if-event-track ospf event 2554
Command Syntax 2554
Parameters 2554
Default 2554
Command Mode 2554
Applicability 2554
Example 2554
ospf restart grace-period 2555
Command Syntax 2555
Parameters 2555
Default 2555
Command Mode 2555
Applicability 2555
Examples 2555
ospf restart helper 2556
Command Syntax 2556
Parameters 2556
Default 2556
Command Mode 2556
Applicability 2556

Examples 2556
restart ip ospf graceful 2557
Command Syntax 2557
Parameters 2557
Default 2557
Command Mode 2557
Applicability 2557
Examples 2557
OSPFv3 Graceful Restart Commands 2558
capability restart 2559
Command Syntax 2559
Parameter 2559
Default 2559
Command Mode 2559
Applicability 2559
Examples 2559
ipv6 ospf restart grace-period 2560
Command Syntax 2560
Parameters 2560
Default 2560
Command Mode 2560
Applicability 2560
Examples 2560
ipv6 ospf restart helper 2561
Command Syntax 2561
Parameters 2561
Default 2561
Command Mode 2561
Applicability 2561
Examples 2561
ipv6 ospf restart planned-only 2562
Command Syntax 2562
Parameters 2562
Default 2562
Command Mode 2562
Applicability 2562
Example 2562
restart ipv6 ospf graceful 2563
Command Syntax 2563
Parameters 2563
Default 2563
Command Mode 2563
Applicability 2563
Examples 2563
OSPFv3 Commands 2564

PREFACE

About this Guide

This guide describes how to configure Layer 3 in OcNOS.

Audience

This guide is intended for network administrators and other engineering professionals who configure OcNOS.

Conventions

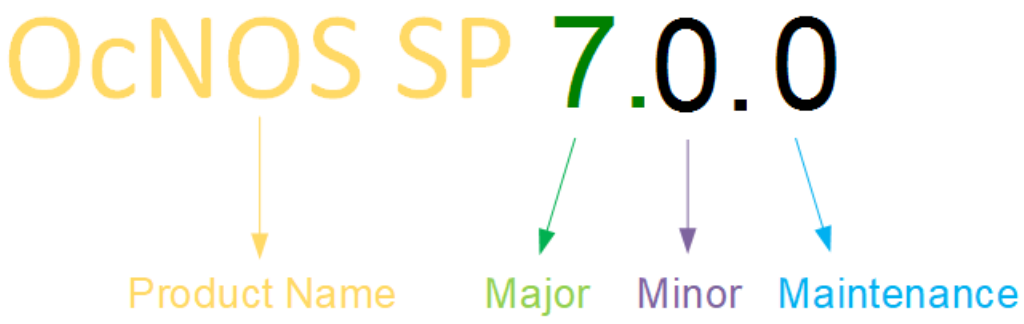
The Table 1 table shows the conventions used in this guide.

Table 1. Conventions

Convention	Description
Italics	Emphasized terms; titles of books
Note:	Special instructions, suggestions, or warnings
`monospaced type`	Code elements such as commands, parameters, files, and directories

IP Infusion Product Release Version

Each integer in release numbers indicates Major, Minor, and Maintenance release versions. Build numbers that follow the release numbers are for internal tracking and verification of the software build process and are visible to customers as part of the software version number.



Product Name: IP Infusion Product Family

Major Version: New customer-facing functionality that represents a significant change to the code base; including a significant marketing change or direction in the product.

Minor Version: Enhancements or extensions to existing features, changes to address external needs, or internal improvements to satisfy new sales regions or marketing initiatives.

Maintenance Version: A collection of product bugs or issues usually scheduled every 30 or 60 days, based on the number of issues.

Related Documentation

For information about installing OcNOS, see the *Installation Guide* for your platform.

Feature Availability

Each OcNOS SKU contains a set of supported features. For a list of available features based on the SKU that you purchased, refer to the *Feature Matrix* .

Migration Guide

Check the *Migration Guide* for necessary configuration changes before migrating from one version of OcNOS to another.

IP Maestro Support

Monitor devices running OcNOS Release 6.3.4-70 and above using IP Maestro software.

Technical Support

IP Infusion maintains an online technical support site that provides a variety of technical support programs for licensed OcNOS customers at the Technical Assistance Center.

Customers and partners enjoy full access to the support website. The site allows customers and partners to open technical support calls, update open calls with new information, and review the status of open or closed calls. The password-protected site includes technical documentation, Release Notes, and descriptions of service offerings.

Technical Sales

Contact the IP Infusion sales representative for more information about the OcNOS solution.

Technical Documentation

For core commands and configuration procedures, visit: Product Documentation.

For training videos, visit: OcNOS Free Training Videos.

For a list of supported platforms and SKUs of OcNOS features, refer to the OcNOS Feature Matrix.

© 2026 IP Infusion Inc. Proprietary

Documentation Disclaimer

The global documentation site is evolving to provide an enhanced website user experience for select topics included in this release. Some guides are now available outside the existing documentation library and can be accessed directly from custom documentation landing pages. These guides offer robust in-built search functionality.

For the latest documentation, visit the product-specific documentation landing page and select the relevant guide.

Comments

If you have comments, or need to report a problem with the content, contact techpubs@ipinfusion.com.

Command Line Interface

This chapter introduces the OcNOS Command Line Interface (CLI) and how to use its features.

Overview

You use the CLI to configure, monitor, and maintain OcNOS devices. The CLI is text-based and each command is usually associated with a specific task.

You can give the commands described in this manual locally from the console of a device running OcNOS or remotely from a terminal emulator such as putty or xterm. You can also use the commands in scripts to automate configuration tasks.

Chapter Organization

The chapters in command references are organized as described in Command Description Format (page 173).

The chapters in configuration guides are organized into these major sections:

- An overview that explains a configuration in words
- Topology with a diagram that shows the devices and connections used in the configuration
- Configuration steps in a table for each device where the left-hand side shows the commands you enter and the right-hand side explains the actions that the commands perform
- Validation which shows commands and their output that verify the configuration

© 2026 IP Infusion Inc. Proprietary

Command Line Interface Help

You access the CLI help by entering a full or partial command string and a question mark “?”. The CLI displays the command keywords or parameters along with a short description. For example, at the CLI command prompt, type:

```
> show ?
```

The CLI displays this keyword list with short descriptions for each keyword:

```
show ?
  application-priority            Application Priority
  arp                             Internet Protocol (IP)
  bfd                             Bidirectional Forwarding Detection (BFD)
  bgp                             Border Gateway Protocol (BGP)
  bi-lsp                          Bi-directional lsp status and configuration
  bridge                          Bridge group commands
  ce-vlan                         COS Preservation for Customer Edge VLAN
  class-map                       Class map entry
  cli                             Show CLI tree of current mode
  clns                            Connectionless-Mode Network Service (CLNS)
  control-adjacency               Control Adjacency status and configuration
  control-channel                 Control Channel status and configuration
  cspf                            CSPF Information
  customer                        Display Customer spanning-tree
  cvlan                           Display CVLAN information
  debugging                       Debugging functions
  etherchannel                    LACP etherchannel
  ethernet                        Layer-2
...
```

If you type the ? in the middle of a keyword, the CLI displays help for that keyword only.

```
> show de?
debugging  Debugging functions
```

If you type the ? in the middle of a keyword, but the incomplete keyword matches several other keywords, OcNOS displays help for all matching keywords.

```
> show i? (CLI does not display the question mark).
interface  Interface status and configuration
ip         IP information
isis       ISIS information
```

© 2026 IP Infusion Inc. Proprietary

Command Completion

The CLI can complete the spelling of a command or a parameter. Begin typing the command or parameter and then press the tab key. For example, at the CLI command prompt type **sh**:

```
> sh
```

Press the tab key. The CLI displays:

```
> show
```

If the spelling of a command or parameter is ambiguous, the CLI displays the choices that match the abbreviation. Type **show i** and press the tab key. The CLI displays:

```
> show i
  interface  ip         ipv6       isis
> show i
```

The CLI displays the **interface** and **ip** keywords. Type **n** to select **interface** and press the tab key. The CLI displays:

```
> show in
> show interface
```

Type ? and the CLI displays the list of parameters for the **show interface** command.

```
> show interface
  IFNAME  Interface name
  |       Output modifiers
  >       Output redirection
  <cr>
```

The CLI displays the only parameter associated with this command, the **IFNAME** parameter.

© 2026 IP Infusion Inc. Proprietary

Command Abbreviations

The CLI accepts abbreviations that uniquely identify a keyword in commands. For example:

```
> sh int xe0
```

is an abbreviation for:

```
> show interface xe0
```

© 2026 IP Infusion Inc. Proprietary

Command Line Errors

Any unknown spelling causes the CLI to display the error **Unrecognized command** in response to the ?. The CLI displays the command again as last entered.

```
> show dd?
% Unrecognized command
> show dd
```

When you press the Enter key after typing an invalid command, the CLI displays:

```
(config)#router ospf here
                        ^
% Invalid input detected at '^' marker.
```

where the ^ points to the first character in error in the command.

If a command is incomplete, the CLI displays the following message:

```
> show
% Incomplete command.
```

Some commands are too long for the display line and can wrap mid-parameter or mid-keyword, as shown below. This does *not* cause an error and the command performs as expected:

```
area 10.10.0.18 virtual-link 10.10.0.19 authentication-key 57393
```

Command Negation

Many commands have a **no** form that resets a feature to its default value or disables the feature. For example:

- The **ip address** command assigns an IPv4 address to an interface
- The **no ip address** command removes an IPv4 address from an interface

© 2026 IP Infusion Inc. Proprietary

Syntax Conventions

Table 2 describes the conventions used to represent command syntax in this reference.

Table 2. Syntax conventions

Convention	Description	Example
monospaced font	Command strings entered on a command line	**show ip ospf**
lowercase	Keywords that you enter exactly as shown in the command syntax.	show ip ospf
UPPERCASE	See Variable Placeholders (page 172)	IFNAME
()	Optional parameters, from which you must select one. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	(A.B.C.D|<0-4294967295>)
()	Optional parameters, from which you select one or none. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	(A.B.C.D|<0-4294967295>|)
()	Optional parameter which you can specify or omit. Do not enter the parentheses or vertical bar as part of the command.	(IFNAME|)
{}	Optional parameters, from which you must select one or more. Vertical bars delimit the selections. Do not enter the braces or vertical bars as part of the command.	{intra-area <1-255>|inter-area <1-255>|external <1-255>}
[]	Optional parameters, from which you select zero or more. Vertical bars delimit the selections. Do not enter the brackets or vertical bars as part of the command.	[<1-65535>|AA:NN|internet|local-AS| no-advertise|no-export]
?	Nonrepeatable parameter. The parameter that follows a question mark can only appear once in a command string. Do not enter the question mark as part of the command.	?route-map WORD
.	Repeatable parameter. The parameter that follows a period can be repeated more than once. Do not enter the period as part of the command.	set as-path prepend .<1-65535>

Variable Placeholders

Table 3 shows the tokens used in command syntax use to represent variables for which you supply a value.

Table 3. Variable placeholders

Token	Description
WORD	A contiguous text string (excluding spaces)
LINE	A text string, including spaces; no other parameters can follow this parameter
IFNAME	Interface name whose format varies depending on the platform; examples are: **eth0**, **Ethernet0**, **ethernet0**, **xe0**
A.B.C.D	IPv4 address
A.B.C.D/M	IPv4 address and mask/prefix
X:X::X:X	IPv6 address
X:X::X:X/M	IPv6 address and mask/prefix
HH:MM:SS	Time format
AA:NN	BGP community value
XX:XX:XX:XX:XX:XX	MAC address
<1-5> <1-65535> <0-2147483647> <0-4294967295>	Numeric range

Command Description Format

The Table 4 table explains the sections used to describe each command in this reference.

Table 4. Command descriptions

Section	Description
Command Name	The name of the command, followed by what the command does and when should it be used
Command Syntax	The syntax of the command
Parameters	Parameters and options for the command
Default	The state before the command is executed
Command Mode	The mode in which the command runs; see Command Modes (page 179)
Applicability	The command introduced in a specific release version and modified or updated in subsequent versions.
Example	An example of the command being executed

© 2026 IP Infusion Inc. Proprietary

Keyboard Operations

The Table 5 table lists the operations you can perform from the keyboard.

Table 5. Keyboard operations

Key combination	Operation
Left arrow or Ctrl+b	Moves one character to the left. When a command extends beyond a single line, you can press left arrow or Ctrl+b repeatedly to scroll toward the beginning of the line, or you can press Ctrl+a to go directly to the beginning of the line.
Right arrow or Ctrl-f	Moves one character to the right. When a command extends beyond a single line, you can press right arrow or Ctrl+f repeatedly to scroll toward the end of the line, or you can press Ctrl+e to go directly to the end of the line.
Esc, b	Moves back one word
Esc, f	Moves forward one word
Ctrl+e	Moves to end of the line
Ctrl+a	Moves to the beginning of the line
Ctrl+u	Deletes the line
Ctrl+w	Deletes from the cursor to the previous whitespace
Alt+d	Deletes the current word
Ctrl+k	Deletes from the cursor to the end of line
Ctrl+y	Pastes text previously deleted with Ctrl+k, Alt+d, Ctrl+w, or Ctrl+u at the cursor
Ctrl+t	Transposes the current character with the previous character
Ctrl+c	Ignores the current line and redisplays the command prompt
Ctrl+z	Ends configuration mode and returns to exec mode
Ctrl+l	Clears the screen
Up Arrow or Ctrl+p	Scroll backward through command history
Down Arrow or Ctrl+n	Scroll forward through command history

© 2026 IP Infusion Inc. Proprietary

Show Command Modifiers

Note: The show command output included in the guides is for illustration purposes only. Based on the combination of features enabled and ongoing enhancements made to the commands, the output for these commands may vary. For instance, the actual command output may differ depending on the software version, configuration, and platform. Field names, values, and formats are subject to change.

You can use two tokens to modify the output of a **show** command. Enter a question mark to display these tokens:

```
# show users ?
  | Output modifiers
  > Output redirection
```

You can type the | (vertical bar character) to use output modifiers. For example:

```
> show rsvp | ?
  begin     Begin with the line that matches
  exclude   Exclude lines that match
  include   Include lines that match
  last      Last few lines
  redirect  Redirect output
```

Begin Modifier

The **begin** modifier displays the output beginning with the first line that contains the input string (everything typed after the **begin** keyword). For example:

```
# show running-config | begin xe1
...skipping
interface xe1
ipv6 address fe80::204:75ff:fee6:5393/64
!
interface xe2
ipv6 address fe80::20d:56ff:fe96:725a/64
!
line con 0
login
!
end
```

You can specify a regular expression after the **begin** keyword, This example begins the output at a line with either “xe2” or “xe4”:

```
# show running-config | begin xe[2-4]

...skipping
interface xe2
 shutdown
!
interface xe4
 shutdown
!
interface svlan0.1
 no shutdown
!
route-map myroute permit 2
!
route-map mymap1 permit 10
!
```

© 2026 IP Infusion Inc. Proprietary

```
route-map rmap1 permit 2
!
line con 0
 login
line vty 0 4
 login
!
end
```

Include Modifier

The **include** modifier includes only those lines of output that contain the input string. In the output below, all lines containing the word “input” are included:

```
# show interface xe1 | include input
    input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

You can specify a regular expression after the **include** keyword. This examples includes all lines with “input” or “output”:

```
#show interface xe0 | include (in|out)put
    input packets 597058, bytes 338081476, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 613147, bytes 126055987, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

Exclude Modifier

The **exclude** modifier excludes all lines of output that contain the input string. In the following output example, all lines containing the word “input” are excluded:

```
# show interface xe1 | exclude input
Interface xe1
  Scope: both
  Hardware is Ethernet, address is 0004.75e6.5393
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet6 fe80::204:75ff:fee6:5393/64
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
```

You can specify a regular expression after the **exclude** keyword. This example excludes lines with “output” or “input”:

```
show interface xe0 | exclude (in|out)put
Interface xe0
  Scope: both
  Hardware is Ethernet  Current HW addr: 001b.2139.6c4a
  Physical:001b.2139.6c4a  Logical:(not set)
  index 2 metric 1 mtu 1500 duplex-full arp ageing timeout 3000
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Bandwidth 100m
  DHCP client is disabled.
  inet 10.1.2.173/24 broadcast 10.1.2.255
  VRRP Master of :  VRRP is not configured on this interface.
  inet6 fe80::21b:21ff:fe39:6c4a/64
    collisions 0
```

Redirect Modifier

The **`redirect`** modifier writes the output into a file. The output is not displayed.

```
# show cli history | redirect /var/frame.txt
```

The output redirection token (>) does the same thing:

```
# show cli history >/var/frame.txt
```

Last Modifier

The **`last`** modifier displays the output of last few number of lines (As per the user input). The last number ranges from 1 to 9999.

For example:

```
#show running-config | last 10
```

String Parameters

The restrictions in Table 6 apply for all string parameters used in OcNOS commands, unless some other restrictions are noted for a particular command.

Table 6. String parameter restrictions

Restriction	Description
Input length	1965 characters or less
Restricted special characters	“?”, “,”, “>”, “|”, and “=” The “|” character is allowed only for the **`description`** command in interface mode.

Command Modes

Commands are grouped into modes arranged in a hierarchy. Each mode has its own set of commands. The table below lists the command modes common to all protocols.

Table 7. Common Command Modes

Name	Description
`Execution mode`	Also called *view* mode, this is the first mode to appear after you start the CLI. It is a base mode from where you can perform basic commands such as show, exit, quit, help, and enable.
Privileged execution mode	Also called *enable* mode, in this mode you can run additional basic commands such as debug, write, and show.
Configure mode	Also called *configure terminal* mode, in this mode you can run configuration commands and go into other modes such as interface, router, route map, key chain, and address family. Configure mode is single user. Only one user at a time can be in configure mode.
Interface mode	In this mode you can configure protocol-specific settings for a particular interface. Any setting you configure in this mode overrides a setting configured in router mode.
Router mode	This mode is used to configure router-specific settings for a protocol such as BGP or OSPF.

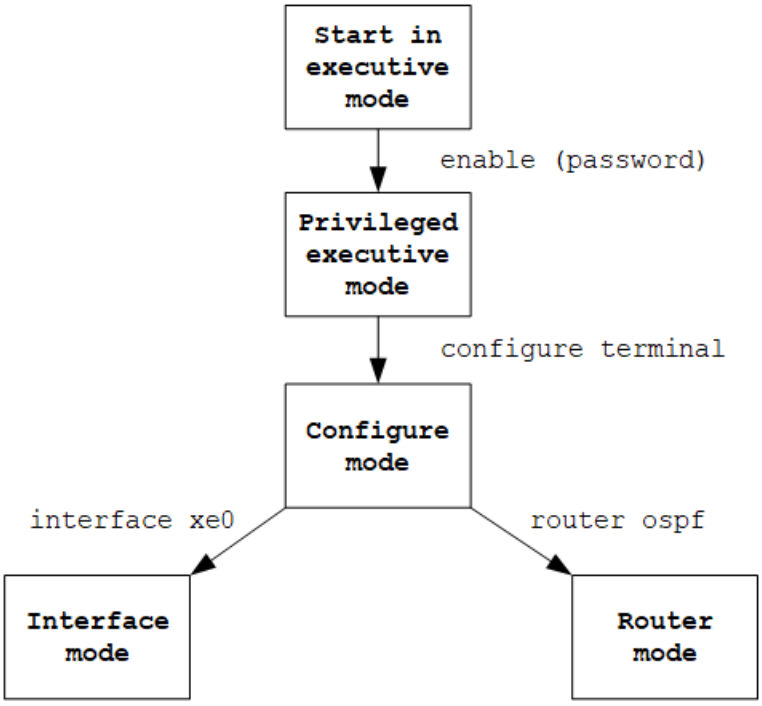
Command Mode Tree

The diagram below shows the common command mode hierarchy.

Figure 1. Common command modes



To change modes:

1. Enter privileged executive mode by entering **`enable`** in Executive mode.
2. Enter configure mode by entering **`configure terminal`** in Privileged Executive mode.

The example below shows moving from executive mode to privileged executive mode to configure mode and finally to router mode:

```
> enable mypassword
# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)# router ospf
(config-router)#
```

Note: Each protocol can have modes in addition to the common command modes. See the command reference for the respective protocol for details.

Transaction-based Command-line Interface

The OcNOS command line interface is transaction based:

- Any changes done in configure mode are stored in a separate *candidate* configuration that you can view with the `show transaction current` command.
- When a configuration is complete, apply the candidate configuration to the running configuration with the command.
- If a `commit` fails, no configuration is applied as the entire transaction is considered failed. You can continue to change the candidate configuration and then retry the `commit`.
- Discard the candidate configuration with the `abort transaction` command.
- Check the last aborted transaction with the `show transaction last-aborted` command.
- Multiple configurations cannot be removed with a single . You must remove each configuration followed by a `commit`.

Note: All commands MUST be executed only in the default CML shell (**`cmlsh`**). If you log in as root and start **`imish`**, then the system configurations will go out of sync. The **`imish`** shell is not supported and should not be started manually.

Forwarding Plane Load Balancing

OcNOS uses Forwarding Plane Load Balancing when the kernel supports Equal Cost Multipath (ECMP). OcNOS installs the maximum number of ECMP routes supported by the kernel. This allows for load balancing to be performed with more than one nexthop to reach a destination. If the router receives and installs multiple paths with the same administrative distance and cost to a destination, load-balancing is possible.

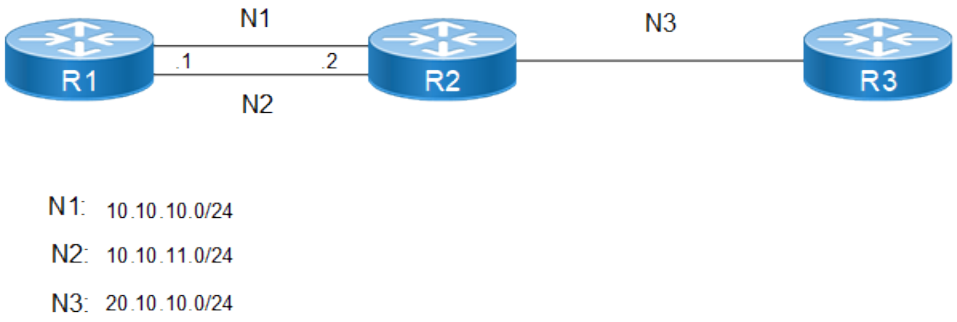
Ideally, multiple nexthops have different interfaces to the destination, but this is not mandatory. The algorithm for distributing traffic across ECMP routes is dependent on the kernel, and typically based on the protocol, source address, destination address, and port.

Enable Load Balancing

The following example illustrates how to enable Equal Cost Multipath (ECMP), and configure a routing protocol (OSPF is used in this example) for load balancing. However, this example will not work if the kernel does not support load balancing. In this topology, R1, R2, and R3 are three Linux routers connected to each other. R1 can reach R3 through two links available to R2.

Topology

Figure 2. Load Balancing Topology



Configuration

R1 - NSM

- Enable multipath support and set the maximum number of paths to be installed in the Forwarding Information Base (FIB):

`#configure terminal`	Enter configure mode
`(config)#maximum-paths 2`	Create maximum paths 2
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

Note: User can save and reboot to bring changes into effect.

R1 - OSPF

- Configure OSPF on all interfaces on R1, R2, and R3.
  R1 learns about R3 through 2 nexthops (both networks N1 and N2).

`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Enter ospf router mode
`(config-router)#router 1.1.1.1`	Specify router id
`(config-router)#net 10.11.1.1/30 a 0`	Configure ospf network in area 0
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface mode

R2 - OSPF

`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Enter ospf router mode
`(config-router)#router 2.2.2.2`	Specify router id
`(config-router)#net 10.11.1.2/30 a 0`	Configure ospf network in area 0
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface mode

R3 - OSPF

`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Enter ospf router mode
`(config-router)#router 3.3.3.3`	Specify router id
`(config-router)#net 10.1.1.2/30 a 0`	Configure ospf network in area 0
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#end`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

Validation

R1 - OSPF

Run the `show ip ospf route` command on R1. The OSPF routing table displays that it can reach R3 through both of the nexthops:

```
R1#show ip ospf route
OSPF process 100:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

C  10.10.10.0/24 [10] is directly connected, eth1, Area 0.0.0.0
C  10.10.11.0/24 [10] is directly connected, eth2, Area 0.0.0.0
O  20.10.10.0/24 [11] via 10.10.10.3, eth1, Area 0.0.0.0
via 10.10.11.3, eth2, Area 0.0.0.0
```

Run the `show ip route` command on R1. It displays that R1 has installed both nexthops to reach R3 in the NSM routing table:

```
R1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C     10.10.10.0/24 is directly connected, eth1, 00:17:08
C     10.10.11.0/24 is directly connected, eth2, 00:16:49
O     20.10.10.0/24 [110/11] via 10.10.11.3, eth2, 00:08:52
             [110/11] via 10.10.10.3, eth1
C     127.0.0.0/8 is directly connected, lo, 00:25:21
C     192.168.52.0/24 is directly connected, eth0, 00:25:16

Gateway of last resort is not set
```

VLAN Interfaces

This section contains examples for configuring VLAN interfaces.

Overview

Several Virtual LAN (VLAN) interfaces can be configured on a single Ethernet interface. Once created, a VLAN interface functions the same as any physical interface.

NSM recognizes VLAN interfaces as physical interfaces. Once VLAN interfaces are created in the kernel, and IP addresses are assigned to them, OcNOS commands can be used to configure and display VLAN interfaces the same as any physical interface. OcNOS routing protocols, such as OSPF and BGP can run across networks using VLAN interfaces.

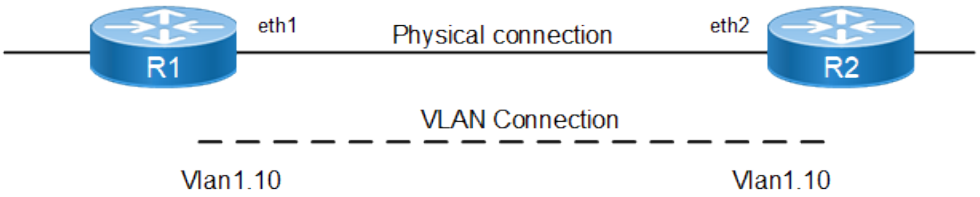
Two systems with physical connectivity (either directly connected or connected through a switch), can communicate with each other via VLAN interfaces that have the same VLAN IDs and belong to the same network.

If the physical interfaces are not directly connected to a switch, the corresponding ports on the switch must be configured as trunks, and should not be associated to any VLANs in the switch. The commands to configure switch ports as trunks depend on the type of the switch, and are beyond the scope of this document.

Topology

Figure 3 is used to describe VLAN interface configuration. In this example, there are two routers, R1 and R2, and the eth1 interface of R1 is connected directly to eth2 using an ethernet cable.

Figure 3. VLAN Connections



The `vlan1.10` VLAN interface is created on R1, and `vlan1.10` is created on R2. The VLAN interfaces are configured in the same network: R1 and R2 can reach each other using the VLAN connection.

Note: A VLAN ID of both VLAN interfaces is the same (10). Two systems with different VLAN IDs cannot communicate, even if they are in the same network, since a VLAN ID tags packets sent on a VLAN interface.

© 2026 IP Infusion Inc. Proprietary

Create a VLAN Interface

When a VLAN interface is configured, a Layer 3 interface based on the bridge-group number and VLAN ID is created. This Layer 3 interface is advertised to all the Layer 3 protocols.

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol mstp`	Create a MSTP bridge.
`(config)#vlan database`	Enter VLAN mode.
`(config-vlan)#vlan 10 bridge 1`	Enable VLAN 10 on bridge 1.
`(config-vlan)#exit`	Exit VLAN mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#switchport`	Configure interface as Layer2 interface.
`(config-if)#bridge-group 1`	Associate bridge group 1.
`(config-if)#switchport mode trunk`	Configure interface eth1 as Layer2 trunk mode.
`(config-if)#switchport trunk allowed vlan add 10`	Associate VLAN 10 as trunk port.
`(config-if)#commit`	Commit the candidate configuration to the running
`(config-if)#exit`	Exit interface mode.

Add IP Addresses to VLAN Interface

In NSM, you can add or remove IP addresses from VLAN interfaces, like normal interfaces. Using IMISH type:

`#configure terminal`	Enter configure mode
`(config)#interface vlan1.10`	Enter interface mode
`(config-if)#ip address 192.168.1.50/24`	Assign ip address to vlan interface
`(config-if)#commit`	Commit the candidate configuration to the running
`(config-if)#end`	Exit interface mode.

Display VLAN Interfaces

In OcNOS, VLAN interfaces appear as any physical interfaces, in the `show running-config` or the `show ip interface brief` outputs, and can be configured as any other interface.

The following is a sample output of the `show ip interface brief` command on R1.

Note: The IP address of interface vlan1.10 has correctly been changed by NSM:

```
#show ip interface brief

'*' - address is assigned by dhcp client
```

```
Interface            IP-Address      Admin-Status          Link-Status
eth0                 10.12.56.26     up                    up
lo                   127.0.0.1       up                    up
lo.management        127.0.0.1       up                    up
vlan1.1              unassigned      up                    up
vlan1.10             192.168.1.50    up                    up
xe1                  unassigned      up                    up
xe2                  unassigned      up                    up
xe3                  unassigned      up                    down
xe4                  unassigned      up                    down
xe5                  unassigned      up                    down
xe6                  unassigned      up                    down
xe7                  unassigned      up                    down
xe8                  unassigned      up                    down
xe9                  unassigned      up                    down
xe10                 unassigned      up                    down
xe11                 unassigned      up                    down
xe12                 unassigned      up                    down
xe13                 unassigned      up                    up
xe14                 unassigned      up                    down
xe15                 unassigned      up                    down
xe16                 unassigned      up                    up
xe17                 unassigned      up                    down
xe18                 unassigned      up                    down
xe19                 unassigned      up                    down
xe20                 unassigned      up                    down
xe21                 unassigned      up                    down
xe22                 unassigned      up                    down
xe23                 unassigned      up                    down
xe24                 unassigned      up                    down
xe25                 unassigned      up                    down
xe26                 unassigned      up                    down
xe28                 unassigned      up                    down
xe29                 unassigned      up                    down
xe30                 unassigned      up                    down
xe31                 unassigned      up                    down
xe32                 unassigned      up                    up
xe33                 unassigned      up                    down
xe34                 unassigned      up                    down
xe35                 unassigned      up                    down
xe36                 unassigned      up                    down
xe37                 unassigned      up                    up

Layer 3 Link Aggregation

Overview

This section contains a complete sample Link Aggregation Control Protocol (LACP) configuration (L3 LAG).

Link Aggregation is the method of combining individual physical network interfaces or ports to increase the capacity of the link to support and sustain beyond the individual port capability. Features like Spanning Tree, VLAN, FDB, Multicast operate on both physical ports as well as Link Aggregated Logical Ports. It bundles all of the controller's distribution system ports into a single 802.3ad port channel, thereby reducing the number of IP addresses needed to configure the ports on your controller. When LAG is enabled, the system dynamically manages port redundancy and load balances access points transparently to the user.

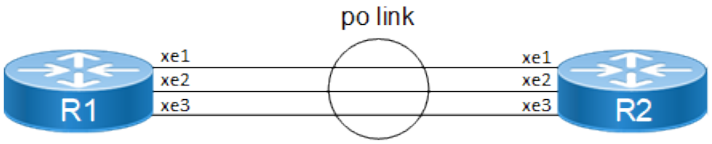
LACP is based on the 802.3ad IEEE specification. It allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The spanning tree views it as one interface and not as two or three interfaces. When there is a failure in one physical interface, the other interfaces stay up and there is no disruption.

The OcNOS LACP implementation supports the aggregation of a maximum of six physical Ethernet links into a single logical channel.

Topology

In this example, 3 links are configured between the two switches R1 and R2. These three links are assigned the same administrative key (1) so that they aggregate to form a single channel 1. They are viewed by STP as one interface.

Figure 4. L3_LAG Topology



Configuration

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface po10`	Enter interface mode.
`R1(config-if)#ip address 1.1.1.1/24`	Assigning IP Address to PO Interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible

© 2026 IP Infusion Inc. Proprietary

	for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`R1(config)#interface xe1`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface xe2`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface xe3`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode.

R2

`R2#configure terminal`	Enter configure mode.
`R2(config)#interface po10`	Enter interface mode.
`R2(config-if)#ip address 1.1.1.2/24`	Assigning IP Address to PO Interface
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.

© 2026 IP Infusion Inc. Proprietary

`R2(config)#interface xe1`	Enter interface mode.
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe2`	Enter interface mode.
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe3`	Enter interface mode.
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode.

Static Channel-group

R1

`R1#configure terminal`	Enter configure mode
`R1(config)#interface sa12`	Enter interface mode
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#ip address 2.2.2.1/24`	Assigning IP Address to PO Interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe1`	Enter interface mode
`R1(config-if)# static-channel-group 12`	Add this interface to channel group 12 and enable link aggregation so that it can be selected for aggregation by the local system.

© 2026 IP Infusion Inc. Proprietary

R1(config-if)#commit	Commit the candidate configuration to the running configuration
R1(config-if)#exit	Exit interface mode

R2

R2#configure terminal	Enter configure mode
R2(config)#interface sa12	Enter interface mode
R2(config-if)#no switchport	Making Interface as L3 Port (This command will remove if switchport configuration is present).
R2(config-if)#ip address 2.2.2.2/24	Assigning IP Address to PO Interface
R1(config-if)#commit	Commit the candidate configuration to the running configuration
R2(config-if)#exit	Exit interface mode
R2(config)#interface xe1	Enter interface mode
R2(config-if)# static-channel-group 12	Add this interface to channel group 12 and enable link aggregation so that it can be selected for aggregation by the local system.
R1(config-if)#commit	Commit the candidate configuration to the running configuration
R2(config-if)#exit	Exit interface mode

IPv4Static Routes

This section contains basic static routing configuration examples.

This example shows the complete configuration to enable static routing in a simple network topology. A static route is composed of a network prefix (host address) and a nexthop (gateway). Static routes are useful in small networks. They are simple solutions for making a few destinations reachable. Large networks use dynamic routing protocols.

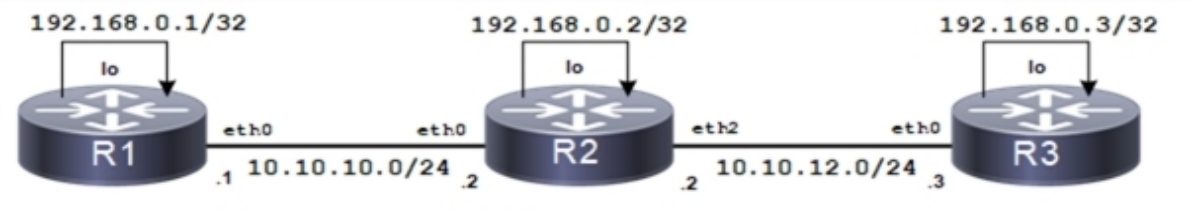
For details about the commands used in these examples, see the Unicast Routing Information Base Command Reference.

Topology

Router R1 is configured with these static routes:

- The remote network 10.10.12.0/24
- The loopback address (host addresses) of router R2
- The loopback address of router R3

Figure 5. Basic Static Route



In all three routes, interface `eth0` of router R2 is the gateway. Router R3 is configured with a default static route that is equivalent to configuring separate static routes with the same gateway or nexthop address. Router R2 has two routes, one for each of the remote routers' loopback address.

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.1/32 secondary`	Configure the IP address on this interface, and specify a 32-bit mask, making it a host address.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode.

`(config)#ip route 10.10.12.0/24 10.10.10.2`
`(config)#ip route 192.168.0.2/32 10.10.10.2`
`(config)#ip route 192.168.0.3/32 10.10.10.2`
	Specify the destination prefix and mask for the network and a gateway.
	Because R2 is the only next hop available, you can configure a default route instead of configuring the

© 2026 IP Infusion Inc. Proprietary

	same static route for individual addresses. See the configuration of R3.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.2/32 secondary`	Configure the IP address on this interface, and specify a 32-bit mask, making it a host address.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit Interface mode.
`(config)#ip route 192.168.0.1/32 10.10.10.1` `(config)#ip route 192.168.0.3/32 10.10.12.3`	Specify the destination and mask for the network and a gateway.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.3/32 secondary`	Configure the IP address on this interface, and specify a 32-bit mask, making it a host address.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit Interface mode.
`(config)#ip route 0.0.0.0/0 10.10.12.2`	Specify 10.10.12.2 as a default gateway to reach any network. Because 10.10.12.2 is the only available route, you can specify it as the default gateway instead of specifying it as the gateway for an individual network or host address.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config)#exit`	Exit configure mode

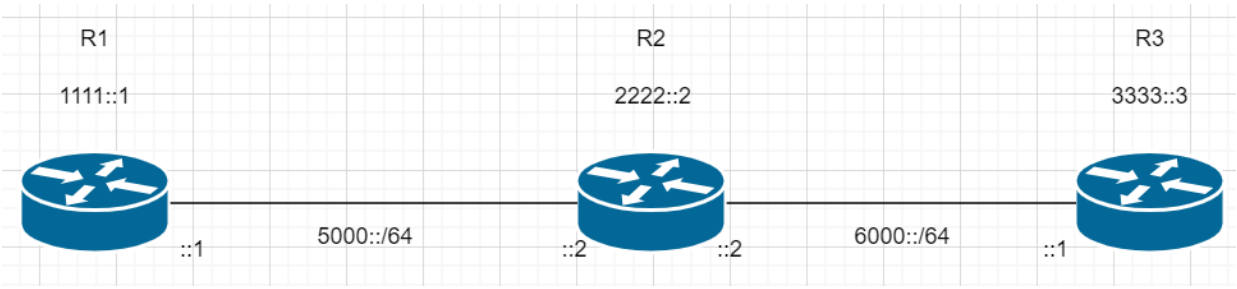
IPv6 Static Routs

This example shows complete configuration to enable IPv6 static routing in a simple network topology.

Note: IPv6 static route with interface alone as gateway (without gateway IPv6 address) is not supported.

Topology

Figure 6. IPv6 static routing



Configuration

R1

`R1#conf t`	Enter Configure mode.
`R1(config)#interface lo`	Enter interface mode.
`R1(config-if)#ipv6 address 1111::1/128`	Configure IPv6 address
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#ipv6 route 6000::/64 5000::2`	Configure IPv6 Static route to reach remote network with R2 as nexthop
`R1(config)#ipv6 route 2222::2/128 5000::2`	Configure IPv6 static route to reach R2 lo with R2 as nexthop
`R1(config)#ipv6 route 3333::3/128 5000::2`	Configure IPv6 static route to reach R3 lo with R2 as nexthop
`R1(config)#commit`	Commit the candidate configuration to the running configuration
`R1(config)#exit`	Exit configure mode

© 2026 IP Infusion Inc. Proprietary

R2

`R2#conf t`	Enter Configure mode.
`R2(config)#int lo`	Enter interface mode.
`R2(config-if)#ipv6 address 2222::2/128`	Configure IPv6 address
`R2(config)#commit`	Commit the candidate configuration to the running configuration
`R2(config)#exit`	Exit configure mode
`R2(config)#ipv6 route 1111::1/128 5000::1`	Configure IPv6 static route to reach R1 lo with R1 as nexthop
`R2(config)#ipv6 route 3333::3/128 6000::1`	Configure IPv6 static route to reach R3 lo with R3 as nexthop
`R2(config)#commit`	Commit the candidate configuration to the running configuration
`R2(config)#exit`	Exit configure mode

R3

`R3#conf t`	Enter Configure mode.
`R3(config)#int lo`	Enter interface mode.
`R3(config-if)#ipv6 add 3333::3/128`	Configure IPv6 address
`R3(config)#commit`	Commit the candidate configuration to the running configuration
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#ipv6 route ::/0 6000::2`	Configure Default IPv6 Static route with R2 as nexthop
`R3(config)#commit`	Commit the candidate configuration to the running configuration
`R3(config)#exit`	Exit configure mode

Static Route Discard Configuration

This section show how to configure the static route discard feature.

Overview

If you identify some routers/attackers distributing invalid/bogus routes just to use the resources of the device or to make the device unstable, you can configure route-map rules, discard all routes, and black hole traffic corresponding to those routes.

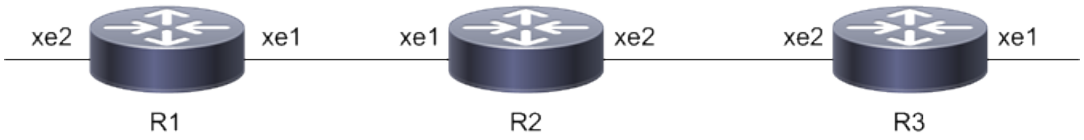
To so this, you add “discard” route entries for a prefix in a route map with the “set interface null0” command. You then apply that route map to a BGP neighbor.

IPv4 Route Discard

Figure 7 shows the configuration required to enable static route discard for IPv4.

Topology

Figure 7. Static route discard topology



Configuration

R1

`R1#configure terminal`	Enter configure mode
`R1(config)#interface xe1`	Enter interface mode for xe1
`R1(config-if)#ip address 2.2.2.2/24`	Assign an IP address to the interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface xe2`	Enter interface mode for xe1
`R1(config-if)#ip address 1.1.1.2/24`	Assign an IP address to the interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode
`R1(config)#router bgp 2`	Enter BGP router mode
`R1(config-router)#neighbor 2.2.2.3 remote-as 3`	Create static BGP neighbor 2.2.2.3 with remote autonomous system value 3

© 2026 IP Infusion Inc. Proprietary

`R1(config-router)#redistribute connected`	Advertise the connected network into BGP
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-router)#end`	Exit BGP router mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#ip prefix-list p1`	Configure IP prefix list
`R2(config-ip-prefix-list)#seq 5 permit any`	Create an access rule to permit any IP packets
`R2(config)#route-map r1`	Enter route-map mode
`R2(config-route-map)#match ip address prefix-list p1`	Configure match ip prefix list p1
`R2(config-route-map)#set interface null0`	Set the interface to null0
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-route-map)#exit`	Exit route-map mode.
`R2(config)#interface xe1`	Enter interface mode for xe1
`R2(config-if)#ip address 2.2.2.3/24`	Assign an IP address to the interface
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe2`	Enter interface mode for xe2
`R2(config-if)#ip address 3.3.3.2/24`	Assign an IP address to the interface
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode
`R2(config)#router bgp 3`	Enter into BGP router mode
`R2(config-router)#neighbor 2.2.2.2 remote-as 2`	Create static BGP neighbor 2.2.2.2 with remote autonomous system value 2
`R2(config-router)#neighbor 3.3.3.3 remote-as 4`	Create static BGP neighbor 3.3.3.3 with remote autonomous system value 4
`R2(config-router)#redistribute connected`	Advertise the connected network into BGP
`R2(config-router)#neighbor 2.2.2.2 route-map r1 in`	Attach the route-map with route discard configured for the neighbor 2.2.2.2 in IN direction
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-router)#end`	Exit BGP router mode

© 2026 IP Infusion Inc. Proprietary

R3

`R3#configure terminal`	Enter configure mode.
`R3(config)#interface xe2`	Enter interface mode for xe2
`R3(config-if)#ip address 3.3.3.3/24`	Assign an IP address to the interface
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration
`R3(config-if)#exit`	Exit interface mode
`R3(config)#interface xe1`	Enter interface mode for xe1
`R3(config-if)#ip address 4.4.4.2/24`	Assign an IP address to the interface
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#router bgp 4`	Enter into BGP router mode
`R3(config-router)#neighbor 3.3.3.2 remote-as 3`	Create static BGP neighbor 3.3.3.2 with remote autonomous system value 3
`R3(config-router)#redistribute connected`	Advertise the connected network into BGP
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration
`R3(config-router)#end`	Exit BGP router.

IPv6 Route Discard

Figure 7 shows the configuration required to enable static route discard for IPv6.

Configuration

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface lo`	Enter interface mode for loopback
`R1(config-if)#ip address 1.1.1.2/24 secondary`	Assign an IPv4 address to the interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe1`	Enter interface mode for xe1
`R1(config-if)#ipv6 address 2001::2/64`	Assign an IPv6 address to the interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

`R1(config)#interface xe2`	Enter interface mode for xe2
`R1(config-if)#ipv6 address 1001::2/64`	Assign an IPv6 address to the interface
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode
`R1(config)#router bgp 2`	Enter BGP router mode
`R1(config-router)#bgp router-id 1.1.1.1`	Specify router ID
`R1(config-router)#neighbor 2001::3 remote-as 3`	Create static BGP neighbor 2001::3 with remote autonomous system value 3
`R1(config-router)#address-family ipv6 unicast`	Enter address family IPv6 unicast mode
`R1(config-router-af)#neighbor 2001::3 activate`	Activate neighbor in IPv6 address family
`R1(config-router-af)#redistribute connected`	Advertise the connected network into BGP
`R1(config-router-af)#commit`	Commit the candidate configuration to the running configuration
`R1(config-router)#end`	Exit BGP router mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#interface lo`	Enter interface mode for loopback
`R2(config-if)#ip address 2.2.2.2/24 secondary`	Assign an IPV4 address
`R2(config-router-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode
`R2(config)#ipv6 prefix-list p1`	Configure IPv6 prefix list.
`R2(config-ipv6-prefix-list)#permit any`	Create an access rule to permit any IP packets
`R2(config)#route-map r1`	Enter route-map mode.
`R2(config-route-map)#match ipv6 address prefix-list p1`	Configure match IPv6 prefix list p1
`R2(config-route-map)#set interface null0`	Set the interface to null0
`R2(config-router-map)#commit`	Commit the candidate configuration to the running configuration
`R2(config-route-map)#exit`	Exit route-map mode
`R2(config)#interface xe1`	Enter interface mode for xe1
`R2(config-if)#ipv6 address 2001::3/64`	Assign ipv6 address to the interface
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode
`R2(config)#interface xe2`	Enter interface mode for xe2

`R2(config-if)#ipv6 address 3001::2/64`	Assign an IPv6 address to the interface
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#exit`	Exit interface mode
`R2(config)#router bgp 3`	Enter BGP router mode
`R2(config-router)#bgp router-id 2.2.2.2`	Specify router ID
`R2(config-router)#neighbor 2001::2 remote-as 2`	Create static BGP neighbor 2001::2 with remote autonomous system value 2
`R2(config-router)#neighbor 3001::3 remote-as 4`	Create static BGP neighbor 3001::3 with remote autonomous system value 4
`R2(config-router)#address-family ipv6 unicast`	Enter address family IPv6 unicast mode
`R2(config-router-af)#redistribute connected`	Advertise the connected network into BGP
`R2(config-router-af)#neighbor 2001::2 activate`	Activate the neighbor in IPv6 address family
`R2(config-router-af)#neighbor 3001::3 activate`	Activate the neighbor in IPv6 address family
`R2(config-router-af)#neighbor 2001::2 route-map r1 in`	Attach the route-map with route discard configured for the neighbor 2001::2 in IN direction
`R2(config-router-af)#commit`	Commit the candidate configuration to the running configuration
`R2(config-router-af)#end`	Exit BGP router mode

R3

`R3#configure terminal`	Enter configure mode
`R3(config)#interface lo`	Enter interface mode for loopback
`R3(config-if)#ip address 3.3.3.2/24 secondary`	Assign an IPV4 address to the interface
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration
`R3(config-if)#exit`	Exit interface mode
`R3(config)#interface xe1`	Enter interface mode for xe1
`R3(config-if)#ipv6 address 4001::2/64`	Assign an IPv6 address to the interface
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration
`R3(config-if)#exit`	Exit interface mode
`R3(config)#interface xe2`	Enter interface mode for xe2
`R3(config-if)#ipv6 address 3001::3/64`	Assign an IPv6 address to the interface
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration
`R3(config-if)#exit`	Exit interface mode
`R3(config)#router bgp 4`	Enter into BGP router mode

© 2026 IP Infusion Inc. Proprietary

`R3(config-router)#bgp router-id 3.3.3.3`	Specify router ID
`R3(config-router)#neighbor 3001::2 remote-as 3`	Create static BGP neighbor 3001::2 with remote autonomous system value 3
`R3(config-router)#address-family ipv6 unicast`	Enter address family IPv6 unicast mode
`R3(config-router-af)#neighbor 3001::2 activate`	Activate neighbor in IPv6 address family
`R3(config-router-af)#redistribute connected`	Advertise the connected network into BGP
`R3(config-router-af)#commit`	Commit the candidate configuration to the running configuration
`R3(config-router-af)#end`	Exit BGP router mode.

Static Route Object Tracking using IP SLA

Overview

Static Route Object Tracking feature tracks the state of an object's reachability using IP SLA. Client processes like Virtual Router Redundancy Protocol (VRRP) or RIB can register their interest in tracking objects and receive notifications when a state change occurs.

IP Service-Level Assurance (SLA) is a protocol used for analyzing IP service levels in applications and services. It employs active traffic-monitoring technology to continuously monitor network traffic. IP SLA utilizes Internet Control Message Protocol (ICMP) pings to detect link failures and notifies registered clients of such events.

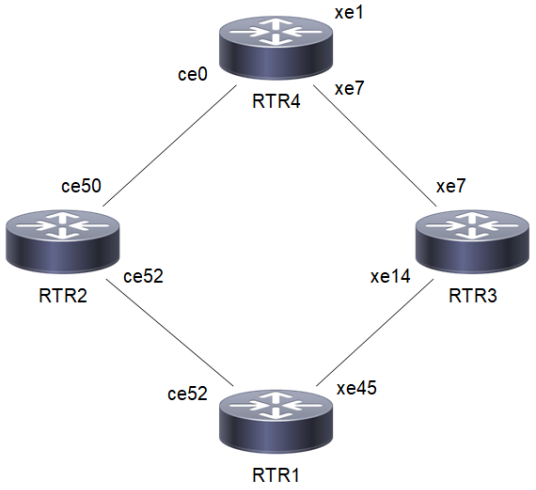
The Object Tracking feature ensures clear separation between the objects to be tracked and the actions taken by clients when a tracked object's state changes. Multiple clients, including VRRP and RIB, can register their interest in tracking the same object, each with distinct actions upon state changes. This Tracking feature is available in OAMD.

Each tracked object is assigned a unique number in the tracking command, which client processes use to monitor specific objects. The tracking process monitors events from these tracked objects and records value changes. Any changes in tracked object values are communicated to interested client processes, either immediately or with a specified delay. The object values are reported as either `up` or `down`.

Topology

The figure below represents a sample network topology featuring RTR1, RTR2, RTR3, and RTR4, used to demonstrate the static route object tracking feature.

Figure 8. Static Route Object Tracking



Static Route Object Tracking IPv4 Configuration

The following configuration commands provide an illustrative example of setting up various network parameters on the routers (RTR1, RTR2, RTR3, and RTR4). These commands showcase the configuration of IPv4 addresses, the implementation of IP SLA for network monitoring, the establishment of static routes, and the use of time ranges.

© 2026 IP Infusion Inc. Proprietary

Each command serves a specific purpose in configuring and fine-tuning the router's behavior within the network. This example demonstrates a basic network setup with key components for efficient network management and monitoring.

RTR1

`RTR1#configure terminal`	Enter Configure mode.
`RTR1(config)#interface ce52`	Enter interface mode.
`RTR1(config-if)#ip address 2.2.2.1/24`	Configure IPv4 address.
`RTR1(config-if)#exit`	Exit interface mode.
`RTR1(config)#interface xe45`	Enter interface mode.
`RTR1(config-if)#ip address 4.4.4.1/24`	Configure IPv4 address.
`RTR1(config-if)#exit`	Exit interface mode.
`RTR1(config)#ip sla 1`	Configure IP SLA with a unique number.
`RTR1(config-ip-sla)#icmp-echo ipv4 2.2.2.2 source-interface ce52`	Configure the ICMP-echo using destination IPv4 address and source interface name.
`RTR1(config-ip-sla-echo)#threshold 1000`	Configure the threshold value.
`RTR1(config-ip-sla-echo)#timeout 1000`	Configure the timeout value.
`RTR1(config-ip-sla-echo)#frequency 5`	Configure the frequency value.
`RTR1(config-ip-sla-echo)#exit`	Exit IP SLA echo mode.
`RTR1(config-ip-sla)#exit`	Exit IP SLA mode.
`RTR1(config)#time-range tr1`	Configure a time-range.
`RTR1(config-tr)#start-time 11:22 3 july 2021`	Configure a start-time.
`RTR1(config-tr)#end-time after 200`	Configure end-time.
`RTR1(config-tr)#exit`	Exit time-range mode.
`RTR1(config)#ip sla schedule 1 time-range tr1`	Schedule an IP SLA measurement.
`RTR1(config)#track 1 ip sla 1 reachability`	Configure the track ID for IP SLA.
`RTR1(config-object-track)#exit`	Exit object track mode.
`RTR1(config)#ip route 3.3.3.0/24 2.2.2.2 track 1`	Configure the static route with the nexthop address.
`RTR1(config)#ip route 5.5.5.0/24 4.4.4.2`	Configure the static route with the nexthop address.
`RTR1(config)#ip route 6.6.6.0/24 2.2.2.2 track 1`	Configure the static route with the nexthop address and track ID.
`RTR1(config)#ip route 6.6.6.0/24 4.4.4.2 10`	Configure the static route with the nexthop address and delay.
`RTR1(config)#commit`	Commit the candidate configuration to the running configuration.
`RTR1(config)#exit`	Exit configure mode.

© 2026 IP Infusion Inc. Proprietary

RTR2

`RTR2#configure terminal`	Enter configure mode.
`RTR2(config)#interface ce50`	Enter interface mode.
`RTR2(config-if)#ip address 3.3.3.1/24`	Configure IPv4 address.
`RTR2(config-if)#exit`	Exit interface mode.
`RTR2(config)#interface ce52`	Enter interface mode.
`RTR2(config-if)#ip address 2.2.2.2/24`	Configure IPv4 address.
`RTR2(config-if)#exit`	Exit interface mode.
`RTR2(config)#ip route 6.6.6.0/24 3.3.3.2`	Configure the static route with the nexthop address.
`RTR2(config)#commit`	Commit the candidate configuration to the running configuration.
`RTR2(config)#exit`	Exit configure mode.

RTR3

`RTR3#configure terminal`	Enter configure mode.
`RTR3(config)#interface xe7`	Enter interface mode.
`RTR3(config-if)#ip address 5.5.5.1/24`	Configure IPv4 address.
`RTR3(config-if)#exit`	Exit interface mode.
`RTR3(config)#interface xe14`	Enter interface mode.
`RTR3(config-if)#ip address 4.4.4.2/24`	Configure IPv4 address.
`RTR3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`RTR3(config-if)#exit`	Exit interface mode.
`RTR3(config)#ip route 6.6.6.0/24 5.5.5.2`	Configure the static route with the nexthop address.
`RTR3(config)#commit`	Commit the candidate configuration to the running configuration.
`RTR3(config)#exit`	Exit configure mode.

RTR4

`RTR4#configure terminal`	Enter configure mode.
`RTR4(config)#interface ce0`	Enter interface mode.
`RTR4(config-if)#ip address 3.3.3.2/24`	Configure IPv4 address.
`RTR4(config-if)#exit`	Exit interface mode.
`RTR4(config)#interface xe1`	Enter interface mode.
`RTR4(config-if)#ip address 6.6.6.6/24`	Configure IPv4 address.
`RTR4(config-if)#exit`	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

`RTR4(config)#interface xe7`	Enter interface mode.
`RTR4(config-if)#ip address 5.5.5.2/24`	Configure IPv4 address.
`RTR4(config-if)#commit`	Commit the candidate configuration to the running configuration.
`RTR4(config-if)#exit`	Exit interface mode.
`RTR4(config)#ip route 2.2.2.0/24 3.3.3.1`	Configure the static route with the nexthop address.
`RTR4(config)#ip route 4.4.4.0/24 5.5.5.1`	Configure the static route with the nexthop address.
`RTR4(config)#commit`	Commit the candidate configuration to the running configuration.
`RTR4(config)#exit`	Exit configure mode.

Static Route Object Tracking IPv4 Validation

RTR1: IP SLA Routing and Tracking Details

Below is the routing and tracking information for RTR1, which includes details about its IP SLA reachability tracking and static routes.

```
RTR1#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is UP
    4 changes, last change : 2019 Mar 14 14:53:47

RTR1#show ip route track-table
 ip route 3.3.3.0 255.255.255.0 2.2.2.2 track 1 state is [up]
 ip route 6.6.6.0 255.255.255.0 2.2.2.2 track 1 state is [up]

RTR1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C            1.1.1.0/24 is directly connected, xe1, 00:55:39
C            2.2.2.0/24 is directly connected, ce52, 00:55:38
S            3.3.3.0/24 [1/0] via 2.2.2.2, ce52, 00:00:03
C            4.4.4.0/24 is directly connected, xe45, 00:49:50
S            5.5.5.0/24 [1/0] via 4.4.4.2, xe45, 00:08:12
S            6.6.6.0/24 [1/0] via 2.2.2.2, ce52, 00:00:03
C            127.0.0.0/8 is directly connected, lo, 6d23h24m

Gateway of last resort is not set
```

RTR2: Remove IPv4 Address

```
RTR2#show running-config interface ce52
!
interface ce52
 ip address 2.2.2.2/24
!
```

Now remove the IPv4 address configuration from interface `ce52` on `RTR2` and commit the changes made in the configuration to the running configuration.

```
RTR2#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
RTR2(config)#interface ce52
RTR2(config-if)#no ip address
RTR2(config-if)#commit
```

RTR1: Down State in IP SLA Routing

The following output from RTR1 routing table and tracking details indicates changes in the reachability of certain routes and related IP SLA measurements:

```
RTR1#sh ip route track-table
2019 Mar 14 14:55:14.350 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_THRESHOLD_CROSSED_2]: IP SLA 1,
response packet 15 exceeds the threshold 10000 ms
2019 Mar 14 14:55:14.351 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_TIMEOUT_2]: IP SLA 1, response packet
15 exceeds the timeout 10000 ms
2019 Mar 14 14:55:14.351 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_DISCONNECT_2]: Stopping IP SLA
measurement for sla(1) as timeout(10000) observed for packet(15)

 ip route 3.3.3.0 255.255.255.0 2.2.2.2 track 1 state is [down]
 ip route 6.6.6.0 255.255.255.0 2.2.2.2 track 1 state is [down]
```

The IP SLA measurement for `SLA 1` experienced threshold exceedances and timeouts, resulting in changes to the reachability status of the tracked routes. The routes associated with IP SLA tracking, such as `3.3.3.0/24 and 6.6.6.0/24`, are marked as `DOWN`.

```
RTR1#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is DOWN
    5 changes, last change : 2019 Mar 14 14:55:14

2019 Mar 14 14:55:19.352 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_THRESHOLD_CROSSED_2]: IP SLA 1,
response packet 16 exceeds the threshold 10000 ms
2019 Mar 14 14:55:19.353 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_TIMEOUT_2]: IP SLA 1, response packet
16 exceeds the timeout 10000 ms
2019 Mar 14 14:55:19.353 : R1 : OAM : CRITI : [IPSLA_ICMP_ECHO_DISCONNECT_2]: Stopping IP SLA
measurement for sla(1) as timeout(10000) observed for packet(16)

RTR1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C            1.1.1.0/24 is directly connected, xe1, 00:56:16
C            2.2.2.0/24 is directly connected, ce52, 00:56:15
C            4.4.4.0/24 is directly connected, xe45, 00:50:27
S            5.5.5.0/24 [1/0] via 4.4.4.2, xe45, 00:08:49
S            6.6.6.0/24 [10/0] via 4.4.4.2, xe45, 00:00:07
C            127.0.0.0/8 is directly connected, lo, 6d23h24m

Gateway of last resort is not set
```

When the IP SLA operation determines that 6.6.6.6 is reachable, the route appears in the routing table, allowing traffic to be routed to that destination. This mechanism provides dynamic routing based on the real-time reachability of the specified IPv4 address.

```
RTR1#ping 6.6.6.6

RTR2: Add IPv4 Address

Now configure the IPv4 address from interface `ce52` on `RTR2` and commit the changes made in the configuration to the running configuration.

```
RTR2#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
RTR2(config)#interface ce52
RTR2(config-if)#ip address 2.2.2.2/24
RTR2(config-if)#commit
```

RTR1: UP State in IP SLA Routing and Tracking

By configuring the IPv4 address on `RTR2interfacece52` brings up the interface and allows RTR1 to reach RTR2 via the IPv4 address `2.2.2.2/24`, leading to the change in the IP SLA tracking state and the associated static route states to `UP`.

```
RTR1#show track
TRACK Id: 1
  IP SLA 1 reachability
```

```
  Reachability is UP

Static Route Object Tracking IPv6 Configuration

The following configuration commands provide an illustrative example of setting up various network parameters on the routers (RTR1, RTR2, RTR3, and RTR4). These commands showcase the configuration of IPv6 addresses, the implementation of IP SLA for network monitoring, the establishment of static routes, and the use of time ranges. Each command serves a specific purpose in configuring and fine-tuning the router's behavior within the network. This example demonstrates a basic network setup with key components for efficient network management and monitoring.

RTR1

`RTR1#configure terminal`	Enter Configure mode.
`RTR1(config)#interface ce52`	Enter interface mode.

`RTR1(config-if)#ip address 1000::1/64`	Configure IPv6 address.
`RTR1(config-if)#exit`	Exit interface mode.
`RTR1(config)#interface xe45`	Enter interface mode.
`RTR1(config-if)#ip address 4000::2/64`	Configure IPv6 address.
`RTR1(config-if)#exit`	Exit interface mode.
`RTR1(config)#ip sla 1`	Configure IP SLA with a unique number.
`RTR1(config-ip-sla)#icmp-echo ipv6 2000::1 source-interface ce52`	Configure the ICMP-echo using destination IPv6 address and source interface name.
`RTR1(config-ip-sla-echo)#threshold 1000`	Configure the threshold value.
`RTR1(config-ip-sla-echo)#timeout 1000`	Configure the timeout value.
`RTR1(config-ip-sla-echo)#frequency 5`	Configure the frequency value.
`RTR1(config-ip-sla-echo)#exit`	Exit IP SLA echo mode.
`RTR1(config-ip-sla)#exit`	Exit IP SLA mode.
`RTR1(config)#time-range tr1`	Configure a time-range.
`RTR1(config-tr)#start-time 11:22 3 july 2021`	Configure a start-time.
`RTR1(config-tr)#end-time after 200`	Configure end-time.
`RTR1(config-tr)#exit`	Exit time-range mode.
`RTR1(config)#ip sla schedule 1 time-range tr1`	Schedule an IP SLA measurement.
`RTR1(config)#track 1 ip sla 1 reachability`	Configure the track ID for IP SLA.
`RTR1(config-object-track)#exit`	Configure object track mode.
`RTR1(config)#ipv6 route 3000::0/64 1000::2 track 1`	Configure the static route with the nexthop address.
`RTR1(config)#ipv6 route 3333::1/128 1000::2 track 1`	Configure the static route with the nexthop address and track ID.
`RTR1(config)#ipv6 route 3333::1/128 1000::2 10`	Configure the static route with the nexthop address and delay.
`RTR1(config)#commit`	Commit the candidate configuration to the running configuration
`RTR1(config)#exit`	Exit configure mode

RTR2

`RTR2#configure terminal`	Enter configure mode.
`RTR2(config)#interface ce50`	Enter interface mode.
`RTR2(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address.
`RTR2(config-if)#exit`	Exit interface mode.
`RTR2(config)#interface ce52`	Enter interface mode.
`RTR2(config-if)#ipv6 address 2000::1/64`	Configure IPv6 address.
`RTR2(config-if)#exit`	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

`RTR2(config)#ipv6 route 3000::0/64 2000::2`	Configure the static route with the nexthop address.
`RTR2(config)#commit`	Commit the candidate configuration to the running configuration.
`RTR2(config)#exit`	Exit configure mode.

RTR3

`RTR3#configure terminal`	Enter configure mode.
`RTR3(config)#interface xe7`	Enter interface mode.
`RTR3(config-if)#ipv6 address 2000::2/64`	Configure IPv6 address.
`RTR3(config-if)#exit`	Exit interface mode.
`RTR3(config)#interface xe14`	Enter interface mode.
`RTR3(config-if)#ipv6 address 3000::1/64`	Configure IPv6 address.
`RTR3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`RTR3(config-if)#exit`	Exit interface mode.
`RTR3(config)#ipv6 route 4000::0/64 3000::2`	Configure the static route with the nexthop address.
`RTR3(config)#ipv6 route 1000::0/64 2000::1`	Configure the static route with the nexthop address.
`RTR3(config)#commit`	Commit the candidate configuration to the running configuration.
`RTR3(config)#exit`	Exit configure mode.

RTR4

`RTR4#configure terminal`	Enter configure mode.
`RTR4(config)#interface ce0`	Enter interface mode.
`RTR4(config-if)#ipv6 address 3000::2/64`	Configure IPv6 address.
`RTR4(config-if)#exit`	Exit interface mode.
`RTR4(config)#interface xe1`	Enter interface mode.
`RTR4(config-if)#ipv6 address 4000::1/64`	Configure IPv6 address.
`RTR4(config-if)#exit`	Exit interface mode.
`RTR4(config)#interface xe7`	Enter interface mode.
`RTR4(config-if)#ipv6 address 5000::2/64`	Configure IPv6 address.
`RTR4(config-if)#commit`	Commit the candidate configuration to the running configuration.
`RTR4(config-if)#exit`	Exit interface mode.
`RTR4(config)#ipv6 route 1000::0/64 4000::2`	Configure the static route with the nexthop address.
`RTR4(config)#ipv6 route 2000::0/64 3000::1`	Configure the static route with the nexthop address.
`RTR4(config)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

`RTR4(config)#exit`	Exit configure mode.

Static Route Object Tracking IPv6 Validation

RTR1

Below is the routing and tracking information for RTR1, which includes details about its IP SLA reachability tracking and static routes.

Route Monitor

Overview

Object Tracking provides a mechanism for tracking the reachability status of objects, such as IP status, using Internet Protocol Service Level Agreement (IP SLA). This feature empowers users to monitor the state of these objects and make decisions based on their status. It permits the configuration of multiple track objects on interfaces, delivering flexibility in managing network link status.

Feature Characteristics

Object Tracking establishes a distinct separation between the tracked objects and the actions initiated by a client when there's a change in the state of a tracked object. Users can configure object tracking types as `any` or `all` on the interface, alongside track IDs that specify which statuses to monitor. Modify the interface's link status to either `up` or `down` based on the selected track type and the statuses of the associated track IDs.

When using `Track type all`, the feature performs a `Boolean AND` operation, requiring every object configured on the interface to be in an `up` state for the interface itself to be considered `up`. If any of these objects are not in an `up` state, the interface is set to d`own`.

Conversely, `Track type any` operates as a `Boolean OR` function, necessitating that at least one object configured on the interface must be in an `up` state for the interface to remain `up`. If none of the tracked objects are in an `up` state, the interface is marked as `down`.

Benefits

Users can ensure network reliability by defining specific tracking criteria and actions, allowing them to take appropriate measures when tracked objects experience status change. This contributes to improved network management and performance.

Configuration

The below topology illustrates a network configuration involving three routers, R1, R2, and R3, with a central device referred to as the Router A positioned in the middle. This topology represents a linear or sequential network structure that showcases the Route Monitor feature.

Prerequisites

Before configuring and utilizing Object Tracking, ensure the following prerequisites:

Track IDs: Users must define and configure the track IDs and corresponding objects they want to track for reachability. These track IDs are essential for the feature to work effectively. Deleting all track IDs from the interface will bring the interface up if it was previously down.

Interface Configuration: The feature involves configuring track types on interfaces. Therefore, ensuring that the interfaces are correctly configured and operational is important. In cases where an interface has both object tracking configurations and next-hop reachability, deleting the object tracking configurations is necessary to bring the interface back up if it goes down.

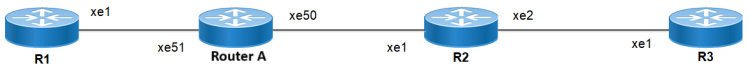
Object Tracking Criteria: Define the specific criteria and conditions for tracking an object’s reachability, such as IP status, using IP SLA.

© 2026 IP Infusion Inc. Proprietary

Topology

A series of configurations were implemented on routers R1, R2, and R3, as well as on the Router A, to showcase the functionality of the Route Monitor feature. The objective was to demonstrate the configuration of network routers to monitor the reachability status of specific IPv4 and IPv6 addresses using IP SLA and illustrate that these configurations can work in conjunction with the Route Monitor feature to enable informed decisions based on the reachability status of tracked objects.

Figure 9. Route Monitor Topology



IPv4 Route Monitor Configuration

Router A Configuration

Use the following configuration to set up an IP SLA and enable object tracking on a network device. These commands assign IPv4 addresses to interfaces, configure specific IP SLA parameters such as threshold, timeout, and frequency, create a time-range for scheduling measurements, and establish static routes with nexthop addresses. Configure object tracking to monitor the reachability of tracked objects. These configurations highlight the versatility and functionality of the network device by allowing it to monitor IPv4 addresses, make decisions based on object tracking, and optimize network operations.

`Router A#configure terminal`	Enter configure mode.
`Router A(config)#interface xe50`	Enter interface mode `xe50`.
`Router A(config-if)#ip address 2.2.2.1/24`	Assign the IP address `2.2.2.1` with a subnet mask of `/24` to interface `xe50`.
`Router A(config-if)#exit`	Exit interface mode `xe50`.
`Router A(config)#interface xe51`	Enter interface mode `xe51`.
`Router A(config-if)#ip address 1.1.1.2/24`	Assign the IP address 1.1.1.2 with a subnet mask of /24 to interface xe51.
`Router A(config-if)#exit`	Exit interface mode `xe51`.
`Router A(config)#ip sla 1`	Create an IP SLA operation with index `1`.
`Router A(config-ip-sla)#icmp-echo ipv4 3.3.3.1 source-interface xe50`	Configure the SLA to send ICMP echo requests to destination IPv4 address `3.3.3.1` using interface `xe50` as the source.
`Router A(config-ip-sla-echo)#threshold 1000`	Set the threshold value for SLA to `1000` milliseconds.
`Router A(config-ip-sla-echo)#timeout 1000`	Set the timeout value for SLA to `1000` milliseconds.
`Router A(config-ip-sla-echo)#frequency 5`	Configure the frequency value for SLA to send ICMP echo packets every 5 seconds.
`Router A(config-ip-sla-echo)#exit`	Exit IP SLA echo mode.
`Router A(config-ip-sla)#exit`	Exit IP SLA mode.
`Router A(config)#time-range tr1`	Create a time range named `tr1`.
`Router A(config-tr)#start-time 11:22 3 july 2021`	Set the start time for the time range to `11:22 on`

	`July 3, 2021`.
`Router A(config-tr)#end-time after 200`	Set the end time to be `200` minutes from the start time.
`Router A(config-tr)#exit`	Exit time-range mode.
`Router A(config)#ip sla schedule 1 time-range tr1`	Schedule IP SLA operation 1 to run within the specified time range `tr1`.
`Router A(config)#track 1 ip sla 1 reachability`	Creating a tracking object to monitor the reachability status of IP SLA operation `1`.
`Router A(config-object-track)#exit`	Exit object track mode.
`Router A(config)#ip route 3.3.3.0/24 2.2.2.2 track 1`	Add a static route for the destination network `3.3.3.0/24` with next-hop IP `2.2.2.2`, tracked by tracking object `1`.
`Router A(config)#ip route 5.5.5.0/24 1.1.1.2`	Add a static route for the destination network `5.5.5.0/24` with next-hop IP `1.1.1.2`.
`Router A(config)#ip route 6.6.6.0/24 2.2.2.2 track 1`	Add a static route for the destination network `6.6.6.0/24` with next-hop IP `2.2.2.2`, tracked by tracking object `1`.
`Router A(config)#ip route 6.6.6.0/24 1.1.1.2 10`	Add a static route for the destination network `6.6.6.0/24` with next-hop IP `1.1.1.2` and a metric of `10`.
`Router A(config)#commit`	Commit the candidate configuration to the running configuration.
`Router A(config)#interface xe51`	Enter interface mode `xe51`.
`Router A(config-if)#object-tracking all`	Enable object tracking for `all` tracking objects on interface `xe51`.
`Router A(config-if)#object-tracking 1`	Configure object tracking `1` on interface `xe51`.
`Router A(config-if)#object-tracking 2`	Configure object tracking `2` on interface `xe51`.
`Router A(config-if)#exit`	Exit interface mode.
`Router A(config)#exit`	Exit configure mode.

Routing and Static Routes Configuration

The following commands configure routers R1, R2, and R3 to forward network traffic to their designated destinations within the network. They assign IP addresses to the interfaces connected to the routing devices and add static routes for destination networks with a next-hop IP.

R1

```
!
interface xe1
 ip address 1.1.1.1/24
commit
!
ip route 2.2.2.0/24 1.1.1.2
ip route 3.3.3.0/24 1.1.1.2
commit
!
```

R2

```
!
interface xe1
 ip address 2.2.2.2/24
commit
!
interface xe2
 ip address 3.3.3.1/24
commit
!
ip route 1.1.1.0/24 2.2.2.1
commit
!
```

R3

```
!
interface xe1
 ip address 3.3.3.2/24
commit
!
ip route 1.1.1.0/24 3.3.3.1
ip route 2.2.2.0/24 3.3.3.1
commit
!
```

IPv4 Route Monitor Validation

IPv6 Route Monitor Configuration

Router A Configuration

Use the following configuration to set up an IP SLA and enable object tracking on a network device. These commands assign IPv6 addresses to interfaces, configure specific IP SLA parameters such as threshold, timeout, and frequency, create a time-range for scheduling measurements, and establish static routes with nexthop addresses. Configure object tracking to monitor the reachability of tracked objects. These configurations highlight the versatility and functionality of the network device by allowing it to monitor IPv6 addresses, make decisions based on object tracking, and optimize network operations.

`Router A#configure terminal`	Enter configure mode.
`Router A(config)#interface xe50`	Enter interface mode `xe50`.
`Router A(config-if)#ipv6 address 2000::1/64`	Assign an IPv6 address (`2000::1/64`) to interface `xe50`.
`Router A(config-if)#exit`	Exit interface mode `xe50`.
`Router A(config)#interface xe51`	Enter interface mode `xe51`.
`Router A(config-if)#ipv6 address 1000::2/64`	Assign an IPv6 address (`1000::2/64`) to interface `xe51`.
`Router A(config-if)#exit`	Exit interface mode `xe51`.
`Router A(config)#ip sla 1`	Create an IP SLA operation with index `1`.
`Router A(config-ip-sla)#icmp-echo ipv6 3000::1 source-interface xe50`	Configure the SLA to send IPv6 ICMP echo requests to destination IPv6 address `3000::1` using interface `xe50` as the source.
`Router A(config-ip-sla-echo)#threshold 1000`	Set the threshold value for SLA to `1000` milliseconds.
`Router A(config-ip-sla-echo)#timeout 1000`	Set the timeout value for SLA to `1000` milliseconds.
`Router A(config-ip-sla-echo)#frequency 5`	Configure the frequency value for SLA to send IPv6 ICMP echo packets every 5 seconds.
`Router A(config-ip-sla-echo)#exit`	Exit IP SLA echo mode.
`Router A(config-ip-sla)#exit`	Exit IP SLA mode.

© 2026 IP Infusion Inc. Proprietary

`Router A(config)#time-range tr1`	Create a time range named `tr1`.
`Router A(config-tr)#start-time 11:22 3 july 2021`	Set the start time for the time range to `11:22 on July 3, 2021`.
`Router A(config-tr)#end-time after 200`	Set the end time to be `200` minutes from the start time.
`Router A(config-tr)#exit`	Exit time-range mode.
`Router A(config)#ip sla schedule 1 time-range tr1`	Schedule IP SLA operation `1` to run within the specified time range `tr1`.
`Router A(config)#track 1 ip sla 1 reachability`	Creating a tracking object to monitor the reachability status of IP SLA operation `1`.
`Router A(config-object-track)#exit`	Exit object track mode.
`Router A(config)#ipv6 route 3000::0/64 2000::2 track 1`	Add an IPv6 static route for the destination network `3000::0/64` with a next-hop IPv6 2000::2, tracked by tracking object `1`.
`Router A(config)#ipv6 route 3333::1/128 1000::1`	Add an IPv6 static route for the destination network 3333::1/128 with next-hop IPv6 1000::1.
`Router A(config)#ipv6 route 3333::1/128 2000::2 track 1`	Add an IPv6 static route for the destination network `6.6.6.0/24` with next-hop IPv6 2000::2, tracked by tracking object `1`.
`Router A(config)#ipv6 route 3333::1/128 1000::1 10`	Add an IPv6 static route for the destination network 3333::1/128 with next-hop IP 1000::1 and a metric of `10`.
`Router A(config)#commit`	Commit the candidate configuration to the running configuration.
`Router A(config)#interface xe51`	Enter interface mode xe51.
`Router A(config-if)#object-tracking all`	Enable object tracking for `all` tracking objects on interface `xe51`.
`Router A(config-if)#object-tracking 1`	Configure object tracking `1` on interface `xe51`.
`Router A(config-if)#object-tracking 2`	Configure object tracking `2` on interface `xe51`.
`Router A(config-if)#exit`	Exit interface mode.
`Router A(config)#exit`	Exit configure mode.

By configuring the routes below, R1, R2, and R3 effectively forward network traffic to its designated destinations within the network. These configurations actively contribute to efficient routing operations and ensure network traffic reaches its targets.

R1 Configuration

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface xe1`	Enter interface mode `xe1`.
`R1(config-if)#ipv6 address 1000::1/64`	Assign the IPv6 address 1000::1 with a subnet mask of `/64` to interface `xe1`.

`R1(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-if)#exit`	Exit interface mode `xe1`.
`R1(config)#ipv6 route 2000::0/64 1000::2`	Add an IPv6 static route for the destination network 2000::0/64 with next-hop IPv6 1000::2.
`R1(config)#ipv6 route 3000::0/64 1000::2`	Add an IPv6 static route for the destination network 3000::0/64 with next-hop IPv6 1000::2.
`R1(config)#commit`	Commit the candidate configuration to the running configuration.
`R1(config)#exit`	Exit configure mode.

R2 Configuration

`R2#configure terminal`	Enter configure mode.
`R2(config)#interface xe1`	Enter interface mode `xe1`.
`R2(config-if)#ipv6 address 2000::2/64`	Assign the IPv6 address 2000::2 with a subnet mask of `/64` to interface `xe1`.
`R2(config-if)#exit`	Exit interface mode `xe1`.
`R2(config)#interface xe2`	Enter interface mode `xe2`.
`R2(config-if)#ipv6 address 3000::1/64`	Assign the IPv6 address 3000::1 with a subnet mask of `/64` to interface `xe2`.
`R2(config-if)#exit`	Exit interface mode `xe2`.
`R2(config)#ipv6 route 1000::0/64 2000::1`	Add an IPv6 static route for the destination network 1000::0/64 with next-hop IPv6 2000::1.
`R2(config)#commit`	Commit the candidate configuration to the running configuration.
`R2(config)#exit`	Exit configure mode.

R3 Configuration

`R3#configure terminal`	Enter configure mode.
`R3(config)#interface xe1`	Enter interface mode `xe1`.
`R3(config-if)#ipv6 address 3000::2/64`	Assign the IPv6 address 3000::2 with a subnet mask of `/64` to interface `xe1`.
`R3(config-if)#commit`	Commit the candidate configuration to the running configuration.
`R3(config-if)#exit`	Exit interface mode `xe1`.
`R3(config)#ipv6 route 1000::0/64 3000::1`	Add an IPv6 static route for the destination network 1000::0/64 with next-hop IPv6 3000::1.
`R3(config)#ipv6 route 2000::0/64 3000::1`	Add an IPv6 static route for the destination network 2000::0/64 with next-hop IPv6 3000::1.
`R3(config)#commit`	Commit the candidate configuration to the running

	configuration.
`R3(config)#exit`	Exit configure mode.

IPv6 Route Monitor Validation

The following show output displays the information about IP SLA reachability tracking, IPv6 route tables, and interface status on a network device running OcNOS.

Router A Validation

```
Router A#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is UP

Implementation Examples

Here is a practical scenario and use case for Object Tracking implementation:

Link Redundancy: Object Tracking can be used to monitor the reachability of primary and backup network links. If the primary link fails or becomes congested, the system can automatically switch traffic to the backup link, ensuring uninterrupted network connectivity.

Load Balancing: Object Tracking helps optimize load balancing by continuously assessing the health and availability of servers or paths. If a server becomes overloaded or fails, traffic can be intelligently redirected to healthy servers, improving resource utilization and user experience.

Failover Testing and Verification: Object Tracking provides a mechanism for simulating network failures and verifying failover mechanisms. By configuring tracked objects to mimic real-world conditions, network administrators can assess the resilience of their network configurations and ensure they perform as expected during failures.

Route Monitor Command

The Route Monitor feature introduces the object-tracking (page 332) configuration command. For more information, refer to the IP Service Level Agreements Commands (page 318), and Object Tracking Commands (page 330) and *Interface Commands* sections in the *OcNOS System Management* document.

object-tracking

Use this command to configure track IDs and options on the interfaces.

Use the `no` parameter with this command to remove the configurations.

These commands configure object tracking on interfaces, with specific track IDs and tracked objects set to determine what gets tracked and affects the interface's status.

The `object-tracking` command provides flexibility, enabling both `all` and `any` tracking behaviors for influencing the interface's status. A maximum of 8 track IDs can be configured per interface. It is possible to configure the same track IDs or options on multiple interfaces.

Command Syntax

```
object-tracking <1-500>
object-tracking <all | any>
no object-tracking <1-500>
no object-tracking <all | any>
```

Parameters

<1-500>
Object tracking ID

all
Boolean AND operation. Each object configured on the interface must be in an up state for the interface itself to be in an up state; otherwise, it will be brought down.

any
Boolean OR operation. At least one object configured on the interface must be in an up state; otherwise, the interface will be brought down.

© 2026 IP Infusion Inc. Proprietary

Default

None

Command Mode

Interface mode

Applicability

Introduced in OcNOS version 6.4.1.

Example

Here are some example commands for configuring object tracking in the interface mode.

```
OcNOS(config)#interface xe5
OcNOS(config-if)#object-tracking 10
OcNOS(config-if)#object-tracking all
OcNOS(config-if)#commit

OcNOS(config-if)#no object-tracking 10
OcNOS(config-if)#no object-tracking all
OcNOS(config-if)#commit
OcNOS(config-if)#exit
```

Troubleshooting

Interface Status: Verify the status of the interface linked with object tracking. If the configured track type is `all`, confirm that all tracked objects are in an `up` state to consider the interface as `up`. In the case of the track type being `any`, ensure that at least one tracked object is `up` to maintain the interface in an `up` state.

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Acronym	Description
NSM	Network and Service Management
IP SLA	Internet Protocol Service Level Agreement
Object Tracking	A feature that monitors the reachability status of objects, such as IP status, using IP SLA and allows users to take actions based on their status.
Track Object	An object configured for tracking within the Object Tracking feature. These objects can represent specific network components or conditions, such as IP addresses or link statuses.
Track ID	A unique identifier associated with a track object that enables the system to monitor and assess the status of that object.
Track Type	The configuration specifies how the interface's link status should be determined based on the statuses of associated track objects. It can be set to all or any.
Track Type “All”	A track type that uses a Boolean AND function, requiring that all tracked objects be

© 2026 IP Infusion Inc. Proprietary

Key Terms/Acronym	Description
	in an up state for the interface to be considered up.
Track Type “Any”	A track type that uses a Boolean OR function, ensuring that at least one tracked object is in an up state for the interface to remain up.

Hybrid Switch Router Configuration

This section describes configurations that can be done with the Hybrid Switch Router solution. OcNOS can be configured as a Layer 2 switch, a Layer 3 router or a Hybrid Switch Router.

Overview

An OcNOS Hybrid Switch Router offers Layer 3 forwarding found in routers with the high-speed performance associated with traditional Layer 2 switches. The following are some advantages of Hybrid Switch Routers:

- Reduced system cost and infrastructure. Traditionally you would require a separate box for switching and one for routing.
- Off-loading IP traffic from backbone routers, thus making them more efficient for firewalls and WAN connectivity.
- Simplified network design and maintenance.

Routing and Switching

Layer 2 and Layer 3 switches are similar at a high-level, both look at the packet headers, and steer the packets toward their destination port. Therefore, after being passed through a switch or router, the packet is closer to its destination.

Layer 2 Switching

Layer 2 switches are typically used to provide connectivity within high bandwidth local area networks (LANs). A Layer 2 switch makes forwarding decisions based on the MAC or the Layer 2 header. It extracts the Layer 2 header from the packet, finds a matching destination address in the forwarding table, and transmits the packet out to the port associated with the specific destination address in the forwarding table. The forwarding table is populated through a self-learning process, whereby each arriving packet is used to update the entries in the table. Typically, the Layer 2 switch implements the switching function in the hardware, as that requires stripping of the packet only in two layers (the physical and data link layer) to get to the useful part of the packet header. This allows switches to steer packets at wire-speed rates without slowing down arriving streams of packets to process them.

Layer 3 Routing

Layer 3 (L3) routers are typically used to provide connectivity between different LANs. A Layer 3 router discards MAC headers, and indexes further into the packet–making decisions based on the IP or Layer 3 header. It extracts the Layer-3 header from the packet, finds a matching destination address in a routing table, identifies a new MAC address for the packet from an ARP cache, wraps the IP packet in a new MAC header, and then transmits the packet out to the port associated with that destination address in the routing table.

The routing table is populated through statically configured command line interface entries or through routing protocol messages from neighboring routers. A Layer 3 router must strip through 3 layers (physical, data link, and network) which is more complicated than a Layer 2 switch. Layer 3 routers historically implement the routing function in software. This often results in limited packet-forwarding rates. However, improvements in VLSI circuit technology have allowed Layer 3 routing functions to be implemented rapidly in hardware, enabling wire-speed performance similar to the performance of Layer 2 switches. As a result, along with the complexity of next-generation Layer 3 routers, the throughput of these routers has also been increasing.

© 2026 IP Infusion Inc. Proprietary

An architecture is required that is flexible enough to accommodate the demands of different customers, and accommodate the changing demands of a single customer whose requirements may change over time. Typical Layer 2 switches and Layer 3 routers fail to provide this flexibility.

An optimal configuration can be an integrated solution, a Layer 3 router with Layer 2 bridge groups around it. The OcNOS Hybrid Switch Router implementation allows easy configuration of different combinations of routers and switches. OcNOS can be configured as an absolute Layer 3 router, absolute Layer 2 switch (Figure 10) or a hybrid Layer 2/Layer 3 switch router, (Figure 11) that can easily change modes with the use of a single command.

System Configuration

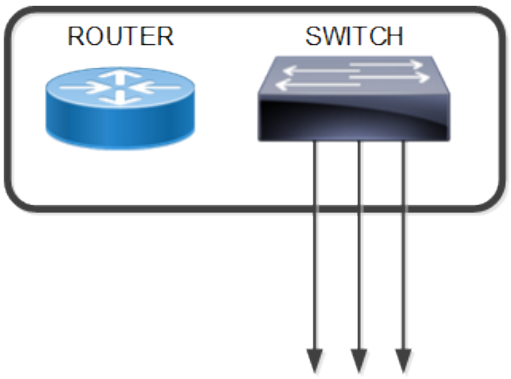
- OcNOS stack will bring up all the ports of the board as routed ports by default.
- However OcNOS provides flexibility to create a Layer 2 bridge, and ports can be converted to switch ports and added to the bridge.
- OcNOS also supports VLAN interfaces and routing between VLANs.

Thus it can work as a router, a switch, or as a hybrid switch.

Hybrid Switch Router Possibilities

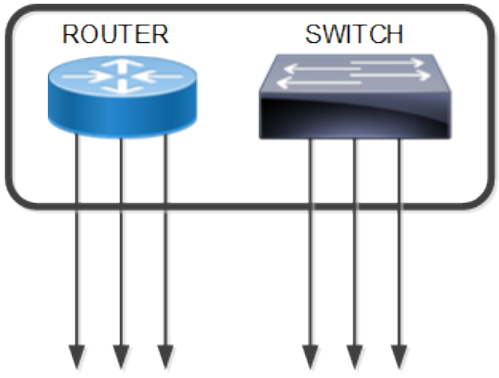
With only Layer 2 protocols configured, the OcNOS Hybrid Switch Router can become an absolute Layer 2 switch.

Figure 10. Layer 2 Switch



With Layer 2 and Layer 3 protocols configured, the OcNOS Hybrid Switch Router can become a Switch and/or a Router.

Figure 11. Working as a Router or a Switch



With only Layer 3 protocols enabled, the OcNOS Hybrid Switch Router can become an absolute router.

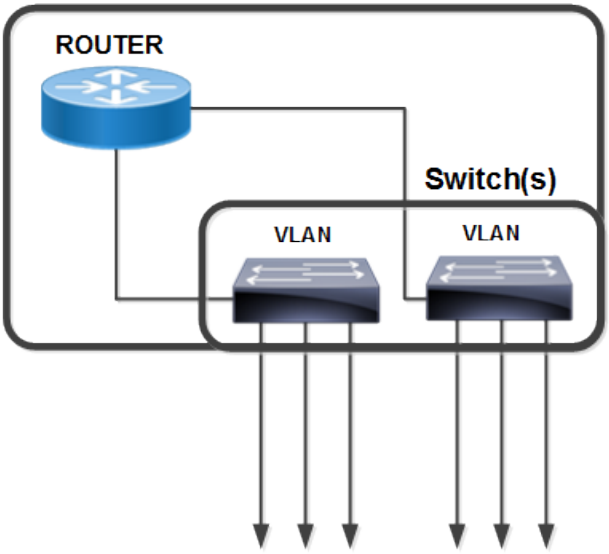
For routing between VLANs and other routing ports, OcNOS routing protocols or static routing via NSM can be utilized.

Figure 15. Routing between VLANs and Routing Ports



Configuring Layer 2 Interfaces

For the Hybrid Switch Router, it is important to understand that by default, all interfaces are configured as routed interfaces. To configure a Layer 2 interface (switched interface), you must explicitly configure this using the `switchport` command in the interface mode. For example:

`#configure terminal`	Enter the Configure mode.
`(config)#bridge 1 protocol mstp`	Create a MSTP bridge.
`(config)#interface eth2`	Specify an interface to configure and enter the Interface mode.
`(config-if)#switchport`	Configure eth2 as a Layer 2 port.
`(config-if)#bridge-group 1`	Associate interface to bridge 1.
`(config-if)#no shutdown`	Start interface.eth2
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode

Configuring Layer 3 Interfaces

For the Hybrid Switch Router, it is important to understand that by default, all interfaces in OcNOS are L3 ports. If a port has been configured as L2, then use the `no switchport` command to make it a L3 port.

For example:

`#configure terminal`	Enter the Configure mode.

`(config)#interface eth3`	Specify an interface to configure and enter the Interface mode.
`(config-if)#no switchport`	Configure eth3 as a Layer 3 port.
`(config-if)#commit`	Commit the candidate configuration to the running configuration
`(config-if)#exit`	Exit interface mode

In the Hybrid Switch Router mode, if a VLAN is configured, a Layer 3 interface based on the bridge-group number and VLAN ID is created. This Layer 3 interface is advertised to all the Layer 3 protocols. For example:

`#configure terminal`	Enter the Configure mode.
`(config)#bridge 1 protocol mstp`	Creating bridge.
`(config)#vlan database`	Enter the VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1`	Enable VLAN 2 on bridge 1.
`(config-vlan)#commit`	Commit the candidate configuration to the running configuration
`(config-vlan)#exit`	Exit VLAN configure mode

The last step in the example above show an interface given a name with the following format:

```
vlanXX.YYYY
```

Where `XX` is the bridge ID, and `YYYY` is the VLAN ID,

For example, the name, `vlan1.3` indicates that VLAN IP's interface is in VLAN 3, and bridge-group 1.

Policy Based Routing Configuration

This section contains a sample Policy Based Routing (PBR) configuration.

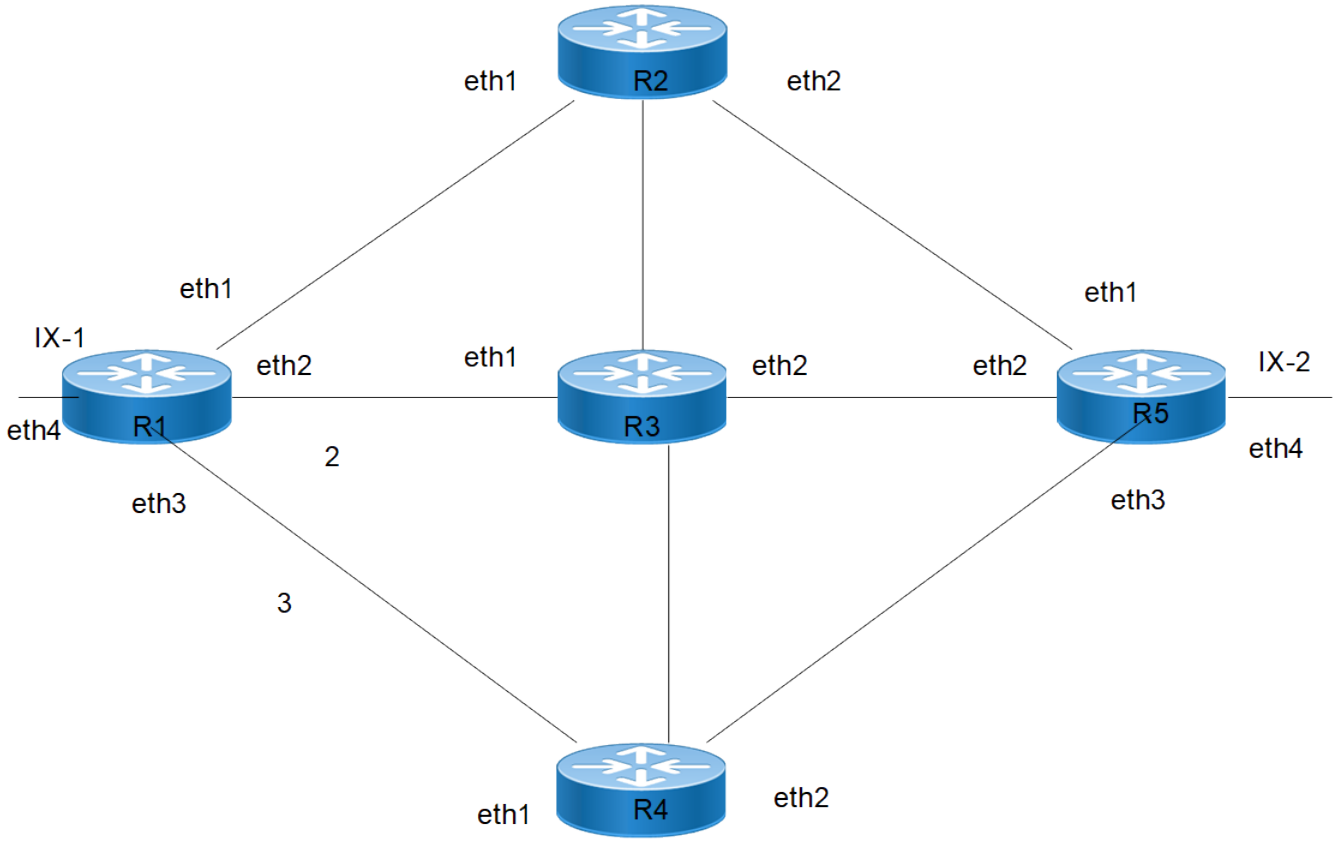
Policy Based Routing (PBR) is an advanced packet forwarding feature which is different from conventional destination address based routing. Policy Based Routing (PBR) allows data packets forwarding based on policies defined by network administrators.

In conventional routing, when a packet is received on the router, destination address in the packet is looked upon in the routing table and if the routing entry is found, packet is routed based on routing entry. In policy based routing, routing decision could be made from source address, destination address, transport protocol id, source port, destination port, or a combination of these criteria.

PBR includes a mechanism for selectively applying policies based on an access list or other criteria. Actions taken might include (a) Forwarding a packet to a directly connected ip nexthop (b) Black hole/Drop. If traffic doesn't match the route-map's match criteria, then it will be routed as if no PBR policy exists. PBR config is interface oriented, hence when applied it affects only the traffic ingressing on that interface. It does not apply on traffic egressing on that interface or traffic ingressing on an interface without a pbr route-map.

Topology

Figure 16. PBR Routing Toplogy



Configurations - PBR IPv4

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#feature pbr`	Enable PBR support
`R1(config)#hardware-profile filter ingress- ipv4-ext enable`	Enable Ingress IPv4 group extended for PBR support
`R1(config)#ip access-list 123`	Create ip access-list named 123
`R1(config-ip-acl)#10 permit any 101.1.1.0/24 201.1.1.0/24`	Create an access rule to permit IP packets with source 101.1.1.0/24 and destination 201.1.1.0/24
`R1(config-ip-acl)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-ip-acl)#exit`	Exit access-list mode
`R1(config)#route-map 123 permit 10`	Configure route-map with name 123 and sequence number 10
`R1(config-route-map)#match ip address 123`	Match ip address with ACL 123
`R1(config-route-map)#set ip next-hop 13.1.1.2`	Set next-hop to forward the matching IP packets
`R1(config-route-map)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-route-map)#exit`	Exit route-map mode
`R1(config)#interface lo`	Enter interface mode.
`R1(config-if)#ip address 1.1.1.1/32`	Configure the IP address of the interface.
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface eth1`	Enter interface mode.
`R1(config-if)#ip address 2.1.1.1/24`	Configure the IP address of the interface.
`R1(config)#interface eth2`	Enter interface mode.
`R1(config-if)#ip address 6.1.1.1/24`	Configure the IP address of the interface.
`R1(config-if)#ip ospf cost 2`	Configuring ospf cost as 2
`R1(config)#interface eth3`	Enter interface mode.
`R1(config-if)#ip address 13.1.1.1/24`	Configure the IP address of the interface.
`R1(config-if)#ip ospf cost 3`	Configuring ospf cost as 3
`R1(config)#interface eth4`	Enter interface mode.
`R1(config-if)#ip address 101.1.1.2/24`	Configure the IP address of the interface.
`R1(config-if)#ip policy route-map 123`	Attach PBR on the ingress interface
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#router ospf 1`	Set the routing process ID .
`R1(config-router)# ospf router-id 1.1.1.1`	Configure OSPF router-id

© 2026 IP Infusion Inc. Proprietary

`R1(config-router)#network 1.1.1.1/32 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)# network 2.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#network 6.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#network 13.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#network 101.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exit router mode.

R2

`R2#configure terminal`	Enter configure mode.
`R2(config)#interface lo`	Enter interface mode.
`R2(config-if)#ip address 2.2.2.2/32`	Configure the IP address of the interface.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface eth1`	Enter interface mode.
`R2(config-if)#ip address 2.1.1.2/24`	Configure the IP address of the interface.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface eth2`	Enter interface mode.
`R2(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#router ospf 1`	Set the routing process ID .
`R2(config-router)# ospf router-id 2.2.2.2`	Configure OSPF router-id
`R2(config-router)#network 2.2.2.2/32 area 0.0.0.0`	Configure OSPF network in area 0
`R2(config-router)# network 2.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R2(config-router)#network 10.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R2(config-router)#commit`	Commit the candidate configuration to the running configuration.
`R2(config-router)#exit`	Exit router mode.

R3

`R3#configure terminal`	Enter configure mode.
`R3(config)#interface lo`	Enter interface mode.
`R3(config-if)#ip address 3.3.3.3/32`	Configure the IP address of the interface.
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#interface eth1`	Enter interface mode.
`R3(config-if)#ip address 6.1.1.2/24`	Configure the IP address of the interface.

R3(config-if)#exit	Exit interface mode.
R3(config)#interface eth2	Enter interface mode.
R3(config-if)#ip address 12.1.1.1/24	Configure the IP address of the interface.
R3(config-if)#exit	Exit interface mode.
R3(config)#router ospf 1	Set the routing process ID .
R3(config-router)# ospf router-id 3.3.3.3	Configure OSPF router-id
R3(config-router)#network 3.3.3.3/32 area 0.0.0.0	Configure OSPF network in area 0
R3(config-router)# network 6.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R3(config-router)#network 12.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R3(config-router)#commit	Commit the candidate configuration to the running configuration.
R3(config-router)#exit	Exit router mode.

R4

R4#configure terminal	Enter configure mode.
R4(config)#interface lo	Enter interface mode.
R4(config-if)#ip address 4.4.4.4/32	Configure the IP address of the interface.
R4(config-if)#exit	Exit interface mode.
R4(config)#interface eth1	Enter interface mode.
R4(config-if)#ip address 13.1.1.2/24	Configure the IP address of the interface.
R4(config-if)#exit	Exit interface mode.
R4(config)#interface eth2	Enter interface mode.
R4(config-if)#ip address 15.1.1.1/24	Configure the IP address of the interface.
R4(config-if)#exit	Exit interface mode.
R4(config)#router ospf 1	Set the routing process ID .
R4(config-router)# ospf router-id 4.4.4.4	Configure OSPF router-id
R4(config-router)#network 4.4.4.4/32 area 0.0.0.0	Configure OSPF network in area 0
R4(config-router)# network 13.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R4(config-router)#network 15.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R4(config-router)#commit	Commit the candidate configuration to the running configuration.
R4(config-router)#exit	Exit router mode.

R5

R5#configure terminal	Enter configure mode.
R5(config)#interface lo	Enter interface mode.

R5(config-if)#ip address 5.5.5.5/32	Configure the IP address of the interface.
R5(config-if)#exit	Exit interface mode.
R5(config)#interface eth1	Enter interface mode.
R5(config-if)#ip address 10.1.1.2/24	Configure the IP address of the interface.
R4(config-if)#exit	Exit interface mode.
R5(config)#interface eth2	Enter interface mode.
R5(config-if)#ip address 12.1.1.1/24	Configure the IP address of the interface.
R5(config-if)#exit	Exit interface mode.
R5(config)#interface eth3	Enter interface mode.
R5(config-if)#ip address 15.1.1.2/24	Configure the IP address of the interface.

Configuration - PBR IPv6

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#feature pbr`	Enable PBR support
`R1(config)#hardware-profile filter ingress- ipv6 enable`	Enable Ingress IPv6 group for PBR support
`R1(config)# ipv6 access-list 123`	Create ipv6 access-list named 123
`R1(config-ipv6-acl)#10 permit any 101::/64 202::/64`	Create an access rule to permit IPv6 packets with source 101::/64 and destination 202::/64
`R1(config-ipv6-acl)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-ipv6-acl)#exit`	Exit access-list mode
`R1(config)#route-map 123 permit 10`	Configure route-map with name 123 and sequence number 10
`R1(config-route-map)# match ipv6 address 123`	Match ip address with ACL 123
`R1(config-route-map)#set ipv6 next-hop 6111::2`	Set next-hop to forward the matching IP packets
`R1(config-route-map)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-route-map)#exit`	Exit route-map mode
`R1(config)#interface lo`	Enter interface mode.
`R1(config-if)#ip address 1.1.1.1/32`	Configure the IPv6 address of the interface.
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#router ipv6 ospf 100`	Creating OSPFv3 routing instance
`R1(config-router)#exit`	Exit router mode.
`R1(config)#interface eth1`	Enter interface mode.
`R1(config-if)#ipv6 address 2111::1/64`	Configure the IPv6 address of the interface.
`R1(config-if)#ipv6 router ospf area 0.0.0.0 tag 100`	Enable OSPFv3 routing on an interface, and assign the Area ID 0.

© 2026 IP Infusion Inc. Proprietary

R1(config-if)#exit	Exit interface mode.
R1(config)#interface eth2	Enter interface mode.
R1(config-if)#ipv6 address 6111::1/64	Configure the IPv6 address of the interface.
R1(config-if)#ipv6 router ospf area 0.0.0.0 tag 100	Enable OSPFv3 routing on an interface, and assign the Area ID 0.
R1(config-if)# ipv6 ospf cost 2	Configuring ospf cost as 2
R1(config-if)#exit	Exit interface mode.
R1(config)#interface eth3	Enter interface mode.
R1(config-if)#ipv6 address 1311::1/64	Configure the IPv6 address of the interface.
R1(config-if)#ipv6 router ospf area 0.0.0.0 tag 100	Enable OSPFv3 routing on an interface, and assign the Area ID 0.
R1(config-if)# ipv6 ospf cost 3	Configuring ospf cost as 3
R1(config-if)#exit	Exit interface mode.
R1(config)#interface eth4	Enter interface mode.
R1(config-if)#ipv6 router ospf area 0.0.0.0 tag 100	Enable OSPFv3 routing on an interface, and assign the Area ID 0.
R1(config-if)#ipv6 address 101::2/64	Configure the IPv6 address of the interface.
R1(config-if)#ipv6 policy route-map 123	Attach PBR on the ingress interface
R1(config-if)#commit	Commit the candidate configuration to the running configuration.
R1(config-if)#exit	Exit interface mode.

R2

R2#configure terminal	Enter configure mode.
R2(config)#interface lo	Enter interface mode.
R2(config-if)#ip address 2.2.2.2/32	Configure the IPv6 address of the interface.
R2(config-if)#exit	Exit interface mode.
R2(config)#router ipv6 ospf 100	Creating OSPFv3 routing instance
R2(config-router)#exit	Exit router mode.
R2(config)#interface eth1	Enter interface mode.
R2(config-if)#ipv6 address 2111::2/64	Configure the IPv6 address of the interface.
R2(config-if)#ipv6 router ospf area 0.0.0.0 tag 100	Enable OSPFv3 routing on an interface, and assign the Area ID 0.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface eth2	Enter interface mode.
R2(config-if)#ipv6 address 1011::1/64	Configure the IPv6 address of the interface.
R2(config-if)#ipv6 router ospf area 0.0.0.0 tag 100	Enable OSPFv3 routing on an interface, and assign the Area ID 0.

PBR with Nexthop Tracking

Policy-Based Routing (PBR) with Next-Hop Tracking is a networking feature designed to increase routing resiliency and efficiency by dynamically tracking the availability of the next-hop IP address associated with a PBR policy. When a next-hop IP address becomes unreachable, the system typically waits for the ARP entry to expire before switching traffic to an alternative route, resulting in dropped traffic during this delay. This feature addresses the issue by enabling faster traffic redirection, minimizing disruptions and improving network reliability.

Policy-Based Routing (PBR) can be configured with a tracker-enabled next hop by using the optional tracking argument in the set nexthop command. When the tracker's state changes to UP, the tracker-enabled next hop is installed in hardware. If the tracker's state goes DOWN, the tracker-enabled next hop is removed—provided it is currently active—and PBR automatically reroutes traffic based on the policy’s fallback configuration.

It is important to note that these dynamic state changes do not affect the output of the show running-config command, which remains static regardless of the tracker's status.

Modify the R1 configuration to enable nexthop tracking. All other configurations will remain unchanged.

IPv4 Configurations for PBR with Nexthop Tracking

R1

`#configure terminal Enter`	configure mode.
`R1(config)#feature pbr`	Enable PBR support
`R1(config)#hardware-profile filter ingress- ipv4-ext enable`	Enable Ingress IPv4 group extended for PBR support
`R1(config)#ip access-list 123`	Create ip access-list named 123
`R1(config-ip-acl)#10 permit any 101.1.1.0/24 201.1.1.0/24`	Create an access rule to permit IP packets with source 101.1.1.0/24 and destination 201.1.1.0/24
`R1(config-ip-acl)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-ip-acl)#exit`	Exit access-list mode
`R1(config)#time-range tr1`	Configure a time-range.
`R1(config-tr)#start-time 11:22 3 july 2025`	Configure a start-time.
`R1(config-tr)#end-time after 200`	Configure end-time.
`R1(config-tr)#exit`	Exit time-range mode.
`R1(config)#ip sla 7`	Configure IP SLA with a unique number.
`R1(config-ip-sla)#icmp-echo ipv4 13.1.1.2 source-interface eth3`	Configure the ICMP-echo using destination IPv4 address and source interface name.
`R1(config-ip-sla-echo)#threshold 1000`	Configure the threshold value.
`R1(config-ip-sla-echo)#timeout 1000`	Configure the timeout value.
`R1(config-ip-sla-echo)#frequency 5`	Configure the frequency value.
`R1(config-ip-sla-echo)#exit`	Exit IP SLA echo mode.

© 2026 IP Infusion Inc. Proprietary

`R1(config-ip-sla)#exit`	Exit IP SLA mode.
`R1(config)#ip sla schedule 7 time-range tr1`	Schedule an IP SLA measurement.
`R1(config)#track 7 ip sla 7 reachability`	Configure the track ID for IP SLA.
`R1(config-object-track)#exit`	Exit object track mode.
`R1(config)#route-map 123 permit 10`	Configure route-map with name 123 and sequence number 10
`R1(config-route-map)#match ip address 123`	Match ip address with ACL 123
`R1(config-route-map)#set ip next-hop 13.1.1.2 verify-availability track 7`	Set next-hop to forward the matching IP packets, enable tracking for nexthop 13.1.1.2
`R1(config-route-map)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-route-map)#exit`	Exit route-map mode
`R1(config)#interface lo`	Enter interface mode.
`R1(config-if)#ip address 1.1.1.1/32`	Configure the IP address of the interface.
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface eth1`	Enter interface mode.
`R1(config-if)#ip address 2.1.1.1/24`	Configure the IP address of the interface.
`R1(config)#interface eth2`	Enter interface mode.
`R1(config-if)#ip address 6.1.1.1/24`	Configure the IP address of the interface.
`R1(config-if)#ip ospf cost 2`	Configuring ospf cost as 2
`R1(config)#interface eth3`	Enter interface mode.
`R1(config-if)#ip address 13.1.1.1/24`	Configure the IP address of the interface.
`R1(config-if)#ip ospf cost 3`	Configuring ospf cost as 3
`R1(config)#interface eth4`	Enter interface mode.
`R1(config-if)#ip address 101.1.1.2/24`	Configure the IP address of the interface.
`R1(config-if)#ip policy route-map 123`	Attach PBR on the ingress interface
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#router ospf 1`	Set the routing process ID .
`R1(config-router)# ospf router-id 1.1.1.1`	Configure OSPF router-id
`R1(config-router)#network 1.1.1.1/32 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)# network 2.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#network 6.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#network 13.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#network 101.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R1(config-router)#commit`	Commit the candidate configuration to the running configuration.
`R1(config-router)#exit`	Exit router mode.

TOS based Queue Distribution Configuration

This feature allows both type of configuration (precedence or DSCP). Before the implementation of this feature only allows DSCP profiles.The most significant three bits of the DSCP are Class Selector bits, which provides backward compatibility with ip precedence.

We will utilize these DSCP bits to set Precedence. For example when user configure Precedence 101 in CLI, we just need to convert this value to DSCPs(101000 ~ 101111), then normally set the DSCP.

Indicate the standards to be imposed or other all-embracing blanket requirements.

On the basis of already existing DSCP profiles, new precedence profiles are introducing as qos map-profile in this section.

The working on these precedence profile is similar to that of DSCP but now we can permit both the configurations according to our requirement.

There are 2 Qos-map Precedence profiles introduced:

- Precedence-to-queue
- Precedence-to-precedence

Precedence-to-queue

This is an ingress profile similar to dscp-to-queue. This profile will map precedence value 0-7 to queue 0-7.

Topology

Figure 17. Precedence-to-queue topology

Configuration

Basic configuration

`#configure terminal`	Enter configure mode
`(config)#enable qos`	Enable Qos
`(config)#exit`	Exit configure mode
`(config)# qos profile precedence-to-queue Prec1_que1`	Configure qos-map profile precedence-to-queue with Profile name as Prece1_que1
`(config-ingress-prec-map)# precedence 1 queue 2`	Configure mapping of prece 1 to queue 2, so that traffic with precedence 1 should take queue as q2
`(config)#exit`	Exit configure mode
`(config)# interface xe1`	Configure ingress interface xe1
`(config-if)#qos map-profile precedence-to-queue Prec1_que1`	Map the profile Prec1_que1 to interface xe1 so that ingress traffic hitting the xe1 interface with prece as 1 should take queue q2

© 2026 IP Infusion Inc. Proprietary

(config-if)#commit	Commit the configuration
(config-if)#end	Exit the configuration.

Validation

```
#show run int xe1
!
interface xe1
 qos map-profile precedence-to-queue Prec1_que1
!

#show qos-profile type precedence-to-queue
profile name: Prec1_que1
profile type: precedence-to-queue
profile attached to 1 instances
configured mapping:
 precedence 1 queue 2
 Detailed mapping:
 -------+------------------
  INPUT |    OUTPUT
 -------+------------------
  PREC  | Queue | Out PREC
 -------+-------+----------
  0       0       0
  1       1       2
  2       2       0
  3       3       0
  4       4       0
  5       5       0
  6       6       0
  7       7       0

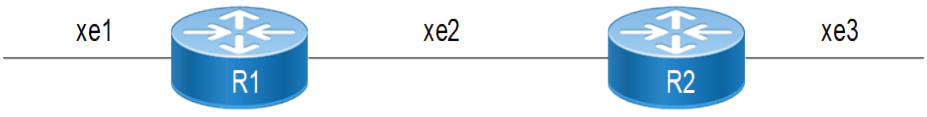
R1#show run qos
qos enable
!
qos profile precedence-to-queue Prec1_que1
 precedence 1 queue 2
!
interface xe1
 qos map-profile precedence-to-queue Prec1_que1
!
```

Precedence-to-precedence

This is an egress profile similar to dscp-to-dscp. This profile will map precedence value 0-7 to precedence value 0-7. It will change the egress queue according to new mapped precedence value.

Topology

Figure 18. Precedence-to-precedence topology



Basic configuration

`#configure terminal`	Enter configure mode
`(config)#enable qos`	Enable Qos
`(config)#exit`	Exit configure mode
`(config)# qos profile precedence-to-precedence prec_prec2`	Configure qos-map profile precedence-to-precedence with Profile name as prec_prec2
`(config-ingress-prec-map)# precedence 2 precedence 5`	Configure mapping of prece 2 to precedence 5, so that traffic with precedence 2 should remark to precedence 5 and should take corresponding queue q5 on next router
`(config)#exit`	Exit configure mode
`(config)# interface xe2`	Configure ingress interface xe2
`(config-if)#qos map-profile precedence-to-queue prec_prec2`	Map the profile prec_prec2 to egress interface xe2 of 1st node.
`(config-if)#commit`	Commit the configuration
`(config-if)#end`	Exit the configuration.

Validation

  6       6
  7       7
```

Internet Protocol SLA Configuration

The Internet Protocol Service Level Agreement (IP SLA) is an active method for monitoring and reliably reporting network performance. The term "active" refers to IP SLA's ability to generate and actively monitor traffic across the network on a continuous basis. An IP SLA Router is capable of generating traffic and providing real-time reporting.

IP SLA configuration consists of two components: the IP SLA router, which generates traffic, and the IP SLA Responder, which can be any device, not limited to just routers. While the IP SLA Responder is not mandatory for IP SLA functionality, it enhances the ability to gather more detailed information and generate more comprehensive reports.

Once IP SLA operations are configured, scheduling the operation is required to start capturing statistics and collecting error data. The operation can be scheduled to start immediately or at a specified month, day, and hour. A "pending" option is also available to schedule the operation for a later time. This "pending" state is visible through SNMP and is utilized when an operation is designed to be triggered by a certain threshold.

You can schedule a single IP SLA operation or a group of operations to start at once.

Note: IP SLA sessions on Edgecore AS7316-26XB switches are limited to 500 sessions. This limit may vary depending on the device's capacity and performance.

Topology

Figure 19. IP SLA Topology

Configuration

Configure IP Address

Configure the IP addresses on the PE-1, P routers.

PE-1

`#configure terminal`	Enter configure mode.
`(config)#interface xe1`	Specify the interface (xe1) to be configured.
`(config-if)#ip address 10.1.1.1/24`	Set the IP address of the interface to 10.1.1.1/24.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

P

`#configure terminal`	Enter configure mode.

© 2026 IP Infusion Inc. Proprietary

`(config)#interface xe1`	Specify the interface (xe1) to be configured.
`(config-if)#ip address 10.1.1.2/24`	Set the IP address of the interface to 10.1.1.2/24.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration

Configure IP SLA Configurations on PE 1 router

PE-1

`#configure terminal`	Enter configure mode.
`(config)#ip sla <1-65535>`	configure IP SLA with a unique no
`(config-ip-sla)# icmp-echo ipv4<destination IP> source-interface <interface name>`	configure the icmp-echo using destination Ip Address and source interface name
`(config-ip-sla-echo)#threshold <1000-60000>`	Configure the threshold value
`(config-ip-sla-echo)#timeout <1000-60000>`	Configure the Timeout value
`(config-ip-sla-echo)#frequency <1-60>`	Configure the frequency value
`(config-ip-sla-echo)#exit`	Exit icmp-echo mode
`(config-ip-sla)#exit`	Exit from IP SLA mode
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#time-range <1-60 characters>`	configure a time-range
`(config-tr)#start-time 11:22 3 july 2021`	configure a start-time
`(config-tr)#end-time after 200`	Configure end-time
`(config-tr)#frequency hourly`	configure frequency
`(config-tr)#exit`	exit from time-range
`(config)#ip sla schedule <1-65535> time-range echo_schedule`	Schedule a IP SLA measurement
`(config)#commit`	Commit the candidate configuration to the running configuration

Validation

PE-1

EVPN AF Route-Maps and Route Filtering

Overview

The EVPN AF Route-Maps and Route Filtering feature extends the existing route-map framework to the L2VPN EVPN address family in BGP. It allows users to filter, modify, or manage EVPN routes exchanged between BGP peers.

A route-map defines the criteria to match specific route attributes and actions to set or modify those attributes. Route-maps can be applied in the incoming (IN) or outgoing (OUT) direction on a BGP neighbor or peer group.

- OUT direction: Processes EVPN routes before BGP advertises them.
- IN direction: Processes routes after BGP receives them.

The framework introduces EVPN-specific match conditions, such as route type and MAC lists, enabling precise control over route propagation and reducing control-plane overhead in large BGP-EVPN networks.

Feature Characteristics

- Supports route-map configuration under the L2VPN EVPN address family.
- Applies route-maps in both IN and OUT directions.
- Integrates with the existing route-map framework with EVPN extensions.
- Supports numbered and unnumbered L2VPN modes.
- Evaluates routes using match and set conditions.
- Adds EVPN-specific match capabilities:
  - match evpn-route-type : Type-1 to Type-5, MAC-only, MAC-IP routes.
- Match mac-list : Permit or deny specific MAC addresses.
- Supports standard BGP route-map matches like ASpath, next-hop, route-target and other match options.
- Controls route propagation direction and scope.
- Reduces unnecessary route advertisements across spines, leaves, and superspines.

Benefits

- Provides granular EVPN route control.
- Allows selective advertisement, acceptance, or rejection of routes.
- Enhances scalability and performance by reducing redundant updates.
- Simplifies multi-tenant isolation via communities or route-targets.
- Ensures consistent configuration across IPv4, IPv6, and EVPN AFs.
- Reduces control-plane load and processing time for operational efficiency.

Prerequisites

Before configuring EVPN AF Route-Maps and Route Filtering, ensure the following conditions are met:

© 2026 IP Infusion Inc. Proprietary

- BGP EVPN Setup:
  - BGP sessions between all relevant PEs, RRs, and leaf/spine nodes must be established.
  - The L2VPN EVPN address family must be enabled on all participating BGP neighbors.

Limitation

- The set option is not supported for import-map in VRF configurations.
- The AIGP path attribute is not supported for EVPN address-family routes. Therefore, when configuring a neighbor route map under the EVPN address family or a route map used in a VRF export map, the **`set aigp-metric <>`** command is not applicable to EVPN routes.
- Under route-map configuration, **`set ip nexthop`** is not supported for EVPN address family routes.

Configuration

This section describes the configuration of EVPN Address Family (AF) with route filtering using route-maps on PE routers.

Route-maps are applied in the EVPN AF to control route import or export policies and to modify all the supported attributes.

Topology

The topology illustrates an EVPN network using MPLS underlay and BGP control plane for end-to-end connectivity between CE1 and CE2.

Figure 20. EVPN AF Route Map

PE1 and PE3 function as Provider Edge routers participating in EVPN BGP sessions, while RR acts as the Route Reflector to distribute EVPN routes between them.

PE1–RR uses LDP with OSPF, and RR–PE3 uses RSVP with ISIS for MPLS transport. BGP Labeled Unicast (BGP-LU) establishes end-to-end label distribution between PEs.

Route-maps are applied for route control:

- PE1 applies an OUT route-map for route advertisement.
- RR applies an IN route-map for route reflection.
- PE3 applies an IN route-map for route import and CE2 advertisement.

Traffic from CE1 to CE2 traverses the MPLS core, with BGP EVPN managing MAC and IP route exchange between PEs.

Router or Node Configuration Steps

Perform the following configuration steps to apply route-maps under the BGP EVPN address family, enabling selective advertisement and acceptance of EVPN routes between peers.

Note: Before configuration meet all Prerequisites (page 261).

1. Configure MAC Access List on PE1.
   Define a MAC access list to restrict specific MAC addresses from being advertised through EVPN.

```
mac-list mac_list1
 seq 10 deny 6821.5f1f.5220 ffff.ffff.ffff
 seq 20 permit 0000.0000.0000 0000.0000.0000
```

2. Configure Outbound Route-Map on PE1.
   a. Define a route-map named **`rm_evpn_out`** to control the EVPN route advertisement.
   b. Match different EVPN route types and set appropriate BGP attributes for each type.

```
route-map rm_evpn_out permit 10
 match evpn-route-type type-1
 set local-preference 200
 set community 65000:100 additive

route-map rm_evpn_out permit 20
 match evpn-route-type type-2
 match mac address list mac_list1
 set local-preference 150
 set metric 50
 set community 65000:200 additive

route-map rm_evpn_out permit 30
 match evpn-route-type type-3
 set local-preference 100
 set origin igp
 set community 65000:300 additive

route-map rm_evpn_out permit 1000
```

   c. Apply the route-map to the BGP EVPN address family for outbound updates to the Route Reflector.

```
router bgp 65000
 address-family l2vpn evpn
  neighbor 3.3.3.3 activate
  neighbor 3.3.3.3 route-map rm_evpn_out out
 exit-address-family
```

3. Configure Inbound Route-Map on PE3.
   a. Create a route-map named **`rm_evpn_in`** to control inbound EVPN route processing.
   b. Match specific EVPN route types and adjust route selection parameters.

```
route-map rm_evpn_in permit 10
 match evpn-route-type type-1
 set weight 200
```

   c. Apply the route-map to the BGP EVPN address family for inbound routes from the Route Reflector.

```
router bgp 65000
 address-family l2vpn evpn
  neighbor 3.3.3.3 activate
  neighbor 3.3.3.3 route-map rm_evpn_in in
 exit-address-family
```

4. Configure the RR for EVPN.
   a. Enable EVPN under the BGP configuration.
   b. Configure both PE1 and PE3 as route-reflector clients.
   c. Activate the EVPN address family for both peers.

```
router bgp 65000
 bgp router-id 3.3.3.3
 address-family l2vpn evpn
```

© 2026 IP Infusion Inc. Proprietary

```
   neighbor 1.1.1.1 activate
   neighbor 1.1.1.1 route-reflector-client
   neighbor 5.5.5.5 activate
   neighbor 5.5.5.5 route-reflector-client
  exit-address-family
```

Validation

- Verify BGP Neighbor Status.

```

Implementation Examples

- EVPN Route Control Between Leaf and Spine Nodes : Leaf nodes may advertise routes that other spines do not require. You can apply a route-map to filter those routes based on AS numbers or route types.
- Community-Based Route Filtering: When VRF routes are redistributed into EVPN, you can tag them with specific communities and use route-maps to advertise only selected routes.

Commands

The EVPN AF route-maps and route filtering feature introduces the following commands:

mac-list

Use this command to create a new MAC list that specifies MAC addresses with an associated mask and defines an action (permit or deny).

Use the **no** parameter of this command to unconfigure.

Command Syntax

Mac List:

```
mac-list WORD

no mac-list WORD
```

Mac list entry:

```
permit/deny XXXX.XXXX.XXXX XXXX.XXXX.XXXX

no permit/deny XXXX.XXXX.XXXX XXXX.XXXX.XXXX
```

Parameters

mac-list
Build a MAC list

WORD
Name of MAC list

Permit
Permits the MAC Address (XXXX.XXXX.XXXX) in HHHH.HHHH.HHHH format

Deny
Denies the MAC Address (XXXX.XXXX.XXXX) in HHHH.HHHH.HHHH format

Default

None

Command Mode

Configure mode and Mac-list mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example illustrates how to specifies MAC addresses with an associated mask and defines an action (permit or deny):

```
ocnos#configure terminal
ocnos(config)#mac-list mlist1
ocnos(config-mac-list)permit 1111.1111.3322 1100.0011.0000
```

© 2026 IP Infusion Inc. Proprietary

match mac address list

Use this command to match a mac address list.

Use the **no** parameter of this command to turn off the matching.

Command Syntax

```
match mac address list WORD

no match mac address list WORD
```

Parameters

WORD

Defines the MAC list name

Default

None

Command Mode

Router Map mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example illustrates how to match a mac address list:

```
R1#configure terminal
R1(config)#route-map rmap1 permit 10
R1(config-route-map)# match mac address list mlist1
```

© 2026 IP Infusion Inc. Proprietary

match evpn-route-type

Use this command to match an EVPN route by its route type. The supported route types are: **`type-1`**, **`type-2`**, **`type-3`**, **`type-4`**, **`type-5`**, **`type-2-MAC-IP`**, and **`type-2-MAC-ONLY`**.

Use the `no` parameter of this command to turn off the matching.

Command Syntax

```
match evpn-route-type (type-1|type-2|type-3|type-4|type-5|type-2-MAC-IP|type-2-MAC-ONLY|)

no match evpn-route-type (type-1|type-2|type-3|type-4|type-5|type-2-MAC-IP|type-2-MAC-ONLY|)
```

Parameters

type-1
Matches Ethernet Auto-Discovery (AD) routes

type-2
Matches both MAC-only and MAC/IP advertisement routes

type-2-MAC-IP
Matches MAC/IP advertisement routes

type-2-MAC-ONLY
Matches MAC-only advertisement routes

type-3
Matches Multicast Ethernet Tag (MET) routes

type-4
Matches Ethernet Segment Identifier (ESI) routes

type-5
Matches IP Prefix routes

Default

None

Command Mode

Router Map mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example illustrates how to match an EVPN route by its route type:

```
R1#configure terminal
R1(config)#route-map rmap1 permit 10
R1(config-route-map)# match evpn-route-type type-2
```

© 2026 IP Infusion Inc. Proprietary

show mac-list

Use this command to view the detailed information about a specific mac-list.

Command Syntax

```
show mac-list detail WORD
```

Parameters

WORD

Specifies the name of the MAC list for which detailed information is to be displayed.

Default

None

Command Mode

Privileged execution mode

Applicability

Introduced in OcNOS version 7.0.0.

Example

The following example illustrates how to view the detailed information about a specific mac-list:

```
ocnos#show mac-list detail mlist1
mac-list mlist1:
   count: 2, sequences: 3 - 5
    ripd:
    ripngd:
    ospfd:
    ospf6d:
    ldpd:
    bgpd:
     seq 3 permit  0000.aaaa.bbbb ffff.ffff.ffff (hit count: 10, refcount: 21)
     seq 5 deny  0000.ccaa.bbbb ffff.ffff.ffff (hit count: 1, refcount: 2)
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
Address Family Identifier / Subsequent AFI (AFI/SAFI)	Specifies network layer protocol and route type.
Border Gateway Protocol (BGP)	Routing protocol used to exchange routing information across autonomous systems.
Ethernet VPN (EVPN)	BGP-based control plane for Ethernet multipoint services.

show running-config urpf 315
show running-config vrf 316
snmp restart rib 317

© 2026 IP Infusion Inc. Proprietary

automatic-router-id-selection enable

Use this command to assure that OcNOS selects the loopback IP address as the router-id each time the device is rebooted.

Use the `no` form of this command to remove this constraint.

Command Syntax

```
automatic-router-id-selection enable
no automatic-router-id-selection enable
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# automatic-router-id-selection enable
(config)#
```

© 2026 IP Infusion Inc. Proprietary

clear ip route

Use this command to clear an all IPv4 routes or any specific prefix routes.

Command Syntax

```
clear ip route (*|A.B.C.D/M)
```

Parameters

*****
Clears all routes

A.B.C.D/M
Prefix to be cleared

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip route *
#clear ip route 1.1.1.0/24
```

© 2026 IP Infusion Inc. Proprietary

clear ip route kernel

Use this command to clear stale IPv4 routes from the RIB (Routing Information Base) and FIB (Forwarding Information Base).

Command Syntax

```
clear ip route kernel
clear ip kernel route
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip route kernel
```

© 2026 IP Infusion Inc. Proprietary

clear ip route vrf

Use this command to clear all IPv4 VRF route or any specific prefix VRF route of any particular VRF name.

Command Syntax

```
clear ip route vrf NAME (*|A.B.C.D/M)
```

Parameters

NAME
VPN Routing or Forwarding instance name

*****
Clears all routes

A.B.C.D/M
Prefix to be cleared

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip route vrf myVRF *
```

clear router-id

Use this command to clear the current Router-Id and trigger the Router-Id calculation again. The new Router-id is sent to all protocol modules.

- To clear only the router-id for the default VRF, enter `clear router-id`.
- To clear the router-id for a particular VRF, enter `clear router-id vrf VRFNAME`.
- To clear the router-id for all VRFs, enter `clear router-id vrf`.

Note: Router-ID is non-preventive and changes at the routing protocol level or removal/modification of the address used for router-ID selection are not automatically reflected. The system retains the previously selected router-ID, use the `clear router-id` command to force re-selection.

Command Syntax

```
clear router-id (vrf (VRFNAME|))
```

Parameters

VRFNAME
VPN routing/forwarding instance name.

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear router-id
#clear router-id vrf
```

© 2026 IP Infusion Inc. Proprietary

debug rib

Use this command to debug the `ribd` process.

Use the `no` form of this command to stop debugging.

Command Syntax

```
debug rib (all|)
debug rib events
debug rib packet (recv|send|) (detail|)
debug rib nsm
debug rib bfd
debug rib kernel
debug rib monitor
debug ip routing (add-route|delete-route|mod-route|
no debug all
no debug rib (all|)
no debug all rib
no debug rib events
no debug rib packet (recv|send|) (detail|)
no debug rib nsm
no debug rib bfd
no debug rib kernel
no debug rib monitor
no debug ip routing (add-route|delete-route|mod-route|)
```

Parameters

all
All debugging functions

events
Events

packet
Packet events

recv
Received packets

send
Sent packets

detail
Detailed information

nsm
NSM events

kernel
RIB kernel

monitor
Enable Monitor route netlink

bfd
BFD (Bidirectional Forwarding Detection) events

ip routing
IPv4 routing events

© 2026 IP Infusion Inc. Proprietary

add-route
Add route events

delete-route
Delete route events

mod-route
Modify route events

Disabled

By default, debug command is disabled.

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# debug rib all
```

description

Use this command to assign a description to a Virtual Router instance.

Use the `no` parameter to remove a description.

Command Syntax

```
description LINE
no description
```

Parameters

LINE

Virtual Router description maximum 80 characters

Disabled

By default, description command is disabled

Command Mode

Virtual-router instance mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#virtual-router VR1
(config-vr)#description VR1 has been created for CLI testing
(config-vr)#exit

(config)#virtual-router VR1
(config-vr)#no description
(config-vr)#exit
```

© 2026 IP Infusion Inc. Proprietary

fib retain

Use this command to set the retention time for stale routes in the Forwarding Information Base (FIB) when `ribd` restarts. The `ribd` process reads the FIB and treats previously self-installed routes as stale.

You can display stale routes by running the `show ip route database` command. All routes preceded by the symbol `p` are stale routes. When protocol modules restart, `ribd` overrides these stale routes with routes updated by the protocol modules.

Below table show the behavior of routes when `ribd` stops.

Table 8. FIB retention

Command	Behavior
`fib retain`	Does not clear routes from the FIB and retains stale routes for 60 seconds when restarted.
`fib retain forever`	Does not clear routes and retains stale routes forever.
`fib retain time <1-65535>`	Does not clear routes and retains stale routes for the specified seconds.
`no fib retain` (default)	Cleans up routes in the FIB, but retains stale routes for 60 seconds when restarted.

You can remove stale routes at any time with the clear ip route kernel (page 282) command.

Use the `no` form of this command to revert to default; that is, do not retain routes in the FIB when `ribd` stops.

Command Syntax

```
fib retain (forever|time <1-65535>|)
no fib retain (forever|time <1-65535>|)
```

Parameters

`forever`
Retain FIB forever

time
Retain FIB for a time after `ribd` restarts

<1-65535>
Retention time in seconds; if you omit this value, the default is 60 seconds

Default

Routes are cleared from the FIB when `ribd` stops. However, when `ribd` restarts, stale routes are retained for 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

```
#configure terminal
(config)#fib retain time 180
```

© 2026 IP Infusion Inc. Proprietary

ip route

Use this command to create an IPv4 static route.

Use the `no` form of this command to delete a static route.

Note: Equal-Cost Multi-Path (ECMP) static routes with one next-hop residing in a local Virtual Routing and Forwarding (VRF) instance while the other next-hop is in an inter-VRF are not supported. Additionally, ECMP static routes within an Inter-VRF (IVRF) are not supported.

Command Syntax

```
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME (<1-255>|) (tag <0-4294967295>|) (track <1-
500>|) (description LINE|)
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D (<1-255>|) (tag <0-4294967295>|) (track <1-
500>|) (recursive|) (description LINE|)
ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME (<1-255>|) (tag <0-4294967295>|)
(track <1-500>|) (recursive|) (description LINE|)
ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME global (track <1-500>|) (recursive|)
ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME global (track <1-500>|)
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME {<1-255>|tag <0-4294967295>|track <1-
500>|description LINE}
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D {<1-255>|tag <0-4294967295>|track <1-
500>|recursive|description LINE}
no ip route (vrf NAME|) (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME {<1-255>|tag <0-4294967295>|track
<1-500>|recursive|description LINE}
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME global
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) A.B.C.D IFNAME global {track <1-500>|recursive}
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME global
no ip route vrf NAME (A.B.C.D/M|A.B.C.D A.B.C.D) IFNAME global (track <1-500>|)
```

Parameters

vrf NAME
Specifies the user-defined VRF instance name.

A.B.C.D/M
Denotes the subnet by specifying the IP address destination prefix along with a mask length.

A.B.C.D A.B.C.D
Specifies the subnet with an IP destination address and its corresponding mask.

A.B.C.D
Specifies the gateway's next-hop IPv4 address.

IFNAME
Specifies the gateway's next-hop interface name.

global
Global table lookup (to support inter-VRF static route leaking).

<1-255>
Specifies the administrative distance value.

© 2026 IP Infusion Inc. Proprietary

track <1-500>
Associates a tracking ID with an IPv4 static route for the tracked object.

description LINE
Adds a description to the static route, with a maximum character limit of 80.

tag <0-4294967295>
Assigns a tag value to the route, which can be used as a “match” value to control route redistribution through route maps.

recursive
Enables recursive lookup behavior for the next-hop in each static route. By default, it is disabled.

Default

None

Command Mode

Configure mode

Applicability

The command was introduced before OcNOS version 1.3 and was updated in OcNOS version 1.3.4. Introduced new parameters `track <1-500>` in OcNOS version 5.1 and `recursive` in OcNOS version 6.6.0.

Examples

```
#configure terminal
(config)#ip route 192.168.3.0 255.255.255.0 2.2.2.2 128
(config)#ip route 1.1.1.0/24 eth0 32
(config)#ip route vrf new 1.1.1.1/1 1.1.1.1 eth1 description new tag 1
(config)# ip route 40.1.1.0/24 eth1 track 10
(config)#commit

(config)#no ip route 40.1.1.0/24 eth1 track 10
(config)#commit
```

This example creates VRF static routes with the nexthops belonging to the default VRF. The nexthop gateway address can be the IFNAME network address or any other IP address reachable via IFNAME.

```
#show ip route vrf

ip route vrf

Use this command to configure a tracking-id to ipv4 static route in non-default vrf.

Use the `no` form of this command to delete the tracking id

Command Syntax

```
ip route vrf <vrf-name> A.B.C.D/M (A.B.C.D|IFNAME){<track <1-500>}
```

Parameters

vrf-name
Vrf name

A.B.C.D/M
Destination prefix with subnet in ipv4 format

A.B.C.D
Gateway address in ipv4 format

IFNAME
Gateway address in interface name format

<1-500>
Identifier for the tracked object

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.1.

Example

```
#configure terminal
(config)# ip route vrf vrf1 40.1.1.0/24 eth1 track 10
(config-object-track)#commit

(config)#no ip route vrf vrf1 40.1.1.0/24 eth1 track 10
(config)#commit
```

© 2026 IP Infusion Inc. Proprietary

ip urpf allow-default

Use this command to enable default route check for uRPF mode.

Use `no` form of this command to disable default route check for uRPF mode.

Command Syntax

This command applies only to Qumran platforms.

```
ip urpf allow-default
no ip urpf allow-default
```

Parameter

None

Default

By default, uRPF mode on the system is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip urpf allow-default

(config)#no ip urpf allow-default
```

© 2026 IP Infusion Inc. Proprietary

ip urpf enable

Use this command to enable uRPF mode on the system.

Use the `no` form of the command to disable uRPF mode on this system.

Note: The configuration is applied only after a reboot.

Command Syntax

```
ip urpf enable
no ip urpf enable
```

Parameter

None

Default

By default, uRPF mode on the system is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip urpf enable
% System Reboot is required for new URPF configurations to take effect

(config)#no ip urpf enable
% System Reboot is required for new URPF configurations to take effect
```

© 2026 IP Infusion Inc. Proprietary

ip verify unicast source reachable-via

Use this command to configure Unicast Reverse Path Forwarding with source-specific reachability on the interface level.

Use the `no` form of the command to disable Unicast Reverse Path Forwarding with source-specific reachability on the interface level.

Command Syntax

```
ip verify unicast source reachable-via (any | rx )
no ip verify unicast source reachable-via
```

Parameters

any
Source is reachable via any interface

rx
Source is reachable via an interface on which packet was received

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 6.0.0

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#ip verify unicast source reachable-via any
(config-if)#ip verify unicast source reachable-via rx
(config-if)#no ip verify unicast source reachable-via
```

ip vrf

This command creates a user-defined VRF (Virtual Routing and Forwarding) RIB (Routing Information Base), assigns a VRF identifier, and switches to VRF mode.

Use the `no` parameter with command to remove a VRF RIB.

Note: On configuration of user-defined VRF with `ip vrf WORD` CLI, `lo.WORD` interface configuration will not be displayed in `show running-config` even though `lo.WORD` interface, default IPv4 address and default IPv6 address are present in system. To display the `interface lo.WORD`, `ip address 127.0.0.1/8` and `ipv6 address ::1/128` configurations in show running configuration user needs to explicitly configure the same from CLI. This is due to a restriction with scaled VRF configurations in a single commit.

Command Syntax

```
ip vrf WORD
no ip vrf WORD
```

Parameter

WORD
VRF identifier

Default

By default, no user-defined VRFs exist, only the default VRF.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip vrf myVRF
(config-vrf)#
```

ipv6 route

Use this command to create an IPv6 static route.

Use the no form of this command to delete a static route

Note: Using an interface name as the gateway next-hop for an IPv6 static route is not supported.

Command Syntax

```
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME (<1-255>|) (track <1-500>|) (description
LINE|)
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X (<1-255>|) (track <1-500>|)
(recursive|) (description LINE|)
ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME (<1-255>|) (track <1-500>|)
(recursive|) (description LINE|)
ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME global (track <1-500>|)
(recursive|)
ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME global (track <1-500>|)
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME {<1-255>|track <1-500>|description
LINE}
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X {<1-255>|track <1-
500>|recursive|description LINE}
no ipv6 route (vrf NAME|) (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME {<1-255>|track <1-
500>|recursive|description LINE}
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME global
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) X:X::X:X IFNAME global {track <1-
500>|recursive}
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME global
no ipv6 route vrf NAME (X:X::X:X/M|X:X::X:X X:X::X:X) IFNAME global (track <1-500>|)
```

Parameters

vrf NAME

Specifies the user-defined VRF instance name.

X:X::X:X/M

Denotes the subnet by specifying the IPv6 address destination prefix along with a mask length.

X:X::X:X X:X::X:X

Specifies the subnet with an IPv6 destination address and its corresponding mask.

X:X::X:X

Specifies the gateway's next-hop IPv6 address.

IFNAME

Specifies the gateway's next-hop interface name.

global

Global table lookup (to support inter-VRF static route leaking).

<1-255>

Specifies the administrative distance value.

© 2026 IP Infusion Inc. Proprietary

track <1-500>
Associates a tracking ID with an IPv6 static route for the tracked object.

description LINE
Adds a description to the static route, with a maximum character limit of 80.

recursive
Enables recursive lookup behavior for the next-hop in each static route. By default, it is disabled.

Default

None

Command Mode

Configure mode

Applicability

Introduced in OcNOS version 1.3. Added a new parameter `recursive` in OcNOS version 6.6.0.

Example

```
#configure terminal
(config)#ipv6 route 1234::/64 1000::1 128
(config)#ipv6 route 1235::/64 eth1 32
(config)#ipv6 route vrf vrf3 1236::/64 eth3
(config)#end

#show ipv6 route vrf all

max-static-routes

Use this command to set the maximum number of static routes.

Use the `no` parameter to disable this command.

Command Syntax

```
max-static-routes <1-4294967294>
no max-static-routes
```

Parameters

<1-4294967294>
Maximum number of static routes

Default

By default, max static routes value is 4294967294

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)# max-static-routes 123

(config)# no max-static-routes
```

© 2026 IP Infusion Inc. Proprietary

maximum-paths

Use this command to set the maximum number of paths to install in the FIB (Forwarding Information Base) for the ECMP (Equal-Cost MultiPath) feature.

Use the `no` parameter with this command to revert to default.

Note: If you change the number of paths from the default (8), you must save the running configuration and perform a reboot.

Command Syntax

```
maximum-paths <1-64>
no maximum-paths
```

Parameter

<1-64>
Maximum number of paths to install in the FIB

Default

By default, the maximum number of paths is 8.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#maximum-paths 5
```

router-id

Use this command to add a router identifier for this system.

Use the `no` form of this command to disable this function.

Command Syntax

```
router-id A.B.C.D
no router-id (A.B.C.D)
```

Parameters

A.B.C.D
Router identifier in IP address format for this system.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router-id 123.12.3.123
(config)#
```

© 2026 IP Infusion Inc. Proprietary

show debugging rib

Use this command to display debug settings.

Command Syntax

```
show debugging rib
```

Parameters

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
# show debugging rib
```

© 2026 IP Infusion Inc. Proprietary

show ip route track-table

Use this command to display ipv4 static routes that are associated to a tracking id across all vrfs.

Command Syntax

```
show ip route track-table
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Examples

```
#show ip rou track-table
 ip route 40.1.1.0 255.255.255.0 eth1 track 10 state is [up]
 ip route 50.1.1.0 255.255.255.0 20.1.1.4 track 10 state is [up]
```

© 2026 IP Infusion Inc. Proprietary

show ip rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

Command Syntax

```
show ip rpf A.B.C.D
show ip rpf (vrf NAME|) A.B.C.D
```

Parameters

A.B.C.D
IP address of multicast source.

NAME
Virtual Routing and Forwarding name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip rpf 10.10.10.50

RPF information for 10.10.10.50
  RPF interface: eth0
  RPF neighbor: 10.1.2.1
  RPF route: 0.0.0.0/0
  RPF type: unicast (kernel)
  RPF recursion count: 0
  Doing distance-preferred lookups across tables
  Distance: 0
  Metric: 0
#
```

Here is the explanation of the "show command" output fields.

Table 9. show ip rpf output fields

Field	Description
RPF Interface	Name of the RPF interface.
RPF neighbor	Upstream RPF neighbor.
RPF route	Route table in which the logical interface address is located.

© 2026 IP Infusion Inc. Proprietary

Table 9. show ip rpf output fields (continued)

Field	Description
RPF type	Different type of RPF like multicast, unicast, MBGP, DVMRP, or static mroutes.
RPF recursion count	Number of times that the router lookups its routing table more than once to find out the immediate next-hop and exiting interface.
Distance	IP address of the remote side of the connection. Doing distance-preferred lookups across tables.
Metric	Metrics are informational units that can be measured and compared.

show ipv6 route track-table

Use this command to display IPv4 static routes that are associated to a tracking ID across all VRFs.

Command Syntax

```
show ipv6 route track-table
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced in OcNOS version 5.1.

Examples

```
#show ipv6 route track-table
 ipv6 route 5000::/64 eth1 track 10 state is [up]
```

show ipv6 rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

Command Syntax

```
show ipv6 rpf X:X::X:X
show ipv6 rpf (vrf NAME|) X:X::X:X
```

Parameters

X:X::X:X
IP address of multicast source.

NAME
Virtual Routing and Forwarding name.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 rpf 10:10::10:50

RPF information for 10.10.10.50
  RPF interface: eth0
  RPF neighbor: 10.1.2.1
  RPF route: 0.0.0.0/0
  RPF type: unicast (kernel)
  RPF recursion count: 0
  Doing distance-preferred lookups across tables
  Distance: 0
  Metric: 0
#
```

Here is the explanation of the "show command" output fields.

Table 10. show ipv6 rpf output fields

Field	Description
RPF Interface	Name of the RPF interface.
RPF neighbor	Upstream RPF neighbor.
RPF route	Route table in which the logical interface address is located.

Table 10. show ipv6 rpf output fields (continued)

Field	Description
RPF type	Different type of RPF like multicast, unicast, MBGP, DVMRP, or static mroutes.
RPF recursion count	Number of times that the router lookups its routing table more than once to find out the immediate next-hop and exiting interface.
Distance	IPv6 address of the remote side of the connection. Doing distance-preferred lookups across tables.
Metric	Metrics are informational units that can be measured and compared.

show rib txlist

Use this command to display internal Routing Information Base (RIB) transaction lists that are pending or currently being transmitted to the Forwarding Information Base (FIB). This command helps monitor routes awaiting installation or synchronization between the routing and forwarding planes. It is mainly used for debugging and operational verification of route processing states.

Command Syntax

```
show rib (txlist | pending-txlist) (ipv4 | ipv6) (vrf WORD|)
```

Parameters

txlist
Displays the list of routes that are currently being transmitted from RIB to FIB.

pending-txlist
Displays the list of routes queued for transmission to the FIB.

ipv4
Displays information for IPv4 routes.

ipv6
Displays information for IPv6 routes.

vrf WORD
Specifies the VRF name for which the RIB transaction information is displayed.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

Introduced before OcNOS version 1.3.

Added the fields (`req_mpls, new_req_mpls, fib_notify_mpls, seq_mpls`) in OcNOS version 7.0.0.

Example

The fields (`req_mpls, new_req_mpls, fib_notify_mpls, seq_mpls`) show MPLS-specific route installation and synchronization details between RIB and FIB.

```
#show rib txlist ipv4
    IPv4:
    0x02739a6c: 127.0.0.0/8        req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)
fib_notify_mpls(0) seq_mpls(0) lock(3)
    0x02810cdc: 1.2.0.0/24         req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)
fib_notify_mpls(0) seq_mpls(0) lock(5)
    0x0281071c: 1.1.1.1/32         req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)
fib_notify_mpls(0) seq_mpls(0) lock(5)
    0x028d9c5c: 2.2.2.2/32         req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)
fib_notify_mpls(0) seq_mpls(0) lock(4)
```

© 2026 IP Infusion Inc. Proprietary

```
    0x028da42c: 11.11.11.11/32     req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)
fib_notify_mpls(0) seq_mpls(0) lock(3)
    0x028dab2c: 12.12.12.12/32     req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)
fib_notify_mpls(0) seq_mpls(0) lock(3)
    0x028daf7c: 13.13.13.13/32     req(0) new_req(0) fib_notify(0) seq(0) req_mpls(0) new_req_mpls(0)

```

© 2026 IP Infusion Inc. Proprietary

show router-id

Use this command to display the Router ID of the current system.

Command Syntax

```
show router-id
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show router-id
Router ID: 10.55.0.2 (automatic)
```

show running-config router

Use this command to display the running system router configuration.

Command Syntax

```
show running-config router bgp
show running-config router isis
show running-config router ldp
show running-config router ospf
show running-config router rip
show running-config router rsvp
show running-config router vrrp
```

Parameters

bgp
Display Border Gateway Protocol (BGP) information.

isis
Display Intermediate System to Intermediate System (IS-IS) information.

ldp
Display Label Distribution Protocol (LDP) information.

ospf
Display Open Shortest Path First (OSPF) information.

rip
Display Routing Information Protocol (RIP) information.

rsvp
Display Resource Reservation Protocol (RSVP) information.

vrrp
Display Virtual Router Redundancy Protocol (VRRP) information.

Default

None

Command Mode

Privileged execution mode, Configure mode, Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config router vrrp
!
router-id 3.3.3.3
!
```

© 2026 IP Infusion Inc. Proprietary

show running-config router-id

Use this command to show the running system global router ID configuration.

Command Syntax

```
show running-config router-id
```

Parameters

None

Default

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config router-id
!
router-id 3.3.3.3
!
```

show running-config urpf

Use this command to check uRPF status for this system.

Command Syntax

```
show running-config urpf
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config urpf
ip urpf enable

(config)#show running-config urpf
ip urpf enable
```

© 2026 IP Infusion Inc. Proprietary

show running-config vrf

Use this command to show the running system status and configuration details for a specified VRF instance name.

Command Syntax

```
show running-config vrf WORD
```

Parameters

WORD
Virtual Routing and Forwarding name

Command Mode

Privileged execution mode, Configure mode, Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config vrf xyz
!
ip vrf xyz
 description vrf
 router-id 11.11.11.11
```

snmp restart rib

Use this command to restart SNMP in Routing Information Base (RIB)

Command Syntax

```
snmp restart rib
```

Parameters

None

Default

By default, snmp restart command is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#config terminal
(config)# snmp restart rib
```

IP Service Level Agreements Commands

IP Service Level Agreements (SLAs) is a diagnostic method which generates and analyses the traffic between an OcNOS device and your network. IP SLA monitors and reports network performance data which helps you to identify the actual root cause of a problem when the performance level drops.

This section describes the commands used to manage the IP SLA for ICMP echo.

clear ip sla statistics 319
frequency 320
icmp-echo 321
ip sla 322
ip sla schedule 323
show ip sla statistics 324
show ip sla summary 326
show running-config ip sla 327
threshold 328
timeout 329

© 2026 IP Infusion Inc. Proprietary

clear ip sla statistics

Use this command to clear the IP SLA statistics.

Command Syntax

```
clear ip sla statistics <1-65535>
```

Parameters

<1-65535>
IP SLA identifier

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#clear ip sla statistics 1
```

© 2026 IP Infusion Inc. Proprietary

frequency

Use this command to configure the frequency or interval to send ICMP echo packets one by one.

Use the `no` form of this command to remove the configured ICMP echo frequency.

Command Syntax

```
frequency <1-60>
no frequency
```

Parameters

<1-60>
Frequency in seconds

Default

5 seconds

Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#frequency 3
```

© 2026 IP Infusion Inc. Proprietary

icmp-echo

Use this command to select and configure the ICMP echo SLA operation. ICMP echo packets are constructed in the device and sent to the destination address that you specify. These packets are transferred on a specific interface by setting the `source-interface` parameter.

Use the `no` form of this command to un-configure or remove the configured ICMP echo measurement sessions.

Command Syntax

```
icmp-echo (ipv4 A.B.C.D|ipv6 X:X::X:X|HOSTNAME) (source-interface IFNAME|)
no icmp-echo (ipv4 A.B.C.D | ipv6 X:X::X:X | HOSTNAME)
```

Parameters

A.B.C.D
IPv4 address

X:X::X:X
IPv6 address

HOSTNAME
Host name

IFNAME
Source interface name

Default

None

Command Mode

IP SLA mode (config-ip-sla)

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#
```

© 2026 IP Infusion Inc. Proprietary

ip sla

Use this command to create an IP SLA instance. One instance maps to a single SLA operation. Users can create multiple SLA operations to perform multiple similar or different SLA operations.

Use the `no` form of this command to remove a configured IP SLA configurations.

Command Syntax

```
ip sla <1-65535>
no ip sla <1-65535>
```

Parameters

<1-65535>
IP SLA identifier

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#
```

ip sla schedule

Use this command to schedule an IP SLA operation by associating a time-range object with the IP SLA operation.

Use the `no` form of this command to stop the configured IP SLA measurement.

Command Syntax

```
ip sla schedule <1-65535> time-range WORD (vrf (NAME)|)
```

Parameters

<1-65535>
IP SLA identifier.

time-range
Time Range

WORD
Time range name that you set with the time-range command.

vrf
VPN Routing/Forwarding instance

NAME
VPN Routing/Forwarding instance name. Maximum limit 32 characters

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla schedule 1 time-range t1 vrf v1
```

© 2026 IP Infusion Inc. Proprietary

show ip sla statistics

Use this command to display the statistics of IP SLA measurement.

Command Syntax

```
show ip sla statistics <1-65535> detail
```

Parameters

<1-65535>
IP SLA identifier.

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ip sla statistics 1 detail
========================================
            IP SLA Statistics
========================================
  IP SLA ID                : 1
  Start Time               : 2021 Aug 30 17:40:04
  Elapsed time(milli sec)  : 46015
  Packets Sent             : 23
  Packets Received         : 23
  Packet Loss(%)           : 0.0000
  Invalid Tests            : 0
  Round Trip Delay(usec)
      Minimum              : 1000
      Maximum              : 1000
      Average              : 1000
```

Here is the explanation of the "show command" output fields.

Table 11. show ip sla statistics fields

Field	Description
IP SLA ID	IP SLA Identifier (1-65535)
Start Time	Measurement start time

Table 11. show ip sla statistics fields (continued)

Field	Description
Elapsed time(milli sec)	Time taken to complete the measurement in milliseconds
Packets Sent	Number of packet sent
Packets Received	Number of packet received
Packet Loss(%)	Packet lost in percentage
Invalid Tests	Received ICMP echo reply packets after configured threshold limit will be marked as invalid tests
Round Trip Delay(usec)	Round trip delay between ICMP echo request and ICMP echo reply: minimum, maximum and average round trip delay in microseconds

show ip sla summary

Use this command to display the summary of all IP SLA measurements.

Command Syntax

```
show ip sla summary
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show ip sla summary
IPSLAs Latest Operation Summary
Codes: * active, ^ inactive

ID       Type        Destination       Stats       Return      Last
                                       (usec)        Code        Run
---------------------------------------------------------------------
^1      icmp-echo    20.2.2.3           0           OK        2021 Aug 23 13:53:37
```

Here is the explanation of the "show command" output fields.

Table 12. show ip sla summary fields

Field	Description
ID	IP SLA Identifier (1-65535)
Type	Measurement type
Destination	Destination address
Stats (usec)	Round trip time in microseconds for the measurement
Return Code	Measurement status
Last Run	Measurement last run date and time

© 2026 IP Infusion Inc. Proprietary

show running-config ip sla

Use this command to display the IP SLA running configuration alone.

Command Syntax

```
show running-config ip sla
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#show running-config ip sla
ip sla 1
 icmp-echo ipv4 20.2.2.3
  frequency 2
  threshold 2000
  timeout 5000
ip sla schedule 1 time-range t1 vrf v1
```

© 2026 IP Infusion Inc. Proprietary

threshold

Use this command to configure the threshold for every ICMP echo packet.

Use the `no` form of this command to remove the configured ICMP echo threshold.

Command Syntax

```
threshold <1000-60000>
no threshold
```

Parameters

<1000-60000>
Threshold in milliseconds.

Default

10000 milliseconds

Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#threshold 5000
```

© 2026 IP Infusion Inc. Proprietary

timeout

Use this command to configure the timeout for every ICMP echo packet. Any packet arriving beyond this interval is considered to be lost.

Use the `no` form of this command to remove the configured ICMP echo timeout.

Command Syntax

```
timeout <1000-60000>
no timeout
```

Parameters

<1000-60000>
Timeout in milliseconds.

Default

10000 milliseconds

Command Mode

IP SLA ICMP Echo mode (config-ip-sla-echo)

Applicability

This command was introduced in OcNOS version 5.0.

Example

```
#configure terminal
(config)#ip sla 1
(config-ip-sla)#icmp-echo ipv4 10.12.28.1 source-interface xe1
(config-ip-sla-echo)#timeout 5000
```

Object Tracking Commands

This section describes the Object Tracking commands:

delay up down 331
object-tracking 332
show running-config track 334
show track 335
show track <1-500> 336
show track summary 337
track ip sla reachability 338

© 2026 IP Infusion Inc. Proprietary

delay up down

Use this command is used to delay the state change notification of Object tracking.

Use the `no` form of this command to remove delay the state change notification of Object

Command Syntax

```
delay (up <1-9999>|)(down <1-9999>|)
no delay (|up|down)
```

Parameters

<1-999>
Delay in Notification in seconds.

Default

None

Command Mode

Object tracking Mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS(config-object-track)#delay up 10 down 20
OcNOS(config-object-track)#no delay
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#
OcNOS(config-object-track)#delay down 10
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#no delay down
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#
OcNOS(config-object-track)#delay up 10
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#no delay up
OcNOS(config-object-track)#commit
OcNOS(config-object-track)#
```

© 2026 IP Infusion Inc. Proprietary

object-tracking

Use this command to configure track IDs and options on the interfaces.

Use the `no` parameter with this command to remove the configurations.

These commands configure object tracking on interfaces, with specific track IDs and tracked objects set to determine what gets tracked and affects the interface's status.

The `object-tracking` command provides flexibility, enabling both `all` and `any` tracking behaviors for influencing the interface's status. A maximum of 8 track IDs can be configured per interface. It is possible to configure the same track IDs or options on multiple interfaces.

Command Syntax

```
object-tracking <1-500>
object-tracking <all | any>
no object-tracking <1-500>
no object-tracking <all | any>
```

Parameters

<1-500>
Object tracking ID

all
Boolean AND operation. Each object configured on the interface must be in an up state for the interface itself to be in an up state; otherwise, it will be brought down.

any
Boolean OR operation. At least one object configured on the interface must be in an up state; otherwise, the interface will be brought down.

Default

None

Command Mode

Interface mode

Applicability

Introduced in OcNOS version 6.4.1.

Example

Here are some example commands for configuring object tracking in the interface mode.

```
OcNOS(config)#interface xe5
OcNOS(config-if)#object-tracking 10
OcNOS(config-if)#object-tracking all
OcNOS(config-if)#commit

OcNOS(config-if)#no object-tracking 10
OcNOS(config-if)#no object-tracking all
```

© 2026 IP Infusion Inc. Proprietary

```
OcNOS(config-if)#commit
OcNOS(config-if)#exit
```

© 2026 IP Infusion Inc. Proprietary

show running-config track

Use this command to display object tracking running configuration alone.

Command Syntax

```
show running-config track
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#sh running-config track
track 1 ip sla 1 reachability
 delay up 20
!
track 2 ip sla 2 reachability
!
OcNOS#
```

show track

Use this command to display Sham link information.

Command Syntax

```
show track
```

Parameters

None

Default

None

Command Mode

Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#show track
TRACK Id: 1
  IP SLA 1 reachability
  Reachability is DOWN
    0 changes, last change : 2021 Dec 11 05:20:23
OcNOS#
```

show track <1-500>

Use this command to display Sham link information.

Command Syntax

```
show track <1-500>
```

Parameters

<1-500>
Object identifier

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#show track 2
TRACK Id: 2
  IP SLA 2 reachability
  Reachability is DOWN
    0 changes, last change : 2021 Dec 11 05:29:49
OcNOS#
```

show track summary

Use this command to display the summary of all object tracking.

Command Syntax

```
show track summary
```

Parameters

None

Default

None

Command Mode

Privileged execution mode and Execution mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
OcNOS#show track summary
Object Tracking Summary
ID       Type        Type-Identifier       State
-----------------------------------------------------
1      ip-sla             1                DOWN
2      ip-sla             2                DOWN
OcNOS#
```

track ip sla reachability

Use this command to configure an Object for tracking using IP SLA.

Use the `no` form of this command to delete to object tracking

Command Syntax

```
track <1-500> ip sla <1-65535> reachability
no track <1-500> ip sla <1-65535> reachability
```

Parameters

object-number <1-500>
Identifier for the tracked object

ip-sla-number <1-65535>
Identifier for IP SLA association with tracking object

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 5.1.

Example

```
#configure terminal
OcNOS(config)#track 1 ip sla 1 reachability
OcNOS(config-object-track)#commit

OcNOS(config)#no track 1
OcNOS(config)#commit
```

© 2026 IP Infusion Inc. Proprietary

Route-Map Commands

This section describes the Route-Map commands:

continue 341
match as-path 343
match community 344
match extcommunity 345
match interface 346
match ip address 347
match ip address prefix-list 348
match ip next-hop 349
match ip next-hop prefix-list 350
match ip peer 351
match ipv6 address 352
match ipv6 address prefix-list 353
match ipv6 next-hop 354
match ipv6 next-hop prefix-list 355
match ipv6 peer 356
match metric 357
match origin 358
match route-map 359
match route-type 361
match tag 362
route-map 363
set aggregator 364
set as-path 365
set atomic-aggregate 366
set comm-list 367
set community 368
set dampening 370
set extcommunity 371
set interface null0 373
set ip next-hop 374
set ipv6 next-hop 376
set ip next-hop self 377
set large-community 378
set level 380

set tag 386
set vpnv4 next-hop 387
set weight 388
show route-map 389
show running-config route-map 390

© 2026 IP Infusion Inc. Proprietary

continue

The `continue` clause provides the capability to execute additional entries in a route map after an entry is executed with a successful `match` and `set` clauses (i.e), the `continue` command allows multiple entries to be evaluated within a single `route-map`. `Continue` commands can be assigned optional `sequence numbers` that indicate the order in which clauses are to be evaluated.

Use the `no` form of the command (specifying a particular `sequence number` if desired), to remove individual or all `continue` clauses from a `route-map`.

Notes:

- Configuration update from `continue` to `continue <sequence number>` or vice versa is not supported. To switch between these command formats, users must first remove the existing configuration and then apply the new one.
- If the target sequence in the continue statement does not exist, the route-map behaves as if there was no continue statement at all and processing stops after the current sequence.

Continue clause with match Clauses

When a `match` clause exists in a route map with `continue` clause, then the `continue` clause is executed only when a successful `match` occurs. If a `match` clause does not exist in the route-map and if a `continue` clause does exist, the `continue` clause will be evaluated and then go to the specified route-map entry. When a successful `match` occurs and we have a `continue` clause, the route-map executes the `set` clauses and then goes to the specified route-map entry. If `continue` clause does not exist in the next route map, then the route-map will behave normally. If a `continue` clause exists in the next route-map but a match is not successful, the route-map will not continue and will *fall through* to the next sequence number if one exists.

Continue clause with set Clauses

`Set` clauses are executed after the route-map evaluation is done. The `set` clauses are evaluated and executed in the order in which they were configured. `Set` clauses are only executed after a successful match occurs. The `continue` statement proceeds to the specified route-map entry only after configured `set` actions are performed. If a `set` action is configured in the first route-map and then the same `set` action occurs again, but with a different value in a subsequent route-map entry, then the last `set` action will override the previous `set` actions, which were configured with the same `set` command.

Command Syntax

```
continue <2-65535>|)
no continue <2-65535>|)
```

Parameter

<2-65535>
Continue sequence number.

Default

No default value is specified

© 2026 IP Infusion Inc. Proprietary

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#route-map Rmap1
(config-route-map)#continue ?
  <2-65535>  Route-map entry sequence number
  <cr>
(config-route-map)#continue 10
(config-route-map)#continue 30
```

© 2026 IP Infusion Inc. Proprietary

match as-path

Use this command to match an autonomous system path access list. This command specifies the autonomous system path to be matched. If there is a match for the specified AS path, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are `not` met then the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to remove a path list entry.

Command Syntax

```
match as-path WORD
no match as-path (WORD|)
```

Parameter

WORD

Autonomous system path access list name.

Default

Enabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match as-path myaccesslist
```

match community

Use this command to to match routes based on BGP standard or expanded community values.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by the `match community` command overrides the global values. The route that does not match at least one match clause is ignored.

Note: Only one `match community` command is permitted per route-map sequence. Configuring a new one replaces the existing entry. This command applies only to BGP routes.

Use the `no` parameter with this command to remove the community list entry.

Command Syntax

```
match community (<1-99>|<100-199>|WORD) (exact-match|)
no match community (<1-99>|<100-199>|WORD|) (exact-match|)
```

Parameters

<1-99>
Specifies standard community list number.

<100-199>
Specifies expanded community list number.

WORD
Specifies named community list (standard or expanded).

exact-match
(Optional) Requires the route's communities to exactly match those in the list.

Default

None

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match community mylist
```

© 2026 IP Infusion Inc. Proprietary

match extcommunity

Use this command to match BGP external community list

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by this command overrides the global values. The route that does not match at least one match clause is ignored.

Note: Only one `match extcommunity` command is permitted per route-map sequence. Configuring a new one replaces the existing entry. This command applies only to BGP routes.

Use the `no` parameter with this command to remove the community list entry.

Command Syntax

```
match extcommunity (<1-99>|<100-199>|WORD) (exact-match|)
no match extcommunity (<1-99>|<100-199>|WORD|) (exact-match|)
```

Parameters

<1-99>
Specifies standard community list number.

<100-199>
Specifies expanded community list number.

WORD
Specifies named community list (standard or expanded).

exact-match
(Optional) Requires the route's communities to exactly match those in the list.

Default

None

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match extcommunity mylist
```

© 2026 IP Infusion Inc. Proprietary

match interface

Use this command to define the interface match criterion. This command specifies the next-hop interface name of a route to be matched.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax

```
match interface IFNAME
no match interface (IFNAME|)
```

Parameter

IFNAME
Interface name.

Default

By default, match interface is disabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match interface eth0
```

© 2026 IP Infusion Inc. Proprietary

match ip address

Use this command to specify the match address of route. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified then the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

Command Syntax

```
match ip address (<1-199>|<1300-2699>|WORD)
no match ip address (<1-199>|<1300-2699>|WORD|)
```

Parameters

WORD
IP access-list name.

<1-199>
IP access-list number (standard range).

<1300-2699>
IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match ip address List1
```

match ip address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to disable this function.

Note: The route-map with `match ip address prefix-list WORD` only applies to IPv4 prefixes. When users apply it to IPv6 prefixes, it does not perform a match. Instead, the route-map is treated as RMAP_PERMIT.

Command Syntax

```
match ip address prefix-list WORD
no match ip address prefix-list (WORD|)
```

Parameter

WORD

IP prefix list name.

Default

None

Command Mode

Route map mode

Applicability

Introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip address prefix-list mylist
```

match ip next-hop

Use this command to specify a next-hop address to be matched in a route-map. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
match ip next-hop (<1-199>|<1300-2699>|WORD)
no match ip next-hop (<1-199>|<1300-2699>|WORD|)
```

Parameters

WORD
Specify the IP access-list name.

<1-199>
Specify the IP access-list number (standard range).

<1300-2699>
Specify the IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip next-hop mylist
```

© 2026 IP Infusion Inc. Proprietary

match ip next-hop prefix-list

Use this command to specify the next-hop IP address match criterion using the prefix-list. This command matches the next-hop IP address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax

```
match ip next-hop prefix-list WORD
no match ip next-hop prefix-list (WORD|)
```

Parameter

WORD

Prefix-list name.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip next-hop prefix-list list1
```

© 2026 IP Infusion Inc. Proprietary

match ip peer

Use this command to specify the match peer IPv4 address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax

```
match ip peer (<1-199>|<1300-2699>|WORD)
no match ip peer (<1-199>|<1300-2699>|WORD|)
```

Parameter

WORD
IP access-list name.

<1-199>
IP access-list number (standard range).

<1300-2699>
IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip peer 123

(config-route-map)#no match ip peer 123
```

© 2026 IP Infusion Inc. Proprietary

match ipv6 address

Use this command to specify the match address of route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

Note: This command is valid for BGP, OSPFv3, and RIPng only.

Command Syntax

```
match ipv6 address WORD
no match ipv6 address (WORD|)
```

Parameter

WORD

IPv6 access list name.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myRM deny 1
(config-route-map)#match ipv6 address myRM
```

match ipv6 address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might differ from what is indicated by the routing protocols. Setting policies allows packets to follow different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding rules specified in routing tables.

Use the `no` parameter with this command to disable this function

Notes:

- This command is valid for BGP, OSPFv3, and RIPng only.
- The route-map with `match ipv6 address prefix-list WORD` only applies to IPv6 prefixes. When users apply it to IPv4 prefixes, it does not perform a match. Instead, the route-map is treated as `RMAP_PERMIT`.

Command Syntax

```
match ipv6 address prefix-list WORD
no match ipv6 address prefix-list (WORD|)
```

Parameter

WORD

IPv6 access list name.

Default

None

Command Mode

Route map mode

Applicability

Introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 address prefix-list mylist
```

match ipv6 next-hop

Use this command to specify the next-hop address to be matched. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP and IS-IS only.

Use the `no` parameter with this command to disable this function

Command Syntax

```
match ipv6 next-hop (X:X::X:X|WORD)
no match ipv6 next-hop (X:X::X:X|WORD|)
```

Parameters

X:X::X:X
IPv6 address of the next-hop.

WORD
IPv6 access list name.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop 3ffe::1
```

match ipv6 next-hop prefix-list

Use this command to match the IPv6 next-hop against entries in a prefix-list. The route defined by policies may differ from the route chosen by routing protocols. Policies allow packets to follow different paths based on their length or content. Packet forwarding determined by configured policies overrides the forwarding decisions made by routing tables. This command applies to BGP and IS-IS.

Note: In 6VPE deployments, the match ipv6 next-hop does not apply to the customer edge (CE) learned IPv6 prefix next-hop because the export map is evaluated only during exporting to the VPNv6 peer. The match condition is only effective when using the provider edges (PEs) IPv4-mapped IPv6 address as the next-hop. For details, see the **`6VPE Configuration`** section in the *OcNOS MPLS Guide*.

Use the `no` parameter with this command to delete the entries in the prefix-list that match the IPv6 next-hop.

Command Syntax

```
match ipv6 next-hop prefix-list WORD
no match ipv6 next-hop prefix-list WORD
```

Parameters

`prefix-list WORD`
Specifies the name of the IPv6 prefix-list used for matching next-hops.

Default

None

Command Mode

Route map mode

Applicability

Introduced before OcNOS version 1.3.

Examples

This example creates a route-map named `rmap1` with sequence number `3` and attaches a condition to match IPv6 next-hops against the prefix-list `nh_prefixes`. Only routes with next-hops allowed by `nh_prefixes` will match this route-map entry.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop prefix-list nh_prefixes
```

© 2026 IP Infusion Inc. Proprietary

match ipv6 peer

Use this command to specify the match peer IPv6 address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax

```
match ipv6 peer (<1-199>|<1300-2699>|WORD)
no match ipv6 peer (<1-199>|<1300-2699>|WORD|)
```

Parameter

WORD
IP access-list name.

<1-199>
IP access-list number (standard range).

<1300-2699>
IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ipv6 peer 123

(config-route-map)#no match ipv6 peer 123
```

© 2026 IP Infusion Inc. Proprietary

match metric

Use this command to match a metric of a route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP, OSPF, RIP, and IS-IS only.

Use the `no` parameter with this command to disable this function

Command Syntax

```
match metric <0-4294967295>
no match metric (<0-4294967295>|)
```

Parameters

<0-4261412864>
Metric value.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match metric 888999
```

match origin

Use this command to match origin code. The origin attribute defines the origin of the path information. The `egp` parameter is indicated as an `e` in the routing table, and it indicates that the origin of the information is learned via EGP (Exterior Gateway Protocol). The `igp` parameter is indicated as an `i` in the routing table, and it indicates the origin of the path information is interior to the originating AS. The `incomplete` parameter is indicated as a `?` in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

This command specifies the origin to be matched. If there is a match for the specified origin, and `permit` is specified when you created the route-map, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to disable this matching.

Command Syntax

```
match origin (egp|igp|incomplete)
no match origin (egp|igp|incomplete|)
```

Parameters

`egp`
Remote exterior gateway protocol.

`igp`
Local internal gateway protocol.

`incomplete`
Unknown heritage.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match origin egp
```

match route-map

Use this command to nest a route-map as a match criteria. The nested route-map entries are executed in the order of sequence ID. The match criteria of the nested route-map entry are evaluated, then if a match occurs and a permit action is specified in the entry, its set actions are executed and a “match” result is returned to the parent route-map, which then continues its evaluations. If a match occurs and a deny action is specified in the entry, the set actions are skipped, and a no-match result is returned to the parent route-map. If the match criteria are not satisfied in any of the nested route-map entries, a no-match is returned to the parent route-map.

Use the `no` parameter with this command to remove a nested route-map.

Notes: This command applies only to BGP.

A maximum of 8 route-maps can be nested within a route-map instance at the same time and more than 4 levels of nesting are not allowed.

A route-map needs to exist to be nested.

Command Syntax

```
match route-map WORD
no match route-map WORD
```

Parameters

WORD
Name for the route-map (Max size 64).

Default

By default, match route-map is disabled

Command Mode

Route map mode

Applicability

This command was introduced in OcNOS version 7.0.0.

Examples

```
#configure terminal
```

```
(config)#route-map CHILD permit 10
(config-route-map)#exit
(config)#route-map PARENT permit 10
(config-route-map)#match route-map CHILD
```

match route-type

Use this command to match an external route type. AS-external LSA is either Type-1 or Type-2. External type-1 matches only Type 1 external routes and external type-2 matches only Type 2 external routes.

Use the `no` parameter with this command to turn off the matching.

Command Syntax

```
match route-type external (type-1|type-2)
no match route-type external (type-1|type-2|)
```

Parameters

type-1
Match OSPF External Type 1 metric.

type-2
Match OSPF External Type 2 metric.

Default

By default, match route type external is disabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match route-type external type-1
```

© 2026 IP Infusion Inc. Proprietary

match tag

Use this command to match the specified tag value.

Use the `no` parameter with this command to turn off the declaration.

Command Syntax

```
match tag <0-4294967295>
no match tag (<0-4294967295>|)
```

Parameters

<0-4294967295>
Tag value.

Default

By default, match tag is disabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match tag 100
```

route-map

Use this command to enter route-map mode and to permit or deny match/set operations.

This command controls and modifies routing information to allow redistribution of routes. It has a list of `match` and `set` commands associated with it. The `match` commands specify the conditions under which redistribution is allowed, and the `set` commands specify the particular redistribution actions to be performed if the criteria enforced by match commands are met. Route maps are used for detailed control over route distribution between routing processes.

Route maps also allow policy routing, and might route packets to a different route than the obvious shortest path.

Use the `no` parameter with this command to turn off the declaration.

Command Syntax

```
route-map WORD (deny|permit) <1-65535>
no route-map WORD ((deny|permit) <1-65535>|)
```

Parameters

WORD
Route-map name (maximum size 63 characters).

deny
Route map deny set operations. If this parameter is specified, and the match criteria are met, the route is not redistributed, and any other route maps with the same map tag are not examined.

permit
Route map permit set operations. If this parameter is specified, and the match criteria are met, the route is redistributed as specified by the set actions. If the `match` criteria are not met, the next route map with the same tag is tested.

<1-65535>
Sequence to insert into or delete from an existing route-map.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map route1 permit 1
(config-route-map)#
```

© 2026 IP Infusion Inc. Proprietary

set aggregator

Use this command to set the AS number for the route map and router ID. An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the `set aggregator` command to assign an AS number for the aggregator.

To use the `set aggregator` command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

Command Syntax

```
set aggregator as <1-65535> A.B.C.D
no set aggregator as (<1-65535> A.B.C.D|)
```

Parameters

<1-65535>
AS number of aggregator.

A.B.C.D
IP address of aggregator.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set aggregator as 43 10.10.0.3
```

© 2026 IP Infusion Inc. Proprietary

set as-path

Use this command to modify an autonomous system path for a route. By specifying the length of the AS-Path, the router influences the best path selection by a neighbor. Use this command to prepend an AS path string to routes increasing the AS path length.

To use this command, users must first give the `match` and `set` commands configure the conditions for redistributing routes from one routing protocol to another:

- The `match` command specifies the match criteria under which redistribution is allowed for the current route-map.
- The `set` command specifies the set redistribution actions to be performed if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set as-path prepend .<1-4294967295>
no set as-path prepend (.<1-4294967295>|)
```

Parameters

`<1-4294967295>`

OcNOS prepends the 32 bit number to the AS path.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set as-path prepend 8 24
```

set atomic-aggregate

Use this command to set an atomic aggregate attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

Command Syntax

```
set atomic-aggregate
no set atomic-aggregate
```

Parameters

No default value is specified

Default

None

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set atomic-aggregate
```

© 2026 IP Infusion Inc. Proprietary

set comm-list

Use this command to delete the matched communities from the community attribute of an inbound or outbound update when applying route-map.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
set comm-list (<1-99>|<100-199>|WORD) delete
no set comm-list (<1-99>|<100-199>|WORD) delete
```

Parameters

<1-99>
Standard community-list number.

<100-199>
Expanded community-list number.

WORD
Name of the community-list.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myRM permit 3
(config-route-map)#set comm-list 34 delete
```

© 2026 IP Infusion Inc. Proprietary

set community

Use this command to set the communities attribute. and group destinations in a certain community, as well as apply routing decisions according to those communities.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to delete the entry.

Command Syntax

```
set community [<65536-4294901759>|AA:NN|internet|local-AS|no-advertise|no-export|none] (additive|)
no set community [AA:NN|internet|local-AS|no-advertise|no-export|none] (additive|)
```

Parameters

<65536-4294901759>
Community number

AA:NN
The community number in aa:nn format.

internet
Internet.

local-AS
Do not send outside the local AS (well-known community).

no-advertise
Do not advertise this route to eBGP peers

no-export
Do not advertise this route to any peer.

none
Remove the community attribute from the prefixes that pass the route-map.

additive
Add to the existing community.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

© 2026 IP Infusion Inc. Proprietary

Examples

The following examples show the use of the `set community` command with different parameters.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-export no-advertise

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-advertise

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community 10:01 23:34 12:14 no-export
```

© 2026 IP Infusion Inc. Proprietary

set dampening

Use this command to enable route-flap dampening and set parameters. Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

Use the `no` parameter with this command to delete the entry.

Command Syntax

```
set dampening <1-45> <1-20000> <1-20000> <1-255> (<1-45>|)
no set dampening <1-45> <1-20000> <1-20000> <1-255> (<1-45>|)
```

Parameters

<1-45>
Reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value.

<1-20000>
Reuse-limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.

<1-20000>
Suppress-limit value. When the penalty for a route exceeds the suppress value, the route is suppressed.

<1-255>
Max-suppress-time. Maximum time that a dampened route is suppressed.

<1-45>
Unreachability half-life time for penalty, in minutes.

Default

Default reachability half-life time: 15 minutes

Default reuse limit value: 750

Default suppress limit value: 2000

Default max-suppress value is 4 times the half-life time (60 minutes)

Default unreachability half-life time value: 15 minutes

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map R1 permit 24
(config-route-map)#set dampening 20 333 534 30
```

© 2026 IP Infusion Inc. Proprietary

set extcommunity

Use this command to set an extended community attribute.

To use this command you must first have a match clause. The `match` and `set` commands define the conditions for redistributing routes from one routing protocol to another:

- The `match` command defines the match criteria under which redistribution is allowed for the current route-map.
- The `set` command defines the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set extcommunity rt .AA:NN (additive|)
set extcommunity soo .AA:NN
set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>
set extcommunity color <1-4294967295>
no set extcommunity rt (.AA:NN|) (additive|)
no set extcommunity soo (.AA:NN|)
no set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>
no set extcommunity color <1-4294967295>
```

Parameters

`rt`
Route target extended community.

`.AA:NN`
VPN extended community

`additive`
Add to the exsisting community.

`soo`
Site-of-origin extended community.

`cost`
Extended cost community.

`igp`
Compare following IGP cost comparison.

`pre-bestpath`
Compare following IGP cost comparison.

`<0-255>`
Community ID.

`<0-4294967295>`
Cost.

`color`
Color value extended community

Default

None

© 2026 IP Infusion Inc. Proprietary

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 06:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 0.0.0.6:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 06:01

#configure terminal
(config-route-map)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 0.0.0.6:01

#configure terminal
(config-route-map)#route-map rmap1 permit 3
(config-route-map)#set extcommunity color 101
```

© 2026 IP Infusion Inc. Proprietary

set interface null0

Use this command to discard routes based on policy/rules configured for a route map.

Route maps can be applied to BGP neighbors. When this command is given for a route map and that route map is applied to a BGP neighbor, the discard route entries are added by BGP for the prefix permitted by the route map.

Use the `no` form of this command to not discard routes based on policy/rules configured for a route map.

Command Syntax

```
set interface null0
no set interface null0
```

Parameters

None

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

To discard 1.1.1.1/24 from BGP neighbor 30.1.1.1:

```
#configure terminal
(config)#ip prefix-list myPrefixList seq 5 permit 1.1.1.1/24 eq 24
(config)#route-map myRM permit 1
(config-route-map)#match ip address prefix-list myPrefixList
(config-route-map)#set interface null0
(config-route-map)#exit
(config)#router bgp 200
(config-router)#neighbor 30.1.1.1 remote-as 200
(config-router)#neighbor 30.1.1.1 route-map myRM in
```

© 2026 IP Infusion Inc. Proprietary

set ip next-hop

Use this command to set the specified next-hop value and configure IPv4 nexthop as tracked object to verify its availability.

Use the `no` parameter with this command to turn off the setting.

Command Syntax

```
set ip next-hop A.B.C.D | verify-availability track <1-500> | peer-address |self
no set ip next-hop (A.B.C.D|)
no set ip next-hop peer-address
no set ip next-hop self
```

Parameter

A.B.C.D
IP address of the next-hop.

verify-availability track <1-500>
Defines a tracking object (numbered 1 to 500) to verify-availability of IPv4 nexthop.

Note: Depends on “IP-SLA” configurations.

peer-address
Use peer address (for Outbound BGP only)

self
Self (for BGP LU only)

Note: The **set ip next-hop** options are mutually exclusive. Only one option can be configured in a route-map at any given time. Configuring more than one option is not permitted.

Default

Disabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.6.1 to include the parameter `verify-availability track`.

Examples

The following example is for configuring a route-map to set the next-hop IP address, without availability trackings:

```
#configure terminal
```

```
(config)#route-map mymap permit 3
(config-route-map)#set ip next-hop 10.10.0.67
```

The following example is for configuring a route-map to set the next-hop IPv4 address, with availability trackings using a tracking object:

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#set ip next-hop 10.10.0.67 verify-availability track 7
```

© 2026 IP Infusion Inc. Proprietary

set ipv6 next-hop

Use this command to set a next hop-address and configure IPv6 nexthop as tracked object to verify its availability.

Use the `no` parameter with this command to delete an entry

Note: This command is valid for BGP and OSPFv3 only.

Command Syntax

```
set ipv6 next-hop X:X::X:X | verify-availability track <1-500>
set ipv6 next-hop local X:X::X:X
no set ipv6 next-hop (X:X::X:X|)
no set ipv6 next-hop local (X:X::X:X|)
```

Parameters

`X:X::X:X`
Global IPv6 address of the nexthop.

`verify-availability track <1-500>`
Defines a tracking object (numbered 1 to 500) to verify-availability of IPv6 nexthop.

Note: Depends on “IP-SLA” configurations.

`local`
Local IPv6 address of the nexthop.

Default

Disabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3 and modified in OcNOS version 6.6.1 to include the parameter `verify-availability track`.

Examples

The following example is for configuring a route-map to set the next-hop IP address, without availability trackings:

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set ipv6 next-hop local fe80::203:47ff:fe97:66dc
```

The following example is for configuring a route-map to set the next-hop IPv6 address, with availability trackings using a tracking object:

© 2026 IP Infusion Inc. Proprietary

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#set ipv6 next-hop 1311::2 verify-availability track 8
```

set ip next-hop self

Use this command to set next hop self for IPV4 BGP-LU neighbors.

Use “no” form of this command to not set next hop self.

Command Syntax

```
set ip next-hop self
no set ip next-hop self
```

Parameters

None

Command Mode

Route map mode mode

Applicability

This command is introduced in OcNOS version 7.0.0

Examples

```
ip prefix-list BCOM-IP
   seq 5 permit 25.4.4.0/24 eq 24

route-map BCOM-RM permit 2
   match ip address prefix-list BCOM-IP
   set ip next-hop self

router bgp 26
..
  address-family ipv4 labeled-unicast
  neighbor 27.27.27.27 route-map BCOM-RM out
  ..
```

© 2026 IP Infusion Inc. Proprietary

set large-community

Use this command to set the large community values in routing policies.

Command Syntax

```
set large-community (.AAaa:NNnn:ZZzz) (additive|)
no set large-community (.AAaa:NNnn:ZZzz) (additive|)
```

Parameters

.AAaa:NNnn:ZZzz
Specifies the large community value with a maximum length of 255 characters.

additive
(Optional) Appends the specified large-community values to the existing large-community values in the route.

Default

The send-community large is enabled by default for peers.

Command Mode

Route map mode

Applicability

This command was introduced in OcNOS version 6.1.0. Introduced a new parameter, `additive`, and updated the maximum character length for large community values to `255` in OcNOS version 6.6.1.

Examples

Setting Multiple Large Communities

```
OcNOS(config)#route-map R1 permit 10
OcNOS(config-route-map)#set large-community 2:2:2 9:9:9 3:3:3
OcNOS(config-route-map)#commit
```

The below configuration adds two large community attributes `132:1:132` and `132:1:132`, to the matching routes. The `additive` option ensures these communities are added without replacing any existing ones.

```
OcNOS(config-route-map)#set large-community 132:1:132 132:1:132 additive
OcNOS(config-route-map)#commit
```

Setting a Single Large Community

```
OcNOS(config-route-map)#set large-community 1:2:3
OcNOS(config-route-map)#commit
```

- Verify the configured lists using the `show` command.

```
OcNOS#show running-config route-map
!
route-map rmap permit 10
 match large-community EXPTEST
 set large-comm-list 100 delete
!
```

```
route-map rmap1 permit 10
 match large-community 1
 set large-community 1:2:3
!
route-map rmap2 permit 10
 match large-community 100
 set large-comm-list 104 delete
!
route-map rmap3 permit 10
 match large-community STDTEST exact-match
!

OcNOS#show route
route-map  router-id

  Set clauses:
```

set level

Use this command to set the IS-IS level to export a route.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set level (level-1|level-2|level-1-2)
no set level (level-1|level-2|level-1-2|)
```

Parameters

level-1
Export into a level-1 area.

level-2
Export into a level-2 sub-domain.

level-1-2
Export into level-1 and level-2.

Default

By default, set level is disabled

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set level level-1
```

© 2026 IP Infusion Inc. Proprietary

set local-preference

Use this command to set the BGP local preference path attribute.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set local-preference <0-4294967295>
no set local-preference (<0-4294967295>|)
```

Parameters

<0-4294967295>

Tag value for destination routing protocol.

Default

By default, set local preference is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set local-preference 12
```

© 2026 IP Infusion Inc. Proprietary

set metric

Use this command to set a metric value for a route and influence external neighbors about the preferred path into an Autonomous System (AS). The preferred path is the one with a lower metric value. A router compares metrics for paths from neighbors in the same ASs. To compare metrics from neighbors coming from different ASs, use the `bgp always-compare-med` command.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set metric WORD
no set metric (WORD|)
```

Parameters

WORD

Metric value [+/-] <1-4294967295>

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric 600
```

© 2026 IP Infusion Inc. Proprietary

set metric-type

Use this command to set the metric type for the destination routing protocol. Select a type to be either Type-1 or Type-2 in the AS-external-LSA when the route-map matches the condition.

Note: This command is for OSPF, OSPFv3, or IS-IS only.

Use the `no` parameter with this command to return to the default.

Command Syntax

```
set metric-type (internal|external)
set metric-type (type-1|type-2)
no set metric-type (internal|external|)
no set metric-type (type-1|type-2|)
```

Parameters

external
IS-IS external metric type.

internal
IS-IS internal metric type.

type-1
OSPF external type 1 metric.

type-2
OSPF external type 2 metric

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In this example the metric type of the destination protocol is set to OSPF external Type 1.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric-type type-1
```

© 2026 IP Infusion Inc. Proprietary

set origin

Use this command to set the BGP origin code. The origin attribute defines the origin of the path information.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to delete an entry.

Command Syntax

```
set origin (egp|igp|incomplete)
no set origin (egp|igp|incomplete|)
```

Parameters

egp
Learned through an Exterior Gateway Protocol.

igp
Interior to the originating AS. This happens when an Internal Gateway Protocol is redistributed into BGP.

incomplete
Unknown or learned through some other means. This happens when a static route is redistributed in BGP and the origin of the route is incomplete.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set origin egp
```

© 2026 IP Infusion Inc. Proprietary

set originator-id

Use this command to set the originator ID attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

Command Syntax

```
set originator-id A.B.C.D
no set originator-id (A.B.C.D|)
```

Parameter

A.B.C.D
IP address of originator.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set originator-id 1.1.1.1
```

© 2026 IP Infusion Inc. Proprietary

set tag

Use this command to set a tag value. The parameter is the route tag that is labeled by another routing protocol (BGP or other IGP when redistributing), because AS-external-LSA has a route-tag field in its LSAs. In addition, when using route-map, OcNOS can tag the LSAs with the appropriate tag value. Sometimes the tag matches with using route-map, and sometimes, the value may be used by another application.

Use the `no` parameter with this command to unset a tag value.

Command Syntax

```
set tag <0-4294967295>
no set tag (<0-4294967295>|)
```

Parameter

<0-4294967295>
Tag value for destination routing protocol.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example the tag value of the destination routing protocol is set to 6:

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set tag 6
```

© 2026 IP Infusion Inc. Proprietary

set vpnv4 next-hop

Use this command to set a VPNv4 next-hop address.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Note: This command is valid for BGP only.

Use the `no` parameter with this command to disable this function

Command Syntax

```
set vpnv4 next-hop A.B.C.D
no set vpnv4 next-hop (A.B.C.D|)
```

Parameter

A.B.C.D
IP address of originator.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set vpnv4 next-hop 6.6.6.6
```

© 2026 IP Infusion Inc. Proprietary

set weight

Use this command to set weights for the routing table.

The weight value is used to assist in best path selection. It is assigned locally to a router. When there are several routes with a common destination, the routes with a higher weight value are preferred.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to delete an entry.

Command Syntax

```
set weight <0-4294967295>
no set weight (<0-4294967295>|)
```

Parameter

<0-4294967295>
Weight value.

Default

No default value is specified

Command Mode

Route map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following configuration, all routes that apply to access-list 10 will have the weight set at 400. If the packets do not match any of the defined criteria, they are routed through the normal routing process.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match as-path 10
(config-route-map)#set weight 400
```

© 2026 IP Infusion Inc. Proprietary

show route-map

Use this command to display route-map information.

Command Syntax

```
show route-map (|WORD)
```

Parameters

WORD
Route-map name (maximum size 63 characters)

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show route-map` command.

```
#show route-map
route-map myRM, permit, sequence 1
Match clauses:
metric 200
Set clauses:
metric 60
#
```

Here is the explanation of the "show command" output fields.

Table 13. show route-map details

Field	Description
route-map	Name of a route map.
permit	Routes that match the match clauses are redistributed according to the conditions defined by the set clauses.
sequence	Position of this route map in sequence of route-maps with the same name.
Match clauses	Routes that match the conditions defined by the match clause are redistributed according to the conditions defined by the set clauses.
Set clauses	Routes that pass the match clause are redistributed according to the conditions defined by the set clauses.

© 2026 IP Infusion Inc. Proprietary

show running-config route-map

Use this command to display the running system status and configuration details for route-maps.

Command Syntax

```
show running-config route-map
```

Parameters

None

Command Mode

Privileged execution mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config route-map
!
route-map abc deny 2
match community 2
!
route-map abc permit 3
match route-type external type-2
set metric-type type-1
!
```

Source Interface Commands

This section is a reference for source interface commands. The source Interface feature routes management traffic to a dedicated interface using `iptables` NAT rules.

The source interface feature is supported for the protocols shown in the table below:

Table 14. Source interface protocols and port numbers

Protocol	Default port number
Tacacs+	49
Radius	1812 and 1813
Snmp	161 and 162
Ntp	123
Syslog	514

This section contains these commands:

ip source-interface 392
ipv6 source-interface 394
show ip source-interface detail 396
show ipv6 source-interface detail 398
show running-config ip source-interface 400
show running-config ipv6 source-interface 401

© 2026 IP Infusion Inc. Proprietary

ip source-interface

Use this command to configure the IPv4 source interface for a protocol.

Use the `no` form of this command to remove the IPv4 source interface for a protocol.

Notes:

- It is possible that the router may establish an outgoing TCP connection using an interface that does not have a valid or routable IP address. In such case, the user must specify the address of a different interface to use as the source IP address for the outgoing connection. For this scenario, the command ip source-interface (page 392) or ipv6 source-interface (page 394) is used.
- NTP is supported only on default port.
- OcNOS supports configuring multiple ports for the same protocol in the `ip source-interface` command.

Command Syntax

```
ip source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (123|162|1812|49|514|<1025-
65535>)|)(vrf (NAME|management)|)
no ip source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (49|123|162|514|1812|<1025-
65535>)|) (vrf (NAME|management)|)
```

Parameters

IFNAME
Interface name (lo or physical interface)

tacacs+
Terminal Access Controller Access Control System

tacacs+ 49
Default source interface protocol port number for TACACS+

ntp
Network Time Protocol

ntp 123
Default source interface protocol port number for NTP

snmp
Simple Network Management Protocol

snmp 162
Default source interface protocol port number for SNMP

syslog
syslog

syslog 514
Default source interface protocol port number for Rsyslog

radius
Remote Authentication Dial-In User Service

© 2026 IP Infusion Inc. Proprietary

radius 1812
Default source interface protocol port number for RADIUS

<1025-65535>
Port number. Default value is as per the protocol.

vrf management
Defines the management VRF instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.0. Added VRF NAME parameter in OcNOS version 6.6.0

Example

```
#configure terminal
(config)#ip source-interface xe12 ntp vrf vrf1
(config)#ip source-interface xe2 radius port 1025
(config)#ip source-interface xe3 syslog port 65535 vrf management
```

The following example shows how to configure multiple source interface protocol port number:

```
OcNOS#configure terminal
OcNOS(config)#ip source-interface lo syslog port 6666
OcNOS(config)#ip source-interface lo syslog port 7777
OcNOS(config)#ip source-interface lo syslog port 8888
OcNOS(config)#ip source-interface lo syslog port 9999
OcNOS(config)#commit
```

© 2026 IP Infusion Inc. Proprietary

ipv6 source-interface

Use this command to configure the IPv6 source interface for a protocol.

Use the `no` form of this command to remove the IPv6 source interface for a protocol.

Command Syntax

```
ipv6 source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (123|162|1812|49|514|<1025-
65535>)|) (vrf (NAME|management)|)
no ipv6 source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port (49|123|162|514|1812|<1025-
65535>)|) (vrf (NAME|management)|)
```

Parameters

IFNAME
Interface name (lo or physical interface)

tacacs+
Terminal Access Controller Access Control System

tacacs+ 49
Default source interface protocol port number for TACACS+

ntp
Network Time Protocol

ntp 123
Default source interface protocol port number for NTP

snmp
Simple Network Management Protocol

snmp 162
Default source interface protocol port number for SNMP

syslog
syslog

syslog 514
Default source interface protocol port number for Rsyslog

radius
Remote Authentication Dial-In User Service

radius 1812
Default source interface protocol port number for RADIUS

<1025-65535>
Port number. Default value is as per the protocol.

vrf management
Defines the management VRF instance.

vrf NAME
Specify the user-defined VRF instance name.

Default

None

© 2026 IP Infusion Inc. Proprietary

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
OcNOS#configure terminal
OcNOS(config)#ipv6 source-interface xe12 ntp vrf vrf1
OcNOS(config)#ipv6 source-interface xe2 radius port 1025
OcNOS(config)#ipv6 source-interface xe3 syslog port 65535 vrf management
```

The following example shows how to configure multiple source interface protocol port number:

```
OcNOS#configure terminal
OcNOS(config)#ipv6 source-interface lo tacacs+ port 1111
OcNOS(config)#ipv6 source-interface lo tacacs+ port 2222
OcNOS(config)#ipv6 source-interface lo tacacs+ port 3333
OcNOS(config)#ipv6 source-interface lo tacacs+ port 4444
OcNOS(config)#commit
OcNOS(config)#
```

show ip source-interface detail

Use this command to display the IPv4 source interface status in detail.

Command Syntax

```
show ip source-interface detail
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

The following example shows the output using different protocols with multiple port numbers:

```
#show ip source-interface detail
Source-Interface Detailed Information
=====================================
  Protocol : tacacs+
  Interface : lo
  Port : 6666
  Address : 1.1.1.1
  Status : Active
  VRF Name : Default

  Protocol : radius
  Interface : lo
  Port : 7777
  Address : 1.1.1.1
  Status : Active
  VRF Name : Default

  Protocol : ntp
  Interface : xe12
  Port : 8888
  Address : 1.1.1.1
  Status : Active
  VRF Name : Management

  Protocol : syslog
  Interface : lo
  Port : 9999
  Address : 0.0.0.0
  Status : Active
  VRF Name : default
```

© 2026 IP Infusion Inc. Proprietary

```
 Protocol : ntp
  Interface : xe12
  Port : 123
  Address : 1.1.1.1
  Status : Active
  VRF Name : vrf1
```

The following example shows the output using the same protocol with multiple port numbers:

```
OcNOS#show ip source-interface detail
Source-Interface Detailed Information
=====================================
  Protocol : syslog
  Interface : lo
  Port : 6666
  Address : 0.0.0.0
  Status : Active
  VRF Name : default

  Protocol : syslog
  Interface : lo
  Port : 7777
  Address : 0.0.0.0
  Status : Active
  VRF Name : default

  Protocol : syslog
  Interface : lo
  Port : 8888
  Address : 0.0.0.0
  Status : Active
  VRF Name : default

  Protocol : syslog
  Interface : lo
  Port : 9999
  Address : 0.0.0.0
  Status : Active
  VRF Name : default
```

Here is the explanation of the "show command" output fields.

Table 15. Output fields

Field	Description
Protocol	tacacs+, ntp, snmp, syslog, or radius
Interface	Interface name (lo or physical interface)
Port	Source interface protocol port number
Address	IP address
Status	Whether active or inactive
VRF Name	Virtual Routing and Forwarding name

show ipv6 source-interface detail

Use this command to display the IPv6 source interface status in detail.

Command Syntax

```
show ipv6 source-interface detail
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

The following example shows the output using different protocols with multiple port numbers:

```
#show ipv6 source-interface detail
Source-Interface Detailed Information
=====================================
  Protocol : tacacs+
  Interface : lo
  Port : 6666
  Address : ::1
  Status : Active
  VRF Name : Default

  Protocol : radius
  Interface : lo
  Port : 7777
  Address : ::1
  Status : Active
  VRF Name : Default

  Protocol : ntp
  Interface : xe12
  Port : 7777
  Address : 2001::1
  Status : Active
  VRF Name : vrf1
```

The following example shows the output using the same protocol with multiple port numbers:

```
OcNOS#show ipv6 source-interface detail
Source-Interface Detailed Information
=====================================
```

© 2026 IP Infusion Inc. Proprietary

```
Protocol : tacacs+
Interface : lo
Port : 1111
Address : ::
Status : Active
VRF Name : default

Protocol : tacacs+
Interface : lo
Port : 2222
Address : ::
Status : Active
VRF Name : default

Protocol : tacacs+
Interface : lo
Port : 3333
Address : ::
Status : Active
VRF Name : default

Protocol : tacacs+
Interface : lo
Port : 4444
Address : ::
Status : Active
VRF Name : default
```

Here is the explanation of the "show command" output fields.

Table 16. Output fields

Field	Description
Protocol	tacacs+, ntp, snmp, syslog, or radius
Interface	Interface name (lo or physical interface)
Port	Source interface protocol port number
Address	IP address
Status	Whether active or inactive
VRF Name	Virtual Routing and Forwarding name

show running-config ip source-interface

Use this command to display the IPv4 source interface running configuration.

Command Syntax

```
show running-config ip source-interface
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 4.0

Example

```
#show running-config ip source-interface
ip source-interface lo tacacs+ port 1025
ip source-interface lo radius
ip source-interface lo.management ntp vrf management
ip source-interface lo.management syslog port 1026 vrf management
ip source-interface ge3 snmp
ip source-interface lo syslog port 6666
ip source-interface lo syslog port 7777
ip source-interface lo syslog port 8888
ip source-interface lo syslog port 9999
```

© 2026 IP Infusion Inc. Proprietary

show running-config ipv6 source-interface

Use this command to display the IPv6 source interface running configuration.

Command Syntax

```
show running-config ipv6 source-interface
```

Parameters

None

Default

None

Command Mode

Execution mode and Privileged execution mode

Applicability

This command was introduced in OcNOS version 4.0.

Example

```
#show running-config ipv6 source-interface
ipv6 source-interface lo tacacs+ port 1025
ipv6 source-interface lo radius
ipv6 source-interface lo.management ntp vrf management
ipv6 source-interface lo.management syslog port 1026 vrf management
ipv6 source-interface ge3 snmp
ip source-interface lo syslog port 6666
ip source-interface lo syslog port 7777
ip source-interface lo syslog port 8888
ip source-interface lo syslog port 9999
```

BGP

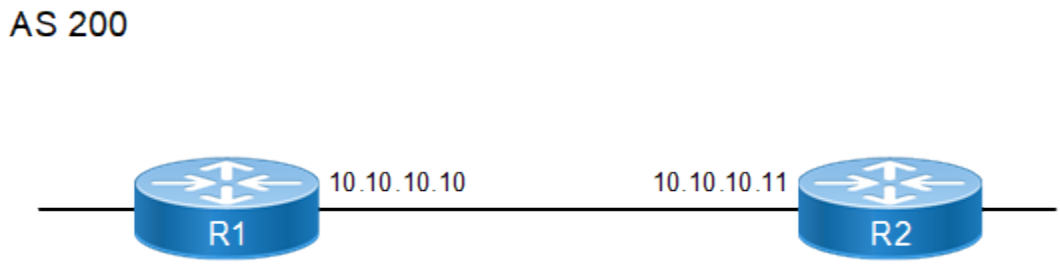
This section contains basic Border Gateway Protocol configuration examples.

Enable BGP Routers in the Same Autonomous System

Figure 21 shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network 10.10.10.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 21. Routers in the Same Autonomous System



R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `200` is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.10.11 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R2`.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (`R1`), and `200` is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.10.10 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

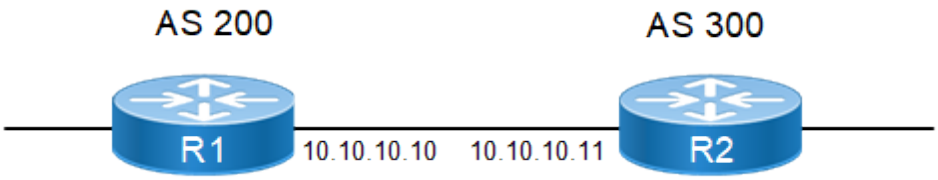
Enable BGP Between Different Autonomous Systems

This example shows the minimum configuration required for enabling BGP on an interface, when the routers belong to different autonomous systems. R1 and R2 are two routers in different autonomous system, AS200 and AS300, connecting to network 10.10.10.0/24.

Topology

Figure 22. Routers in Different Autonomous Systems



R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remote-as 300`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `300` is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.10.11 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 300`	Define the routing process. The number `300` specifies the AS number of `R2`.
`(config-router)#neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R1), and `200` is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.10.10 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Route-Map

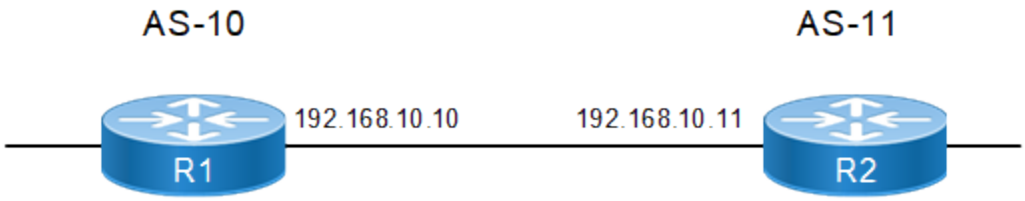
Use route maps to filter incoming updates from a BGP peer. In this example, the prefix-list `ABC` on R1 is configured to deny entry of any routes with the IP address 1.1.1.0/M (M = 26, 27, 28). To test the filter, R2 is configured to generate network addresses 1.1.1.0/27 and 1.1.2.0/24. To verify, use the show ip bgp command on R1; it displays R1 receiving updates from only 1.1.2.0/24.

Note: Route maps enable filtering and modification of BGP routes using 'match' and 'set' clauses. They can be applied to a BGP peer or peer-group in either the inbound or outbound direction to influence received or advertised routes. However, for route-map updates to take effect, a manual command such as clear ip bgp A.B.C.D`<neighbor> soft` must be executed for each BGP peer or peer-group address-family. This manual step is required in all software releases except for release 6.6.x and later, provided that the 'bgp auto-policy-soft-reset enable' feature is configured.

© 2026 IP Infusion Inc. Proprietary

Topology

Figure 23. Configure Route-Map



R1

`#configure terminal`	Enter configure mode.
`(config)#ip prefix-list ABC`	Create an entry in the prefix-list. The ABC parameter is the name of the map that is created above. 5 specifies the sequence number or position of this specific route map. deny specifies the packets are to be rejected. 26 and 28 are the minimum and maximum prefix lengths to be matched.
`(config-ip-prefix-list)#seq 5 deny 1.1.1.0/24 ge 26 le 28`	5 specifies the sequence number or position of this specific route map. deny specifies the packets are to be rejected. 26 and 28 are the minimum and maximum prefix lengths to be matched.
`(config-ip-prefix-list)#seq 10 permit any`	10 specifies the sequence number or position of this specific route map. The permit parameter any specifies accept all packets of any length.
`(config-ip-prefix-list)#exit`	Exit the prefix-list mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#route-map ABC permit 1`	Enter Route-map mode to set the match operation.
`(config-route-map)#match ip address prefix-list ABC`	Set the match criteria. In this case, if the route-map name matches ABC, the packets from the first sequence are denied.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 10`	Define the routing process, and establish a TCP session. The number 10 specifies the AS number of R1.
`(config-router)#neighbor 192.168.10.11 remote-as 11`	Define BGP neighbors, and establish a TCP session. 192.168.10.11 is the IP address of the neighbor (R2), and 11 is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 192.168.10.11 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)#neighbor 192.168.10.11 route-map ABC in`	Apply a route map to routes. 192.168.10.11 specifies

© 2026 IP Infusion Inc. Proprietary

	the IP address of BGP neighbor. The ABC parameter is the name of the route map, and in specifies that the access list applies to incoming advertisements.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 1.1.1.1/27 secondary	Specify the interface address.
(config-if)#ip address 1.1.2.1/24 secondary	Specify the interface address.
(config-if)#exit	Exit loopback interface mode.
(config)#router bgp 11	Define the routing process, and establish a TCP session. The number 11 specifies the AS number of R2.
(config-router)#neighbor 192.168.10.10 remote-as 10	Define BGP neighbors, and establish a TCP session. 192.168.10.10 is the IP address of the neighbor (R1), and 10 is the neighbor's AS number.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 192.168.10.10 activate	Activate the neighbor in the Ipv4 address family.
(config-router-af)#network 1.1.1.0/27	Specify the network to be advertised by the BGP routing process.
(config-router-af)#network 1.1.2.0/24	Specify the network to be advertised by the BGP routing process.
(config-router-af)#exit-address-family	Exit router mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

```

Route-map Continue

The continue clauses allow you to configure and organize more modular policy definitions to reduce the number of policy configurations that are repeated within the same route map.

Continue clause under a route-map provides the capability to execute additional entries in a route map after an entry is executed with a successful match and set clauses. The continue command allows multiple entries to be evaluated within a single route-map. Continue commands can be assigned optional sequence numbers that indicates the order in which clauses are to be evaluated.

Using Continue with Match Clauses

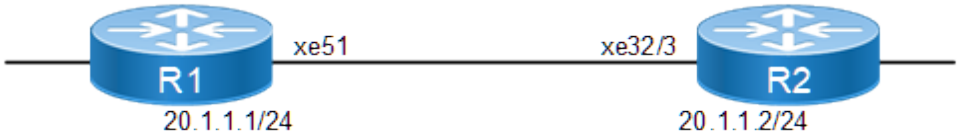
When a `match` clause exists in a route-map with continue clause then `continue` clause is executed only when a successful match occurs. If a `match` clause does not exist in the route-map and if a `continue` clause exists, the `continue` clause will be evaluated and will go to the specified route-map entry. When a successful match occurs and we have a `continue` clause, the route-map executes the `set` clauses and then goes to the specified route-map entry. If a `continue` clause does not exist in the next route map, then the route-map will behave normally. If a `continue` clause exists in the next route-map but a match is not successful, the route-map will not continue and will "fall through" to the next sequence number if one exists

Using Continue with Set Actions

`Set` clauses are executed after the route-map evaluation is done. The `set` clauses are evaluated and executed in the order in which they were configured. `Set` clauses are only executed after a successful match occurs. The `continue` statement proceeds to the specified route-map entry only after configured `set` actions are performed. If a `set` action is configured in the first route-map and then the same `set` action occurs again but with a different value, in a subsequent route-map entry, then the last `set` action will override the previous `set` actions which were configured with the same set command.

Topology

Figure 24. Route-map continue



Configure Route-map continue on R1

In the below example we will apply route-map `continue` on R1 under BGP 100, with redistributed connected routes from R2 on R1. Here, 10.1.0.0/16 is a superset, while 10.1.1.0/24, 10.1.2.0 /24, 10.1.3.0/24, 10.1.4.0/24, and 10.1.5.0/24 are subsets and will filter PF1, which is a superset and sets several prefixes.

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface xe51`	Enter interface mode.
`R1(config-if)#ip address 20.1.1.1/24`	Configure the IP address of the interface.
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#ip prefix-list PF1`	Configure IP prefix-list PF1
`R1(config-ip-prefix-list)#seq 5 permit 10.1.0.0/16`	Create an access rule to permit IP packets with

© 2026 IP Infusion Inc. Proprietary

`le 32`	Maximum prefix length match
R1(config-ip-prefix-list)#exit	Exit interface mode
R1(config-ip-prefix-list)#ip prefix-list P1	Configure IP prefix list P1
`R1(config-ip-prefix-list)#seq 10 permit 10.1.1.0/24 le 32`	Create an access rule to permit IP packets with Maximum prefix length match
R1(config-ip-prefix-list)#exit	Exit interface mode
R1(config-ip-prefix-list)#ip prefix-list P2	Configure IP prefix list P2
`R1(config-ip-prefix-list)#seq 15 permit 10.1.2.0/24 le 32`	Create an access rule to permit IP packets with Maximum prefix length match
R1(config-ip-prefix-list)#exit	Exit interface mode
R1(config-ip-prefix-list)#ip prefix-list P3	Configure IP prefix list P3
`R1(config-ip-prefix-list)#seq 20 permit 10.1.3.0/24 le 32`	Create an access rule to permit IP packets with Maximum prefix length match
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-if)#exit`	Exit interface mode
`R1(config)#route-map myid1 permit 1`	Configure route-map myid1 with sequence number 1
`R1(config-route-map)#match ip address prefix-list PF1`	Match for prefix PF1
`R1(config-route-map)#continue`	Configure continue command without sequence number
`R1(config-route-map)#set metric 10`	Set metric as 10
`R1(config-route-map)#set weight 65535`	Set weight as 65535
R1(config-route-map)#exit	Exit Route map mode
`R1(config-route-map)#route-map myid1 permit 2`	Configure route-map myid1 with sequence number 2
`R1(config-route-map)#match ip address prefix-list P1`	Match for IP prefix-list P1
`R1(config-route-map)#continue 3`	Configure continue with sequence number 3
`R1(config-route-map)#set metric 20`	Set metric as 20.
`R1(config-route-map)#set origin igp`	Set origin as IGP protocol
R1(config-route-map)#exit	Exit Route map mode
`R1(config-route-map)#route-map myid1 permit 3`	Configure route-map myid1 with sequence number 3
`R1(config-route-map)#match ip address prefix-list P2`	Match for IP prefix-list P2
`R1(config-route-map)#continue 4`	Configure continue with sequence number 4
`R1(config-route-map)#set metric 30`	Set metric as 30
`R1(config-route-map)#set as-path prepend 600`	Set as-path prepend as 600
R1(config-route-map)#exit	Exit Route map mode

© 2026 IP Infusion Inc. Proprietary

`R1(config-route-map)#route-map myid1 permit 4`	Configure route-map myid1 with sequence number 4
`R1(config-route-map)#match ip address prefix-list P3`	Match for IP prefix-list P3
`R1(config-route-map)#set local-preference 400`	Set local preference as 400
`R1(config-route-map)#set weight 400`	Set weight as 400
`R1(config-if)#commit`	Commit the candidate configuration to the running configuration
`R1(config-route-map)#exit`	End the route-map
R1(config)#router bgp 100	Configure bgp process 100
R1(config-router)#bgp router-id 1.1.1.1	Configure bgp router id
R1(config-router)#neighbor 20.1.1.2 remote- as 100	Configure bgp remote-as 100 with neighbor IP
R1(config-router)#address-family ipv4 unicast	Enter address-family mode
R1(config-router-af)#neighbor 20.1.1.2 activate	Activate neighbor
R1(config-router-af)#neighbor 20.1.1.2 route- map myid1 in	Configure bgp route-map myid1 as In bound policy with neighbor ip
R1(config-router-af)#exit-address-family	Exit address-family mode
R1(config-router-af)#commit	Exit router bgp mode
R1(config-router-af)#exit	Commit the candidate configuration to the running configuration

R2

`R2(config)#interface xe32/1`	Enter interface mode.
`R2(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface on an interface which is up and running
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#interface xe32/2`	Enter interface mode.
`R2(config-if)#ip address 10.1.2.1/24`	Configure the IP address of the interface on an interface which is up and running
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#interface xe32/4`	Enter interface mode.
`R2(config-if)#ip address 10.1.3.1/24`	Configure the IP address of the interface on an interface which is up and running
`R2(config-if)#commit`	Commit the candidate configuration to the running configuration
`R2(config-if)#interface xe17/1`	Enter interface mode.
`R2(config-if)#ip address 10.1.4.1/24`	Configure the IP address of the interface on an interface which is up and running

© 2026 IP Infusion Inc. Proprietary

R2(config-if)#commit	Commit the candidate configuration to the running configuration
R2(config-if)#interface xe21/1	Enter interface mode.
R2(config-if)#ip address 10.1.5.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#commit	Commit the candidate configuration to the running configuration
R2(config-if)#interface xe32/3	Enter interface mode.
R2(config-if)#ip address 20.1.1.2/24	Configure the IP address on the connected interface.
R2(config-if)#commit	Commit the candidate configuration to the running configuration
R2(config-if)#exit	Exit interface mode.
R2(config)#router bgp 100	Configure BGP process 100
R2(config-router)#bgp router-id 2.2.2.2	Configure BGP router id
R2(config-router)#neighbor 20.1.1.1 remote-as 100	Configure BGP remote-as 100 with neighbor IP
R2(config-router)#address-family ipv4 unicast	Enter address-family mode
R2(config-router-af)#neighbor 20.1.1.1 activate	Activate neighbor
R2(config-router)#redistribute connected	Redistribute the connected routes which are 10 networks here.
R2(config-if)#commit	Commit the candidate configuration to the running configuration
R2(config-if)#exit	Exit interface mode.

Validation

R1

The following provides the R1 validation:

Route-map Nesting

Route-maps can be used to filter incoming updates from a BGP peer. The `match route-map` command within a route-map allows another route-map to be called as a subroutine. The nested route-map is evaluated, and if it returns permit, it is treated as a match; if it returns deny, it is treated as a no-match. A route-map must exist to be nested.

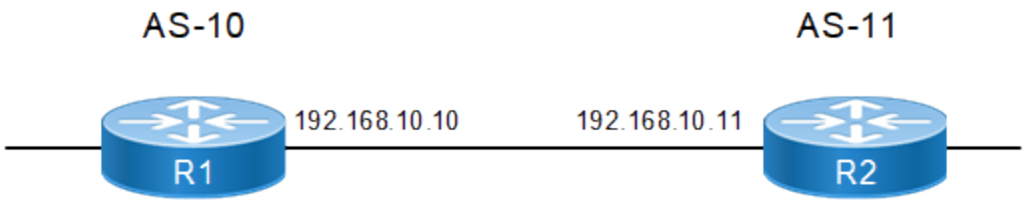
Topology

In the below example, router R2 sets the metric to 300 for all the routes except those with the prefix 20.1.2.0/23. Router R1 then filters incoming route advertisements by matching metric 300 and matching the nested route-map

CHILD.

In the CHILD route-map, the sequence 10 denies prefix 10.1.1.0/24, while sequence 20 denies prefix 1.1.1.0/24 and permits all other routes. Since 20.1.2.0/23 is the only route from R2 with a metric different from 300, it is denied.

Figure 25. Route-map Nesting



Note: The nested route-map is referred to only by the name, so the first route-map in the sequence with the same name will be evaluated, and if no match is found, the next in the sequence will be evaluated. This continues until a match is found or the sequence ends. A maximum of 8 route-maps can be nested within a route-map instance at the same time. Note that more than 4 levels of nesting are not allowed.

Configure Route-map

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#ip prefix-list ABC`	Create an entry in the prefix-list. The `ABC` parameter is the name of the prefix-list.
`R1(config-ip-prefix-list)#seq 5 deny 1.1.1.0/24 ge 26 le 28`	The sequence number of the prefix entry is specified as `5`. `deny` specifies that the packets must be rejected. The minimum and maximum prefix lengths to be matched are `26` and `28`.
`R1(config-ip-prefix-list)#seq 10 permit any`	The sequence number of the prefix-list entry is specified as 10. The permit parameter `any` denotes accepting all packets of any length.
`R1(config-ip-prefix-list)#exit`	Exit prefix-list mode.
`R1(config)#ip prefix-list ABC2`	Create an entry in the prefix-list. The `ABC2` parameter is thename of the prefix-list.
`R1(config-ip-prefix-list)#seq 5 permit 10.1.1.0/24`	The sequence number of the prefix entry is specified as `5`. The parameter `permit` specifies that the packets with the prefix 10.1.1.0/24 will be accepted.
`R1(config-ip-prefix-list)#exit`	Exit prefix-list mode
`R1(config)#route-map PARENT permit 10`	Create the PARENT route-map.
`R1(config-route-map)#match route-map CHILD`	Match route-map CHILD as a subroutine. If a match is returned, this match condition is satisfied.

© 2026 IP Infusion Inc. Proprietary

`R1(config-route-map)#match metric 300`	Match only the routes with the metric 300.
`R1(config-route-map)#exit`	Exit Route-map mode and return to Configure mode.
`R1(config)#route-map CHILD deny 10`	Create an entry with the sequence number `10` and a `deny` action for the route-map that is being nested.
`R1(config-route-map)#match ip address prefix-list ABC2`	Set the match criteria based on the prefix-list `ABC2`. As the prefix 10.1.1.0/24 will be a match, and the action of the route-map is “deny”, the routes with the prefix 10.1.1.0/24 will be denied. If an entry does not have a match, the next route-map in the sequence will be evaluated.
`R1(config-route-map)#exit`	Exit Route-map mode and return to Configure mode.
`R1(config)#route-map CHILD permit 20`	Create an entry with the sequence number `20` and a `permit` action for the route-map that is being nested.
`R1(config-route-map)#match ip address prefix-list ABC`	Set the match criteria based on the prefix-list `ABC`. Every prefix that is matched by the prefix-list will be accepted.
`R1(config-route-map)#exit`	Exit Route-map mode and return to Configure mode.
`R1(config)#router bgp 10`	Define the routing process, and establish a TCP session. The number 10 specifies the AS number of R1.
`R1(config-router)#neighbor 192.168.10.11 remote-as 11`	Define BGP neighbors, and establish a TCP session. 192.168.10.11 is the IP address of the neighbor (R2), and `11` is the neighbor's AS number.
`R1(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode.
`R1(config-router-af)#neighbor 192.168.10.11 activate`	Activate the neighbor in the IPv4 address family.
`R1(config-router-af)#neighbor 192.168.10.11 route-map PARENT in`	Apply a route map to routes. 192.168.10.11 specifies the IP address of the BGP neighbor. The name of the route map is PARENT, and the `in` parameter specifies that the access list applies to incoming advertisements.
`R1(config-router-af)#exit-address-family`	Exit address-family mode.
`R1(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`R2(config)#ip prefix-list PLIST`	Create an entry in the prefix-list. The name of the prefix-list is `PLIST`.
`R2(config-ip-prefix-list)#seq 5 deny 20.1.2.0/23`	The sequence number or position of the prefix entry is specified as `5`. `deny` specifies that the packets with the prefix

	20.1.2.0/23 are to be rejected.
`R2(config-ip-prefix-list)#seq 10 permit any`	The sequence number or position of this prefix entry is specified as `10`. The permit parameter `any` specifies that all packets of any length are accepted.
`R2(config-ip-prefix-list)#exit`	Exit the prefix-list mode .
`R2(config)#route-map TEST permit 10`	Enter Route-map mode to set the match operation.
`R2(config-route-map)#match ip address prefix-list PLIST`	Set the match criteria based on the prefix-list PLIST
`R2(config-route-map)#set metric 300`	Configure the set action. If the match condition is satisfied, the metric is set to 300.
`R2(config-route-map)#exit`	Exit Route-map mode and return to Configure mode.
`R2 (config)#interface lo`	Enter loopback interface mode.
`R2(config-if)#ip address 1.1.1.1/27 secondary`	Specify a secondary interface address.
`R2(config-if)#ip address 1.1.2.1/24 secondary`	Specify a secondary interface address
`R2(config-if)#ip address 10.1.1.1/24 secondary`	Specify a secondary interface address
`R2(config-if)#ip address 20.1.1.1/24 secondary`	Specify a secondary interface address
`R2(config-if)#ip address 20.1.2.1/23 secondary`	Specify a secondary interface address
`R2(config-if)#ip address 30.1.1.1/28 secondary`	Specify a secondary interface address
`R2(config-if)#exit`	Exit loopback interface mode.
`R2(config)#router bgp 11`	Define the routing process, and establish a TCP session. The number `11` specifies the AS number of R2.
`R2(config-router)#neighbor 192.168.10.10 remote-as 10`	Define BGP neighbors, and establish a TCP session. 192.168.10.10 is the IP address of the neighbor (R1), and `10` is the neighbor's AS number.
`R2(config-router)#address-family ipv4 unicast`	Enter address-family IPv4 unicast mode
`R2(config-router-af)#neighbor 192.168.10.10 activate`	Activate the neighbor in the IPv4 address family.
`R2(config-router-af)#neighbor 192.168.10.10 route-map TEST out`	Apply a route map to routes. `192.168.10.10` specifies the IP address of the BGP neighbor. The `TEST` parameter is the name of the route map, and `out` specifies that the route-map applies to outgoing advertisements.
R2(config-router-af)#network 1.1.1.0/27	Specify the network to be advertised by the BGP routing process.
R2(config-router-af)#network 1.1.2.0/24	Specify the network to be advertised by the BGP routing process.
`R2(config-router-af)#network 10.1.1.0/24`	Specify the network to be advertised by the BGP routing process.
`R2(config-router-af)#network 20.1.1.0/24`	Specify the network to be advertised by the BGP routing process.

© 2026 IP Infusion Inc. Proprietary

`R2(config-router-af)#network 20.1.2.0/23`	Specify the network to be advertised by the BGP routing process.
`R2(config-router-af)#network 30.1.1.0/28`	Specify the network to be advertised by the BGP routing process.
`R2(config-router-af)#exit-address-family`	Exit router mode.
`R2(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

Here is the validation:

```

Route Reflector

The configurations in this section apply to BGP Route Reflectors (RR).

Reduce the iBGP Mesh Inside an Autonomous System

Use Route Reflectors to reduce the iBGP mesh inside an Autonomous System (AS).

Notes:

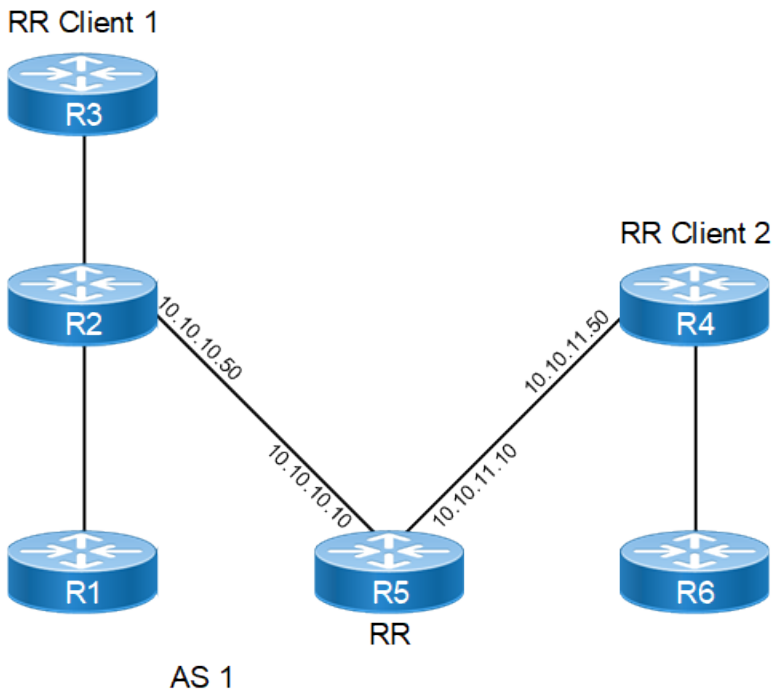
- When utilizing BGP redundant route reflectors with BFD, setting the multi-hop timer to 999ms and the multiplier to 3 results in a BGP convergence time of approximately 6 seconds in the event of an aggregator node reload.

Topology

In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with the RR only, but not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to R2. This reduces the iBGP peer connections in AS1.

© 2026 IP Infusion Inc. Proprietary

Figure 26. BGP Route Reflector



RR (R5)

`#configure terminal`	Enter configure mode.
`(config)#router bgp 1`	Define the routing process. The number 1 identifies the AS number of R5.
`(config-router)#neighbor 10.10.10.50 remote-as 1`	Define the BGP neighbor, and establish a TCP session. 10.10.10.50 is the IP address of one of the neighbors (R2), and 1 is the neighbor's AS number.
`(config-router)#neighbor 10.10.11.50 remote-as 1`	Define the BGP neighbor, and establish a TCP session. 10.10.11.50 is the IP address of one of the neighbors (R4), and 1 is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.10.50 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)#neighbor 10.10.11.50 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)#neighbor 10.10.10.50 route-reflector-client`	Configure R5 as the Route-Reflector (RR) and neighbor R2 as its client.
`(config-router-af)#neighbor 10.10.11.50 route-reflector-client`	Configure R5 as the Route-Reflector (RR) and neighbor R4 as its client.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

RR Client 1 (R2)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of R2.
`(config-router)#neighbor 10.10.10.10 remote-as 1`	Define the BGP neighbor, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R5), and `1` is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.10.10 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.

RR Client 2 (R4)

`(config)#router bgp 1`	Define the routing process. The number `1` identifies the AS number of `R4`.
`(config-router)#neighbor 10.10.11.10 remote-as 1`	Define BGP neighbor, and establish a TCP session. `10.10.11.10` is the IP address of the neighbor (R5), and `1` is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.10.11.10 activate`	Activate the neighbor in the Ipv4 address family.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.

Validation

R5

The following provides the R5 validation:

```
#show ip bgp neighbors
BGP neighbor is 10.10.10.50, remote AS 1, local AS 1, internal link
  BGP version 4, local router ID 192.160.50.3, remote router ID 10.12.4.152
  BGP state = Established, up for 00:01:04

```

Multiple Route Reflectors

The basic rule of BGP is that a BGP speaker cannot advertise a route to an iBGP neighbor if that route was learned from another iBGP neighbor. Configuring a route reflector provides a means to circumvent this rule. The entire route reflector process is transparent to the clients, and no configuration is necessary on these clients.

Whenever an iBGP-speaking router receives a route update, it forwards the route to the neighbor without changing the nexthop IP address, thus making it an unreachable route, unless verified by an iGP (for example, neighbor x.x.x.x route-reflector-client).

- A route learned from a non-RR client is advertised to RR clients but not to non-RR clients.
- A route learned from a RR client is advertised to both RR clients and non-RR clients. Even the RR client that advertised the route will receive a copy and discards it because it sees itself as the originator.
- A route learned from an EBGP neighbor is advertised to both RR clients and non-RR clients.

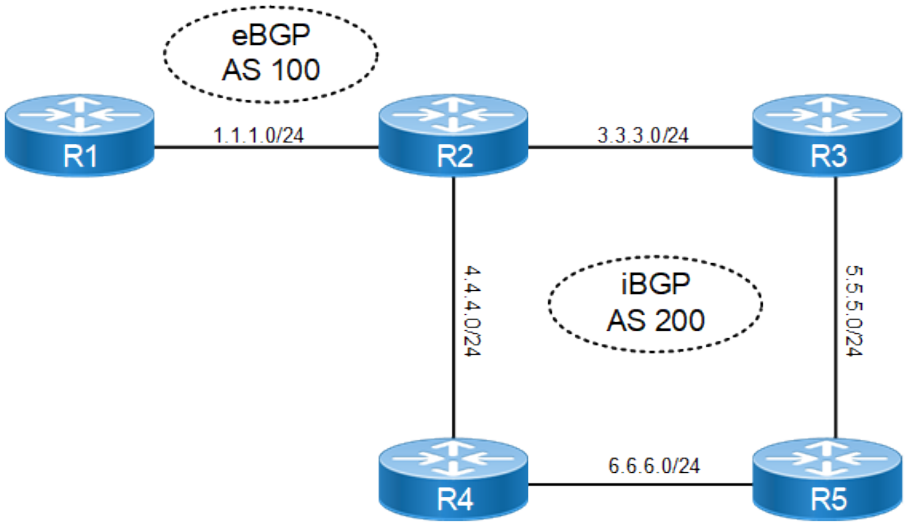
Topology

Figure 27. eBGP and iBGP Route Reflector Topology



R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip addr 1.1.1.1/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 100.100.100.100/32 secondary`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Define the eBGP neighbor (R2).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 1.1.1.2 activate`	Activate the neighbor under address family mode
`(config-router-af)#network 100.100.100.100/32`	Advertise a route via eBGP connection to R2.
`(config-router-af)#exit-address-family`	Exit router mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 1.1.1.2/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 3.3.3.2/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth3`	Enter interface mode
`(config-if)#ip address 4.4.4.2/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process with AS number 200.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Define the eBGP neighbor (R1).
`(config-router)#neighbor 4.4.4.1 remote-as 200`	Define the iBGP neighbor (R4).
`(config-router)#neighbor 3.3.3.1 remote-as 200`	Define the iBGP neighbor (R3).
`(config-router)#bgp cluster-id 4`	Define a cluster ID (4) when multiple Route Reflectors exist.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 1.1.1.1 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 4.4.4.1 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 3.3.3.1 activate`	Activate the neighbor under address family mode
`(config-router-af)#neighbor 3.3.3.1 route-reflector-client`	Configure R2 as the Route-Reflector and neighbor R3 as its client.
`(config-router-af)#neighbor 4.4.4.1 route-reflector-client`	Configure R2 as the Route-Reflector and neighbor R4 as its client.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 3.3.3.1/24`	Assign an IP address
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip addr 5.5.5.1/24`	Assign an IP address
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process with AS number 200.
`(config-router)#neighbor 3.3.3.2 remote-as 200`	Define the iBGP neighbor (R2).
`(config-router)#neighbor 5.5.5.2 remote-as 200`	Define the iBGP neighbor (R5).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 3.3.3.2 activate`	Activate the neighbor under address family mode

© 2026 IP Infusion Inc. Proprietary

`(config-router-af)# neighbor 5.5.5.2 activate`	Activate the neighbor under address family mode
`(config-router-af)#neighbor 5.5.5.2 route-reflector-client`	Configure R3 as the Route-Reflector and neighbor R5 as its client.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R4

`#configure terminal`	Enter configure mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 6.6.6.1/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth4`	Enter interface mode
`(config-if)#ip address 4.4.4.1/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 4.4.4.2 remote-as 200`	Define the iBGP neighbor (R2).
`(config-router)#neighbor 6.6.6.2 remote-as 200`	Define the iBGP neighbor (R5).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 4.4.4.2 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 6.6.6.2 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.

R5

`#configure terminal`	Enter configure mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 5.5.5.2/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config-if)#interface eth2`	Enter interface mode
`(config-if)#ip address 6.6.6.2/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 5.5.5.1 remote-as 200`	Define the iBGP neighbor (R3).
`(config-router)#neighbor 6.6.6.1 remote-as 200`	Define the iBGP neighbor (R4).

© 2026 IP Infusion Inc. Proprietary

`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 5.5.5.1 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 6.6.6.1 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R2

The following provides the R2 validation:

```
#show ip bgp neighbors
BGP neighbor is 1.1.1.1, remote AS 100, local AS 200, external link

BGP Confederations

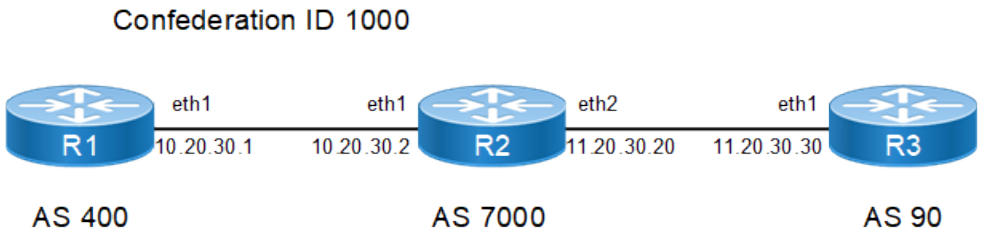
In BGP, nodes running iBGP protocols must be interconnected forming a full mesh. Confederation solves the iBGP full-mesh network complexity and inefficiency by splitting a large autonomous system domain into smaller autonomous system domains, called member autonomous systems. Member autonomous systems can form eBGP connections among themselves, to prevent full-mesh connections among each iBGP-running node.

The `bgp confederation identifier` command tells the router that it is a member of a confederation and the confederation ID. The `bgp confederation peers` command lists the member AS to which the router is connected.

In the following example, R1, R2, and R3 are members of the same confederation with different AS numbers.

Topology

Figure 28. BGP Confederation



R1

`#configure terminal`	Enter configure mode.

`(config)#router bgp 400`	Assign the ASN value (400) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID, the externally visible autonomous system number that identifies the BGP confederation as a whole.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (10.20.30.2) and the ASN value of the neighbor (7000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.20.30.2 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 7000`	Assign the ASN value (7000) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400 90`	Specify the neighbor ASN values for confederation membership.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (10.20.30.1) and the ASN value of the neighbor (400).
`(config-router)#neighbor 11.20.30.30 remote-as 90`	Specify the neighbor's IP address (11.20.30.30) and the ASN value of the neighbor (90).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.20.30.1 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 11.20.30.30 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R3

`#configure terminal`	Enter configure mode.
`(config-router)#router bgp 90`	Assign the ASN value (90) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 11.20.30.20 remote-as 7000`	Specify the neighbor's IP address (11.20.30.20) and the ASN value of the neighbor (7000).

© 2026 IP Infusion Inc. Proprietary

(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 11.20.30.20 activate	Exit address-family mode.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

Validation

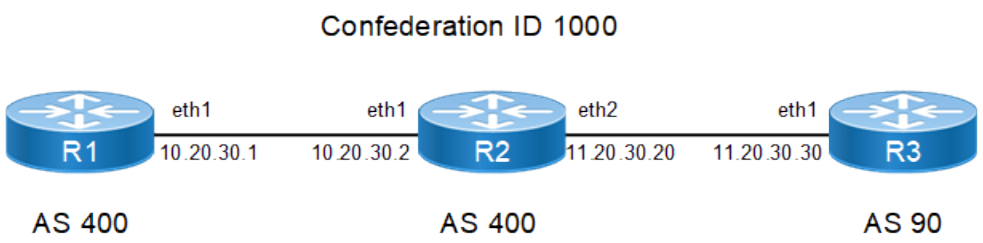
Outside Autonomous System

In the following example, R1 and R2 are members of the same confederation with different AS numbers, and R3 is a member outside the confederation.

Topology

Figure 30. Single Confederation with Outside AS



R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 400`	Assign the ASN value (400) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (10.20.30.2) and the ASN value of the neighbor (7000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.20.30.2 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`(config)#configure terminal`	Enter configure mode
`(config)#router bgp 7000`	Assign the ASN value (7000) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (10.20.30.1) and the ASN value of the neighbor (400).
`(config-router)#neighbor 11.20.30.30 remote-as 90`	Specify the neighbor's IP address (11.20.30.30) and the ASN value of the neighbor (90).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.20.30.1 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 11.20.30.30 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 90`	Assign the ASN value (90) to the router.
`(config-router)#neighbor 11.20.30.20 remote-as 1000`	Specify the neighbor's IP address (11.20.30.20) and the BGP confederation ID (1000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 11.20.30.20 activate`	Activate the neighbor under address family mode

© 2026 IP Infusion Inc. Proprietary

`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Dynamic BGP Peering

BGP Dynamic Neighbors is a quick way of setting up BGP on device like a Hub router where user is expecting numerous BGP neighbors. Before dynamic neighbors, user had to provide a large amount of configuration to work with all these neighbors. This new feature dramatically reduces the amount and complexity of CLI configuration on the router and save CPU and memory usage.

BGP dynamic neighbor support allows BGP peering to a group of remote neighbors that are defined by a range of IP addresses. Each range can be configured as a subnet IP address. BGP dynamic neighbors are configured using a range of IP addresses and BGP peer groups.

After a subnet range is configured for a BGP peer group and a TCP session is initiated by another router for an IP address in the subnet range, a new BGP neighbor is dynamically created as a member of that group. After the initial configuration of subnet ranges and activation of the peer group, dynamic BGP neighbor creation does not require any further CLI configuration on the initial router. Other routers can establish a BGP session with the initial router,

but the initial router need not establish a BGP session to other routers if the IP address of the remote peer used for the BGP session is not within the configured range.

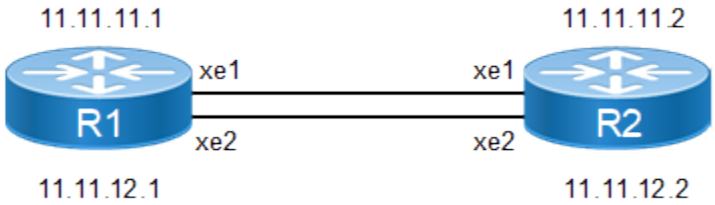
A dynamic BGP neighbor will inherit any configuration for the peer group. In larger BGP networks, implementing BGP dynamic neighbors can reduce the amount and complexity of CLI configuration and save CPU and memory usage. Both IPv4 and IPV6 peering is supported.

IPv4 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 31. IPv4 IBGP Peering



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 33.33.33.33/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ip add 11.11.12.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor IPV4_IBGP_PEER peer- group range 11.11.0.0/16`	Create a dynamic peer-group, IPV4_IBGP_PEER with a dynamic range 11.11.0.0/16
`(config-router)#neighbor IPV4_IBGP_PEER remote-as 100`	Assign a remote AS for the peer-group, IPV4_IBGP_ PEER.
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor IPV4_IBGP_PEER activate`	Activate peer-group in the address family

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#exit-address-family	Exit from address family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ip address 22.22.22.22/32 secondary	Assign a secondary IP address.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ip address 11.11.11.2/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ip add 11.11.12.2/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor 11.11.11.1 remote-as 100	Create a static BGP neighbor 11.11.11.1 in remote AS 100.
(config-router)#neighbor 11.11.12.1 remote-as 100	Create a static BGP neighbor 11.11.12.1 in remote AS 100.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 11.11.12.1 activate	Activate the neighbor under address family mode
(config-router-af)# neighbor 11.11.12.1 activate	Activate the neighbor under address family mode
(config-router-af)# network 22.22.22.22/32	Advertise the loopback network into BGP.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

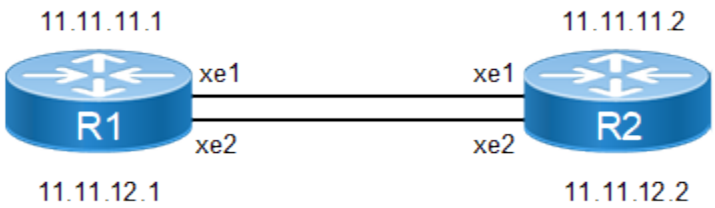
IPv4 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with vrf enabled on the device and interface being part of vrf. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 32. IPv4 VRF IBGP Peering



R1

#configure terminal	Enter Configuration mode.
(config)#ip vrf vrfA	Create a VRF, vrfA on the router.
(config-vrf)#rd 1:1	Assign a route distinguisher to VRF.
(config-if)#exit	Exit VRF mode and return to Configure mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ip address 11.11.11.1/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ip add 11.11.12.1/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 1.1.1.1	Assign a BGP router ID.
(config-router)#address-family ipv4 vrf vrfA	Enter IPv4 VRF Address Family.
(config-router-af)#neighbor IPV4_IBGP_PEER peer-group range 11.11.0.0/16	Create a dynamic peer-group, IPV4_IBGP_PEER with a dynamic range 11.11.0.0/16.
(config-router-af)#neighbor IPV4_IBGP_PEER remote-as 100	Assign a remote AS for the peer-group, IPV4_ IBGP_PEER.
(config-router-af)# neighbor IPV4_IBGP_PEER activate	Activate peer-group in the address family
(config-router-af)#network 33.33.33.33/32	Advertise the loopback network into BGP
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal (config)#ip vrf vrfA	Enter configure mode. Create a VRF, vrfA on router.
(config-vrf)#rd 2:1	Assign a route distinguisher to VRF.
(config-if)#exit	Exit VRF mode and return to Configure mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ip address 11.11.11.2/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

`#configure terminal` `(config)#interface xe2`	Enter configure mode. Enter interface mode for xe2.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ip add 11.11.12.2/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 2.2.2.2`	Assign a BGP router ID.
`(config-router)#address-family ipv4 vrf vrfA`	Enter IPv4 VRF Address Family.
`(config-router-af)#neighbor 11.11.11.1 remote-as 100`	Create a static BGP neighbor 11.11.11.1 in remote AS 100.
`(config-router-af)# neighbor 11.11.11.1 activate`	Activate neighbor in the address family
`(config-router-af)#neighbor 11.11.12.1 remote-as 100`	Create a static BGP neighbor 11.11.12.1 in remote AS 100
`(config-router-af)# neighbor 11.11.12.1 activate`	Activate neighbor in the address family
`(config-router-af)#network 22.22.22.22/32`	Advertise the loopback network into BGP.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

IPv4 EBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 33. IPv4 EBGP Peering

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 33.33.33.33/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor 11.11.11.2 remote-as 200`	Create a static neighbor 11.11.11.2 with remote AS 200.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode.
`(config-router-af)# neighbor 11.11.11.2 activate`	Activate the neighbor under address family mode
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 22.22.22.22/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 11.11.11.2/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ip add 11.11.12.2/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 200	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor IPV4_EBGP_PEER peer-group range 11.11.0.0/16	Create a dynamic peer-group, IPV4_EBGP_PEER.
(config-router)#neighbor IPV4_EBGP_PEER remote-as 100	Assign remote AS with the peer-group IPV4_ EBGP_PEER.
(config-router)#neighbor IPV4_EBGP_PEER optional-as 300	Assign optional AS with the peer-group IPV4_ EBGP_PEER
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor IPV4_EBGP_PEER activate	Activate the peer-group in address family
(config-router-af)#network 22.22.22.22/32	Advertise the loopback network into BGP.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ip address 44.44.44.44/32 secondary	Assign a secondary IP address.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ip add 11.11.12.3/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 300	Enter Router BGP mode.
(config-router)#bgp router-id 3.3.3.3	Assign a BGP router ID.
(config-router)#neighbor 11.11.12.2 remote-as 200	Create a static BGP neighbor 11.11.12.2 with remote AS 200.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 11.11.12.2 activate	Activate the neighbor under address family mode
(config-router-af)#network 44.44.44.44/32	Advertise the loopback network into BGP.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

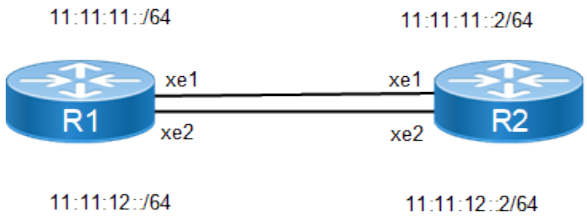
IPv6 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1/64 and 11:11:12::1/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 34. IPv6 IBGP Peering



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ipv6 address 33::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.

(config-if)#ipv6 address 11:11:11::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ipv6 address 11:11:12::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 1.1.1.1	Assign a BGP router ID.
(config-router)#neighbor IPV6_IBGP_PEER peer-group range 11:11::/16	Create a dynamic peer-group, IPV6_IBGP_PEER with a dynamic range 11:11::/16
(config-router)#neighbor IPV6_IBGP_PEER remote-as 100	Configure a remote AS with the peer group, IPV6_ IBGP_PEER.
(config-router)#neighbor IPV6_IBGP_PEER limit 1	Set peer group neighbors limit to 1. Only one BGP session will be up.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#neighbor IPV6_IBGP_PEER activate	Activate the peer group, IPV6_IBGP_PEER in the IPv6 address family.
(config-router-af)#network 33::1/128	Advertise the loopback network into the BGP IPv6 address family.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter Configuration mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ipv6 address 22::2/128	Assign an IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor 11:11:11::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#neighbor 11:11:12::1 remote-as 100`	Configure BGP neighbor by specifying the neighbor IP address.
`(config-router)#address-family ipv4 unicast`	Enter the Ipv4 Unicast Address Family.
`(config-router-af)# neighbor 11:11:11::1 activate`	Activate the neighbor under address family mode
`(config-router-af)# neighbor 11:11:12::1 activate`	Activate the neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#address-family ipv6 unicast`	Enter the IPv6 Unicast Address Family.
`(config-router-af)#network 22::2/128`	Advertise the loopback network into BGP.
`(config-router-af)#neighbor 11:11:12::1 activate`	Activate the neighbor in the IPv6 address family.
`(config-router-af)#neighbor 11:11:11::1 activate`	Activate the neighbor in the IPv6 address family.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

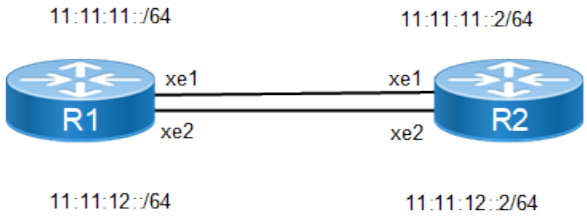
IPV6 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with VRF enabled on the device and interface being part of VRF. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1 and 11:11:12::1. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 35. IPv6 VRF IBGP peering



R1

`#configure terminal`	Enter Configuration mode.
`(config)#ip vrf vrfA`	Configure a VRF, vrfA.
`(config-vrf)#rd 1:1`	Configure a route distinguisher to VRF.
`(config-vrf)#router-id 7.7.7.7`	Configure a router ID.
`(config-vrf)#exit`	Exit from VRF mode and return to Configuration mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ipv6 address 11:11:11::1/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ipv6 address 11:11:12::1/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#address-family ipv6 vrf vrfA`	Enter IPv6 VRF Address Family.
`(config-router-af)#neighbor IPV6_VRF_IBGP_PEER peer-group range 11:11::1/16`	Configure a dynamic peer group, IPV6_IBGP_ PEER with a dynamic range value.
`(config-router-af)#neighbor IPV6_VRF_IBGP_PEER remote-as 100`	Configure a remote AS with the peer group, IPV6_ IBGP_PEER.
`(config-router-af)# neighbor IPV6_VRF_IBGP_PEER activate`	Activate neighbor in the address family
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R2

#configure terminal	Enter configure mode.
(config)#ip vrf vrfA	Configure a VRF, vrfA.
(config-vrf)#rd 2:1	Configure a route distinguisher to VRF.
(config-vrf)#router-id 1.1.1.1	Configure a router ID.
(config-vrf)#exit	Exit from VRF mode and return to Configuration mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to vrf.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)#address-family ipv6 vrf vrfA	Enter IPv6 VRF Address Family.
(config-router-af)#neighbor 11:11:12::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router-af)# neighbor 11:11:12::1 activate	Activate neighbor in the address family
(config-router-af)#neighbor 11:11:11::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router-af)# neighbor 11:11:11::1 activate	Activate neighbor in the address family
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

IPv6 EBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11:11:11::/64 and 11:11:12::/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 36. IPv6 EBGP peering

R1

#configure terminal	Enter Configuration mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ipv6 address 33::1/128	Assign an IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ipv6 address 11:11:11::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 1.1.1.1	Assign a BGP router ID.
(config-router)#neighbor 11:11:11::2 remote-as 200	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#neighbor 11:11:11::2 activate	Activate the neighbor in the address family.
(config-router-af)#network 33::1/128	Advertise the loopback network into BGP.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter Configuration mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ipv6 address 22::1/128	Assign an IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode for xe1
(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 200	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor IPV6_EBGP_PEER peer-group range 11::1/16	Configure a dynamic peer group, IPV6_EBGP_ PEER.
(config-router)#neighbor IPV6_EBGP_PEER remote-as 100	Configure remote AS with peer group, IPV6_ EBGP_PEER.
(config-router)#neighbor IPV6_EBGP_PEER optional-as 300	Configure optional AS with peer group, IPV6_ EBGP_PEER.

© 2026 IP Infusion Inc. Proprietary

(config-router)#address-family ipv6 unicast	Enter IPv6 Unicast Address Family.
(config-router-af)#neighbor IPV6_EBGP_PEER activate	Activate peer group in the address family.
(config-router-af)#network 22::1/128	Advertise the loopback network into BGP.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter Configuration mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ipv6 address 44::1/128	Assign an IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2
(config-if)#ipv6 address 11:11:12::3/64	Assign an IPv6 address.
(config-if)#exit	Exit interface mode.
(config)#router bgp 300	Enter Router BGP mode.
(config-router)#bgp router-id 3.3.3.3	Assign a BGP router ID.
(config-router)#neighbor 11:11:12::2 remote-as 200	Configure the BGP neighbor by specifying the neighbor IP address.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#neighbor 11:11:12::2 activate	Activate the neighbor in address family.
(config-router-af)#network 44::1/128	Advertise the loopback network into BGP.
(config-router-af)#exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

VPNV4 Configuration

Below mentioned topology displays bgp vpnv4 configuration on PE nodes, R1 and R3. IBGP peering will be formed on the loopback interface of R1 and R3; also IGP is running between all the routers.

Topology

Figure 37. IPv4 IBGP VPNv4 Configuration

R1

`#configure terminal`	Enter Configuration mode.
`(config)#ip vrf vrf1`	Create a VRF, vrf1.
`(config-vrf)#rd 100:1`	Configure a route distinguisher value.
`(config-vrf)#route-target export 100:1`	Configure a route target export value to VRF.
`(config-vrf)#route-target import 200:1`	Configure a route target import value to VRF.
`(config-vrf)#exit`	Exit from VRF configuration mode.
`(config)#router ldp`	Enter Router LDP mode.
`(config-router)#router-id 3.3.3.3`	Configure an LDP router ID.
`(config-router)#exit`	Exit from Router LDP mode.
`(config)#interface xe5`	Enter Interface configuration mode.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip vrf forwarding vrf1`	Configure the interface to a VRF.
`(config-if)#ip address 1.1.1.1/24`	Assign an IP address to the interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface xe1`	Enter another interface.
`(config-if)#ip address 11.11.11.1/24`	Assign an IP address to the interface.
`(config-if)#label-switching`	Enable label switching on interface.
`(config-if)#enable-ldp ipv4`	Enable IPv4 LDP configuration on interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface lo`	Enter the loopback interface.
`(config-if)#ip address 20.20.20.20/32 secondary`	Assign a secondary IP address to the interface.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config-if)#exit`	Exit from Interface Configuration mode.
`(config)#router ospf 100`	Enter Router OSPF mode.
`(config-router)#network 11.11.11.0/24 area 0`	Configure the interface on which OSPF runs, and associate the area ID.
`(config-router)#network 20.20.20.20/32 area 0`	Configure the interface on which OSPF runs, and associate the area ID.
`(config-router)#exit`	Exit from Router OSPF mode.
`(config)#router ospf 200 vrf1`	Create an OSPF process on VRF.
`(config-router)#network 1.1.1.1/24 area 0`	Configure the interface on which OSPF runs, and associate the area ID.
`(config-router)#redistribute bgp`	Redistribute BGP into OSPF.
`(config-router)#exit`	Exit from Router OSPF mode.
`(config)#router bgp 100`	Create a BGP process.
`(config-router)#neighbor lo_peer peer-group range 30.30.30.30/32`	Configure a dynamic peer group with the range command.
`(config-router)#neighbor lo_peer remote-as 100`	Configure remote AS to the peer group.
`(config-router)#neighbor lo_peer update-source lo`	Configure BGP neighbors to update the source routes.
`(config-router)#address-family vpnv4 unicast`	Enter the VPNv4 Address Family.
`(config-router-af)#neighbor lo_peer activate`	Activate the peer group in VPNv4 address family.
`(config-router-af)#exit-address-family`	Exit from VPNv4 address family.
`(config-router)#address-family ipv4 vrf vrf1`	Enter IPv4 VRF address family.
`(config-router-af)#redistribute ospf 200`	Redistribute OSPF into the IPv4 VRF address family.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R2

#configure terminal	Enter Configuration mode.
(config)#router ldp	Enter Router LDP mode.
(config-router)#router-id 4.4.4.4	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode.
(config-if)#interface xe2	Enter Interface Configuration mode.
(config-if)#ip address 12.12.12.2/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface xe1	Enter another Interface.
(config-if)#ip address 11.11.11.2/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 100	Create an OSPF process.
(config-router)#network 11.11.11.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#network 12.12.12.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#exit	Exit from Router BGP mode.
(config)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter Configuration mode.
(config)#router ldp	Enter Router LDP mode.
(config-router)#router-id 5.5.5.5	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode.
(config)#ip vrf vrf2	Create a VRF, vrf2.
(config-vrf)#rd 200:1	Configure a route distinguisher value.
(config-vrf)#route-target export 200:1	Configure a route target export value to VRF.
(config-vrf)#route-target import 100:1	Configure a route target import value to VRF.
(config-vrf)#exit	Exit from VRF configuration mode.
(config)#interface xe1	Enter Interface configuration mode.

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip vrf forwarding vrf2`	Configure an interface to a VRF.
`(config-if)#ip address 2.2.2.3/24`	Assign an IP address to the interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface xe2`	Enter another interface.
`(config-if)#ip address 12.12.12.3/24`	Assign an IP address to the interface.
`(config-if)#label-switching`	Enable label switching on interface.
`(config-if)#enable-ldp ipv4`	Enable IPv4 LDP configuration on the interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface lo`	Enter loopback interface.
`(config-if)#ip address 30.30.30.30/32 se`	Assign a secondary IP address to the interface.
`(config-if)#exit`	Exit from Interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 100`	Enter Router OSPF mode.
`(config-router)#network 12.12.12.0/24 area 0`	Define the interface on which OSPF runs, and associate the area ID
`(config-router)#network 30.30.30.30/32 area 0`	Define the interface on which OSPF runs, and associate the area ID
`(config-router)#exit`	Exit from Router OSPF mode.
`(config)#router ospf 200 vrf2`	Create an OSPF process on VRF.
`(config-router)#network 2.2.2.3/24 area 0`	Define the interface on which OSPF runs, and associate the area ID.
`(config-router)#redistribute bgp`	Redistribute BGP into OSPF.
`(config-router)#exit`	Exit from Router OSPF mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Create a BGP process.
`(config-router)#neighbor 20.20.20.20 remote-as 100`	Configure BGP neighbor by specifying a neighbor IP address.
`(config-router)#neighbor 20.20.20.20 update-s lo`	Define the BGP neighbors to update the source routes.
`(config-router)#address-family vpnv4 unicast`	Enter VPNv4 Address Family.
`(config-router-af)#neighbor 20.20.20.20 activate`	Activate the neighbor in VPNv4 address family.
`(config-router-af)#exit-address-family`	Exit from VPNv4 address family.
`(config-router)#address-family ipv4 vrf vrf2`	Enter IPv4 VRF address family.
`(config-router-af)#redistribute ospf 200`	Redistribute OSPF into the IPv4 address family.
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

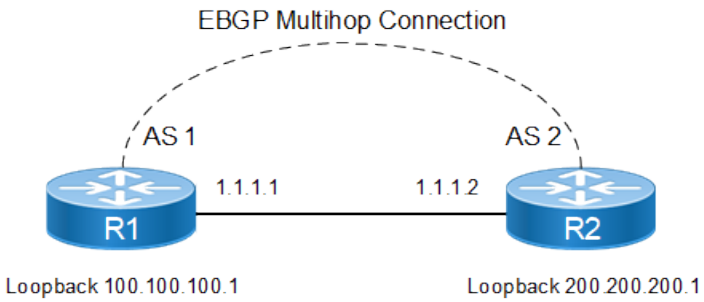
Enable eBGP Multihop

This example shows the minimum configuration required for enabling eBGP multihop on peers speaking BGP. eBGP multihop is used for routers that are not directly connected to each other. Typically, eBGP peers are directly connected, but if there is a requirement that necessitates this scenario, this configuration can be used.

Note: The IP addresses used in the configuration should be accessible through an IGP or static routing.

Topology

Figure 38. eBGP Multihop Connection



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 100.100.100.1/24 secondary`	Specify IP address to the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#ip route 200.200.200.0/24 1.1.1.2`	Specify route IP address.
`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of `R1`.
`(config-router)#neighbor 200.200.200.1 remote-as 2`	Define BGP neighbors, and establish a TCP session. 200.200.200.1 is the IP address of the neighbor (R2), and 2 is the neighbor's AS number.
`(config-router)#neighbor 200.200.200.1 update-source lo`	Define BGP neighbors, to update the source

	routes.
(config-router)#neighbor 200.200.200.1 ebgp-multihop	Define the neighbor 200.200.200.1 for eBGP multihops.
(config-router)#address-family ipv4 unicast	Enter the Ipv4 Unicast Address Family.
(config-router-af)# neighbor 200.200.200.1 activate	Activate the neighbor under address family mode
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 200.200.200.1/24 secondary	Specify IP address to the interface.
(config-if)#exit	Exit loopback interface mode.
(config)#ip route 100.100.100.0/24 1.1.1.1	Specify route IP address.
(config)#router bgp 2	Define the routing process. The number 2 specifies the AS number of R1.
(config-router)#neighbor 100.100.100.1 remote-as 1	Define BGP neighbors, and establish a TCP session. 100.100.100.1 is the IP address of the neighbor (R2), and 1 is the neighbor's AS number.
(config-router)#neighbor 100.100.100.1 update-source lo	Define BGP neighbors, to update the source routes.
(config-router)#neighbor 100.100.100.1 ebgp-multihop	Define the neighbor 100.100.100.1 for eBGP multihops.
(config-router)#address-family ipv4 unicast	Config redistribute under address-family
(config-router-af)# neighbor 100.100.100.1 activate	Activate the neighbor under address family mode
(config-router-af)#redistribute static	Redistribute static route
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

```

Enable Peer Groups

A BGP speaker might have the same update policies for a set of its peers. This is very useful if you have to change the update policies for all of the peers: Changing individual routers for separate policies can be very time-consuming, thus, peer groups play an important role in creating and assigning policies to a group of routers.

Note: A maximum of 32 peers can be bound in a peer group.

The peer group can be created dynamically or statically.

For dynamic peer groups all configuration can be done at group level only.

The static peer group configuration falls into two categories:

- Attributes that can be configured only at group level. Attempt to configure at member peer level will return error.

- Attributes that allow member peer level configuration. The member peer configuration has precedence.

Category A: Neighbor configuration allowed only at peer-group level

The outbound update impacting configurations of peer group will replace peer member configurations of same attributes when a peer becomes member of peer group. Outbound attribute modifications to group members are not allowed.

Following are the commands which are allowed at peer-group level.

- neighbor WORD activate - neighbor activate (page 1338)
- neighbor WORD as-origination-interval <1-65535> - neighbor as-origination-interval (page 1342)
- neighbor WORD attribute-unchanged ({as-path|next-hop|med}|) - neighbor attribute-unchanged (page 1343)
- neighbor WORD fall-over bfd - neighbor extended-optional-param (page 1364)
- neighbor WORD fall-over bfd multihop - neighbor extended-optional-param (page 1364)
- neighbor WORD next-hop-self - neighbor next-hop-self (page 1375)
- neighbor WORD remove-private-AS - neighbor remove-private-AS (page 1389)
- neighbor WORD route-reflector-client - neighbor route-reflector-client (page 1393)
- neighbor WORD route-server-client - neighbor route-server-client (page 1395)
- neighbor WORD send-community - neighbor send-community (page 1396)
- neighbor WORD distribute-list WORD out - neighbor distribute-list (page 1359)
- neighbor WORD capability orf prefix-list (both|receive|send) - neighbor capability orf prefix-list (page 1348)
- neighbor WORD filter-list WORD out - neighbor filter-list (page 1366)
- neighbor WORD prefix-list WORD out - neighbor prefix-list (page 1385)

Category B: Neighbor configuration allowed at peer-group member level; precedence based

For the below configuration, member level configurations will take precedence over peer group configuration.

Following are the commands which are allowed at member level also.

- neighbor WORD authentication-key WORD - neighbor authentication-key (page 1345)
- neighbor WORD remote-as <1-4294967295> - neighbor remote-as (page 1387)
- neighbor WORD allowas-in <1-10> - neighbor allowas-in (page 1340)
- neighbor WORD description WORD - neighbor description (page 1356)
- neighbor WORD distribute-list WORD In - neighbor distribute-list (page 1359)
- neighbor WORD ebgp-multihop - neighbor ebgp-multihop (page 1361)
- neighbor WORD ebgp-multihop <1-255> - neighbor ebgp-multihop (page 1361)
- neighbor WORD maximum-prefix <1-4294967295> - neighbor maximum-prefix (page 1373)

© 2026 IP Infusion Inc. Proprietary

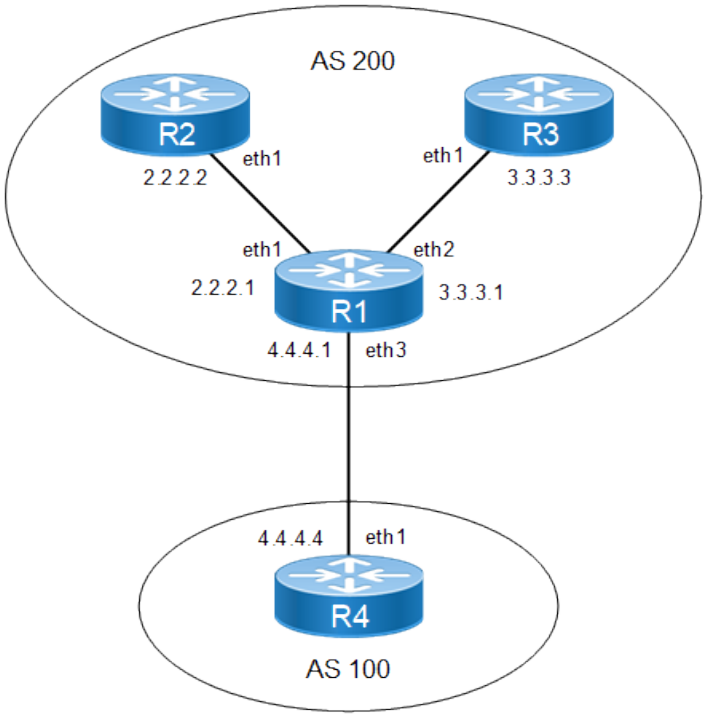
- neighbor WORD update-source WORD - neighbor update-source (page 1406)
- neighbor WORD weight <0-65535> - neighbor weight (page 1409)
- neighbor WORD shutdown - neighbor shutdown (page 1399)
- neighbor WORD strict-capability-match - neighbor strict-capability-match (page 1401)
- neighbor WORD route-map WORD in - neighbor route-map (page 1391)
- neighbor WORD prefix-list WORD in - neighbor prefix-list (page 1385)
- neighbor WORD passive - neighbor passive (page 1378)
- neighbor WORD override-capability - neighbor override-capability (page 1377)
- neighbor WORD filter-list WORD in - neighbor filter-list (page 1366)
- neighbor WORD enforce-multihop - neighbor enforce-multihop (page 1363)
- neighbor WORD collide-established - neighbor collide-established (page 1350)

BGP Peer Groups for Address-Family IPv4 Unicast

In the following scenario, R1, R2, and R3 belong to the same peer group ABC. R1, R2 and R3 are in AS 200 and R1 is the route reflector.R4 and R1 are eBGP peers. R4 is in AS 100.

Topology

Figure 39. BGP Peer Groups with IPv4 Unicast Members



R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R2.

(config-router)#neighbor ABC peer-group	Configuring ABC peer-group
(config-router)#neighbor ABC remote-as 200	Assign options to the peer group named ABC.
(config-router)#neighbor 2.2.2.2 peer-group ABC	Define neighbor 2.2.2.2 (R2) as a peer group member.
(config-router)#neighbor 3.3.3.3 peer-group ABC	Define neighbor 3.3.3.3 (R3) as a peer group member.
(config-router)#neighbor 4.4.4.4 remote-as 100	Define neighbor 4.4.4.4 (R4) is the IP address of R4 and 100 is the AS number.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor ABC activate	Activate neighbor under address family mode
(config-router-af)# neighbor 4.4.4.4 activate	Activate neighbor under address family mode
(config-router-af)# neighbor ABC route-reflector-client	Configure the peer-group ABC to be route-reflector-client
(config-router-af)#network 1.1.1.1/32	Advertise the network 1.1.1.1/32
(config-router-af)#network 11.11.11.11/32	Advertise the network 11.11.11.11/32
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R2.
(config-router)#neighbor 2.2.2.1 remote-as 200	Create a TCP connection with neighbor 2.2.2.1 of AS 200.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 2.2.2.1 activate	Activate neighbor under address family mode
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R3.
(config-router)#neighbor 3.3.3.1 remote-as 200	Create a TCP connection with neighbor 3.3.3.1 of AS 200.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 3.3.3.1 activate	Activate neighbor under address family mode

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R4

#configure terminal	Enter configure mode.
(config)#router bgp 100	Define the routing process. The number 100 specifies the AS number of R4.
(config-router)#neighbor 4.4.4.1 remote-as 200	Create a TCP connection with neighbor 4.4.4.1 of AS 200.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 4.4.4.1 activate	Activate neighbor under address family mode
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

Validation

R1

The following provides the R1 validation:

```
R1#show ip bgp neighbors
BGP neighbor is 2.2.2.2, remote AS 200, local AS 200, internal link
 Member of peer-group ABC for session parameters
  BGP version 4, local router ID 192.168.52.2, remote router ID 10.12.7.155
  BGP state = Established, up for 00:04:55
  Last read 00:04:55, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 11 messages, 0 notifications, 0 in queue
  Sent 11 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  ABC peer-group member
  Route-Reflector Client

Total number of prefixes 2
R3#
```

Peer-group can have either iBGP or eBGP peers but not both.

Validation

The configuration above fails with an appropriate error:

```
R1(config)#router bgp 200
R1(config-router)#neighbor 4.4.4.4 peer-group ABC
%% Peer with AS 100 cannot be in this peer-group, members must be all internal or all external
R1(config-router)#
```

Peer group members inherit the properties of Outbound Policies configured for Peer-group.

R1

`#configure terminal`	Enter configure mode.
`(config)# ip access-list permit-1`	Configure access-list to permit 1.1.1.1/32
`(config-ip-acl)# permit any 1.1.1.1/32 any`	Configure a permit statement in the acl to permit 1.1.1.1/32
`(config-ip-acl)#exit`	Exit ip access-list mode
`(config)# route-map permit-only-1`	Configure route-map
`(config-route-map)# match ip address permit-1`	Configure a match statement in the route-map to match the access-list permit-1
`(config-route-map)#set local-preference 250`	Set local preference as 250
`(config-route-map)#exit`	Exit route-map mode

© 2026 IP Infusion Inc. Proprietary

`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R1.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor ABC route-map permit-only-1 out`	Configure the peer-group ABC with route-map in the outbound direction
`(config-router-af)#exit`	Exit router BGP mode
`(config-router)#exit`	Exit router mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)# exit`	Exit configure terminal mode
`#clear ip bgp peer-group ABC soft out`	Do outbound soft reset for the peer-group ABC for the policy to take affect for the peer-group members

Validation

R1

The following provides the R1 validation:

```

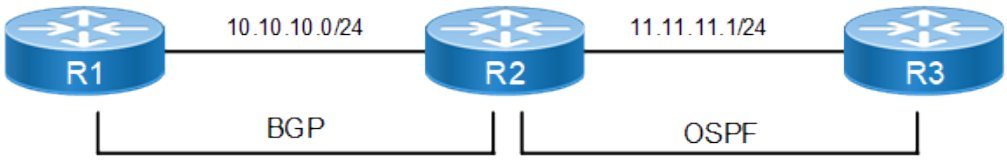
Route Redistribution in BGP

If there are routers that run both OSPF and BGP, certain OSPF routes might have to be sent to other eBGP peers. This can be achieved using the redistribution feature. Consider the following topology, in which R1 and R2 are eBGP peers, and R2 and R3 are OSPF peers. R2 is redistributing OSPF routes into BGP. The OSPF routes are sent to the R1 BGP routing table. This configuration assumes that all OSPF and eBGP sessions are up and running, and that only the redistribution must be configured.

Topology

Figure 40. Redistribute with OSPF



R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Define the routing process. The number `100` specifies the AS number of R2.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#redistribute ospf`	Redistribute OSPF routes in the R2 routing table into the R1 BGP routing table.
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

```
#show ip bgp

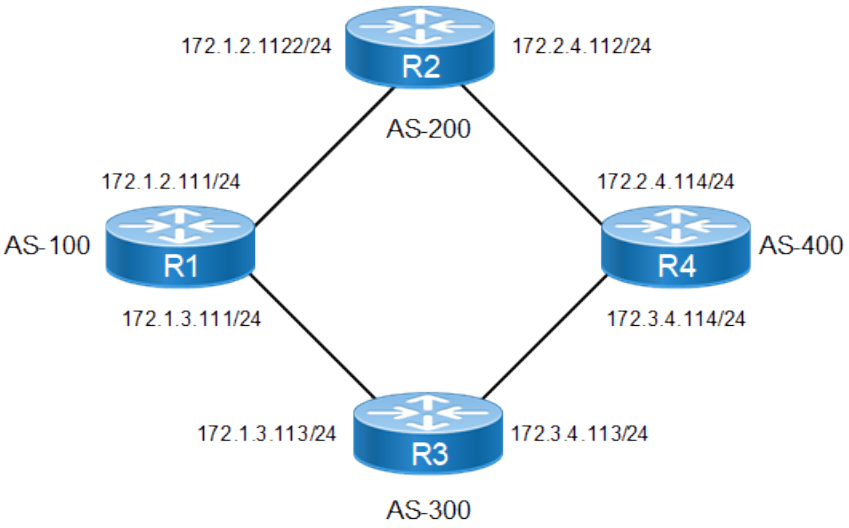
Add Multiple Instances of the Same Autonomous System

BGP supports adding the same AS number multiple times to influence the route selection process. This can be done using route maps, as described below.

Under normal circumstances, any route advertised by R1 is sent to R4 via two different routes, and then R4 selects the path from R2. This decision can be influenced by adding multiple instances of AS number 200 at R2.

Topology

Figure 41. Multiple Instances of Same AS



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 44.44.44.1/24 secondary`	Specify the IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Define the routing process with AS number 100.
`(config-router)#neighbor 172.1.2.112 remote-as 200`	Define neighbor R2. 172.1.2.112 is the IP address of R2, and 200 is the AS number.
`(config-router)#neighbor 172.1.3.113 remote-as 300`	Define neighbor R3. 172.1.3.113 is the IP address of R2, and 300 is the AS number.
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 172.1.2.112 activate`	Activate neighbor under address family mode
`(config-router-af)# neighbor 172.1.2.113 activate`	Activate neighbor under address family mode
`(config-router-af)#network 44.44.44.0/24`	Advertise network 44.44.44.0/24 through BGP. This route reaches R4 via R2 and R3.
`(config-router-af)# exit-address-family`	Exit address-family mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#route-map mul_inst permit 10`	Define the route-map multiple instance with permit definition sequence number 10.

(config-route-map)#set as-path prepend 200 200	Prepend AS number 200 two times to the AS_PATH attribute in the BGP Update message.
(config-route-map)#exit	Exit Route-map mode, and return to Configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 172.1.2.111 remote-as 100	Define neighbor R1. 172.1.2.111 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 172.2.4.114 remote-as 400	Define neighbor R4. 172.2.4.114 is the IP address of R2, and 400 is the AS number.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 172.2.4.114 activate	Activate neighbor under address family mode
(config-router-af)# neighbor 172.1.2.111 activate	Activate neighbor under address family mode
(config-router-af)#neighbor 172.2.4.114 route-map mul_inst out	Apply route-map multi_inst to all outbound routes to R4
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#router bgp 300	Define the routing process with AS number 300.
(config-router)#neighbor 172.1.3.111 remote-as 100	Define neighbor R1. 172.1.3.111 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 172.3.4.114 remote-as 400	Define neighbor R4. 172.3.4.114 is the IP address of R4, and 400 is the AS number.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 172.3.4.114 activate	Activate neighbor under address family mode
(config-router-af)# neighbor 172.1.3.111 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R4

#configure terminal	Enter configure mode.
(config)#router bgp 400	Define the routing process with AS number 400.
(config-router)#neighbor 172.2.4.112 remote-as 200	Define neighbor R2. 172.2.4.112 is the IP address of R2, and 200 is the AS number.
(config-router)#neighbor 172.3.4.113 remote-as 300	Define neighbor R3. 172.3.4.113 is the IP address of R3, and 300 is the AS number.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode

© 2026 IP Infusion Inc. Proprietary

(config-router-af)# neighbor 172.2.4.112 activate	Activate neighbor under address family mode
(config-router-af)# neighbor 172.3.4.113 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

Remove the Multi-Exit Disc Attribute from Update Messages

You can remove the Multi-Exit Disc (MED) attribute values from received update messages.

Topology

Figure 42. Remove MED Attribute

R1

#configure terminal	Enter configure mode.
(config)#route-map med permit 1	Define the route-map MED with permit definition sequence number 1.
(config-route-map)#set metric 400	Set the metric value.
(config-route-map)#exit	Exit Route-map mode, and return to Configure mode.
(config)#router bgp 100	Define the routing process with AS number 100.
(config-router)#neighbor 1.1.1.2 remote-as 200	Define neighbor R2. 1.1.1.2 is the IP address of R2, and 200 is the AS number.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 1.1.1.2 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode

© 2026 IP Infusion Inc. Proprietary

(config-router)#exit	Exit router BGP mode
(config)#interface xe2	Enter interface mode
(config-if)#ip ad 10.10.10.1/24	Assign IP address
(config-if)#no shutdown	Make interface administratively up
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-if)#exit	Exit interface mode
(config)#ip route 100.0.0.0/8 10.10.10.2	Configure the static route with the nexthop address.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 2.2.2.1 remote-as 200	Define neighbor R2. 2.2.2.1 is the IP address of R2, and 200 is the AS number.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 2.2.2.1 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

Removing Sent and Received MED values

The following describes how to remove the received and sent MED values, respectively.

R2 - Remove Received MED Value

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 1.1.1.1 remote-as 100	Define neighbor R1. 1.1.1.1 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 2.2.2.2 remote-as 200	Define neighbor R3. 2.2.2.2 is the IP address of R3, and 200 is the AS number.
(config-router)#bgp bestpath med remove-recv- med	Enable the remove received MED value option.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 1.1.1.1 activate	Activate neighbor under address family mode
(config-router-af)# neighbor 2.2.2.2 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R1 - Add Static Route

(config)#router bgp 100	Enter to router bgp mode
(config)#address-family ipv4 unicast	Config redistribute under address-family
(config-router-af)#redistribute static	Redistribute the static routes
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2 - Remove Send MED Value

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 1.1.1.1 remote-as 100	Define neighbor R1. 1.1.1.1 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 2.2.2.2 remote-as 200	Define neighbor R3. 2.2.2.2 is the IP address of R3, and 200 is the AS number.
(config-router)#bgp bestpath med remove-send- med	Enable the remove sent MED value option.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 1.1.1.1 activate	Activate neighbor under address family mode
(config-router-af)# neighbor 2.2.2.2 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

BGP Four-Byte Autonomous System

Extended AS numbers can be mapped to 2-byte AS numbers if the value is less than, or equal to, 65535. If the AS number is higher than 65535, it cannot be mapped to a 2-byte AS number. Therefore, if a BGP speaker is configured with a non-mappable AS number, it must enable the BGP extended ASN capability in OcNOS.

Notes:

- Autonomous System number 23456 is a reserved IANA number for AS transition; thus, it is recommended that no system be configured with 23456 as its AS number.
- OcNOS does not support 4-byte BGP Autonomous System Numbers (ASNs) in as-dot notation format

The extended ASN capability is disabled by default. However, when it is enabled, it is able to interoperate with a 2-byte AS-numbered speaker, in compliance with RFC 4893.

If a 4-byte AS number is configured in the provider's network using BGP MPLS VPN or standard IPv4/IPv6 BGP, it is recommended that the PE routers be 4-byte AS-enabled before connecting to 4-byte AS-enabled customer networks. For implications related to AS number transition issues, refer to RFC 4893.

You can also set up 4-byte AS-specific extended communities and route distinguishers (RDs) with limited capabilities. However, it is recommended that 2-byte AS-specific RDs and extended communities be used for regular deployment.

BGP encodes an ASN into four octets, so that more autonomous systems can be supported. Extended ASN capability is advertised in the Open message capabilities when the 4-octet ASN capability is enabled. When the 4-octet ASN capability is enabled, the valid ASN value range is <1-4294967295>, with the exception discussed in the first Note, above.

Notes:

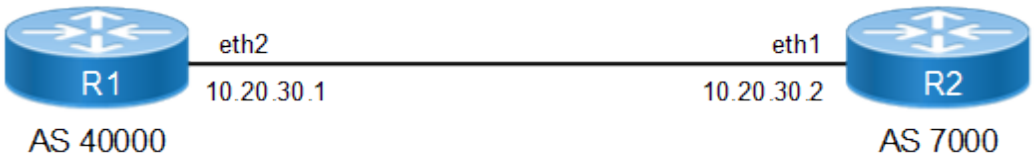
- Four-octet capability is disabled by default.
- OcNOS only supports 4-byte BGP ASNs in asplain format; as-dot notation is not supported.

4-Octet ASN Capability Enabled on R1 and R2

In this example, 4-Octet ASN capability is enabled on BGP speakers R1 and R2.

Topology

Figure 43. 4-Octet ASN on Both Routers



R1

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 400000`	Assign the ASN value (400000) to the router.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (10.20.30.2) and the ASN value of the neighbor (7000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.20.30.2 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

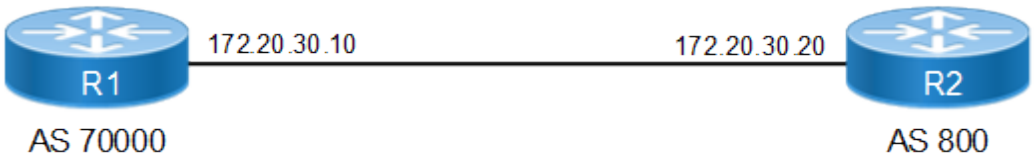
`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 7000`	Assign the ASN value (7000) to the router.
`(config-router)#neighbor 10.20.30.1 remote-as 400000`	Specify the neighbor's IP address (10.20.30.1) and the ASN value of the neighbor (400000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 10.20.30.1 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

4-Octet ASN Capability Enabled on R1 and Disabled on R2

In the following two examples, 4-Octet ASN capability is enabled on BGP speaker R1 and disabled on R2.

Topology

Figure 44. 4-Octet ASN on One Router



R1

`#configure terminal`	Enter configure mode.

(config)#bgp extended-asn-cap	Enable 4-octet ASN capability.
(config)#router bgp 70000	Assign the ASN value (70000) to the router.
(config-router)#neighbor 172.20.30.20 remote-as 800	Specify the neighbor's IP address (172.20.30.20) and the ASN value of the neighbor (800).
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 172.20.30.20 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#no bgp extended-asn-cap	Disable 4-octet ASN capability.
(config)#router bgp 800	Assign the ASN value (800) to the router.
(config-router)#neighbor 172.20.30.10 remote-as 70000	Specify the neighbor's IP address (172.20.30.10) and the ASN value of the neighbor (70000).
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 172.20.30.10 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

Topology

BGP Extended Community Attribute

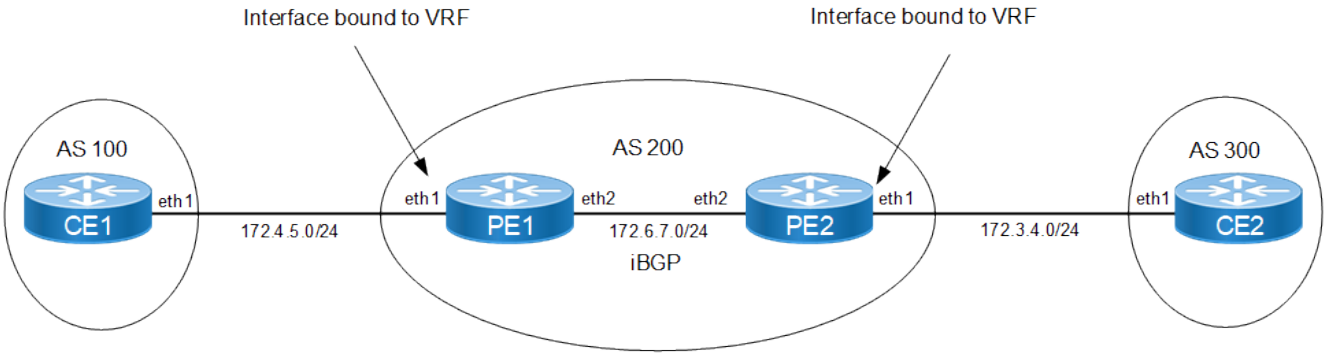
The Extended Community Attribute provides a mechanism for labeling information carried in BGP.

Extended Community with a 2-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 are 2-byte-ASN capable, and do not support 4-byte-ASN capability.

Topology

Figure 46. Extended Communities — 2-Byte ASN



CE1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.4.5.115/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 172.4.5.116 remote-as 200`	Specify the neighbor's IP address (172.4.5.116) and the ASN value of the neighbor (200).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 172.4.5.116 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

CE2

`#configure terminal`	Enter configure mode.

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.3.4.114/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 300`	Assign the ASN value (300) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 172.3.4.117 remote-as 200`	Specify the neighbor's IP address (172.3.4.117) and the ASN value of the neighbor (200).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 172.3.4.117 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

PE1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf VRF1`	Specify the name of the VRF (VRF1) to be created.
`(config-vrf)#rd 100:10`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:10`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (VRF1).
`(config-if)#ip address 172.4.5.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#ip route vrf VRF1 75.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 172.6.7.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router.
`(config-router)#neighbor 172.6.7.117 remote-as 200`	Specify the neighbor’s (PE2) IP address (172.6.7.117) and the ASN value of the neighbor (200). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#neighbor 172.6.7.117 activate	Activate the neighbor in address-family.
(config-router-af)#exit	Exit Address-Family-VPNv4 mode.
(config-router)#address-family ipv4 vrf VRF1	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
(config-router-af)#neighbor 172.4.5.115 remote-as 100	Specify the neighbor's (CE1) IP address and ASN value.
(config-router-af)#neighbor 172.4.5.115 activate	Activate the neighbor in address-family
(config-router-af)#neighbor 172.4.5.115 send-community both	Enable extended community attribute for the neighbor.
(config-router-af)#redistribute static	Configure static redistribution.
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

PE2

#configure terminal	Enter configure mode.
(config)#ip vrf VRF1	Specify the name of the VRF (VRF1) tobe created.
(config-vrf)#rd 100:10	Assign a route distinguisher (RD) for the VRF.
(config-vrf)#route-target both 100:10	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip vrf forwarding VRF1	Bind the interface (eth1) to the VRF (VRF1).
(config-if)#ip address 172.3.4.117/24	Configure the IP address on this interface
(config-if)#exit	Exit interface mode.
(config)#ip route vrf VRF1 100.1.1.0/24 eth1	Create a VRF static route.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 172.6.7.117/24	Configure the IP address on this interface
(config-if)#exit	Exit interface mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 172.6.7.116 remote-as 200	Specify the neighbor's (PE1) IP address (172.6.7.116) and the ASN value of the neighbor (200). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
(config-router)#address-family vpnv4 unicast	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 172.6.7.116 activate	Enable the exchange of routing information with a

	peer router.
(config-router-af)#exit	Exit Address-Family-VPNv4 mode.
(config-router)#address-family ipv4 vrf VRF1	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
(config-router-af)#neighbor 172.3.4.114	
remote-as 300	Specify the neighbor's (CE2) IP address and ASN value.
(config-router-af)# neighbor 17.3.4.114 activate	Activate the neighbor in address family mode
(config-router-af)#neighbor 172.3.4.114 send-community both	Enable extended community attribute for the neighbor.
(config-router-af)#redistribute static	Configure static redistribution.
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

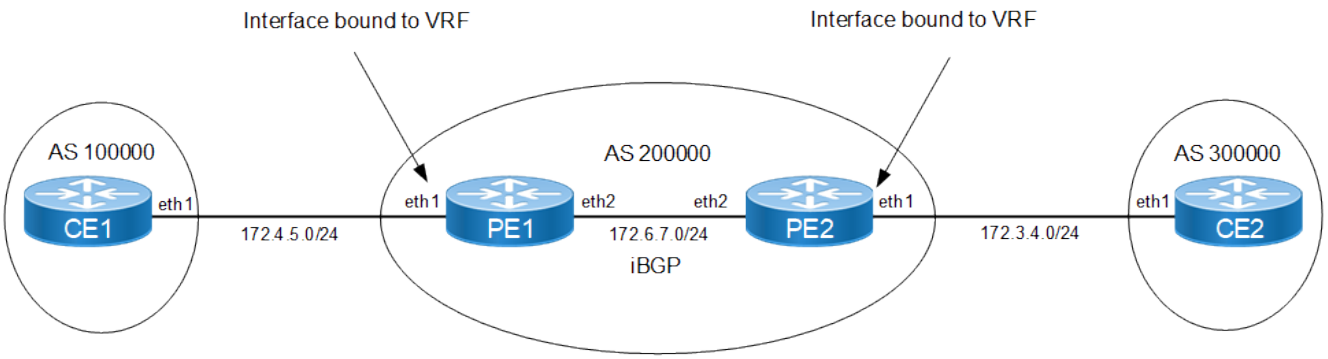
Extended Community with a 4-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 support 4-byte ASN capability.

Note: PE1 and PE2 should both either be 4-byte-ASN capable or 2-byte-ASN capable. Support for the combination of one 4-byte-ASN capable PE with one 2-byte-ASN-capable PE is currently unavailable.

Topology

Figure 47. Extended Communities — 4-Byte ASN



CE1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.4.5.115/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.

`(config)#router bgp 100000`	Assign the ASN value (100000) to the router. The ASN range is <1-4294967295>.
`(config-router)#neighbor 172.4.5.116 remote-as 200000`	Specify the neighbor's IP address (172.4.5.116) and the ASN value of the neighbor (200000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 172.4.5.116 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

PE1

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability. Dynamic change from 2- byte to 4-byte capability, or vice versa, is not allowed, unless the VRF is removed.
`(config)#ip vrf VRF1`	Specify the name of the VRF (VRF1) to be created.
`(config-vrf)#rd 1.1.1.1:200`	Assign a 4-byte route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in A.B.C.D:NN format.
`(config-vrf)#route-target both 1.1.1.1:200`	Specify the 4-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (VRF1).
`(config-if)#ip address 172.4.5.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#ip route vrf VRF1 50.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 172.6.7.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200000`	Assign the ASN value (200000) to the router.
`(config-router)#neighbor 172.6.7.117 remote-as 200000`	Specify the neighbor's (PE2) IP address (172.6.7.117) and the ASN value of the neighbor (200000). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.117 activate`	Enable the exchange of routing information with a

	peer router.
(config-router-af)#exit	Exit Address-Family-VPNv4 mode.
(config-router)#address-family ipv4 vrf VRF1	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
(config-router-af)#neighbor 172.4.5.115	
remote-as 100000	Specify the neighbor's (CE1) IP address and ASN value.
(config-router-af)# neighbor 172.4.5.115 activate	Activate neighbor in address family mode
(config-router-af)#neighbor 172.4.5.115 send-community both	Enable extended community attribute for the neighbor.
(config-router-af)#redistribute static	Configure static redistribution.
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

PE2

#configure terminal	Enter configure mode.
(config)#bgp extended-asn-cap	Enable 4-octet ASN capability. Dynamic change from 2- byte to 4-byte capability, or vice versa, is not allowed, unless the VRF is removed.
(config)#ip vrf VRF1	Specify the name of the VRF (VRF1) to be created.
(config-vrf)#rd 1.1.1.1:200	Assign a 4-byte route distinguisher (RD) for the VRF.
(config-vrf)#route-target both 1.1.1.1:200	Specify the 4-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip vrf forwarding VRF1	Bind the interface (eth1) to the VRF (VRF1).
(config-if)#ip address 172.3.4.117/24	Configure the IP address on this interface
(config-if)#exit	Exit interface mode.
(config)#ip route vrf VRF1 200.1.1.0/24 eth1	Create a VRF static route.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 172.6.7.117/24	Configure the IP address on this interface
(config-if)#exit	Exit interface mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 200000	Assign the ASN value (200000) to the router.
(config-router)#neighbor 172.6.7.116 remote-as 200000	Specify the neighbor's (PE2) IP address

© 2026 IP Infusion Inc. Proprietary

	(172.6.7.116) and the ASN value of the neighbor (200000). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.116 activate`	Enable the exchange of routing information with a peer router.
`(config-router-af)#exit`	Exit Address-Family-VPNv4 mode.
`(config-router)#address-family ipv4 vrf VRF1`	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
`(config-router-af)#neighbor 172.3.4.114`	
`remote-as 300000`	Specify the neighbor's (CE1) IP address and ASN value.
`(config-router-af)# neighbor 172.3.4.114 activate`	Activate neighbor under address family mode
`(config-router-af)#neighbor 172.3.4.114 send-community both`	Enable extended community attribute for the neighbor.
`(config-router-af)#redistribute static`	Configure static redistribution.
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

CE2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.3.4.114/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 300000`	Assign the ASN value (300000) to the router.
`(config-router)#neighbor 172.3.4.117 remote-as 200000`	Specify the neighbor's IP address (172.3.4.117) and the ASN value of the neighbor (200000).
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 172.3.4.117 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

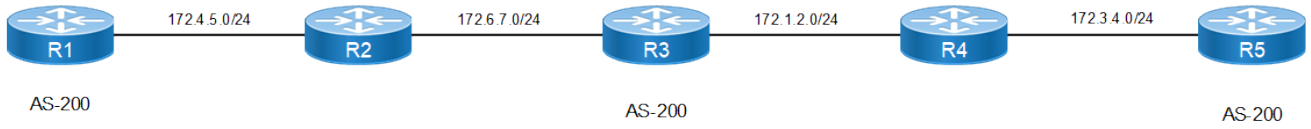
Nexthop Tracking

Nexthop tracking is used to notify the BGP process asynchronously whenever there is any change in the IGP routes. It reduces the convergence time of BGP routes when IGP routes are changed.

Topology

Figure 48. BGP Nexthop Tracking



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 100.100.100.100/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 200.200.200.200 remote-as 200`	Specify the neighbor's IP address (200.200.200.200) and the ASN value of the neighbor (200).
`(config-router)#neighbor 200.200.200.200 update-source lo`	Specify the routing update source.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 200.200.200.200 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area 0.

© 2026 IP Infusion Inc. Proprietary

(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback interface, and enter Interface mode.
(config-if) #ip address 150.150.150.150/32 secondary	Configure the IP address on this interface.
(config-if)#ip address 200.200.200.200/32 secondary	Configure the IP address on this interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 100.100.100.100 remote-as 200	Specify the neighbor's IP address (100.100.100.100) and the ASN value of the neighbor (200).
(config-router)#neighbor 100.100.100.100 update-source 200.200.200.200	Specify the routing update source.
(config-router)#neighbor 220.220.220.220 remote-as 200	Specify the neighbor's IP address (220.220.220.220) and the ASN value of the neighbor (200).
(config-router)#neighbor 220.220.220.220 update-source 150.150.150.150	Specify the routing update source.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 100.100.100.100 activate	Activate neighbor under address family mode
(config-router-af)# neighbor 220.220.220.220 activate	Activate neighbor under address family mode
(config-router-af)# exit-address-family	Exit address family mode
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.6.7.0/24 area 0	Advertise the network in Area 0.
(config-router)#network 172.1.2.0/24 area 0	Advertise the network in Area 0.
(config-router)#redistribute connected	Redistribute the connected routes.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#bgp nexthop-trigger enable	Enable Nexthop tracking.
(config)#bgp nexthop-trigger delay 20	Configure the nexthop trigger-delay time interval.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R4

#configure terminal	Enter configure mode.
(config)#router ospf 1	Configure the OSPF process (1).

© 2026 IP Infusion Inc. Proprietary

(config-router)#network 172.1.2.0/24 area 0	Advertise the network in Area 0.
(config-router)#network 172.3.4.0/24 area 0	Advertise the network in Area 0.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R5

#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback interface, and enter Interface mode.
(config-if)#ip address 220.220.220.220/32 secondary	Configure the IP address on this interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 150.150.150.150 remote-as 200	Specify the neighbor's IP address (150.150.150.150) and the ASN value of the neighbor (200).
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# neighbor 150.150.150.150 activate	Activate neighbor under address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.
(config-router-af)# exit-address-family	Exit address family mode
#configure terminal	Enter configure mode.
(config)#interface lo	Specify the loopback interface, and enter Interface mode.

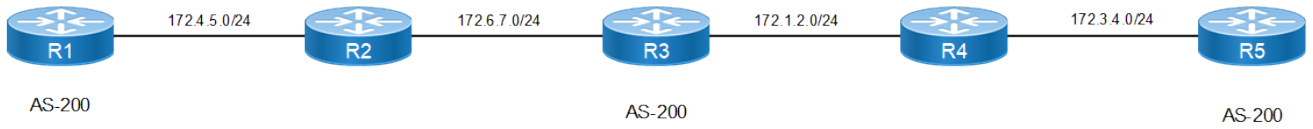
Nexthop Tracking Delay Timer

The delay interval between routing table walks can be configured for nexthop delay tracking. This time determines how long BGP waits before it starts walking the full BGP routing table after receiving notification from NSM about a

next-hop change.

Topology

Figure 49. Topology for Nexthop Tracking Delay Timer



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 150.150.150.150/32 secondary`	Configure the IP address on this interface.
`(config-if)#ip address 100.100.100.100/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 200.200.200.200 remote-as 200`	Specify the neighbor's IP address (200.200.200.200) and the ASN value of the neighbor (200).
`(config-router)#neighbor 200.200.200.200 update-source lo`	Specify the routing update source.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 200.200.200.200 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 150.150.150.150/32 secondary`	Configure the IP address on this interface.
`(config-if)#ip address 100.100.100.100/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 200.200.200.200/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router.
`(config-router)#neighbor 100.100.100.100 remote-as 200`	Specify the neighbor's IP address (100.100.100.100) and the ASN value of the neighbor (200).
`(config-router)#neighbor 100.100.100.100 update-source 200.200.200.200`	Specify the routing update source.
`(config-router)#neighbor 220.220.220.220 remote-as 200`	Specify the neighbor's IP address (220.220.220.220) and the ASN value of the neighbor (200).
`(config-router)#neighbor 220.220.220.220 update-source 150.150.150.150`	Specify the routing update source.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 100.100.100.100 activate`	Activate neighbor under address family mode
`(config-router-af)# neighbor 220.220.220.220 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.1.2.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.
`(config)#bgp nexthop-trigger enable`	Enable nexthop tracking.
`(config)#bgp nexthop-trigger delay 20`	Configure the nexthop trigger-delay time interval.

© 2026 IP Infusion Inc. Proprietary

R4

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.1.2.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.3.4.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R5

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 220.220.220.220/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router.
`(config-router)#neighbor 150.150.150.150 remote-as 200`	Specify the neighbor's IP address (150.150.150.150) and the ASN value of the neighbor (200).
`(config-router)#neighbor 150.150.150.150 update-source lo`	Specify the routing update source.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# neighbor 150.150.150.150 activate`	Activate neighbor under address family mode
`(config-router-af)# exit-address-family`	Exit address family mode
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.3.4.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

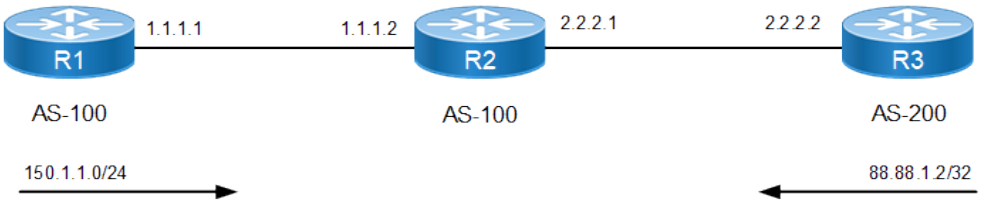
BGP Distance

Administrative distance in BGP can be configured for a specific address family.

Topology

Figure 50. Administrative Distance for IPv4 BGP



R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 150.1.1.1/24 secondary`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router.
`(config-router)#neighbor 1.1.1.2 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#neighbor 1.1.1.2 activate`	Activate the neighbor in address family mode
`(config-router-af)#network 150.1.1.0/24`	Specify the network to be advertised by the BGP routing process.
`(config-router-af)#exit-address-family`	Exit address-family ipv4 unicast mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router.
`(config-router)#neighbor 2.2.2.2 remote-as 200`	Specify the neighbor's IP address and ASN value.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address and the ASN value of another neighbor.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#distance bgp 12 13 120`	Configure the administrative distance for external, internal, and local routes received.
`(config-router-af)#aggregate-address 150.1.0.0/16 summary-only`	Configure a non-AS-set aggregate route on R2. The local distance is applied to this route.

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor in address family mode
(config-router-af)#neighbor 2.2.2.2 activate	Activate the neighbor in address family mode
(config-router-af)#exit-address-family	Exit address-family ipv4 unicast mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 88.88.1.2/32 secondary	Specify IP address for the interface.
(config-if)#exit	Exit loopback interface mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 2.2.2.1 remote-as 100	Specify the neighbor's IP address and ASN value.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#network 88.88.1.2/32	Specify the network to be advertised by the BGP routing process.
(config-router-af)#neighbor 2.2.2.1 activate	Activate the neighbor in address family mode
(config-router-af)#exit-address-family	Exitr address-family ipv4 unicast mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

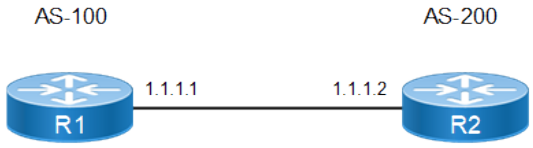
BGP Weight per Peer

A different weight can be assigned per address family of a peer. For example, a system can be configured to prefer VPN4 routes from peer A and IPv4 routes from peer B.

If the neighbor weight command is given under a specific address-family mode, the peer weight is set for that specific address family. If the address family is not specifically set, the weight is updated for the default address-family.

Topology

Figure 51. BGP Weight Per Peer



R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Specify the neighbor's IP address and ASN value.

(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#neighbor 1.1.1.2 activate	Activate the neighbor in address family mode
(config-router-af)#exit-address-family	Exit address-family ipv4 unicast mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 1.1.1.1 remote-as 100	Specify the neighbor's IP address and ASN value.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#neighbor 1.1.1.1 weight 500	Add a weight of 500 to all the routes coming from the neighbor, 1.1.1.1 (only IPv4 routes).
(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor in address family mode
(config-router-af)#exit-address-family	Exit address-family ipv4 unicast mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

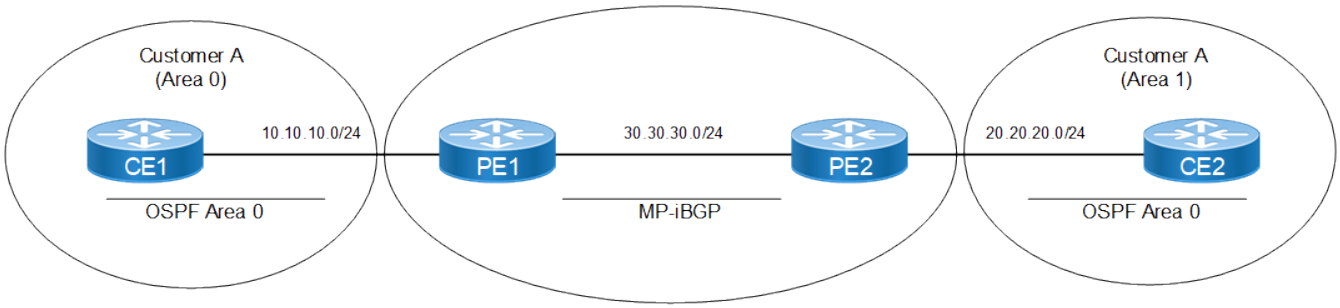
OSPF as PE-CE Protocol for VPNs

In an MPLS VPN environment, customer networks are connected to an MPLS VPN-enabled provider backbone. As shown in Figure 52, Customer A areas, Areas 0 and 1, are connected to an MPLS VPN–enabled provider network. Area 0 and Area 1 have routers CE1 and CE2 running OSPF. MP-iBGP is used between PE1 and PE2 to propagate routes between Site 1 (Area 0) and Site 2 (Area 1). Traditional OSPF-BGP redistribution is performed at PE routers, PE1 and PE2. In this case, routes distributed by CE1 into the MP-iBGP cloud are sent to CE2 as external routes, even though both CE1 and CE2 belong to the same customer.

This behavior can be changed with the additional domain ID configuration. Each VRF should be configured a domain ID on the PE routers. If a PE router gets a route through the MP-iBGP cloud and has to send to any customer site, it checks the domain ID value against the list of stored domain ID values. If the incoming domain ID matches any of the stored IDs, that route is inserted into the customer site with the same type, as it was inserted into the MP-BGP cloud; otherwise, it is inserted as external route.

Topology

Figure 52. OSPF as PE-CE Protocol



Configuration

CE1

`#configure terminal`	Enter configure mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 60.1.1.1/24 secondary`	Specify IP address for the interface
`(config-if)#exit`	Exit loopback interface mode
`(config)#router ospf 1`	Configure the routing process and specify the Process ID (`1`).
`(config-router)#network 10.10.10.0/24 area 0`	Advertise the network in OSPF
`(config-router)#network 60.1.1.0/24 area 0`	Advertise the loopback IP address in area 0 of router OSPF 1.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

PE1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf ABC`	Specify the name of the VRF (ABC) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 10:100`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding ABC`	Associate interface eth1 to vrf ABC.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1 ABC`	Configure OSPF for VRF.
`(config-router)#network 10.10.10.0/24 area 0`	Advertise the network for OSPF adjacency with CE1.
`(config-router)#domain-id 1.1.1.1`	Configure the primary domain ID.
`(config-router)#domain-id 2.2.2.2 secondary`	Configure a secondary domain ID.
`(config-router)#domain-id 3.3.3.3 secondary`	Configure a secondary domain ID.
`(config-router)#exit`	Exit Router mode and return to Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#neighbor 30.30.30.2 remote-as 100`	Configure neighbor 30.30.30.2 for iBGP.
`(config-router)#address-family vpnv4 unicast`	Enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 30.30.30.2 activate`	Activate neighbor 30.30.30.2.

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf ABC	Enter Address-Family-VRF mode.
(config-router-af)#redistribute ospf	Specify redistributing routes from OSPF into BGP.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

PE2

#configure terminal	Enter configure mode.
(config)#ip vrf ABC	Specify the name of the VRF (ABC) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 10:100	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip vrf forwarding ABC	Associate interface eth1 to vrf ABC.
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 1 ABC	Configure OSPF for VRF.
(config-router)#network 20.20.20.0/24 area 0	Advertise the network for OSPF adjacency with CE1.
(config-router)#domain-id 1.1.1.1	Configure the primary domain ID.
(config-router)#domain-id 2.2.2.2 secondary	Configure a secondary domain ID.
(config-router)#domain-id 3.3.3.3 secondary	Configure a secondary domain ID.
(config-router)#exit	Exit Router mode and return to Configure mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#neighbor 30.30.30.1 remote-as 100	Configure neighbor 30.30.30.1 for iBGP.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 30.30.30.1 activate	Activate neighbor 30.30.30.1.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#address-family ipv4 vrf ABC`	Enter Address-Family-VRF mode.
`(config-router-af)#redistribute ospf`	Specify redistributing routes from OSPF into BGP.
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

CE2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`).
`(config-router)#network 20.20.20.0/24 area 0`	Advertise the network in OSPF.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

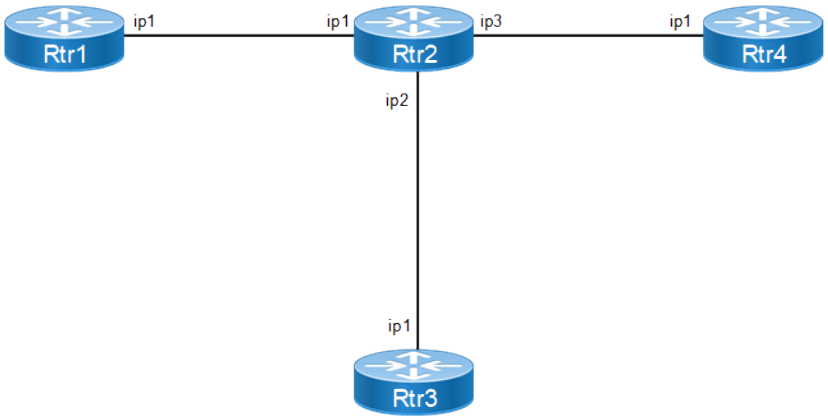
BGP Multipath for IPv4

BGP supports multipath for IPv4 prefixes. BGP Multipath allows load-balancing traffic among multiple BGP routes. It supports both iBGP and eBGP routes. In case of eBGP, the routes should arrive from same AS number.

Topology

Figure 53. Multipath iBGP for IPv4



Configuration

Rtr1

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#bgp router-id 2.2.2.2`	Configure a fixed Router ID (2.2.2.2).
`(config-router)#neighbor 30.30.30.9 remote-as 100`	Configure neighbor 30.30.30.9 for iBGP.
`(config-router)# address-family ipv4 unicast`	.Under address family, Redistribute the static routes.
`(config-router-af)#redistribute static`	Redistribute the static routes.
`config-router-af)# neighbor 30.30.30.9 activate`	Activate the neighbor
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#exit`	Exit the BGP Router mode and return to the Configure mode.
`(config)#ip route 88.88.0.0/16 Null`	Configure static route.
`(config)#commit`	Commit the candidate configuration to the running configuration.

Rtr3

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#bgp router-id 4.4.4.4`	Configure a fixed Router ID (4.4.4.4).
`(config-router)#neighbor 40.40.40.9 remote-as 100`	Configure neighbor 40.40.40.9 for iBGP.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#redistribute static`	Redistribute the static routes.
`config-router-af)# neighbor 40.40.40.9 activate`	Activate the neighbor

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.
(config)#commit	Commit the candidate configuration to the running configuration.

Rtr4

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#bgp router-id 6.6.6.6	Configure a fixed Router ID (6.6.6.6).
(config-router)#neighbor 50.50.50.9 remote-as 100	Configure neighbor 50.50.50.9 for iBGP.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#redistribute static	Redistribute the static routes.
config-router-af)# neighbor 50.50.50.9 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.
(config-router)#commit	Commit the candidate configuration to the running configuration.

Rtr2

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config)#bgp router-id 9.9.9.9	Configure a fixed Router ID (9.9.9.9).
(config-router)#neighbor 30.30.30.2 remote-as 100	Configure neighbor 30.30.30.2 for iBGP.
(config-router)#neighbor 40.40.40.4 remote-as 100	Configure neighbor 40.40.40.4 for iBGP.
(config-router)#neighbor 50.50.50.6 remote-as 100	Configure neighbor 50.50.50.6 for iBGP.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
config-router-af)# neighbor 30.30.30.2 activate	Activate the neighbor
config-router-af)# neighbor 40.40.40.4 activate	Activate the neighbor
config-router-af)# neighbor 50.50.50.6 activate	Activate the neighbor
config-router-af)# max-paths ibgp 2	Configure iBGP max-paths (2).
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#exit`	Exit the BGP Router mode and return to the Configure mode.
`(config)#ip route 88.88.0.0/16 Null`	Configure static route.
`(config)#commit`	Commit the candidate configuration to the running configuration.

Rtr3

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the BGP router.
`(config-router)#bgp router-id 4.4.4.4`	Configure a fixed Router ID (4.4.4.4).
`(config-router)#neighbor 40.40.40.9 remote-as 100`	Configure neighbor 40.40.40.9 for eBGP.
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#redistribute static	Redistribute the static routes.
config-router-af)# neighbor 40.40.40.9 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.
(config)#commit	Commit the candidate configuration to the running configuration.

Rtr4

#configure terminal	Enter the Configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the BGP router.
(config-router)#bgp router-id 6.6.6.6	Configure a fixed Router ID (6.6.6.6).
(config-router)#neighbor 50.50.50.9 remote-as 100	Configure neighbor 50.50.50.9 for eBGP.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#redistribute static	Redistribute the static routes.
config-router-af)# neighbor 50.50.50.9 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address-family mode
(config)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.
(config)#commit	Commit the candidate configuration to the running configuration.

Rtr2

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config)#bgp router-id 9.9.9.9	Configure a fixed Router ID (9.9.9.9).
(config-router)#neighbor 30.30.30.2 remote-as 200	Configure neighbor 30.30.30.2 for eBGP.
(config-router)#neighbor 40.40.40.4 remote-as 200	Configure neighbor 40.40.40.4 for eBGP.
(config-router)#neighbor 50.50.50.6 remote-as 200	Configure neighbor 50.50.50.6 for eBGP.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
config-router-af)# neighbor 30.30.30.2 activate	Activate the neighbor
config-router-af)# neighbor 40.40.40.4 activate	Activate the neighbor
config-router-af)# neighbor 50.50.50.6 activate	Activate the neighbor
config-router-af)# max-paths ebgp 2	Configure eBGP max-paths (2).
(config-router-af)#exit-address-family	Exit address-family mode

Multipath eiBGP

Use this command to set the number of equal-cost multi-path (ECMP) routes for both eBGP and iBGP. This feature allows to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol.

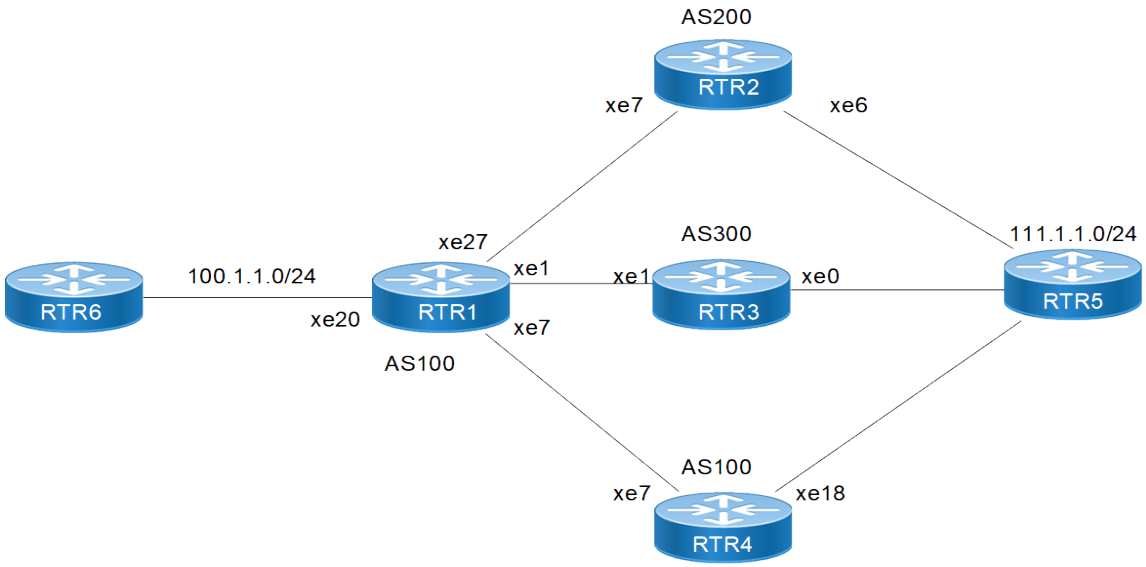
When enabled, this feature can perform load balancing on eBGP and/or iBGP paths. With multiple eBGP and iBGP paths, selection is per all paths sorted according to BGP rules and hence either of all eBGP or iBGP or both will be marked as candidates for multipath programming i.e., it is possible either all eBGP paths or all iBGP paths or both eBGP and iBGP are programmed as multipaths.

Exceptions during path selections when eiBGP is enabled:

- AS Path length check is ignored.
- Origin Check is ignored.
- Peer type check is ignored.
- IGP Metric check is ignored.

Topology

Figure 55. Multipath eiBGP topology



Configuration

RTR1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode
`(config-if)# ip address 41.41.41.41/32 sec-ondary`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe27`	Enter Interface mode

`(config-if)# ip address 21.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter Interface mode
`(config-if)# ip address 22.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe7`	Enter Interface mode
`(config-if)# ip address 23.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe20`	Enter Interface mode
`(config-if)# ip address 100.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)# router bgp 100`	Enter Router BGP mode
`(config-router)# neighbor 21.1.1.2 remote-as 200`	Define BGP neighbors. 21.1.1.2 is the IP address of the neighbor (RTR2) and 200 is the neighbors AS number
`(config-router)# neighbor 22.1.1.2 remote-as 300`	Define BGP neighbors. 22.1.1.2 is the IP address of the neighbor (RTR3) and 300 is the neighbors AS number
`(config-router)# neighbor 23.1.1.2 remote-as 100`	Define BGP neighbors. 23.1.1.2 is the IP address of the neighbor (RTR4) and 100 is the neighbors AS number
`(config-router)# address-family ipv4 unicast`	Enter into BGP address family IPv4
`(config-router-af)#max-paths eibgp 4`	Configure eiBGP max-paths (4).
`(config-router-af)#redistribute connected`	Redistribute connected routes into BGP
`(config-router-af)#neighbor 21.1.1.2 acti-vate`	Activate the neighbor
`(config-router-af)#neighbor 22.1.1.2 acti-vate`	Activate the neighbor
`(config-router-af)#neighbor 23.1.1.2 acti-vate`	Activate the neighbor
`(config-router-af)# commit`	Commit the configurations
`(config-router-af)# end`	Return to privilege mode

RTR2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode
`(config-if)# ip address 45.45.45.45/32 sec-ondary`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe7`	Enter Interface mode
`(config-if)# ip address 21.1.1.2/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

`(config)#interface xe6`	Enter Interface mode
`(config-if)# ip address 111.1.1.11/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)# router bgp 200`	Enter Router BGP mode
`(config-router)# neighbor 21.1.1.1 remote-as 100`	Define BGP neighbors. 21.1.1.1 is the IP address of the neighbor (RTR1) and 100 is the neighbors AS number
`(config-router)# address-family ipv4 unicast`	Enter into BGP address family IPv4
`(config-router-af)#redistribute connected`	Redistribute connected routes
`(config-router-af)#neighbor 21.1.1.1 acti-vate`	Activate the neighbor
`(config-router-af)# commit`	Commit the configurations
`(config-router-af)# end`	Return to privilege mode

RTR3

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode
`(config-if)# ip address 42.42.42.42/32 sec-ondary`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe0`	Enter Interface mode
`(config-if)# ip address 111.1.1.42/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe1`	Enter Interface mode
`(config-if)# ip address 22.1.1.2/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)# router bgp 300`	Enter Router BGP mode
`(config-router)# neighbor 22.1.1.1 remote-as 100`	Define BGP neighbors. 22.1.1.1 is the IP address of the neighbor (RTR1) and 100 is the neighbors AS number
`(config-router)# address-family ipv4 unicast`	Enter into BGP address family IPv4
`(config-router-af)#redistribute connected`	Redistribute connected routes
`(config-router-af)#neighbor 22.1.1.1 acti-vate`	Activate the neighbor
`(config-router-af)# commit`	Commit the configurations
`(config-router-af)# end`	Return to privilege mode

BGP AS-PATH Multipath-relax

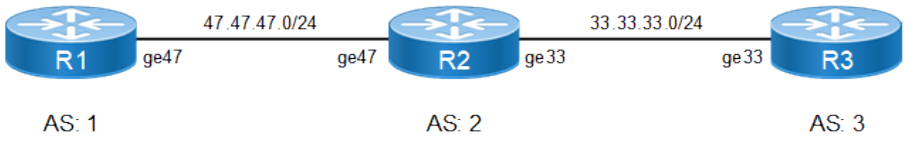
BGP will not load balance across multiple paths by default. We can configure it to do so with the `max-paths ebgp <no-of-multipaths>` command. The criterion of this command is that all attributes must match (Weight, Local preference, AS Path, etc). This is acceptable if we are multi-homed to a single AS, but what if we are multi-homed to different AS.

BGP AS PATH multipath relax effectively allows for ECMP to be done across different neighboring ASN's.

Topology

Figure 56. BGP AS-PATH Multipath-relax Topology

Below topology explains about BGP AS PATH multipath relax functionality.



Configuration

R1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter Interface loopback

BGP FIB Install (Selective Route Download)

The BGP—Selective Route Download feature allows a network administrator to selectively download some or none of the BGP routes into the Routing Information Base (RIB). The primary application for this feature is to suppress the unnecessary downloading of certain BGP routes to the RIB or Forwarding Information Base (FIB) on a dedicated route reflector, which propagates BGP updates without carrying transit traffic. The feature thereby helps to maximize resources available and to improve routing scalability and convergence on the dedicated route reflector.

With RFC 4456, the concept of route reflection was defined; this would allow configuring designated one or more BGP routers in iBGP network as route reflectors. BGP relaxes the re-advertising restriction on these route reflectors, allowing them to accept and propagate IBGP routes to their clients.

The role of a dedicated route reflector (RR) is to propagate BGP updates without participating in the actual forwarding of transit traffic. That means the RR does not need to have all BGP routes downloaded into its RIB or FIB. It is beneficial for the RR to preserve its resources by not processing and storing those routes.

By default, BGP routes are downloaded to the RIB. To save resources on a dedicated route reflector, such downloading can be reduced or prevented by configuring a table map. A table map is so named because it controls what is put into the BGP routing table.

© 2026 IP Infusion Inc. Proprietary

By reducing the route installation in the dedicated route reflectors, we can maximize availability of resources and improve routing scalability and convergence.

A new command ‘table map’ is being introduced to achieve this. A table map controls what is put into the BGP routing table. When configured it would reduce or prevent downloading routes to RIB.

Table map command references ‘route map’ rules available in BGP to control the routes going into the BGP routing table.

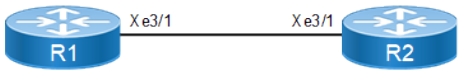
Table-map command can be used in two ways:

- When a simple table-map command is given (without filter option), the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option ‘filter’ is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Topology

Below topology explains about BGP FIB Install functionality.

Figure 57. BFP FIB Install Topology



Configuration

R1

`#configure terminal`	Enter the Configure mode.
`(config)#interface xe3/1`	Enter interface mode.
`(config-if)#ip address 20.1.1.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit interface mode
`(config)# router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#neighbor 20.1.1.2 remote-as 100`	Configure neighbor in IBGP
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#redistribute static`	Redistribute static routes to advertise to its neighbor
`(config-router-af)#neighbor 20.1.1.2 activate`	Activate the neighbor
`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#exit`	Exit Router mode and enter Configure mode
`(config)#ip route 1.1.1.0/24 xe3/1`	Configure static route.
`(config)#ip route 2.2.2.0/24 xe3/1`	Configure static route.
`(config)#ip route 3.3.3.0/24 xe3/1`	Configure static route.
`(config)#ip route 4.4.4.0/24 xe3/1`	Configure static route.

© 2026 IP Infusion Inc. Proprietary

(config)#ip route 5.5.5.0/24 xe3/1	Configure static route.
(config)#ip route 6.6.6.0/24 xe3/1	Configure static route.
(config)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter the Configure mode.
(config)#interface xe3/1	Configure IP address for interface
(config-if)#ip address 20.1.1.2/24	Configure IP address for interface
(config-if)#exit	Exit from interface mode and enter into Configure mode
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#neighbor 20.1.1.1 remote-as 100	Configure neighbor iBGP.
(config-router)#address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#redistribute static	Redistribute the static routes.
(config-router-af)#neighbor 20.1.1.1 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip access-list 1	Login to Configure access-list parameters
(config-ip-acl)#permit ipip 2.2.2.0 0.0.0.225 any	Configure access-list by allowing only one route to install in FIB table.
(config-ip-acl)#exit	Exit assess list mode
(config)# route-map test permit 1	Configure route-map to match access-list
(config-route-map)# match ip address 1	Match the above configured access-list 1
(config-route-map)#exit	Exit from route-map Configure mode and enter into Configure mode
(config)#router bgp 100	Enter into BGP router mode
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# table-map test filter	Apply table-map with route-map created and with filter option
(config-router-af)#exit-address-family	Exit address family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

Validation

Table-map with Filter Option

Verify BGP neighborship is up between R1 and R2. Before applying table-map in R2, all routes will be installed in FIB table, as in below output.

R1

Table-map With Filter Option

Now verify after applying table-map with filter option, only one route will be installed in FIB table according to route-map and access-list configured, BGP table remains same, table-map effect will be seen only for FIB table.

After applying table-map, clear BGP with "clear ip bgp table-map."

```
(config)#router bgp 100
(config-router)#address-family ipv4-unicast
(config-router-af)#table-map test filter
(config-router-af)#end
#clear ip bgp table-map

#show ip bgp
BGP table version is 2, local router ID is 192.168.52.5

Table-map Without Filter Option

Remove filter option while applying table-map as below in R2

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Enter into BGP router mode
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# table-map test`	Apply table-map with route-map created and with filter option
`(config-router-af)#exit-address-family`	Exit address family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

```
#show running-config bgp
!
router bgp 100 redistribute static
neighbor 20.1.1.1 remote-as 100 table-map test
!
 address-family ipv4 unicast
 neighbor 20.1.1.1 activate
 exit-address-family
!
#clear ip bgp table-map

```

Note: Same can be tried with IPV6 VRF–v4 and VRF–v6 address-families and this feature is not supported for VPNV4 address-family

Route Target Constraint

BGP/MPLS IP VPNs use PE routers to Route Target (RT) extended communities and control the distribution of routes into the VRFs. Within a given iBGP mesh, PE routers hold routes marked with RouteTargets pertaining to VRFs that have local CE attachments.

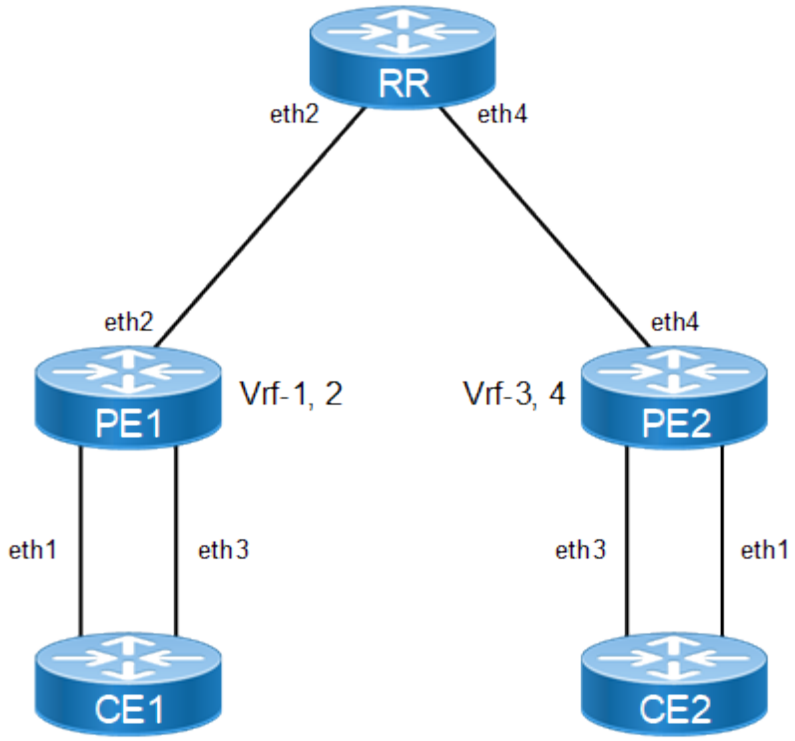
BGP RT Constrained Route Distribution is a feature that can be used by service providers in Multiprotocol Label Switching (MPLS) Layer 3 VPNs to reduce the number of unnecessary routing updates that route reflectors (RRs) send to Provider Edge (PE) routers. The reduction in “routing updates” saves resources by allowing RRs, Autonomous System Boundary Routers (ASBRs), and PEs to carry fewer routes. Route targets are used to constrain routing updates.

With (MPLS)VPNs, the (iBGP) peers or Route Reflectors send all VPN4 and/or VPN6 prefixes to the PE routers. The PE routers drop the VPN4/6 prefixes for which there is no importing VPN route forwarding (VRF).

Topology

The topology below shows Route-target filtering in an L3VPN—with Route Target Constraint (RTC), the RR sends only wanted VPN4/6 prefixes to the PE; wanted” means that the PEs have the VRFs importing the specific prefixes.

Figure 58. Route-target Filter Topology



Configuration

CE1

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode
(config-if)#ip address 80.1.1.1/24	Configure IP address for interface
(config-if)#exit	Exit from interface mode and enter into Configure mode
(config)#interface eth3	Enter interface mode

(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#exit	Exit router and configure mode
(config)#commit	Commit the candidate configuration to the running configuration.

Validation

Through RTfilter, address-family RT values will be exchanged between RR and PEs. Neighbors are activated under this address-family and configured clients as well. RR will learn routes from PEs and send them to other PEs if it has any peer requesting those routes based on their RT import values.

The outputs below show the routes sent and learned in PEs, installed in VRFs, and display the RT filter values exchanged between them. For more details on show command output fields, refer to show ip bgp (page 1560), show ip bgp vpnv4 (page 1573), and show ip bgp rtfilter all (page 1567)

CE1

The following provides the CE1 validation:

```

```

BGP Best Path Selection Process

BGP assigns the first valid path as the current best path. BGP then compares the best path with the next path in the list, until BGP reaches the end of the list of valid paths. Below steps provides the rules that are used to determine the best path:

1. Prefer the path with the highest WEIGHT.
2. Prefer the path with the highest LOCAL_PREF.
3. Prefer the path that was locally originated via a network or aggregate BGP subcommand or through redistribution from an IGP.
4. Prefer the path with the shortest AS_PATH.

Notes: Beware of these items:

- This step is skipped if user has configured the `bgp bestpath as-path ignore` command.
- If `bgp bestpath compare-confed-aspath` is configured then Prefer the path with the shortest AS_CONFED path.

5. Prefer the path with the lowest ORIGIN type.

Notes: Beware of these items:

- IGP is lower than Exterior Gateway Protocol (EGP), and EGP is lower than INCOMPLETE.

6. Prefer the path with the lowest multi-exit discriminator (MED).

Notes: Beware of these items:

- MEDs are compared only if the first AS in the AS_SEQUENCE is the same for multiple paths.
- If both the paths are internal as routes.
- If paths have confederation as-path then MEDs are compared only if the first AS in the BGP_ AS_CONFED_SEQUENCE is the same for multiple paths.
- To override all above checks, user can configure `bgp always-compare-med` command

7. Prefer eBGP over iBGP paths.

© 2026 IP Infusion Inc. Proprietary

Notes: Beware of these items:

- EBGP is preferred over IGBP or EBGP is preferred over CONFED.

8. Path learned from LU Address-family is preferred over IPv4 Unicast Address-family.

Notes: Beware of these items:

- This is Exception Rule for IPv4 Labeled-Unicast Address-family.
- This rule applicable only for IPv4 Labeled-Unicast/Unicast routes over default VRF.

9. Prefer the path with the lowest IGP metric to the BGP next hop.
10. Determine if multiple paths require installation in the routing table for BGP Multipath and mark the ECMP candidate.
11. When both paths are external, prefer the path that was received first (the oldest one). This step minimizes route-flap, since a newer path won't displace an older one, even if it was the preferred route based on the additional decision criteria below. This has to be enabled by BGP command `bestpath tie-break-on-age`

Notes: Beware of these items:

- Skip this step if any of these items are true:
  - If `bgp bestpath compare-routerid` is configured in addition to `bestpath tie-break-on-age`, then this step will be skipped.
  - If the router ID is same for multiple paths, because the routes were received from the same router, then this step will be skipped.

12. Router ID and Originator Id:
    - If `bgp bestpath compare-routerid` is configured, then prefer the route that comes from the BGP router with the lowest Router ID.
    - If `bgp bestpath dont-compare-originator-id` is not configured, prefer the route that comes from the BGP router with the lowest Router ID.

Notes: Beware of these items:

- If a path contains Route Reflector (RR) attributes, the Originator ID is substituted for the Router ID in the path selection process.
- If `bgp bestpath dont-compare-originator-id` is configured, prefer the route that comes from the BGP router with the lowest router ID. In this case, Originator ID is not compared even if the RR attribute is present.

13. If the originator or Router ID is the same for multiple paths, prefer the path with the minimum cluster list length.

Prefer the path that comes from the lowest neighbor address.

BGP Dampening

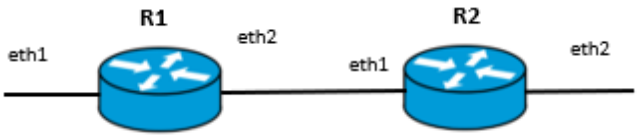
BGP supports route dampening for IPv4 and IPv6 prefixes. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the

suppress limit, the advertisement of the route is suppressed. This penalty is decayed according to the configured half time value. Once the penalty is lower than the reuse limit, the route advertisement is unsuppressed. The dampening information is purged from the router once the penalty becomes less than half of the reuse limit.

Topology

In this example, a successful TCP connection is being established between the routers.

Figure 59. BGP dampening



IPv4 Configuration

R1

`#configure terminal`	Enter configure mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure the secondary loopback address
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 101.1.0.1/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Configure BGP with the AS number 100
`(config-router)#neighbor 10.1.1.2 remote-as 200`	Define the BGP neighbor, and establish a TCP session. 10.1.1.2 is the IP address of one of the neighbors (R2), and 200 is the neighbor's AS number.
`(config-router)#neighbor 100.1.0.2 remote-as 300`	Define the BGP neighbor, and establish a TCP session. 100.1.0.2 is the IP address of one of the neighbors on interface eth1, and 300 is the neighbor's AS number.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#redistribute connected	Enable redistribute connected
(config-router-af)#neighbor 10.1.1.2 activate	Activate the neighbor
(config-router-af)#neighbor 100.1.0.2 activate	Activate the neighbor
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter configure mode
(config)#interface lo	Enter loopback interface mode
(config-if)# ip address 2.2.2.2/32 secondary	Configure the secondary loopback address
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.2/24	Configure the IP address of the interface
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 101.1.0.1/24	Configure the IP address of the interface
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 200	Configure BGP with the AS number 100
(config-router)#neighbor 10.1.1.1 remote-as 100	Define the BGP neighbor, and establish a TCP session. 10.1.1.1 is the IP address of one of the neighbors (R1), and 100 is the neighbor's AS number.
(config-router)#neighbor 101.1.0.2 remote-as 400	Define the BGP neighbor, and establish a TCP session.101.1.0.2 is the IP address of one of the neighbors on eth2 interface, and 400 is the neighbor's AS number.
(config-router)#neighbor 100.1.0.2 remote-as 300	Define the BGP neighbor, and establish a TCP session. 100.1.0.2 is the IP address of one of the neighbors of router R1 on eth1 interface, and 300 is the neighbor's AS number.
(config-router)#neighbor 100.1.0.2 ebgp-multihop 2	Increase BGP neighbors with ebgp-multihop value
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)#neighbor 10.1.1.1 activate	Activate BGP neighbor
(config-router-af)#neighbor 101.1.0.2 activate	Activate BGP neighbor
(config-router-af)#redistribute connected	Enable redistribute connected
(config-router-af)#bgp dampening	Enable BGP dampening with default values:

	• Reachability half-life is 15 minutes • Reuse limit is 750: • Suppress limit is 2000 • Max-suppress value is 60 minutes • Un-reachability half-life is 15 minutes
`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R2

The following provides the R2 validation:

Verify the BGP dampening parameters.

```
#show ip bgp dampening parameters

dampening 15 750 2000 60 15 Dampening Control Block(s):
Reachability Half-Life time : 15 min Reuse penalty   : 750
Suppress penalty   : 2000
Max suppress time   : 60 min Un-reachability Half-Life time : 15 min Max penalty (ceil)   :
11999
Min penalty (floor)   : 375
```

Verify BGP dampened paths for flapping networks.

```
#show ip bgp dampening dampened-paths

IPv6 Configuration

R1

`#configure terminal`	Enter configure mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 address 2000:0:0:1::1/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 2000:0:2:1::1/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 100`	Configure BGP with the AS number 100
`(config-router)#neighbor 2000:0:0:1::2 remote-as 300`	Define the BGP neighbor, and establish a TCP session. 2000:0:0:1::2 is the IP address of one of the neighbors on interface eth1, and 300 is the neighbor's AS number.
`(config-router)#neighbor 2000:0:2:1::2 remote-as 200`	Define the BGP neighbor, and establish a TCP session. 2000:0:2:1::2 is the IP address of one of the neighbors (R2), and 200 is the neighbor's AS number.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 address family
`(config-router)#redistribute connected`	Enable redistribute connected
`(config-router-af)neighbor 2000:0:0:1::2 activate`	Activate BGP neighbor
`(config-router-af)neighbor 2000:0:2:1::2 activate`	Activate BGP neighbor
`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 2000:0:2:1::2/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip address 2000:0:1:1::1/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Configure BGP with the AS number 200
`(config-router)#address-family ipv6 unicast`	Enter IPv6 address family
`(config-router-af)#redistribute connected`	Enable redistribute connected
`(config-router-af)#exit-address-family`	Exit address-family mode.
`(config-router)#neighbor 2000:0:1:1::2 remote-as 400`	Define the BGP neighbor, and establish a TCP session. 2000:0:1:1::2 is the IP address of one of the neighbors on interface eth2, and 400 is the neighbor's AS number.
`(config-router)#neighbor 2000:0:2:1::1 remote-as 100`	Define the BGP neighbor, and establish a TCP session. 2000:0:2:1::1 is the IP address of one of the neighbors (R1), and 100 is the neighbor's AS number.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 address-family
`(config-router-af)#bgp dampening`	Enable BGP dampening with default values: • Reachability half-life is 15 minutes • Reuse limit is 750 • Suppress limit is 2000 • Max-suppress value is 60 minutes • Un-reachability half-life is 15 minutes
`(config-router-af)#neighbor 2000:0:1:1::2 activate`	Activate BGP neighbor
`(config-router-af)#neighbor 2000:0:2:1::1 activate`	Activate BGP neighbor
`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

Validation

R2

The following provides the R2 validation:

Verify the IPv6 BGP dampening parameters.

```
#sh bgp dampening parameters

 dampening 15 750 2000 60 15
 Dampening Control Block(s):
  Reachability Half-Life time    : 15 min
  Reuse penalty                  : 750
  Suppress penalty               : 2000
  Max suppress time              : 60 min
  Un-reachability Half-Life time : 15 min
  Max penalty (ceil)             : 11999
  Min penalty (floor)            : 375
```

Verify IPv6 BGP dampened paths for flapping networks.

```
#sh bgp dampening dampened-paths

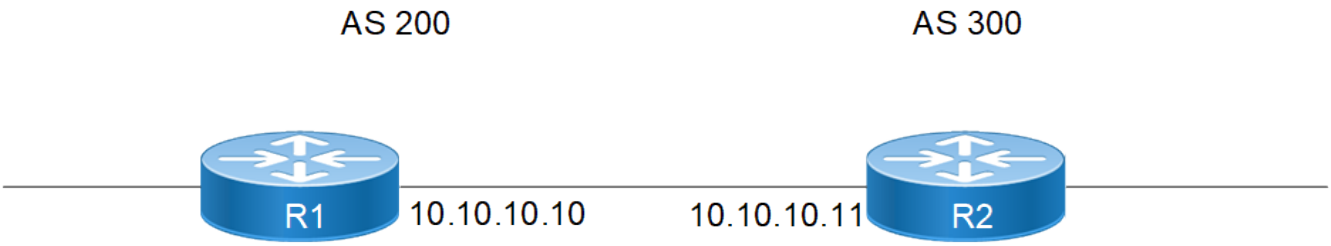
BGP Authentication

BGP authentication allows users to receive selected routing information, enhancing security of their network traffic. When BGP authentication is enabled on a router, the router verifies routing packets it receives by exchanging a password that is configured on both the sending and receiving routers.

In this example, both R1 and R2 have ABC as the password. Configure the same password on all routers that are to communicate using BGP in a network.

Topology

Figure 60. BGP Authentication



Configuration

R1

`#configure terminal`	Enter configure mode
`(config)#interface xe0`	Enter interface mode
`(config-if)#ip address 10.10.10.10/24`	Assign ip address
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter BGP router mode
`(config-router)#neighbor 10.10.10.11 remote-as 300`	Configure neighborship
`(config-router)#neighbor 10.10.10.11 authentication-key 0 ABC`	Configure authentication for BGP neighbors
`(config-router)#address-family ipv4 unicast`	Enter ipv4 address family
`(config-router-af)#neighbor 10.10.10.11 activate`	Activate neighborship
`(config-router-af)#exit-address-family`	Exit address family
`(config-router)#exit`	End config mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter configure mode
`(config)#interface ce2/1`	Enter interface mode
`(config-if)#ip address 10.10.10.11/24`	Assign ip address
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter BGP router mode
`(config-router)#neighbor 10.10.10.10 remote-as 200`	Configure neighborship
`(config-router)#neighbor 10.10.10.10 authentication-key 0 ABC`	Configure authentication for BGP neighbors

© 2026 IP Infusion Inc. Proprietary

(config-router)#address-family ipv4 unicast	Enter ipv4 address family
(config-router-af)#neighbor 10.10.10.10 activate	Activate neighborship
(config-router-af)#exit-address-family	Exit address family
(config-router)#exit	End config mode
(config)#commit	Commit the candidate configuration to the running configuration.

Validation

R1

BGP Unnumbered

Th is section contains configurations for BGP unnumbered interface which provides BGP peering with minimal configuration .

Overview

BGP protocol is used to exchange IP prefixes between AS. For BGP neighbor ship to be established, IPv4 address configuration on peer is pre-requisite. In a large network, this can consume a lot of your address space, requiring a separate IP address for each peer-facing interface apart from administrator effort in configuration. When a BGP peer advertises an IPv4 prefix, it must include an IPv4 next hop address, which is usually the address of the advertising router; for this each BGP peer should have an IPv4 address. This feature is to enable BGP peering with minimal configuration, less IPv4 address-space.

For DC use-case, where hundreds of switches can be connected in CLOS topology, configuring each neighbor is both time consuming and (IPv4) address hungry.

To minimize this, BGP unnumbered can, avoid the need for an IP address on each BGP interface and by removing the need to configure the IP address and ASN of each neighbor. This feature uses link local ipv6 address of interface as per RFC-5549.

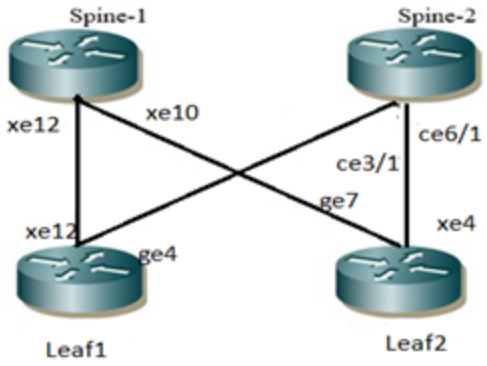
© 2026 IP Infusion Inc. Proprietary

Notes:

- If BGP unnumbered is configured with only if /30 or /31 on the IPv4 address interface, then the BGP session is established through the IPv4 address. To establish the BGP session through link-local, configure `no ipv6 nd supress-ra` and `ipv6 nd ra-interval <value>` commands on the interface without any IP address.
- To enable router solicitation or advertisement on an interface for un-numbered support, the `no ipv6 nd suppress-ra` command must be configured on both sides of the interface. Currently, suppression is disabled by default. This facilitates learning a neighbor's IPv6 Link-Local Address (LLA), which is necessary for sending OPEN messages to establish BGP neighborship.
- As per RFC 5549, extended next-hop is not supported when IPv6 prefixes are advertised to a next-hop device running IPv4. Both devices must have either IPv6 or IPv4 addresses. AFI 1, SAFI 1, and IPv6 next-hop (Link-Local Address) are the only supported combinations with this feature. Global Unicast Address (GUA) for IPv6 next-hop is not supported.
- The hardware supports only data path packet forwarding (for IPv4 prefixes received through BGP neighborship with the unnumbered interface over IPv6 LLA). Ping and traceroute do not work since entries are not installed in the kernel.

Topology

Figure 61. BGP unnumbered



Configuration

Spine 1

`configure terminal`	Enter configure mode
`(config)#interface lo`	Enter interface mode for loopback interface
`(config-if)#ip add 1.1.1.1/32 secondary`	Assign secondary interface to loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface xe12`	Enter interface mode
`(config-if)# ipv6 nd ra-interval 4`	Assign the IPv6 Router Advertisements interval

(config-if)#exit	Exit interface mode
(config)#interface xe10	Enter interface mode
(config-if)# ip address 10.10.10.2/31	Assign IP address to the interface in /31 subnet
(config-if)#exit	Exit interface mode
(config)#router bgp 100	Enter bgp router mode
(config-router)#bgp router-id 1.1.1.1	Assign router id for BGP
(config-router)#bgp unnumbered-mode	Enter bgp unnumbered mode
(config-router-unnum)#neighbor xe12 remote-as internal	Configure iBGP neighborship
(config-router-unnum)#neighbor xe10 remote-as internal	Configure iBGP neighborship
(config-router-unnum)# exit-unnumbered-mode	Exit unnumbered mode

BGP Blackhole Community Attribute

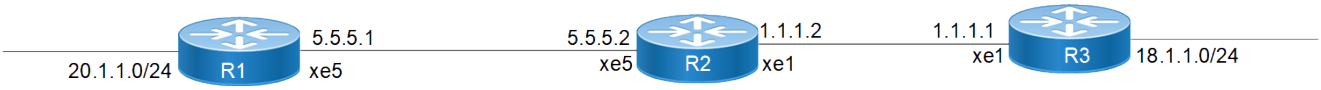
A blackhole route is used to forward unwanted or undesirable traffic into a black hole. In other words, a special logical interface called a null interface, is used to create the black hole. Static routes are created for destinations that are not desirable, and the static route configuration points to the null interface. Any traffic that has a destination address that has a best match of the black hole static route automatically will be dropped.

Notes:

- 65535:666 is reserved for Blackhole community.
- BGP blackhole community is supported only for unicast address-family.

Topology

Figure 62. BGP Blackhole Community Attribute topology



Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface xe5`	Enter Interface mode
`(config-if)# ip address 5.5.5.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe20`	Enter Interface mode
`(config-if)# ip address 20.1.1.1/24`	Assign IP address to interface
`(config-if)#exit`	Exit interface mode
`(config)# router bgp 100`	Enter Router BGP mode

© 2026 IP Infusion Inc. Proprietary

(config-router)# neighbor 5.5.5.2 remote-as 200	Define BGP neighbors. 5.5.5.2 is the IP address of the neighbor (R2) and 200 is the neighbors AS number
(config-router)# address-family ipv4 unicast	Enter into BGP address family IPv4
(config-router-af)#neighbor 5.5.5.2 activate	Activate the neighbor
(config-router-af)#network 20.1.1.0/24	Advertise networks with prefix
(config-router-af)# commit	Commit the configurations
(config-router-af)# end	Return to privilege mode

R2

#configure terminal	Enter Configure mode.
(config)#interface xe5	Enter Interface mode
(config-if)# ip address 5.5.5.2/24	Assign IP address to interface
(config-if)#exit	Exit interface mode
(config)#interface xe1	Enter Interface mode
(config-if)# ip address 1.1.1.2/24	Assign IP address to interface
(config-if)#exit	Exit interface mode
(config)# router bgp 200	Enter Router BGP mode
(config-router)# neighbor 5.5.5.1 remote-as 100	Define BGP neighbors. 5.5.5.1 is the IP address of the neighbor (R1) and 100 is the neighbors AS number
(config-router)# neighbor 1.1.1.1 remote-as 300	Define BGP neighbors. 1.1.1.1 is the IP address of the neighbor (R3) and 100 is the neighbors AS number
(config-router)# address-family ipv4 unicast	Enter into BGP address family IPv4
(config-router-af)#neighbor 5.5.5.1 activate	Activate the neighbor
(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor
(config-router-af)# commit	Commit the configurations
(config-router-af)# end	Return to privilege mode

R3

#configure terminal	Enter Configure mode.
(config)#interface xe1	Enter Interface mode
(config-if)# ip address 1.1.1.1/24	Assign IP address to interface
(config-if)#exit	Exit interface mode
(config)#interface xe18	Enter Interface mode
(config-if)# ip address 18.1.1.1/24	Assign IP address to interface
(config-if)#exit	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

(config)# router bgp 300	Enter Router BGP mode
(config-router)# neighbor 1.1.1.2 remote-as 200	Define BGP neighbors. 1.1.1.2 is the IP address of the neighbor (R2) and 200 is the neighbors AS number
(config-router)# address-family ipv4 unicast	Enter into BGP address family IPv4
(config-router-af)#neighbor 1.1.1.2 activate	Activate the neighbor
(config-router-af)#network 18.1.1.0/24	Advertise networks with prefix
(config-router-af)# commit	Commit the configurations
(config-router-af)# end	Return to privilege mode

Black Hole configuration on R3

#configure terminal	Enter Configure mode.
(config)#route-map D permit 10	Enter Route-map mode to set the match operation
(config-route-map)#set community no-export 65535:666 additive	Configure Reserved Black hole community in Route-map mode
(config-route-map)#commit	Commit the configuration
(config-route-map)#exit	Return to configuration mode
(config)#router bgp 300	Enter Router BGP mode
(config-router)#address-family ipv4 unicast	Enter into BGP address family IPv4
(config-router-af)#neighbor 1.1.1.2 route-map D out	Apply Route-map for the neighbor 1.1.1.2 in out direction
(config-router-af)#commit	Commit the configurations
(config-router-af)#end	Return to privilege mode
#clear ip bgp * soft out	Soft reset after applying Route-map

Gateway of last resort is not set
```

Accumulated Interior Gateway Protocol

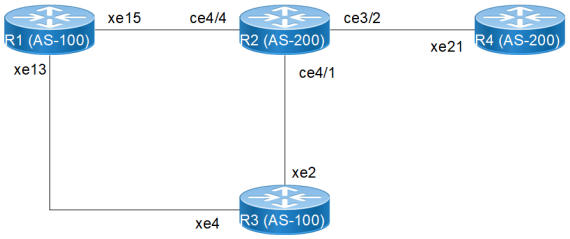
Overview

This section includes step-by-step configuration of AIGP Metric Attribute for BGP It also contains an overview of the concepts of AIGP. AIGP is a non-transitive attribute that includes the accumulated IGP metric. BGP routers advertise this AIGP metric to neighbors in other ASes. This allows BGP routers to select the best path based on the end-to-end IGP metric.

Topology

The diagram depicts the topology for the configuration examples that follow.

Figure 63. Accumulated Interior Gateway Protocol



Base Configurations

R1

Loopback Interface:

`#configure terminal`	Enter configuration mode.
`(config)#interface lo`	Enter the Interface mode for the loopback interface.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure IP address on loopback interface.
`(config-if)#commit`	Commit the transaction

Interface Configuration:

`(config)#interface xe15`	Enter the Interface mode for xe15.
`(config-if)# ip address 10.10.10.1/24`	Configure IP address on the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe13`	Enter the Interface mode for xe13.
`(config-if)# ip address 11.11.11.1/24`	Configure IP address on the interface.
`(config)#interface xe12`	Enter the Interface mode for xe12.
`(config-if)# ip address 50.50.50.2/24`	Configure IP address on the interface.
`(config-if)#commit`	Commit the transaction.

OSPF Configuration:

`(config)#router ospf 100`	Enter the Router OSPF mode.
`(config-router)#ospf router-id 1.1.1.1`	Router-id configurations

BGP Graceful Restart Configuration

During a BGP restart, all BGP peers detect that a session had gone down and come back up. OcNOS invalidates the associated portion of the IP forwarding cache, does a BGP route re-computation, and generates BGP routing updates. The forwarding tables become corrupted and unstable.

Graceful restart helps minimize these negative effects on routing caused by a BGP restart by allowing the restarting BGP router to temporarily retain routing information and continue forwarding packets while BGP restarts. In this way, even while a router rebuilds routing and forwarding tables, the router continues to operate across the TCP connection.

Graceful restart allows a restarting router, and its neighbors, to continue forwarding packets, without disrupting network performance. Because neighboring routers assist in the restart, the restarting router can quickly resume full operation.

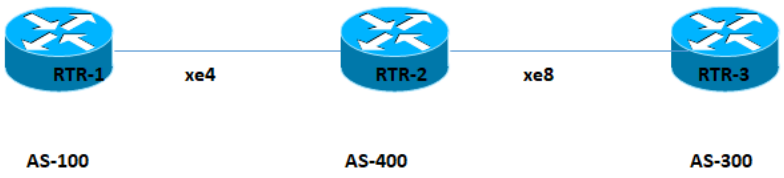
The graceful restart capability extends to the case when a configuration change forces a peer reset.

Graceful reset is a refinement of graceful restart to help ensure smooth restarts when a configuration change forces BGP peer reset.

Note: For seamless recovery and optimal functionality, configure VPNv4 GR only for a peer along with VPN AF in BGP. No other BGP capabilities must be configured.

Topology

Figure 64. Device topology for BGP in VR/VRF



RTR1

`#configure terminal`	Enter Configuration mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure ip address on loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe4`	Enter interface mode for eth2.
`(config-if)#ip address 10.10.10.1/24`	Configure ip address on eth2.
`(config-if)#exit`	Exit interface mode for eth2.
`(config)# router bgp 100`	Enter router bgp mode.
`(config-router)# bgp router-id 1.1.1.1`	Configure bgp router-id same as loopback ip address.

BGP Automated Dynamic Route Policy Update

Overview

The Border Gateway Protocol (BGP) is a peer routing protocol, and route maps within BGP play an essential role in filtering and modifying routing information to ensure that only the most optimal routes are advertised. BGP route maps use a combination of prefix lists and sequence numbers, which provide precise control over which IP addresses are allowed or denied. These route maps can be applied in both inbound (Adj-RIB-In) and outbound (Adj-RIB-Out) directions for routing updates to BGP peer neighbors.

In OcNOS 6.5.x or earlier releases, route maps are not automatically applied to a BGP peer neighbor upon updates. Manually executing commands, such as clear ip bgp A.B.C.D (page 1309) with `soft in/out`, is required for each address family to apply route map changes. This manual intervention is necessary to reflect the changes in the BGP Routing Information Base (RIB).

To address this limitation, a new CLI bgp auto-policy-soft-reset enable (page 619), has been introduced. This functionality automatically applies changes to the BGP RIB when route maps or associated lists (such as prefix-list, distribute-list, as-list, access-list, community-list, extended community list, redistribution settings, and more) are applied or updated to a BGP peer neighbor. This dynamic route policy update eliminates the need for the manual execution of the `clear ip bgp <> soft in/out` command for various address families. This greatly simplifies network operations.

The dynamic seamless BGP route policy update introduces the following two new CLIs:

- bgp auto-policy-soft-reset enable (page 619)
- debug bgp soft-clear (page 620)

Notes:

- The bgp auto-policy-soft-reset enable (page 619) functionality is applicable only when apply or remove or update the following:
  - route map
  - prefix-list
  - distribute-list
  - as-list
  - access-list
  - community-list
- This functionality is not supported:
  - when the peer does not support route refresh messages.
  - when the peer is configured with `bgp soft-reconfig-backup`.
  - when the router config disables auto soft reset and the administrator prefers manual resets instead.

Benefits

This feature benefits network administrators by reducing the manual effort involved in BGP route filtering and advertisement updates, improving operational efficiency, and ensuring that routing policies are applied immediately

© 2026 IP Infusion Inc. Proprietary

without requiring a BGP session reset in real-time propagation of routing information.

Prerequisites

Make sure the provider edge routers and BGP route reflectors have the following active configurations.

- Stable BGP session should exist between Provider edge nodes.
- Support for IPv4, IPv6, VPNv4, BGP Labeled-Unicast, VPNv6 address families on all nodes.
- Established BGP neighbor peers or peer groups are up.
- Ensure baseline BGP configurations are proper.
- Check advertised and received routes for accuracy.

Configuring BGP auto-policy-soft-reset

This procedure outlines the steps to configure the bgp auto-policy-soft-reset enable (page 619) functionality, which ensures routing policy changes are applied without disrupting active BGP sessions.

Topology

The configuration uses the below topology, which involves two Provider Edge routers PE1, PE2 and an iBGP router act as a Route Reflector (RR) between PE1 and PE2.

Figure 65. Topology of BGP Auto Policy Soft Reset

Note: Before configuration meet all Prerequisites (page 609)

Procedure

This procedure uses the following interfaces and IP addresses:

- PE1 - `xe3` interface IP address 10.11.1.1/29, loopback IP - 1.1.1.1/32
- PE2 - `ge14` IP address 10.12.3.2/29, loopback IP - 3.3.3.3/32
- RR - `ce46/1` IP address 10.11.1.2/29, loopback IP - 11.11.11.11/32

1. Verify the base BGP configuration on PE1, PE2, and RR before enabling the bgp soft-clear CLI. Refer to the sample out shown in PE1 - Before enabling the bgp auto-policy-soft-reset CLI (page 613), RR - Before enabling the bgp auto-policy-soft-reset CLI (page 614), and PE2 - Before enabling the bgp auto-policy-soft-reset CLI (page 615).
2. Verify the interface, label-switching, IGP, LDP, existing route maps filter criteria such as prefix-list on PE1 and PE2. Here, is the sample configuration.

 router-id 11.11.11.11
!
```

3. Enable `bgp auto-policy-soft-reset` on PE1, PE2, and RR. Here, is the sample configuration.

   PE1

```
!
router bgp 100
 bgp router-id 1.1.1.1
  bgp auto-policy-soft-reset enable
 !
```

   PE2

```
!
router bgp 100
 bgp router-id 3.3.3.3
  bgp auto-policy-soft-reset enable
 !
```

RR

```
!
router bgp 100
 bgp router-id 11.11.11.11
  bgp auto-policy-soft-reset enable
 no bgp inbound-route-filter
 neighbor peer_group1 peer-group
 neighbor peer_group1 remote-as 100
 neighbor peer_group1 update-source lo
 neighbor peer_group1 advertisement-interval 0
  neighbor 1.1.1.1 peer-group peer_group1
 neighbor 3.3.3.3 peer-group peer_group1
 !
```

4. Add a route map policy on PE1. For example, configure route map to allow or deny additional prefixes and change the attributes values.

```
!
ip prefix-list prefix1
 seq 5 permit 31.0.1.0/24
!
route-map rm_pe1 permit 1
 match ip address prefix-list prefix1
 set metric 200
 set weight 200
 set local-preference 200
 set community 100:101
!
```

5. Add a route map policy on PE2. For example, configure route map to allow or deny additional prefixes and change the attributes values.

```
!
ip community-list standard Community1 permit 100:101
!
route-map rm_pe2 permit 1
 match community Community1
 set community 100:102
!
```

6. Attach the updated route map filter to BGP peers on PE1 and PE2. For example, on PE1, attach the route map to filter specific routes on outgoing routes using "`neighbor 11.11.11.11 route-map rm-pe1 out`" command towards PE2 under address family vpnv4 unicast. On, PE2, attach it to filter specific routes on incoming routes using "`neighbor 11.11.11.11 route-map rm-pe2 in`" command under address family vpnv4 unicast.

PE1

```
!
router bgp 100
 bgp router-id 1.1.1.1
!
address-family vpnv4 unicast
 neighbor 11.11.11.11 activate
 neighbor 11.11.11.11 route-map rm_pe1 out
 exit-address-family
!
```

PE2

```
!
router bgp 100
bgp router-id 3.3.3.3
!
address-family vpnv4 unicast
 neighbor 11.11.11.11 activate
 neighbor 11.11.11.11 route-map rm_pe2 in
 exit-address-family
!
```

7. Verify the advertised and received routes to ensure the policy changes have taken effect on PE1, PE2 and RR. Refer to the sample out shown in PE2 - After enabling the bgp auto-policy-soft-reset (page 617).

```

Implementation Examples

Following are some of the use cases where manual clearance clear ip bgp A.B.C.D (page 1309) of route updates are necessary before applying them to a neighbor peer or peer group.

Scenario 1:

When configuring bgp additional-paths (page 1595) with options send|receive|send-receive|select (all | best<2-3>))or when enabling neighbor advertise additional-

paths (page 1598), route change occurs that needs to be updated in the neighbor peer or peer group through BGP RIB-out.

Scenario 2:

Configuring neighbor unsuppress-map (page 1404) leads to route changes that needs to be announced in BGP RIB-out.

Scenario 3:

Enabling neighbor allowas-in (page 1340) causes change in routes that needs to accepted via BGP RIB-in.

Scenario 4:

When multiple BGP address families facilitate route management between two customer edge devices (CE1 and CE2) via Route Reflector, enabling bgp auto-policy-soft-reset enable (page 619) dynamically updates newly announced route map prefixes.

CLI Commands

Following are the CLIs introduced to clear the route-map updates automatically for each BGP address-family.

bgp auto-policy-soft-reset enable

Use this command ONLY to enable BGP soft clear for address families IPv4, IPv6, VPNv4, VPNv6, labeled-unicast regarding route map, table-map, prefix-list, distribute-list, as-list, access-list or community-list updates to apply the modified routes and attributes automatically on the neighbor peer or peer group.

Use the `no` form of this CLI to disable the soft reset.

Note: EVPN address family is not supported.

Command Syntax

```
bgp auto-policy-soft-reset enable
no bgp auto-policy-soft-reset enable
```

Parameters

None

Default

Disabled

Command Mode

BGP Router Mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

Entering the CLI enables the soft clear the route map.

```
OcNOS(config)#router bgp
OcNOS(config-router)#bgp auto-policy-soft-reset enable
OcNOS(config-router)#address-family vpnv4 unicast
OcNOS(config-router-af)#neighbor 50.50.50.50 prefix-list prefix-inside in
OcNOS(config-router-af)#commit
OcNOS(config-router-af)#exit
OcNOS(config-router)#commit
```

© 2026 IP Infusion Inc. Proprietary

debug bgp soft-clear

Use this command to log the BGP auto soft clear information with timestamp for debug purpose.

Command Syntax

```
debug bgp soft-clear
```

Parameters

None

Default

Disabled

Command Mode

Configure Mode

Applicability

Introduced in OcNOS version 6.6.0.

Example

Entering the CLI enables the BGP soft clear log file.

```
OcNOS(config)#debug bgp soft-clear
```

Glossary

The following provides definitions for key terms or abbreviations and their meanings used throughout this document:

Key Terms/Acronym	Description
AS	Autonomous System
BGP	Border Gateway Protocol router
PE	Provider Edge router
RIB	Route Information Base
RR	Route-Reflector router
Route-map	Maps used for filtering RIB in/out on various use cases
Prefix list	List created on router with Network prefixes ge, le options too to indicate network address length
Access List	List created on a router with IP addresses mentioned (IPv4, IPv6) without any network address length flexibility like prefix lists.
AS List	Autonomous System path list where BGP can filter routes based on AS path it checks in the control packet
Community List	Community is a mini group inside AS, and BGP can filter these communities based on AS:NN where the first 16 bits are AS, next 16 bits a unique number with AS.

© 2026 IP Infusion Inc. Proprietary

BGP4+

This section contains basic BGP4+ configuration examples.

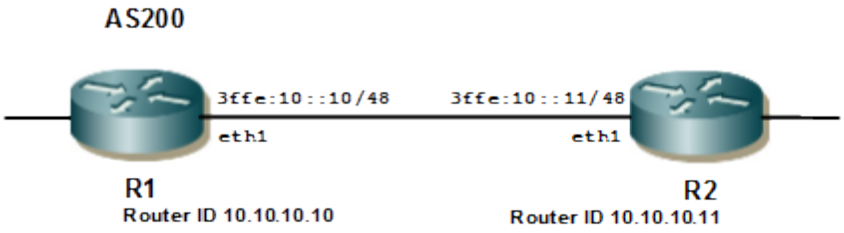
For details about the commands used in these examples, see the Border Gateway Protocol Command Reference.

Enable iBGP Peering Using a Global Address

This example shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same Autonomous System (AS), AS200, connecting to network **`3ffe:10::/48`**. First, specify the IPv6 global address, then define the routing process and AS number to which the routers belong. Configure a fixed Router ID, then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 66. iBGP Peering



Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface `(eth1)` to configure.
`(config-if)#ipv6 address 3ffe:10::10/48`	Specify the IPv6 global address.
`(config-if)#exit`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R2`.
`(config-router)#bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::10 remote-as 200`	Define the BGP neighbor (R1), and establish a TCP session by specifying the global IPv6 address (`3ffe:10::10`) and the AS number `(200)` of neighbor `R1`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::10 activate`	Activate the neighbor `R1(3ffe:10::10)`, and

© 2026 IP Infusion Inc. Proprietary

	enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#exit-address-family	Exit address family
(config-router)#commit	Commit the candidate configuration to the running configuration

R2

#configure terminal	Enter Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure.
(config-if)#ipv6 address 3ffe:10::11/48	Specify the IPv6 global address.
(config-if)#exit	Enter Configure mode.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R2.
(config-router)#bgp router-id 10.10.10.11	Configure a fixed Router ID (10.10.10.11) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::10 remote-as 200	Define the BGP neighbor (R1), and establish a TCP session by specifying the global IPv6 address (3ffe:10::10) and the AS number (200) of neighbor R1.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::10 activate	Activate the neighbor R1(3ffe:10::10), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#exit-address-family	Exit address family
(config-router)#commit	Commit the candidate configuration to the running configuration

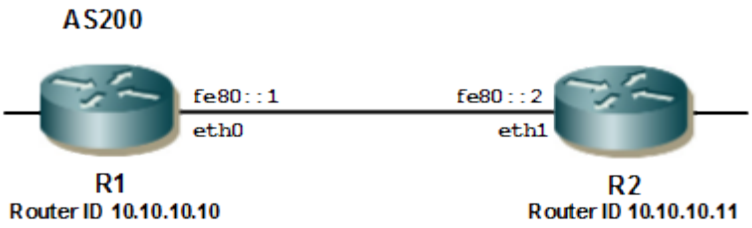
Enable iBGP Peering Using Link-local Address

This example shows the minimum configuration required to enable iBGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network fe80::/10. First, define the routing process and AS number to which the routers belong. Configure a fixed Router ID for the BGP4+ routing process, then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 67. iBGP Peering Link-Local Address



Configuration

R1

`#configure terminal`
 	
`(config)#router bgp 200`
	Enter Configure mode.
	
	Define the routing process. The number `200` specifies the AS number of `R1`.

`(config-router)#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor fe80::2 remote-as 200`	Define BGP neighbor (R2), and establish a TCP session by specifying the link-local address (`fe80::2`) and the AS number `(200)` of neighbor `R2`.
`(config-router)#neighbor fe80::2 interface eth0`	To specify a link-local neighbor, configure the interface name of the neighbor `fe80::2`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor fe80::2 activate`	Activate the neighbor `R2(fe80::2)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#exit-address-family`	Exit address family
`(config-router)#commit`	Commit the candidate configuration to the running configuration

© 2026 IP Infusion Inc. Proprietary

R2

`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R2`.
`(config-router)#bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`(config-router)#neighbor fe80::1 remote-as 200`	Define the BGP neighbor (R1), and establish a TCP session by specifying the link-local address `R1` (`fe80::1`) and the AS number `(200)` of neighbor `R1`.
`(config-router)#neighbor fe80::1 interface eth1`	To specify a link-local neighbor, configure the interface name of the neighbor `fe80::1`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor fe80::1 activate`	Activate the neighbor `R1(fe80:1)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#exit-address-family`	Exit address family
`(config-router)#commit`	Commit the candidate configuration to the running configuration

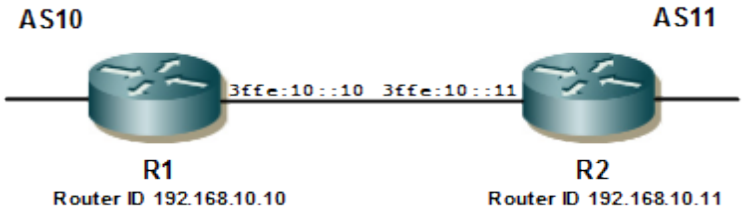
Route-Map

Use route-maps to filter incoming updates from a BGP peer. In this example, a prefix list named myPrefixList on R1 is configured to deny entry of any routes with the IP address **`3ffe:12::/32`**. To test the filter, R2 is configured to generate network prefixes **`3ffe:11::/48`** and **`3ffe:12::/48`**. To verify, use the show bgp ipv6 command on R1; it displays R1 receiving only the **`3ffe:11::/48`** network prefix.

Topology

Figure 69. Route-Map



Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)Interface eth1`	Specify the interface (**`eth1`**) to configure
`(config)Ipv6 address 3ffe:10::10/64`	Specify the IPv6 global address
`(config)Exit`	Enter Configure mode
`(config)#ipv6 prefix-list myPrefixList`	Create an entry in the prefix-list. myPrefixList is the name of the map that is created
`(config-ipv6-prefix-list)#seq 5 deny 3ffe:12::/32 ge 48 le 64`	Here 5 and 10 specify the sequence number or position of this specific route map. deny specifies the packets are to be rejected. permit specifies the packets are to be allowed. 48 and 64 are the minimum and maximum prefix lengths, respectively, to be matched.
`(config-ipv6-prefix-list)#seq 10 permit any`	Create another entry in the myPrefixList map. 10 specifies the sequence number or position of this specific route map. permit any specifies accept all packets of any length.
`(config-ipv6-prefix-list)#exit`	Exit the prefix-list mode
`(config)#route-map myPrefixList permit 1`	Enter Route-map mode.
`(config-route-map)#match ipv6 address prefix-list myPrefixList`	Set the match criteria. In this case, if the route-map name matches myPrefixList, the packets from the first sequence will be denied.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#commit`	Commit the candidate configuration to the running configuration
`(config)#router bgp 10`	Define the routing process. The number `10` specifies the AS number of `R1`.
`(config-router)#bgp router-id 192.168.10.10`	Configure a fixed Router ID (`192.168.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10:11 remote-as 11`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::11`) and the AS number (`11`) of neighbor `R2`.
`(config-router-af)#exit`	Exit from router BGP mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::11 activate`	Activate the neighbor `R2(3ffe:10::11)`, and

	enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:10::11 route-map myPrefixList in	Apply the route-map myPrefixList to all incoming routes.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router-af)#exit	Exit Router mode, and return to Configure mode.
(config)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter Configure mode.
(config)Interface eth1	Specify the interface (**eth1**) to configure
(config)Ipv6 address 3ffe:10::11/64	Specify the IPv6 global address
(config)Exit	Enter Configure mode
(config)#router bgp 11	Define the routing process. The number 11 specifies the AS number of R2.
(config-router)#bgp router-id 192.168.10.11	Configure a fixed Router ID (192.168.10.11) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::10 remote-as 10	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (3ffe:10::10) and the AS number (10) of neighbor R1.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#network 3ffe:11::/48	Announce the IPv6 network prefix (3ffe:11::/48).
(config-router-af)#network 3ffe:12::/48	Announce the IPv6 network prefix (3ffe:12::/48).
(config-router-af)#neighbor 3ffe:10::10 activate	Activate the neighbor R1(3ffe:10::10), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config)#commit	Commit the candidate configuration to the running configuration.

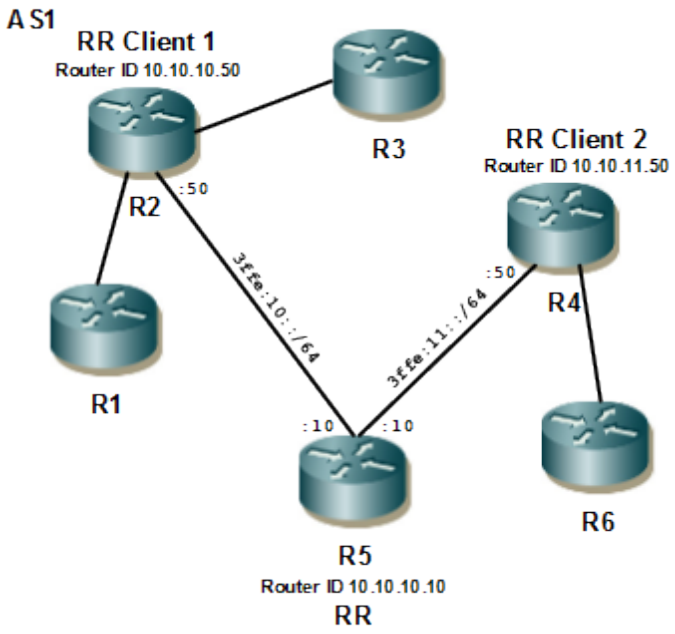
Route Reflector

Use Route Reflectors to reduce the iBGP mesh inside an AS. In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with RR only, and not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to the R2. This reduces the iBGP peer connections in AS1.

Topology

Figure 70. BGP4+ Route Reflector



Configuration

RR (R5)

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 1`	Define the routing process. The number `1`

	specifies the AS number of R5 (RR).
(config-router)#bgp router-id 10.10.10.10	Configure a fixed Router ID (10.10.10.10) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::50 remote-as 1	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (3ffe:10::50) and the AS number (1) of neighbor R2.
(config-router)#neighbor 3ffe:11::50 remote-as 1	Define the BGP neighbor (R4), and establish a TCP session by specifying the IPv6 address (3ffe:11::50) and the AS number (1) of neighbor R4.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::50 activate	Activate the neighbor R2 (3ffe:10::50), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:10::50 route-reflector-client	Configure R5 as the Route-Reflector (RR) and neighbor R2 as its client.
(config-router-af)#neighbor 3ffe:11::50 activate	Activate the neighbor R4 (3ffe:11::50), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:11::50 route-reflector-client	Configure R5 as the Route-Reflector (RR) and neighbor R4 as its client.
(config-router-af)#exit-address-family	Exit address family
(config-router)#commit	Commit the candidate configuration to the running configuration.

RR Client 1 (R2)

(config)#router bgp 1	Define the routing process. The number 1 specifies the AS number of R2 (RR Client 1).
(config-router)#bgp router-id 10.10.10.50	Configure a fixed Router ID (10.10.10.50) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::10 remote-as 1	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (3ffe:10::10) and the AS number (1) of neighbor R5.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::10 activate	Activate the neighbor (3ffe:10::10), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#exit-address-family	Exit address family

`(config-router)#commit`	Commit the candidate configuration to the running configuration.

RR Client 2 (R4)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of `R4` (RR Client 2).
`(config-router)#bgp router-id 10.10.11.50`	Configure a fixed Router ID (`10.10.11.50`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:11::10 remote-as 1`	Define the BGP neighbor (`R5`), and establish a TCP session by specifying the IPv6 address (`3ffe:11::10`) and the AS number `(1)` of the neighbor.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:11::10 activate`	Activate the neighbor `(3ffe:11::10)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#exit-address-family`	Exit address family
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

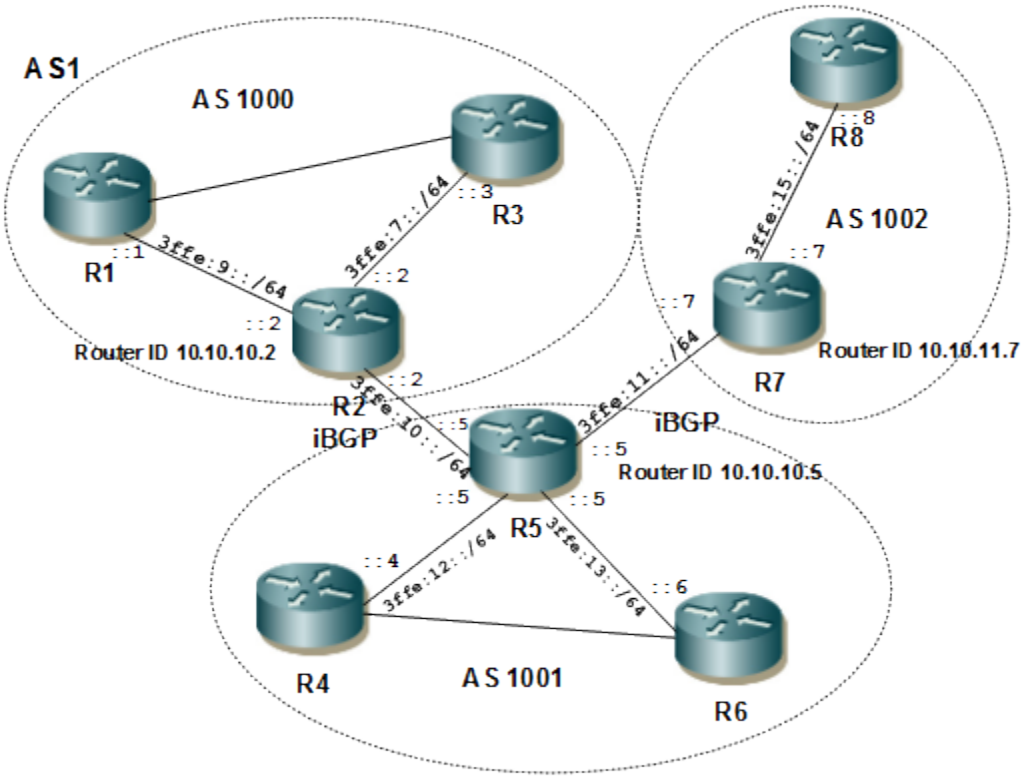
Confederations

In this example, AS1 contains three Confederated Autonomous Systems--AS 1000, AS 1001 and AS 1002. To any outside AS, the overall Confederation is a single AS, AS1. Confederation eBGP is run between R2 and R5, and between R5 and R7. R2 is configured so that its local AS is 1000. Its peer connection to R5 is set up like any other eBGP session. The `bgp confederation identifier` command informs the router that it is a member of a Confederation and passes the Confederation ID. The `bgp confederation peers` command lists the member AS to which R2 is connected. The same command tells the BGP process that the eBGP connection is a Confederation eBGP, rather than a normal eBGP.

Topology

Figure 71. BGP4+ Confederations



Configuration

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 1000`	Define the routing process. The number `1000` specifies the AS number of `R2`.
`(config-router)#bgp router-id 10.10.10.2`	Configure a fixed Router ID (`10.10.10.2`) for the BGP4+ routing process.
`(config-router)#bgp confederation identifier 1`	Specify the BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the

	identifier as its AS number.
(config-router)#bgp confederation peers 1001	Specify AS 1001 as s confederation peer, making it a member of the Confederation.
(config-router)#bgp confederation peers 1002	Specify AS 1002 as s confederation peer, making it a member of the Confederation.
(config-router)#neighbor 3ffe:10::5 remote-as 1001	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (3ffe:10::5) and the AS number (1001) of neighbor R5.
(config-router)#neighbor 3ffe:9::1 remote-as 1000	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (3ffe:9::1) and the AS number (1000) of neighbor R1.
(config-router)#neighbor 3ffe:7::3 remote-as 1000	Define the BGP neighbor (R3), and establish a TCP session by specifying the IPv6 address (3ffe:7::3) and the AS number (1000) of neighbor R3.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::5 activate	Activate neighbor R5(3ffe:10::5), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:9::1 activate	Activate neighbor R1(3ffe:9::1), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:7::3 activate	Activate neighbor R3(3ffe:7::3), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#exit-address-family	Exit address family
(config-router)#commit	Commit the candidate configuration to the running configuration.

R5

(config)#router bgp 1001	Define the routing process. The number 1001 specifies the AS number of R5.
(config-router)#bgp router-id 10.10.10.5	Configure a fixed Router ID (10.10.10.5) for the BGP4+ routing process.
(config-router)#bgp confederation identifier 1	Specify the BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
(config-router)#bgp confederation peers 1000	Specify AS 1000 as s confederation peer, making it a member of the Confederation.
(config-router)#bgp confederation peers 1002	Specify AS 1002 as s confederation peer, making it a

	member of the Confederation.
`(config-router)#neighbor 3ffe:10::2 remote-as 1000`	Define the BGP neighbor (`R2`), and establish a TCP session by specifying the IPv6 address (`3ffe:10::2`) and the AS number (`1000`) of neighbor `R2`.
`(config-router)#neighbor 3ffe:11::7 remote-as 1002`	Define the BGP neighbor (`R7`), and establish a TCP session by specifying the IPv6 address (`3ffe:11::7`) and the AS number (`1002`) of neighbor `R7`.
`(config-router)#neighbor 3ffe:12::4 remote-as 1001`	Define the BGP neighbor (`R4`), and establish a TCP session by specifying the IPv6 address (`3ffe:12::4`) and the AS number (`1001`) of neighbor `R4`.
`(config-router)#neighbor 3ffe:13::6 remote-as 1001`	Define the BGP neighbor (`R6`), and establish a TCP session by specifying the IPv6 address (`3ffe:13::6`) and the AS number (`1001`) of neighbor `R6`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::2 activate`	Activate the neighbor `R2(3ffe:10::2)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:11::7 activate`	Activate the neighbor `R7(3ffe:11::7)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:12::4 activate`	Activate the neighbor `R4(3ffe:12::4)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:13::6 activate`	Activate the neighbor `R6(3ffe:13::6)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#exit-address-family`	Exit address family
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R7

`(config)#router bgp 1002`	Define the routing process. The number `1002` specifies the AS number of `R7`.
`(config-router)#bgp router-id 10.10.11.7`	Configure a fixed Router ID (`10.10.11.7`) for the BGP4+ routing process.
`(config-router)#bgp confederation identifier 1`	Specify BGP Confederation Identifier (`1`). To others, the group will appear as a single AS, and the identifier as its AS number.

© 2026 IP Infusion Inc. Proprietary

`(config-router)#bgp confederation peers 1000`	Specify AS `1000` as s confederation peer, making it a member of the Confederation.
`(config-router)#bgp confederation peers 1001`	Specify AS `1001` as s confederation peer, making it a member of the Confederation.
`(config-router)#neighbor 3ffe:11::5 remote-as 1001`	Define the BGP neighbor (`R5`), and establish a TCP session by specifying the IPv6 address (`3ffe:11::5`) and the AS number `(1001)` of neighbor R5.
`(config-router)#neighbor 3ffe:15::8 remote-as 1002`	Define the BGP neighbor (`R8`), and establish a TCP session by specifying the IPv6 address (`3ffe:15::8`) and the AS number `(1002)` of neighbor `R8`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:11::5 activate`	Activate the neighbor `R5(3ffe:11::5)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:15::8 activate`	Activate the neighbor `R8(3ffe:15::8)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#exit-address-family`	Exit address family
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

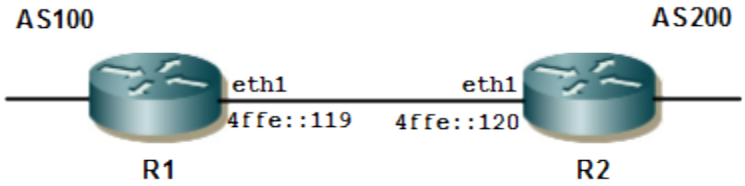
BGP4+ Graceful Restart

Using BGP+ graceful restart, the data-forwarding plane of a router can continue to process and forward packets, even if the control plane (which is responsible for determining best paths) fails.

Topology

Figure 72. BGP4+ Graceful Restart



Configuration

R1

`#configure terminal` `(config)#interface lo`	Enter Configure mode. Enter to the interface mode.
`(config-if)#ipv6 address 4000::1/64`	Assign ipv6 address to loopback interface.
`(config-if)#exit`	Exit from interface mode.
`(config)#interface xe9`	Enter to the interface mode.
`(config-if)#ipv6 address 4ffe::119/64`	Configure ipv6 address.
`(config-if)#exit`	Exit from interface mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router.
`(config-router)# bgp router-id 1.1.1.1`	Configuring bgp router id.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.
`(config-router)#neighbor 4ffe::120 remote-as 200`	Specify the neighbor's IP address (4ffe::120) and the ASN value of the neighbor (200).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#network 4000::/64`	Advertising ipv6 address.
`(config-router-af)#neighbor 4ffe::120 activate`	Specify the neighbor's IPv6 address (4ffe::120) , and activate the neighbor.
`(config-router-af)#neighbor 4ffe::120 capability graceful-restart`	Specify the neighbor's IPv6 address (4ffe::120) for which the graceful restart capability is supported.

#configure terminal	Enter Configure mode.
(config-router-af)#exit-address-family	Exit address family
(config-router)#commit	Commit the candidate configuration to the running configuration.

R2

#configure terminal	Enter Configure mode
(config)#interface xe9	Enter to the interface mode
(config-if)#ipv6 address 4ffe::119/64	Configure ipv6 address.
(config-if)#exit	Exit from interface mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)# bgp router-id 2.2.2.2	Configuring bgp router id.
(config-router)#bgp graceful-restart	Enable BGP graceful restart support.
(config-router)#bgp graceful-restart restart-time 120	Configure the maximum time (120) required for neighbor(s) to restart.
(config-router)#bgp graceful-restart stalepath-time 120	Configure the maximum time (120) to retain stale paths from the restarting neighbor(s).
(config-router)#neighbor 4ffe::119 remote-as 100	Specify the neighbor's IP address (4ffe::119) and the ASN value of the neighbor (100).
(config-router)#address-family ipv6 unicast	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
(config-router-af)#neighbor 4ffe::119 activate	Specify the neighbor's IPv6 address（4ffe::119）, and activate the neighbor.
(config-router-af)#neighbor 4ffe::119 capability graceful-restart	Specify the neighbor's IPv6 address (4ffe::119) for which the graceful restart capability is supported.
(config-router-af)#exit-address-family	Exit address family
(config-router)#commit	Commit the candidate configuration to the running configuration.

Restarting the BGP Daemon

```
#start-shell
bash-5.0$ su
Password:
root@OcNOS:/home/ocnos# cd /usr/local/sbin/
root@OcNOS:/usr/local/sbin# ./bgpd -d
```

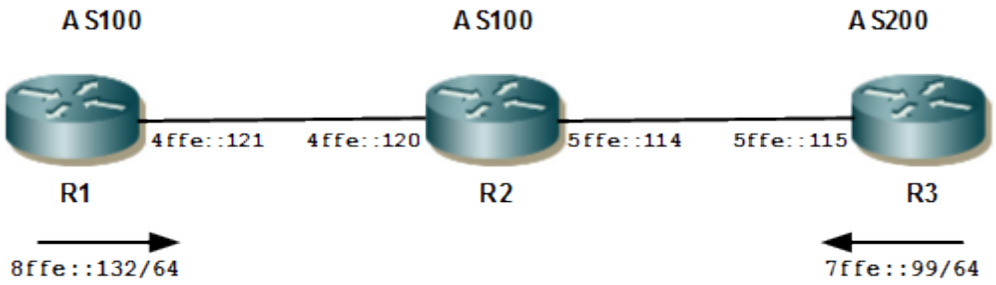
Configure BGP4+ Distance

Administrative distance in BGP+ can be configured for a specific address family.

This example shows configuring the BGP administrative distance for the IPv6 address family.

Topology

Figure 73. BGP4+ Distance



Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router.
`(config-router)#neighbor 4ffe::120 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#neighbor 4ffe::120 activate`	Activate the IPv6 neighbor.
`(config-router-af)#network 8ffe::132/64`	Specify the network to be advertised by the BGP routing process.
`(config-router-af)#exit-address-family`	Exit Address Family mode, and return to Router mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the router.
`(config-router)#neighbor 4ffe::121 remote-as 100`	Specify the neighbor’s IP address and ASN value.
`(config-router)#neighbor 5ffe::115 remote-as 200`	Specify the neighbor’s IP address and the ASN value of another neighbor.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#aggregate-address 2ffe::102/32 summary-only`	Configure an IPv6 non-AS-set aggregate route on R2. The local distance will be applied to this route.
`(config-router-af)#neighbor 4ffe::121 activate`	Activate the IPv6 neighbor.
`(config-router-af)#neighbor 5ffe::115 activate`	Activate the IPv6 neighbor.
`(config-router-af)#distance bgp 12 13 11`	Configure the administrative distance for external, internal, and local routes received in IPv6 Address-

	Family mode.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

R3

#configure terminal	Enter Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the router.
(config-router)#neighbor 5ffe::114 remote-as 100	Specify the neighbor's IP address and ASN value.
(config-router)#address-family ipv6 unicast	Enter IPv6 Address-Family mode.
(config-router)#network 7ffe::99/64	Specify the network to be advertised by the BGP routing process.
(config-router-af)#neighbor 5ffe::114 activate	Activate the IPv6 neighbor.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

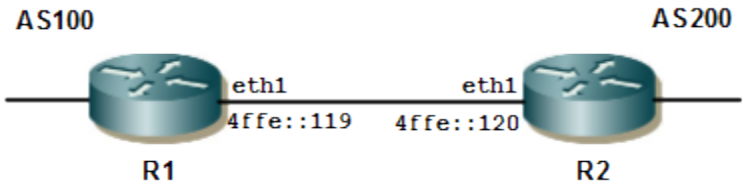
BGP4+ Graceful Reset

The graceful restart mechanism for BGP+ session reset (the BGP+ daemon is not restarted) is used so that any changes in network configuration do not affect packet forwarding. The bgp graceful-restart graceful-reset CLI invokes graceful restart when a configuration change forces a peer reset. Graceful restart is invoked only when these CLI configuration changes force a peer reset.

Topology

Figure 74. BGP4+ Graceful Reset



Configuration

R1

`#configure terminal` `(config)#router bgp 100`	Enter Configure mode. Assign the ASN value (100) to the router.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.
`(config-router)#bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`(config-router)#neighbor 4ffe::120 remote-as 200`	Specify the neighbor's IP address (4ffe::120) and the ASN value of the neighbor (200).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#neighbor 4ffe::120 activate`	Specify the neighbor's IPv6 address (4ffe::120) , and activate the neighbor.
`(config-router-af)#neighbor 4ffe::120 capability graceful-restart`	Specify the neighbor's IPv6 address (4ffe::120) for which the graceful restart capability is supported.
`(config-router-af)#exit-address-family`	Exit Address Family mode, and return to Router mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

R2

`#configure terminal` `(config)#router bgp 200`	Enter Configure mode. Assign the ASN value (200) to the router.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.

© 2026 IP Infusion Inc. Proprietary

`#configure terminal`	Enter Configure mode.
`(config-router)#bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`(config-router)#neighbor 4ffe::119 remote-as 100`	Specify the neighbor's IP address (4ffe::119) and the ASN value of the neighbor (100).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#neighbor 4ffe::119 activate`	Specify the neighbor's IPv6 address (4ffe::119) , and activate the neighbor.
`(config-router-af)#neighbor 4ffe::119 capability graceful-restart`	Specify the neighbor's IPv6 address (4ffe::119) for which the graceful restart capability is supported.
`(config-router-af)#exit-address-family`	Exit Address Family mode, and return to Router mode.
`(config-router)#commit`	Commit the candidate configuration to the running configuration.

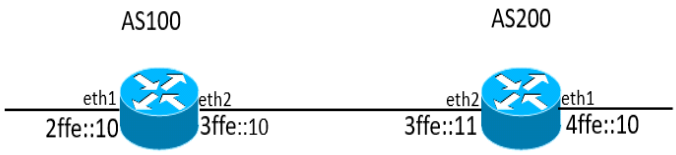
VPNv4 NLRI with IPv6 Nexthop

Multi-protocol BGP (MP-BGP) specifies that the set of usable next-hop address families is determined by the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). Historically the AFI/SAFI definitions for the IPv4 address family only have provisions for advertising a Next Hop address that belongs to the IPv4 protocol when advertising IPv4 or VPN-IPv4 Network Layer Reachability Information (NLRI).

The extensions necessary to allow advertising IPv4 NLRI or VPN-IPv4 NLRI with a Next Hop address that belongs to the IPv6 protocol. This comprises an extension of the AFI/SAFI definitions to allow the address of the Next Hop for IPv4 NLRI or VPN-IPv4 NLRI to also belong to the IPv6 Protocol. The encoding of the Next Hop to determine which of the protocols the address actually belongs to, and a new BGP Capability allowing MP-BGP Peers to dynamically discover whether they can exchange IPv4 NLRI and VPN-IPv4 NLRI with an IPv6 Next Hop.

Topology

Figure 75. VPNv4 NLRI with IPv6 Nexthop



Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)# ip vrf VRF1`	Create a VRF, vrf1.
`(config-vrf)#rd 100:10`	Configure a route distinguisher value.
`(config-vrf)#route-target both 100:10`	Configure a route target both value to VRF.
`(config-vrf)#exit`	Exit from VRF configuration mode.
`(config)#interface eth1`	Enter Interface configuration mode.
`(config-if)#ip vrf forwarding VRF1`	Configure the interface to a VRF.
`(config-if)#ip address 30.30.30.30/24`	Assign an IP address to the interface.
`(config-if)#ipv6 address 2ffe::10/64`	Assign an IPV6 address to the interface.
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#ip route vrf VRF1 50.50.50.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2 Enter`	
`(config-if)#ipv6 address 3ffe::10/64`	Assign an IPV6 address to the interface.
`(config-if)#exit`	Exit from interface configuration mode.

© 2026 IP Infusion Inc. Proprietary

(config)#router bgp 100 Define the routing process.	
(config-router)#bgp router-id 1.1.1.1	Configure a fixed Router ID (1.1.1.1) for the BGP4+ routing process.
(config-router)#neighbor 2.2.2.2 remote-as 200	Define BGP neighbors, and establish a TCP session. 2.2.2.2 is the IP address of the neighbor (R1), and 200 is the neighbor's AS number.
(config-router)#neighbor 3ffe::11 remote-as 200	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (3ffe::11)and the AS number(200)of neighbor R2.
(config-router)#address-family vpnv4 unicast	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 2.2.2.2 activate	Activate the neighbor R2 (2.2.2.2), and enable exchange of IP address prefix types with this neighbor.
(config-router-af)#neighbor 2.2.2.2 allow-ebgp-vpn	Configures the neighbor address to allow EBGP VPN.
(config-router-af)#neighbor 3ffe::11 allow-ebgp-vpn	Apply allow-ebgp-vpn to allow an eBGP neighbor to be a VPN peer.
(config-router-af)#neighbor 3ffe::11 activate	Activate the neighbor R2(3ffe::11), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe::11 capability extended-nexthop-encode	Enable capability to encode IPv6 nexthop in VPNv4 NLRI.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#address-family ipv4 vrf VRF1	Enter IPv4 VRF address family.
(config-router-af)#redistribute static	Redistribute static into the IPv4 VRF address family.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#commit	Apply commit.
(config)#exit	Exit the config mode.

R2

#configure terminal	Enter Configure mode.
(config)# ip vrf VRF1	Create a VRF, vrf1.
(config-vrf)#rd 100:10	Configure a route distinguisher value.
(config-vrf)#route-target both 100:10	Configure a route target both value to VRF.
(config-vrf)#exit	Exit from VRF configuration mode.

© 2026 IP Infusion Inc. Proprietary

(config)#interface eth1	Enter Interface configuration mode.
(config-if)#ip vrf forwarding VRF1	Configure the interface to a VRF.
(config-if)#ip address 40.40.40.40/24	Assign an IP address to the interface.
(config-if)#ipv6 address 4ffe::10/64	Assign an IPV6 address to the interface.
(config-if)#exit	Exit from interface configuration mode.
(config)#ip route vrf VRF1 66.66.66.0/24 eth1	Create a VRF static route.
(config)#interface eth2	Enter Interface configuration mode.
(config-if)#ipv6 address 3ffe::11/64	Assign an IPV6 address to the interface.
(config-if)#exit	Exit from interface configuration mode.
(config)#router bgp 200 Define the routing process.	The number 200 specifies the AS number of R1.
(config-router)#bgp router-id 2.2.2.2	Configure a fixed Router ID (2.2.2.2) for the BGP4+ routing process.
(config-router)#neighbor 1.1.1.1 remote-as 100	Define BGP neighbors, and establish a TCP session. 1.1.1.1 is the IP address of the neighbor (R1), and 100 is the neighbor's AS number.
(config-router)#neighbor 3ffe::10 remote-as 100	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (3ffe::10)and the AS number(100)of neighbor R2.
(config-router)#address-family vpnv4 unicast	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor R2(1.1.1.1), and enable exchange of IP address prefix types with this neighbor.
(config-router-af)#neighbor 1.1.1.1 allow-ebgp-vpn	Configures the neighbor address to allow EBGP VPN.
(config-router-af)#neighbor 3ffe::10 allow- ebgp-vpn	Apply allow-ebgp-vpn to allow an eBGP neighbor to be a VPN peer.
(config-router-af)#neighbor 3ffe::10 activate	Activate the neighbor R2(3ffe::10), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe::10 capability extended-nexthop-encode	Enable capability to encode IPv6 nexthop in VPNv4 NLRI.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#address-family ipv4 vrf VRF1	Enter IPv4 VRF address family.
(config-router-af)#redistribute static	Redistribute static into the IPv4 VRF address family.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#exit	Exit Router mode, and return to Configure mode.

© 2026 IP Infusion Inc. Proprietary

(config)#commit	Apply commit.
(config)#exit	Exit the config mode.

BGP Labeled Unicast

As well as distributing routes, BGP with Multiprotocol Extensions (MP-BGP) can advertise MPLS label mappings that are mapped to routes. BGP Labeled Unicast (BGP-LU) attaches an MPLS label to an advertised IGP prefix and distributes the MPLS label mapped to the prefix to its peers.

With BGP-LU, a network can be divided into multiple regions to limit the total number of LSPs and enable failures to be contained and restored in a single region These regions operate separate instances of the IGP and use BGP-LU to advertise route information between inter-region routers.

A configuration for BGP-LU uses these type of nodes:

- Provider Edge (PE) nodes advertise label bindings to remote PEs in other regions. These advertisements only affect the PE routers and the ABRs and not provider routers (“P”) in the core network.
- Area Border Router (ABR) nodes advertise the label bindings to remote PEs in other regions.

Notes:

- Default route advertisement is not supported in BGP Labeled Unicast. Because BGP-LU operates as both a service and transport layer, default routes at the LU level in MPLS can create ambiguity in route resolution and dependency tracking. OcNOS prevents such configurations to maintain routing consistency. To avoid this, do not advertise the default route in LU, or apply a route map to filter it (deny default route using route map) on LU neighbors.
- The default behavior in BGP LU for all connected or local IPv4 unicast routes advertised in labeled-unicast address-family mode is modified to assign implicit null label. For more information, refer to BGP Labeled Unicast with Implicit Null Label for Local Routes (page 720).

Hierarchical BGP LU: BGP Labeled Unicast (LU) deployment is not supported as both transport or underlay and service or overlay within a single OcNOS node. This refers to configuring an LU LSP to utilize another LU LSP as its service transport. The MPLS service manager in OcNOS restricts LU FTN over LU FTN. However, hierarchical Labeled BGP is supported, allowing for L3VPN, 6PE, or 6VPE LSPs over LU LSPs. LU LSPs can function as a service or transport and are compatible with various underlay labeling protocols.

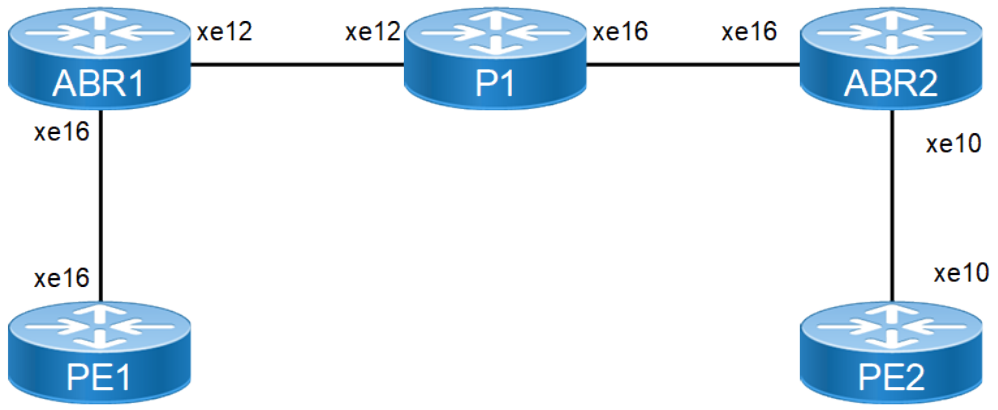
BGP Labeled Unicast as Transport Configuration

Topology

Figure 76. BGP labeled unicast



PE1 Configuration

The following are the PE1 configuration procedures.

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 11.11.11.55/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface xe16`	Enter interface mode
`(config-if)#ip address 172.4.5.55/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 1`	Configure the routing process OSPF with process Id 1.
`(config-router)#network 172.4.5.0/24 area 0`	Define the interface (172.4.5.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 11.11.11.55/32 area 0`	Define the interface (11.11.11.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

© 2026 IP Infusion Inc. Proprietary

`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 21.21.21.56 update-source lo`	Add loopback IP of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 21.21.21.56 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 172.4.5.52 remote-as 100`	Add neighbor with neighbor AS
`(config-router)#allocate-label all`	Allocate labels
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 172.4.5.52 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 21.21.21.56 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4.
`(config-router)#address-family ipv4 unicast`	Enter into ipv4 unicast address family
`(config-router-af)#network 11.11.11.55/32`	Advertise the loopback of RTR1 in BGP
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router)#exit`	Exit from router BGP mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)# ip vrf vrf1`	Specify the name of the VRF (vrf1) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:300`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface xe10`	Enter interface mode
`(config-if)# ip vrf forwarding vrf1`	Bind the interface (eth2) to the VRF vrf1
`(config-if)# ip address 172.10.20.55/24`	Configure the IP address of the interface eth2
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode

© 2026 IP Infusion Inc. Proprietary

(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

ABR1 Configuration

The following are the ABR1 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 22.22.22.52/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface xe16	Enter interface mode
(config-if)#ip address 172.4.5.52/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#interface xe12	Enter interface mode
(config-if)#ip address 172.6.7.52/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 1	Configure the routing process OSPF with process Id 1
(config-router)#network 172.4.5.0/24 area 0	Define the interface (172.4.5.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 172.6.7.0/24 area 0	Define the interface (172.6.7.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#router bgp 100	Enter Router BGP mode

© 2026 IP Infusion Inc. Proprietary

(config-router)# neighbor 172.4.5.55 remote-as 100	Add neighbor with neighbor AS
(config-router)# neighbor 172.6.7.54 remote-as 100	Add neighbor with neighbor AS
(config-router)#allocate-label all	Allocate labels
(config-router)# address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 172.6.7.54 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#neighbor 172.4.5.55 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)# neighbor 172.4.5.55 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.6.7.54 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.4.5.55 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.6.7.54 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit address-family mode
(config-router)#exit	Exit from router BGP mode
(config)#commit	Commit the candidate configuration to the running configuration.

P1 Configuration

The following are the P1 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)# ip address 200.200.200.54/32 secondary	Configure the IP address of the interface loopbak
(config-if)#exit	Exit interface mode
(config)#interface xe16	Enter interface mode
(config-if)#ip address 172.1.2.54/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#interface xe12	Enter interface mode
(config-if)#ip address 172.6.7.54/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.

© 2026 IP Infusion Inc. Proprietary

`(config)#router ospf 1`	Configure the routing process OSPF with process Id 1
`(config-router)#network 172.1.2.0/24 area 0`	Define the interface (172.1.2.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 172.6.7.0/24 area 0`	Define the interface (172.6.7.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)# neighbor 172.1.2.53 remote-as 100`	Add neighbor with neighbor AS
`(config-router)# neighbor 172.6.7.52 remote-as 100`	Add neighbor with neighbor AS
`(config-router)#allocate-label all`	Allocate labels
`(config-router)# address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 172.6.7.52 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#neighbor 172.1.2.53 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)# neighbor 172.1.2.53 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 172.6.7.52 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 172.1.2.53 next-hop-self`	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 172.6.7.52 next-hop-self`	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
`(config-router)# exit-address-family`	Exit from address family.
`(config-router)#exit`	Exit from router BGP mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

ABR2 Configuration

The following are the ABR2 configuration procedures.

`#configure terminal`	Enter the Configure mode.

`(config)#interface lo`	Enter interface mode
`(config-if)# ip address 44.44.44.53/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface xe16`	Enter interface mode
`(config-if)#ip address 172.1.2.53/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe10`	Enter interface mode
`(config-if)#ip address 172.3.4.53/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 1`	Configure the routing process OSPF with process Id 1
`(config-router)#network 172.1.2.0/24 area 0`	Define the interface (172.1.2.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 172.3.4.0/24 area 0`	Define the interface (172.3.4.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)# neighbor 172.1.2.54 remote-as 100`	Add neighbor with neighbor AS
`(config-router)# neighbor 172.3.4.56 remote-as 100`	Add neighbor with neighbor AS
`(config-router)#allocate-label all`	Allocate labels
`(config-router)# address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 172.3.4.56 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#neighbor 172.1.2.54 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)# neighbor 172.3.4.56 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 172.1.2.54 route-`	Enable Route reflector client for the neighbor

© 2026 IP Infusion Inc. Proprietary

reflector-client	inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.3.4.56 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.1.2.54 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#exit	Exit from router BGP mode
(config)#end	Exit from config mode
(config)#commit	Commit the candidate configuration to the running configuration.

PE2 Configuration

The following are the PE2 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 21.21.21.56/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface xe10	Enter interface mode
(config-if)#ip address 172.3.4.56/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process OSPF with process Id 1
(config-router)#network 172.3.4.0/24 area 0	Define the interface (172.3.4.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 21.21.21.56/32 area 0	Define the interface (21.21.21.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 11.11.11.55 remote-as 100	Add loopback ip of PE1 as neighbor with neighbor AS

© 2026 IP Infusion Inc. Proprietary

`(config-router)#neighbor 11.11.11.55 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)# neighbor 172.3.4.53 remote-as 100`	Add neighbor with neighbor AS
`(config-router)#allocate-label all`	Allocate labels
`(config-router)# address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 172.3.4.53 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 11.11.11.55 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router-af)#network 21.21.21.56/32`	Advertise the loopback in BGP
`(config-router-af)#exit-address-family`	Exit from address family ipv4 unicast
`(config-router)#exit`	Exit from router BGP mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)# ip vrf vrf1`	Specify the name of the VRF (vrf1) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:300`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface xe0`	Enter interface mode
`(config-if)# ip vrf forwarding vrf1`	Bind the interface (eth2) to the VRF vrf1
`(config-if)# ip address 172.23.4.56/24`	Configure the IP address of the interface eth2
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)# address-family ipv4 vrf vrf1`	Enter address family ipv4 vrf mode
`(config-router)# redistribute connected`	Redistribute connected routes
`(config-router)#exit`	Exit from router mode into privilege mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

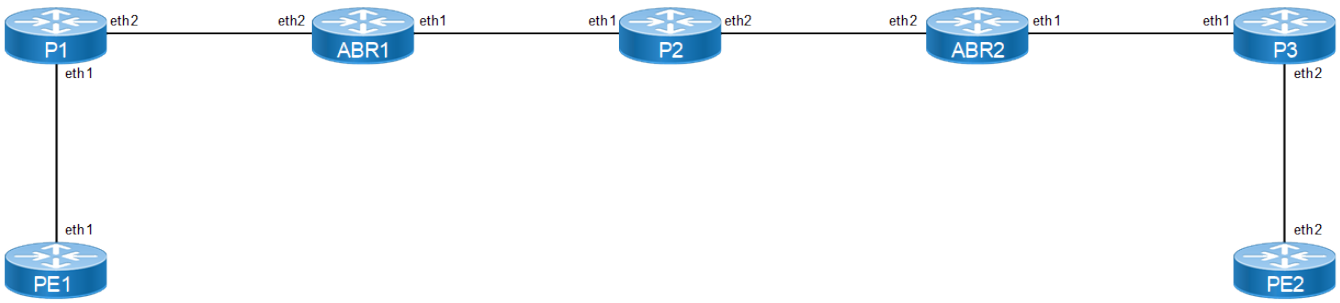
BGP Labeled Unicast with Seamless MPLS Configuration

Topology

Figure 77. BGP_LU with MPLS



PE1 Configuration

The following are the PE1 configuration procedures.

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.54/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.1.1.54/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 10`	Configure the routing process OSPF with process id 10
`(config-router)#network 1.1.1.54/32 area 0`	Define the interface (1.1.1.54/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone

© 2026 IP Infusion Inc. Proprietary

	area).
(config-router)#network 10.1.1.0/24 area 0	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 7.7.7.55 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 7.7.7.55 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#neighbor 3.3.3.52 remote-as 100	Add loopback ip of ABR1 as neighbor with neighbor AS
(config-router)#neighbor 3.3.3.52 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#allocate-label all	Allocate labels
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 3.3.3.52 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 7.7.7.55 activate	Activate the neighbor inside vpnv4 address family
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router)#address-family ipv4 unicast	Enter into ipv4 unicast address family
(config-router-af)#network 1.1.1.54/32	Advertise the loopback of RTR1 in BGP
(config-router-af)#exit-address-family	Exit from address family
(config-router)#exit	Exit from router BGP mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 1.1.1.54 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)# ip vrf vrf1	Specify the name of the VRF (vrf1) to be created.

(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 100:300	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 61.1.1.54/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

P1 Configuration

The following are the P1 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.23/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.23/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.1.1.23/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure the routing process OSPF with process id 10

© 2026 IP Infusion Inc. Proprietary

`(config-router)#network 20.1.1.0/24 area 0`	Define the interface (20.1.1.0/24)) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 2.2.2.23/32 area 0`	Define the interface (2.2.2.23/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 2.2.2.23 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)# ip route 7.7.7.55/32 20.1.1.52`	Specify the destination prefix and mask for the network and a gateway.
`(config)#commit`	Commit the candidate configuration to the running configuration.

ABR1 Configuration

The following are the ABR1 configuration procedures.

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 3.3.3.52/32`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 30.1.1.52/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 20.1.1.52/24`	Configure the IP address of the interface eth2
`(config-if)#label-switching`	Enable label-switching on interface eth2
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth2 interface

© 2026 IP Infusion Inc. Proprietary

`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 20`	Configure the routing process OSPF with process id 20
`(config-router)#network 3.3.3.52/32 area 0`	Define the interface (3.3.3.52/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.1.1.0/24 area 0`	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 3.3.3.52 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 1.1.1.54 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.54 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 5.5.5.56 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 5.5.5.56 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#allocate-label all`	Allocate labels
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 1.1.1.54 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#neighbor 5.5.5.56 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)# neighbor 1.1.1.54 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 5.5.5.56 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 1.1.1.54 next-hop-self`	Enable next hop self for the particular neighbor

© 2026 IP Infusion Inc. Proprietary

	inside address family IPv4 labeled unicast
(config-router-af)# neighbor 5.5.5.56 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family labeled-unicast
(config)#commit	Commit the candidate configuration to the running configuration.

P2 Configuration

The following are the P2 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 4.4.4.53/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 30.1.1.53/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 40.1.1.53/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 20	Configure the routing process OSPF with process id 20
(config-router)#network 30.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 40.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 4.4.4.53/32 area 0	Define the interface (4.4.4.53/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone

© 2026 IP Infusion Inc. Proprietary

	area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 4.4.4.53 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)#commit	Commit the candidate configuration to the running configuration.

ABR2 Configuration

The following are the ABR2 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 5.5.5.56/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.56/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 40.1.1.56/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 30	Configure the routing process OSPF with process id 20
(config-router)#network 5.5.5.56/32 area 0	Define the interface 5.5.5.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 50.1.1.0/24 area 0	Define the interface (50.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 20`	Configure the routing process OSPF with process id 20
`(config-router)#network 5.5.5.56/32 area 0`	Define the interface 5.5.5.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 40.1.1.0/24 area 0`	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 3.3.3.52 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 3.3.3.52 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 3.3.3.52 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 7.7.7.55 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 7.7.7.55 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 3.3.3.52 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#neighbor 7.7.7.55 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)# neighbor 3.3.3.52 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 7.7.7.55 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 3.3.3.52 next-hop-self`	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast

© 2026 IP Infusion Inc. Proprietary

(config-router-af)# neighbor 7.7.7.55 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family labeled-unicast
(config-router)#exit	Exit from router BGP mode
(config)#commit	Commit the candidate configuration to the running configuration.

P3 Configuration

The following are the P3 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 6.6.6.22/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.22/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.22/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 30	Configure the routing process OSPF with process id 20
(config-router)#network 50.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 6.6.6.22/32 area 0	Define the interface (4.4.4.53/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone

© 2026 IP Infusion Inc. Proprietary

	area).
(config-router)#exit	Exit from router ospf mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 6.6.6.22 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip route 1.1.1.54/32 50.1.1.56	Specify the destination prefix and mask for the network and a gateway.
(config)#exit	Exit from config mode
(config)#commit	Commit the candidate configuration to the running configuration.

PE2 Configuration

The following are the PE2 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 7.7.7.55/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.55/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 30	Configure the routing process OSPF with process id 10
(config-router)#network 7.7.7.55/32 area 0	Define the interface (7.7.7.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (60.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

© 2026 IP Infusion Inc. Proprietary

`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 1.1.1.54 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.54 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 5.5.5.56 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 5.5.5.56 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#allocate-label all`	Allocate labels
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 5.5.5.56 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 1.1.1.54 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router)#address-family ipv4 unicast`	Enter into ipv4 unicast address family
`(config-router-af)#network 7.7.7.55/32`	Advertise the loopback of RTR1 in BGP
`(config-router-af)#exit-address-family`	Exit from address family
`(config-router)#exit`	Exit from router BGP mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 7.7.7.55 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)# ip vrf vrf1`	Specify the name of the VRF (vrf1) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:300`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.

(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 62.1.1.55/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

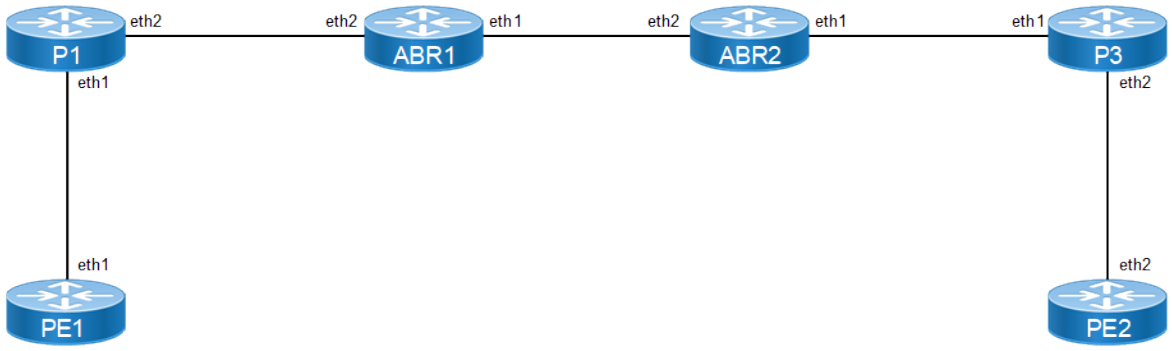
BGP Labeled Unicast with Inter-AS Configuration

Topology

Figure 78. BGP Labeled unicast with Inter-AS



PE1 Configuration

The following are the PE1 configuration procedures.

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.54/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.1.1.54/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 10`	Configure the routing process OSPF with process id 10
`(config-router)#network 1.1.1.54/32 area 0`	Define the interface (1.1.1.54/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with

© 2026 IP Infusion Inc. Proprietary

	the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 7.7.7.55 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 7.7.7.55 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 3.3.3.52 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 3.3.3.52 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#allocate-label all`	Allocate labels
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 3.3.3.52 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 7.7.7.55 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#network 1.1.1.54/32`	Advertise the loopback of RTR1 in BGP
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router)#exit`	Exit from router BGP mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 1.1.1.54 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)# ip vrf vrf1`	Specify the name of the VRF (vrf1) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:300`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.

© 2026 IP Infusion Inc. Proprietary

(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 61.1.1.54/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

P1 Configuration

The following are the P1 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.23/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.23/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.1.1.23/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 10	Configure the routing process OSPF with process id 10
(config-router)#network 20.1.1.0/24 area 0	Define the interface (20.1.1.0/24)) on which OSPF runs, and associate the area ID (0) with

© 2026 IP Infusion Inc. Proprietary

	the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.1.1.0/24 area 0	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 2.2.2.23/32 area 0	Define the interface (2.2.2.23/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 2.2.2.23 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip route 7.7.7.55/32 20.1.1.52	Specify the destination prefix and mask for the network and a gateway.
(config)#commit	Commit the candidate configuration to the running configuration.

ABR1 Configuration

The following are the ABR1 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 3.3.3.52/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 52.56.1.52/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.1.1.52/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure the routing process OSPF with process id 20

© 2026 IP Infusion Inc. Proprietary

`(config-router)#network 3.3.3.52/32 area 0`	Define the interface (3.3.3.52/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.1.1.0/24 area 0`	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 3.3.3.52 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 1.1.1.54 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.54 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 52.56.1.56 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#allocate-label all`	Allocate labels
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 1.1.1.54 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#neighbor 52.56.1.56 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)# neighbor 1.1.1.54 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 1.1.1.54 next-hop-self`	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
`(config-router-af)# neighbor 52.56.1.56 next-hop-self`	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
`(config-router-af)#exit-address-family`	Exit from address family labeled-unicast
`(config-router)#exit`	Exit from router BGP mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

ABR2 Configuration

The following are the ABR2 configuration procedures.

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 5.5.5.56/32`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 50.1.1.56/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 52.56.1.56/24`	Configure the IP address of the interface eth2
`(config-if)#label-switching`	Enable label-switching on interface eth2
`(config-if)#exit`	Exit interface mode.
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router ospf 30`	Configure the routing process OSPF with process Id 1
`(config-router)#network 5.5.5.56/32 area 0`	Define the interface (5.5.5.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 50.1.1.0/24 area 0`	Define the interface (50.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 5.5.5.56 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 200`	Enter Router BGP mode
`(config-router)#neighbor 52.56.1.52 remote-as 100`	Add neighbor peer ip and neighbor AS

© 2026 IP Infusion Inc. Proprietary

(config-router)#neighbor 7.7.7.55 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 7.7.7.55 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#allocate-label all	Allocate labels
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 52.56.1.52 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#neighbor 7.7.7.55 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)# neighbor 7.7.7.55 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 52.56.1.52 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 7.7.7.55 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#exit	Exit from router BGP mode
(config)#commit	Commit the candidate configuration to the running configuration.

P2 Configuration

The following are the P2 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 6.6.6.22/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.22/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.22/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface

© 2026 IP Infusion Inc. Proprietary

(config-if)#exit	Exit interface mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 30	Configure the routing process OSPF with process id 20
(config-router)#network 50.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 6.6.6.22/32 area 0	Define the interface (4.4.4.53/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 6.6.6.22 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip route 1.1.1.54/32 50.1.1.56	Specify the destination prefix and mask for the network and a gateway.
(config)#exit	Exit from Cofig mode
(config)#commit	Commit the candidate configuration to the running configuration.

PE2 Configuration

The following are the PE2 configuration procedures.

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 7.7.7.55/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.55/24	Configure the IP address of the interface eth1

© 2026 IP Infusion Inc. Proprietary

(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router ospf 30	Configure the routing process OSPF with process id 10
(config-router)#network 7.7.7.55/32 area 0	Define the interface (7.7.7.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (60.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 200	Enter Router BGP mode
(config-router)#neighbor 1.1.1.54 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 1.1.1.54 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#neighbor 1.1.1.54 ebgp-multihop	Enable neighbor connection between two eBGP
(config-router)#neighbor 5.5.5.56 remote-as 200	Add loopback ip of ABR1 as neighbor with neighbor AS
(config-router)#neighbor 5.5.5.56 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#allocate-label all	Allocate labels
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 5.5.5.56 activate	Activate the neighbor inside vpnv4 address family
(config-router-af)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 1.1.1.54 allow-ebgp-vpn	Allow eBGP neighbor to be a vpn peer.
(config-router-af)#neighbor 1.1.1.54 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#exit-address-family	Exit from address family vpnv4

© 2026 IP Infusion Inc. Proprietary

(config-router)#address-family ipv4 unicast	Enter into ipv4 unicast address family
(config-router-af)#network 7.7.7.55/32	Advertise the loopback of RTR1 in BGP
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#exit	Exit from router BGP mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 7.7.7.55 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip vrf vrf1	Specify the name of the VRF (vrf1) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 100:300	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 62.1.1.55/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router-af)# redistribute connected	Redistribute connected routes
(config-router-af)# exit-address-family	Exit address-family mode.
(config-router)#commit	Commit the candidate configuration to the running configuration.

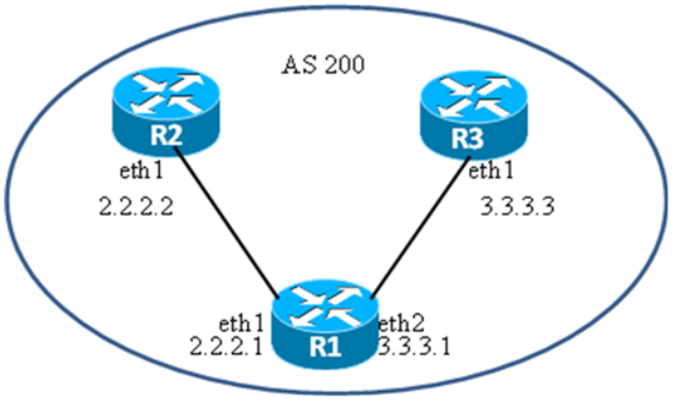
BGP Peer Groups for Address-Family IPv4 Labeled Unicast

Topology

Figure 79. BGP Peer-Groups with IPv4 Labeled-Unicast Members



R1 Configuration

The following are the R1 configuration procedures.

`(config)# interface lo`	Enter interface mode for Loopback
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure ip address for Loopback interface
`(config-if)#ip address 11.11.11.11/32 secondary`	Configure ip address for Loopback interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R1.
`(config-router)#neighbor ABC peer-group`	Create a peer group named ABC.
`(config-router)#neighbor ABC remote-as 200`	Assign options to the peer group named ABC.
`(config-router)#neighbor 2.2.2.2 peer-group ABC`	Define neighbor 2.2.2.2 (R2) as a peer group member.
`(config-router)#neighbor 3.3.3.3 peer-group ABC`	Define neighbor 3.3.3.3 (R3) as a peer group member.
`(config-router)#address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast mode
`(config-router-af)#neighbor ABC activate`	Activate the peer-group ABC for address-family ipv4 labeled-unicast
`(config-router-af)#neighbor ABC route-reflector-client`	Configure the peer-group ABC to be route-reflector-client
`(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast mode
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#network 1.1.1.1/32`	Advertise the network 1.1.1.1/32

© 2026 IP Infusion Inc. Proprietary

(config-router-af)#network 11.11.11.11/32	Advertise the network 11.11.11.11/32
(config-router-af)# exit-address-family	Exit address-family ipv4 unicast mode
(config-router)#allocate-label all	Allocate labels for all IPv4 prefixes advertised
(config-router)#exit	Exit router bgp mode
(config)#commit	Commit the candidate configuration to the running configuration.

R2 Configuration

The following are the R2 configuration procedures.

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R2.
(config-router)#neighbor 2.2.2.1 remote-as 200	Create a TCP connection with neighbor 2.2.2.1 of AS 200.
config-router)#allocate-label all	Allocate labels for all IPv4 prefixes advertised
(config-router)#address-family ipv4 labeled-unicast	Enter address-family ipv4 labeled-unicast mode
(config-router-af)#neighbor 2.2.2.1 activate	Activate the neighbor R1 for address-family ipv4 labeled-unicast
(config-router-af)# exit-address-family	Exit address-family ipv4 labeled-unicast mode
(config-router)# exit	Exit router bgp mode
(config)#commit	Commit the candidate configuration to the running configuration.

R3 Configuration

The following are the R3 configuration procedures.

#configure terminal	Enter configure mode.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R3.
(config-router)#neighbor 3.3.3.1 remote-as 200	Create a TCP connection with neighbor 3.3.3.1 of AS 200.
config-router)#allocate-label all	Allocate labels for all IPv4 prefixes advertised
(config-router)#address-family ipv4 labeled-unicast	Enter address-family ipv4 labeled-unicast mode
(config-router-af)#neighbor 3.3.3.1 activate	Activate the neighbor R1 for address-family ipv4 labeled-unicast
(config-router-af)# exit-address-family	Exit address-family ipv4 labeled-unicast mode

© 2026 IP Infusion Inc. Proprietary

`(config-router)# exit`	Exit router bgp mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

Peer Group Outbound Policies Inheritance

Peer group members inherit the properties of Outbound Policies configured for Peer-group under Address-family IPv4 Labeled-Unicast.

R1

`#configure terminal`	Enter configure mode.
`(config)# ip access-list permit-1`	Configure access-list to permit 1.1.1.1/32
`(config-ip-acl)# permit any 1.1.1.1/32 any`	Configure a permit statement in the acl to permit

	1.1.1.1/32
(config-ip-acl)#exit	Exit ip access-list mode
(config)# route-map permit-only-1	Configure route-map
(config-route-map)# match ip address permit- 1	Configure a match statement in the route-map to match the access-list permit-1
(config-route-map)#exit	Exit route-map mode
(config)#commit	Commit the candidate configuration to the running configuration.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R1.
(config-router)#no allocate-label all	Unconfiguring allocate label all
config-router)# allocate-label route-map permit-only-1	Allocate labels to the route map
(config-router)#address-family ipv4 labeled-unicast	Enter address-family ipv4 labeled-unicast mode
(config-router-af)# neighbor ABC route-map permit-only-1 out	Configure the peer-group ABC with route-map in the outbound direction
(config-router-af)#exit	Exit address-family mode
(config-router)#exit	Exit router bgp mode
(config# exit	Exit configure terminal mode
(config)#commit	Commit the candidate configuration to the running configuration.
#clear ip bgp peer-group ABC ipv4 labeled- unicast soft out	Do outbound soft reset for the peer-group ABC for the policy to take affect for the labelled-unicast peer-group members

Peer Group Inbound Policies Inheritance

Peer-group-members inherit the properties of Inbound Policies configured for Peer-group under Address-family ipv4 Labeled-Unicast.

Follow the configuration of R1, R2, R3 in the previous section with the following configuration

R2

The following are the R2 configuration procedures.

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback interface
`(config-if)#ip address 100.1.1.1/24 secondary`	Configure IP address for Loopback interaface
`(config-if)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ip address 22.1.1.1/24`	Configure IP address for interface eth3
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter router bgp mode
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#network 22.1.1.0/24`	Advertise the network of eth3 in BGP
`(config-router-af)#network 100.1.1.0/24`	Advertise the network of Loopback in BGP
`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#exit`	Exit router bgp mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

© 2026 IP Infusion Inc. Proprietary

R3

The following are the R3 configuration procedures.

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback interface
`(config-if)#ip address 100.1.1.2/24 secondary`	Configure IP address for Loopback interaface
`(config-if)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ip address 22.1.1.2/24`	Configure IP address for interface eth3
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter router bgp mode
`(config-router)#address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)#network 22.1.1.0/24`	Advertise the network of eth3 in BGP
`(config-router-af)#network 100.1.1.0/24`	Advertise the network of Loopback in BGP
`(config-router-af)#exit-address-family`	Exit address-family mode
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#exit`	Exit router bgp mode
`(config)#commit`	Commit the candidate configuration to the running configuration.

R1

The following are the R1 configuration procedures.

`#configure terminal`	Enter configure mode.
`(config)#ip access-list permit-22`	Configure access-list to permit 22.1.1.0/24
`(config-ip-acl)# permit any 22.1.1.0/24 any`	Configure a permit statement to permit 22.1.1.0/24
`(config-ip-acl)#exit`	Exit ip access-list mode
`(config)#route-map permit-only-22`	Configure route-map
`(config-route-map)#match ip address permit- 22`	Configure match statement in route-map to match the access- list permit-22
`(config-route-map)#exit`	Exit route-map mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`(config)#router bgp 200`	Enter BGP router mode
`(config-router)#address-family ipv4 labeled-unicast`	Enter the address-family ipv4 labeled-unicast mode
`(config-router-af)#neighbor ABC route-map permit-only-22 in`	Configure the peer-group ABC with route-map in the inbound direction under address-family ipv4 labeled-unicast

© 2026 IP Infusion Inc. Proprietary

`(config-router-af)# neighbor ABC activate`	Activate PEER-GROUP in the address family
`(config-router-af)#exit-address-family`	Exit address-family ipv4 labeled-unicast mode
`(config-router)#exit`	Exit router bgp mode
`(config)# exit`	Exit configure terminal mode
`(config)#commit`	Commit the candidate configuration to the running configuration.
`#clear ip bgp peer-group ABC ipv4 labeled-unicast soft in`	Do inbound soft reset for the peer-group ABC for the policy to take affect for the labelled-unicast peer-group members

Validation

BGP Labeled Unicast with Implicit Null Label for Local Routes

Overview

In OcNOS, by default, the BGP router allocates a unique, valid MPLS label (>16) for all the IPv4 routes when `allocate-label (all | route-map NAME)` command is issued. The BGP Labeled Unicast (BGP LU) attaches the MPLS label to the routes and advertises them to its peers. This existing functionality is enhanced for Penultimate hop popping (PHP) requirement with an implicit null label allocation only for locally originated IPv4 routes, whether connected or redistributed from other protocols. Meanwhile, the non local routes are assigned with a valid MPLS label. Using PHP with implicit null eliminates the unnecessary label allocation, providing a more efficient and effective solution for handling local routes in the BGP-LU. If BGP LU is deployed in multiple segments, the implicit null label plays a significant role in the last segment.

A new CLI is introduced under the BGP router configuration mode. When the CLI is configured, the BGP implicit null label allocation is applied only after the expiry of the currently active BGP RIB scan timer that validates all the routes at the configured interval time.

This feature is supported on Qumran1 (Q1) series platforms, Qumran2 (Q2) series platforms, and Qumran (Q1 and Q2) series platforms (Q1, Q2 Qax Qux Q2c, Qmx).

Benefits

The regular MPLS label allocation for connected routes necessitates additional label processing on the egress Provider Edge (PE) and, sometimes, fails to forward traffic. The BGP LU with IMPLICIT NULL support reduces the label processing overheads at the egress node and efficiently uses the hardware FEC resources during route allocation.

Prerequisites

The following is mandatory before issuing the `bgp implicit-null` CLI:

- Set up the global BGP configuration using the command `allocate-label (all | route-map NAME)` to assign MPLS labels for IPv4 unicast routes. This configuration ensures that IPv4 unicast routes are qualified for MPLS label assignment. The following show running sample output illustrates that the MPLS labels are assigned to the routes.

```
!
router bgp 100
 allocate-label all
 neighbor 11.11.11.55 remote-as 100
 neighbor 172.3.4.53 remote-as 100
 neighbor 11.11.11.55 update-source lo
 !
 address-family ipv4 unicast
 network 21.21.21.56/32
 exit-address-family
 !
```

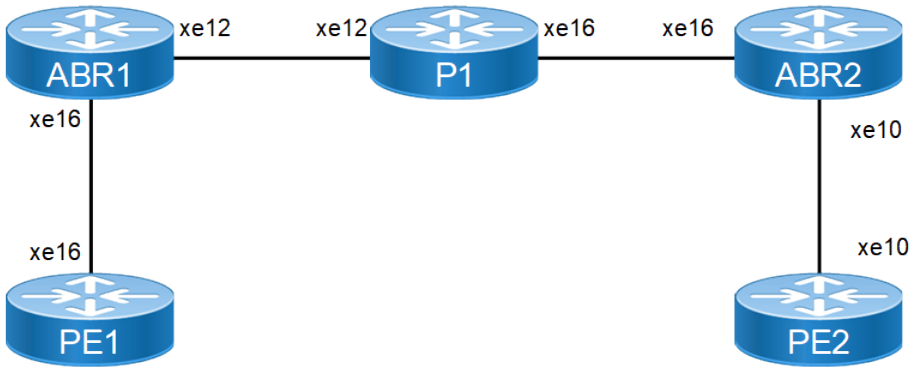
- Configuring BGP implicit null among network peers running different OcNOS versions earlier than 6.5.x causes traffic drops. To restore traffic flow, remove the implicit null configuration. Additionally, to implement this feature, ensure all peers are using version 6.5.x or higher.

© 2026 IP Infusion Inc. Proprietary

Topology

In this topology, PE1 node advertise all connected or local IPv4 unicast routes advertised in labeled-unicast address-family mode with implicit null label to remote PE2 via ABR node.

Figure 80. BGP labeled unicast with Implicit Null Label



Configuration

The following configuration adds the implicit null label (3) to the locally connected IPv4 routes.

The BGP-LU with implicit null label introduces bgp implicit-null (page 1276) the configuration command.

BGP Labeled Unicast as Transport with Implicit Null Label

Perform the following configurations on OcNOS router to apply implicit null label.

1. Configure BGP-LU using the configuration provided in BGP Labeled Unicast (page 662) section.
2. In the BGP Labeled Unicast (page 662)onfiguration after the alocate-label all CLI issued in PE1 node, enable the `address-family IPv4 labeled-unicast` mode. Enabling the `address-family ipv4 labeled-unicast` mode, automatically adds bgp implicit-null CLI to the existing configuration.

```
(config-router)#allocate-label all
(config-router)#address-family ipv4 labeled- unicast
(config-router-af)#bgp implicit-null
```

> **Note:** Use of the `bgp implicit-null` command allows the BGP algorithm to automatically assign an implicit null label to local routes and a valid label (value > 16) to non-local routes.

BGP MPLS Next Hop Tracking Configuration

MPLS nexthop tracking is used to track the registered next-hop in the NSM. It helps to notify the client when the LSP operational status changes, so that clients can take action accordingly.

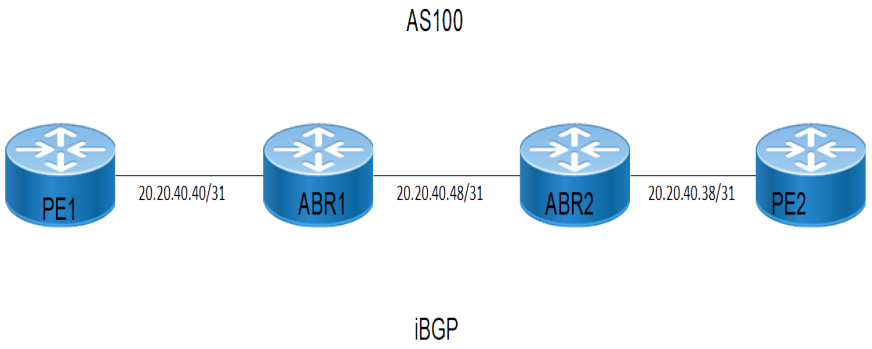
BGP shall do lookup with NSM for LSP reachability, if lookup is successful, BGP marks the nexthop as reachable and register with NSM for the LSP tracking. Further proceeds for FTN/ILM installation and route advertisement. If it is down or does not exist, BGP will mark it as in-valid, route advertisement will not happen until LSP is reachable, BGP query NSM for every rib scan.

Notes:

- QOS should be enabled in all devices for this feature.
- Traceroute from CE-to-CE output doesn't show MPLS node details after enabling MPLS propagate-TTL in PE router. It only shows one hop between ingress to egress direction of PE routers.

Topology

Figure 81. BGP MPLS Next Hop Tracking



Configuration

PE1

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)# router ldp`	Configure Router LDP instance
`(config)# commit`	Committing the configuration to apply in running configuration

© 2026 IP Infusion Inc. Proprietary

`(config)# bfd interval 3 minrx 3 multiplier 3`	Configure BFD single-hop sessions timer and reception interval in millisecond and the Hello multiplier.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#interface xe4`	Enter interface mode
`(config-if)#ip address 20.20.40.40/31`	Configure the IP address on the interface
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)# enable-ldp ipv4`	Enable LDP process on interface
`(config-if)#exit`	Exit interface mode.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router ospf 1`	Configure the routing process OSPF with process id
`(config-router)# bfd all-interfaces`	Enable BFD for all neighbors.
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.20.40.40/31 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#bgp nexthop-trigger enable`	Enable Nexthop tracking.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)# mpls-nexthop-tracking`	Enable MPLS Next Hop tracking
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#neighbor 4.4.4.4 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 4.4.4.4 update- source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 2.2.2.2 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 2.2.2.2 update- source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)# neighbor 2.2.2.2 fall-over bfd multihop`	Enabling BFD at BGP level for particular neighbor.
`(config-router)# address-family ipv4 unicast`	Enter address-family ipv4 unicast mode
`(config-router-af)# network 1.1.1.1/32`	Advertise a route via iBGP connection.
`(config-router-af)#exit-address-family`	Exit from address family IPv4 unicast

© 2026 IP Infusion Inc. Proprietary

(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 2.2.2.2 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 4.4.4.4 activate	Activate the neighbor inside vpnv4 address family
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#exit	Exit from router BGP mode
(config)# commit	Committing the configuration to apply in running configuration
(config)#end	Exit from config mode into privilege mode

ABR1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.2/32 Secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)# commit	Committing the configuration to apply in running configuration
(config)# router ldp	Configure Router LDP instance
(config)# commit	Committing the configuration to apply in running configuration
(config)# bfd interval 3 minrx 3 multiplier 3	Configure BFD single-hop sessions timer and reception interval in millisecond and the Hello multiplier.
(config)# commit	Committing the configuration to apply in running configuration
(config)#interface xe4	Enter interface mode
(config-if)#ip address 20.20.40.41/31	Configure the IP address on the interface
(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP process on interface
(config-if)#exit	Exit interface mode.
(config)#interface xe10	Enter interface mode
(config-if)#ip address 20.20.40.48/31	Configure the IP address on the interface
(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP process on interface
(config-if)#exit	Exit interface mode.
(config)# commit	Committing the configuration to apply in running

	configuration
`(config)# enable ext-ospf-multi-inst`	
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router ospf 1`	Configure the routing process OSPF with process id
`(config)# bfd all-interfaces`	Enable BFD for all neighbors.
`(config-router)#network 2.2.2.2/32 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.20.40.40/31 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#router ospf 2`	Configure the routing process OSPF with process id
`(config)# bfd all-interfaces`	Enable BFD for all neighbors.
`(config)# redistribute connected`	Redistribute connected routes.
`(config-router)#network 2.2.2.2/32 area 0 instance-id 2`	Advertise the network in Area 0 with an instance ID of 2.
`(config-router)#network 20.20.40.48/31 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#bgp nexthop-trigger enable`	Enable Nexthop tracking.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)# mpls-nexthop-tracking`	Enable MPLS Next Hop tracking
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Add loopback ip of PE1 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.1 update- source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)# neighbor 1.1.1.1 fall-over bfd multihop`	Enabling BFD at BGP level for particular neighbor.
`(config-router)#neighbor 3.3.3.3 remote-as 100`	Add loopback ip of ABR2 as neighbor with neighbor AS
`(config-router)#neighbor 3.3.3.3 update- source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)# neighbor 3.3.3.3 fall-over bfd multihop`	Enabling BFD at BGP level for particular neighbor.

(config)# commit	Committing the configuration to apply in running configuration

© 2026 IP Infusion Inc. Proprietary

`(config)# router ldp`	Configure Router LDP instance
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)# bfd interval 3 minrx 3 multiplier 3`	Configure BFD single-hop sessions timer and reception interval in millisecond and the Hello multiplier.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#interface xe5`	Enter interface mode
`(config-if)#ip address 20.20.40.39/31`	Configure the IP address on the interface
`(config-if)#label-switching`	Enable label-switching on interface
`(config-if)# enable-ldp ipv4`	Enable LDP process on interface
`(config-if)#exit`	Exit interface mode.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router ospf 3`	Configure the routing process OSPF with process id
`(config)# bfd all-interfaces`	Enable BFD for all neighbors.
`(config-router)#network 3.3.3.3/32 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.20.40.38/31 area 0`	Define the interface on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#bgp nexthop-trigger enable`	Enable Nexthop tracking.
`(config)# commit`	Committing the configuration to apply in running configuration
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)# mpls-nexthop-tracking`	Enable MPLS Next Hop tracking
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Add loopback ip of PE1 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.1 update- source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)# neighbor 1.1.1.1 fall-over bfd multihop`	Enabling BFD at BGP level for particular neighbor.
`(config-router)#neighbor 3.3.3.3 remote-as 100`	Add loopback ip of ABR2 as neighbor with neighbor AS
`(config-router)#neighbor 3.3.3.3 update- source lo`	Update the source for that particular neighbor as loopback interface

© 2026 IP Infusion Inc. Proprietary

(config-router)# neighbor 3.3.3.3 fall-over bfd multihop	Enabling BFD at BGP level for particular neighbor.
(config-router)# address-family ipv4 unicast	Enter address-family ipv4 unicast mode
(config-router-af)# network 4.4.4.4/32	Advertise a route via iBGP connection.
(config-router-af)#exit-address-family	Exit from address family IPv4 unicast
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor inside vpnv4 address family
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#exit	Exit from router BGP mode
(config)# commit	Committing the configuration to apply in running configuration
(config)#end	Exit from config mode into privilege mode

BGP Labeled Unicast Next Hop Self in Route-Map

Overview

The BGP-LU next-hop-self in route map feature provides the ability set the local BGP peer as the next-hop for select BGP-LU routes. When such a route map is applied to a BGP-LU neighbor in the outbound direction, the matched routes will be updated as below:

- The next-hop address is replaced with the local BGP peer address. Based on the BGP configuration, this is either the local interface address or the local loopback address
- The label is replaced with the local label allocated for the prefix

Feature Characteristics

BGP-LU routes permitted by the route-map and configured with `set ip next-hop self` are advertised with the local BGP peer address as the next-hop and the locally assigned label. BGP-LU routes permitted by the route-map without `set next-hop self` are advertised with their original next-hop and the label remains unchanged. The BGP-LU routes denied by the route-map are not advertised.

Limitations

The existing route-map CLIs to set next-hop, such as, `set ip next-hop a.b.c.d` or `set ip next-hop peer-address` are not recommended to be used for this feature and they can impact adversely.

Prerequisites

While deploying BGP labelled unicast, ensure that the `allocate-label` command is enabled under `router bgp` mode. This command is required for allocating labels to IPv4 prefixes.

Configuration

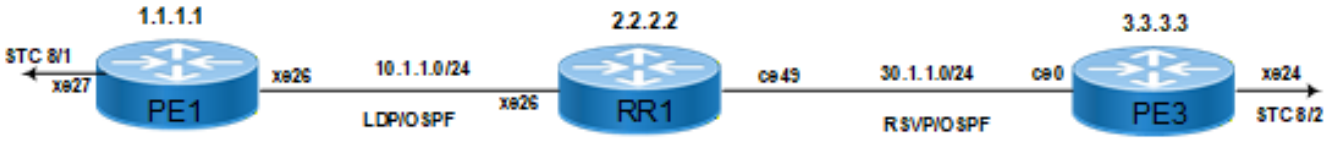
Topology

This topology contains Route Reflectors (RR) and PE nodes with BGP-LU as the transport between them.

Domain 1 contains LDP as transport with OSPF as IGP on all nodes. Domain 2 contains RSVP as transport with IS-IS as IGP on all nodes.

© 2026 IP Infusion Inc. Proprietary

Figure 82. BGP LU Next-hop in Route-map



To configure BGP LU Next-hop, follow the steps mentioned below:

1. Configure BGP LU as transport

```
#configure terminal
(config)#interface lo
(config-if)#ip address 11.11.11.55/32 secondary
(config-if)#exit
(config)#interface xe16
(config-if)#ip address 172.4.5.55/24
(config-if)#label-switching
(config-if)#exit
(config)#commit
```

2. Configure the routing process OSPF with process ID 1.

```
(config)#router ospf 1
```

3. Define the interface (172.4.5.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

```
 (config-router)#network 172.4.5.0/24 area 0
```

4. Define the interface (11.11.11.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

```
 (config-router)#network 11.11.11.55/32 area 0
(config-router)#exit
(config)#commit
(config)#router bgp 100
```

5. Create a Prefix-list to match the advertised prefixes

```
 (config-router)# ip prefix-list BGP-LU-FILTER permit 10.10.10.0/24
```

6. Create Route-map for LU using the prefix-list

```
 (config-router)#route-map RM-BGPLU-OUT permit 10
(config-router)#match ip address prefix-list BGP-LU-FILTER
```

Optionally, apply strict filtering using `deny`

```
 (config-router)#route-map RM-BGPLU-OUT deny 20
```

7. Apply Route-map on BGP-LU Neighbor

```
(config-router)# allocate-label all route-map RM-BGPLU-OUT
```

Commands

The BGP LU Next-hop self in Route-map feature has the following configuration commands:

set ip next-hop self

Use this command to set next hop self for IPV4 BGP-LU neighbors.

Use “no” form of this command to not set next hop self.

Command Syntax

```
set ip next-hop self
no set ip next-hop self
```

Parameters

None

Command Mode

Route map mode mode

Applicability

This command is introduced in OcNOS version 7.0.0

Examples

```
ip prefix-list BCOM-IP
   seq 5 permit 25.4.4.0/24 eq 24

route-map BCOM-RM permit 2
   match ip address prefix-list BCOM-IP
   set ip next-hop self

router bgp 26
..
  address-family ipv4 labeled-unicast
  neighbor 27.27.27.27 route-map BCOM-RM out
  ..
```

BGP Additional Paths for VPNv4

Overview

The Border Gateway Protocol (BGP) ADDPATH feature allows the advertisement of multiple paths through the same peering session for a given prefix without the new paths implicitly replacing any previous paths. This behavior promotes path diversity and reduces the severity of a network failure, thereby improving the control plane convergence in case of network failures.

Normal BGP Behavior

By default, all BGP routers and Route-Reflectors propagate only their best paths over their sessions. In case they advertise any route with the same NLRI as a previously advertised route, the latest one implicitly replaces the previous advertisement, which is known as an Implicit Withdraw. The Implicit Withdraw can achieve better scaling, but at the cost of path diversity.

The use of route-reflectors (or confederations), thus has significant effect on redundancy by hiding alternate paths. Using full-mesh is not an option, so a mechanism is needed to allow the propagation of multiple alternate paths in an RR/Confederation environment. Such mechanism is already available in BGP/MPLS VPN scenarios, where multiple point of attachments for CE sites could utilize different RD values to differentiate the same routes advertised from different connection points. However, a generic solution is required, allowing for advertising multiple alternate paths with IPv4 or any other address-family.

The “Advertisement of Multiple Paths in BGP” or “BGP Add-Path” as the feature is usually called is a BGP extension that allows the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previously advertised ones.

BGP Behavior with ADDPATH

The advertisement of multiple paths in BGP is made possible by

- Sending a BGP OPEN message to the neighbor with a BGP capability code of 69, which identifies the BGP ADD-PATH Capability.

Address Family Identifier (AFI)	2 octets
Subsequent Address Family Identifier (SAFI)	1 octet
Send/Receive	1 octet

The send/receive field in the BGP Capability TLV indicates whether for a given <AFI, SAFI>, the sender is able to :

  - Receive multiple paths from its peer (value 1)
  - Send multiple paths to its peer (value 2), or
  - both (value 3)
- Each alternate path is identified by a Path Identifier in addition to the address prefix

Path Identifier	4 octets
Length	1 octet
Prefix	variable

© 2026 IP Infusion Inc. Proprietary

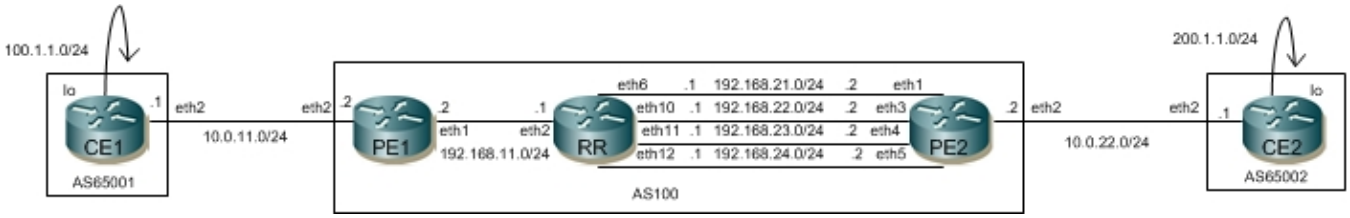
In the event of a next-hop failure, the BGP Add-Path feature hence improves the BGP control plane convergence.

Notes:

- BGP does not advertise additional (non-best) paths to an eBGP neighbor, or to an iBGP neighbor when **`next-hop-self`** is explicitly configured (using the **`neighbor A.B.C.D next-hop-self`** command). Furthermore, if the best path is learned from an eBGP neighbor, any other internal paths if available for the same routes will not be selected or considered as additional paths.
- We neither support BGP Add-path for eBGP neighbors, nor do we currently have a use case for it. Although our documentation previously included eBGP Add-path, the feature primarily applies to iBGP Route Reflectors (RRs) with in VPN environments.

Topology

Figure 83. BGP Add-Path VPNv4 Topology



Initial Configuration

CE1 Configuration

`#configure terminal`	Enter configure mode
`(config)#interface eth2`	Enter Interface mode for eth2.
`(config-if)#ip address 10.0.11.1/24`	Assign IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter Interface mode for lo.
`(config-if)#ip address 100.1.1.2/24`	Assign IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 65001`	Enter BGP router mode.
`(config-router)#neighbor 10.0.11.2 remote-as 100`	Configure an eBGP neighbor on PE1
`(config-router)#network 100.1.1.0/24`	Announce the network 100.1.1.0/24 into BGP
`(config-router)#address-family ipv4 unicast`	Configure the address family ipv4 under router BGP
`(config-router-af)#neighbor 10.0.11.2 activate`	Activate eBGP neighbor on PE1
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.

(config-router)#exit	Exit Router BGP.
(config)#commit	Apply commit
(config)#exit	Exit Router BGP and Configure mode.

PE1Configuration

#configure terminal	Enter configure mode
(config)#ip vrf vrf1	Configure a VRF vrf1
(config-vrf)#rd 100:1	Configure the Route-Distinguisher ie., RD for vrf1
(config-vrf)#route-target both 200:1	Configure the Route-Target ie., RT to import and export the VPNv4 routes
(config-vrf)#exit	Exit the configure VRF mode
(config)#interface eth2	Configure the interface eth2
(config-if)#ip vrf forwarding vrf1	Configure the interface eth2 for IP VRF forwarding for vrf1
(config-if)#ip address 10.0.11.2/24	Configure the IP address for interface eth2
(config-if)#exit	Exit the interface mode for interface eth2
(config)#interface eth1	Configure the interface eth1
(config-if)#ip address 192.168.11.2/24	Configure the IP address for interface eth1
(config-if)#exit	Exit the interface mode for eth1
(config)#router bgp 100	Configure the BGP routing instance 100
(config-router)#neighbor 192.168.11.1 remote-as 100	Configure the neighbor address and remote-as for the 4 iBGP neighbors on RR
(config-router)#address-family vpnv4 unicast	Configure the address family VPNv4 under router BGP
(config-router-af)#neighbor 192.168.11.1 activate	Activate the IPv4 iBGP neighbors on RR for the VPNv4 address family
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf vrf1	Configure the address family IPv4 VRF vrf1 under router BGP
(config-router-af)#neighbor 10.0.11.1 remote-as 65002	Configure the neighbor address and remote-as for the eBGP neighbor on CE1
(config-router-af)#neighbor 10.0.11.1 activate	Activate the eBGP neighbor on CE1 for the address family IPv4 VRF vrf1
(config-router-af)#exit	Exit the router BGP mode and return to the configure terminal mode
(config)#router ospf 100	Configure an OSPF routing instance
(config-router)#network 192.168.11.0/24 area 0	Define the interface eth1 to run OSPF and associate the area ID 0 with interface eth1

© 2026 IP Infusion Inc. Proprietary

(config-router)#exit	Exit the router OSPF mode and return to the configure terminal mode
(config)#router ldp	
(config-router)#exit	Exit the Router mode for LDP and return to the configure terminal mode
(config)#interface eth1	Enter interface mode for interfacec eth1
(config-if)#label-switching	Enable label-switching for interface eth1
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth1
(config)#commit	Apply commit
(config)#exit	Exit Router BGP and Configure mode.

RR Configuration

#configure terminal	Enter configure mode
(config)#interface eth2	Enter interface mode for interface eth2
(config-if)#ip address 192.168.11.1/24	Configure IP address for the interface eth2
(config-if)#exit	Exit the interface mode for eth2
(config)#interface eth6	Enter interface mode for interface eth6
(config-if)#ip address 192.168.21.1/24	Configure IP address for the interface eth6
(config-if)#exit	Exit the interface mode for eth6
(config)#interface eth10	Enter interface mode for interface eth10
(config-if)#ip address 192.168.22.1/24	Configure IP address for the interface eth10
(config-if)#exit	Exit the interface mode for eth10
(config)#interface eth11	Enter interface mode for interface eth11
(config-if)#ip address 192.168.23.1/24	Configure IP address for the interface eth11
(config-if)#exit	Exit the interface mode for eth11
(config)#interface eth12	Enter interface mode for interface eth12
(config-if)#ip address 192.168.24.1/24	Configure IP address for the interface eth12
(config-if)#exit	Exit the interface mode for eth12
(config)#router bgp 100	Enter the router BGP mode
(config-router)#neighbor 192.168.11.2 remote-as 100	Configure the neighbor address and remote-as for the iBGP neighbor on PE1
(config-router)#neighbor 192.168.21.2 remote-as 100	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth1 of PE2
(config-router)#neighbor 192.168.22.2 remote-as 100	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth3 of PE2
(config-router)#neighbor 192.168.23.2 remote-as 100	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth4 of PE2
(config-router)#neighbor 192.168.24.2 remote-as 100	Configure the neighbor address and remote-as for

	the iBGP neighbor on interface eth5 of PE2
`(config-router)#address-family vpnv4 unicast`	Configure the address family VPNv4 under router BGP
`(config-router-af)#neighbor 192.168.11.2 activate`	Activate the IPv4 iBGP neighbor on PE1 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.21.2 activate`	Activate the IPv4 iBGP neighbor on interface eth1 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.22.2 activate`	Activate the IPv4 iBGP neighbor on interface eth3 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.23.2 activate`	Activate the IPv4 iBGP neighbor on interface eth4 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.24.2 activate`	Activate the IPv4 iBGP neighbor on interface eth5 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.11.2 route-reflector-client`	Configure the VPNv4 neighbor on PE1 as route-reflector-client
`(config-router-af)#neighbor 192.168.21.2 route-reflector-client`	Configure the VPNv4 neighbor on interface eth1 of PE2 as route-reflector-client
`(config-router-af)#neighbor 192.168.22.2 route-reflector-client`	
	Configure the VPNv4 neighbor on interface eth3 of PE2 as route-reflector-client
`(config-router-af)#neighbor 192.168.23.2 route-reflector-client`	Configure the VPNv4 neighbor on interface eth4 of PE2 as route-reflector-client
`(config-router-af)#neighbor 192.168.24.2 route-reflector-client`	Configure the VPNv4 neighbor on interface eth5 of PE2 as route-reflector-client
`(config-router-af)#exit`	Exit the router BGP mode
`(config)#router ospf 100`	Configure an OSPF instance 100
`(config-router)#network 192.168.11.0/24 area 0`	Define the interface eth2 connected to PE1 to run OSPF and associate it with the backbone area ID 0
`(config-router)#network 192.168.21.0/24 area 0`	Define the interface eth6 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#network 192.168.22.0/24 area 0`	Define the interface eth10 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#network 192.168.23.0/24 area 0`	Define the interface eth11 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#network 192.168.24.0/24 area 0`	Define the interface eth12 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#exit`	Exit the router OSPF mode
`(config)#router ldp`	
`(config-router)#exit`	Exit the Router mode for LDP
`(config)#interface eth1`	Enter interface mode for interface eth2

© 2026 IP Infusion Inc. Proprietary

(config-if)#label-switching	Enable label-switching for interface eth2
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth2
(config-if)#exit	Exit the interface mode for eth2
(config)#interface eth6	Enter interface mode for interface eth6
(config-if)#label-switching	Enable label-switching for interface eth6
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth6
(config-if)#exit	Exit the interface mode for eth6
(config)#interface eth10	Enter interface mode for interface eth10
(config-if)#label-switching	Enable label-switching for interface eth10
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth10
(config-if)#exit	Exit the interface mode for eth10
(config)#interface eth11	Enter interface mode for interface eth11
(config-if)#label-switching	Enable label-switching for interface eth11
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth11
(config-if)#exit	Exit the interface mode for eth11
(config)#interface eth12	Enter interface mode for interface eth12
(config-if)#label-switching	Enable label-switching for interface eth12
(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth12
(config)#commit	Apply commit
(config)#exit	exit the global mode

PE2 Configuration

#configure terminal	Enter configure mode
(config)#ip vrf vrf1	Configure a VRF vrf1
(config-vrf)#rd 100:1	Configure the Route-Distinguisher ie., RD for vrf1
(config-vrf)#route-target both 200:1	Configure the Route-Target ie., RT to import and export the VPNv4 routes
(config-vrf)#exit	Exit the configure VRF mode
(config)#interface eth2	Configure the interface eth2
(config-if)#ip vrf forwarding vrf1	Configure the interface eth2 for IP VRF forwarding for vrf1
(config-if)#ip address 10.0.22.2/24	Configure the IP address for interface eth2
(config-if)#exit	Exit the interface mode for eth2
(config)#interface eth1	Configure the interface eth1
(config-if)#ip address 192.168.21.2/24	Configure the IP address for interface eth1
(config-if)#exit	Exit the interface mode for eth1
(config)#interface eth3	Configure the interface eth3

© 2026 IP Infusion Inc. Proprietary

`(config-if)#ip address 192.168.22.2/24`	Configure the IP address for interface eth3
`(config-if)#exit`	Exit the interface mode for eth3
`(config)#interface eth4`	Configure the interface eth4
`(config-if)#ip address 192.168.23.2/24`	Configure the IP address for interface eth4
`(config-if)#exit`	Exit the interface mode for eth4
`(config)#interface eth5`	Configure the interface eth5
`(config-if)#ip address 192.168.24.2/24`	Configure the IP address for interface eth5
`(config-if)#exit`	Exit the interface mode for eth5
`(config)#router bgp 100`	Configure the BGP routing instance 100
`(config-router)#neighbor 192.168.21.1 remote-as 100`	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth6 of PE2
`(config-router)#neighbor 192.168.22.1 remote-as 100`	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth10 of PE2
`(config-router)#neighbor 192.168.23.1 remote-as 100`	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth11 of PE2
`(config-router)#neighbor 192.168.24.1 remote-as 100`	Configure the neighbor address and remote-as for the iBGP neighbor on interface eth12 of PE2
`(config-router)#address-family vpnv4 unicast`	Configure the address family VPNv4 under router BGP
`(config-router-af)#neighbor 192.168.21.1 activate`	Activate the IPv4 iBGP neighbor on interface eth6 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.22.1 activate`	Activate the IPv4 iBGP neighbor on interface eth10 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.23.1 activate`	Activate the IPv4 iBGP neighbor on interface eth11 of PE2 for the VPNv4 address family
`(config-router-af)#neighbor 192.168.24.1 activate`	Activate the IPv4 iBGP neighbor on interface eth12 of PE2 for the VPNv4 address family
`(config-router-af)#exit`	Exit the router BGP address family VPNv4 mode
`(config)#router bgp 100`	Enter the router BGP mode
`(config-router)#address-family ipv4 vrf vrf1`	Configure the address family IPv4 VRF vrf1 under router BGP
`(config-router-af)#neighbor 10.0.22.1 remote-as 65002`	Configure the neighbor address and remote-as for the eBGP neighbor on CE2
`(config-router-af)#neighbor 10.0.22.1 activate`	Activate the 4 eBGP neighbor on CE2 for the address family IPv4 VRF vrf1
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config)#router ospf 100`	Configure an OSPF instance 100
`(config-router)#network 192.168.21.0/24 area 0`	Define the interface eth1 connected to PE2 to run OSPF and associate it with the backbone area ID 0

© 2026 IP Infusion Inc. Proprietary

`(config-router)#network 192.168.22.0/24 area 0`	Define the interface eth3 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#network 192.168.23.0/24 area 0`	Define the interface eth4 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#network 192.168.24.0/24 area 0`	Define the interface eth5 connected to PE2 to run OSPF and associate it with the backbone area ID 0
`(config-router)#exit`	Exit the router OSPF mode
`(config)#router ldp`	Enter Router mode for LDP
`(config-router)#exit`	Exit the Router mode for LDP
`(config)#interface eth1`	Enter interface mode for interface eth1
`(config-if)#label-switching`	Enable label-switching for interface eth1
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth1
`(config-if)#exit`	Exit the interface mode for eth1
`(config)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#label-switching`	Enable label-switching for interface eth3
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth3
`(config-if)#exit`	Exit the interface mode for eth3
`(config)#interface eth4`	Enter interface mode for interface eth4
`(config-if)#label-switching`	Enable label-switching for interface eth4
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth4
`(config-if)#exit`	Exit the interface mode for eth4
`(config)#interface eth5`	Enter interface mode for interface eth5
`(config-if)#label-switching`	Enable label-switching for interface eth5
`(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth5
`(config-if)#exit`	Return to the global mode
`(config)#commit`	Apply commit
`(config)#exit`	exit the global mode

CE2 Configuration

`#configure terminal`	Enter configure mode
`(config)#interface eth2`	Enter Interface mode for eth2.
`(config-if)#ip address 10.0.22.1/24`	Assign IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter Interface mode for lo.
`(config-if)#ip address 200.1.1.2/24`	Assign IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 65002`	Enter BGP router mode.

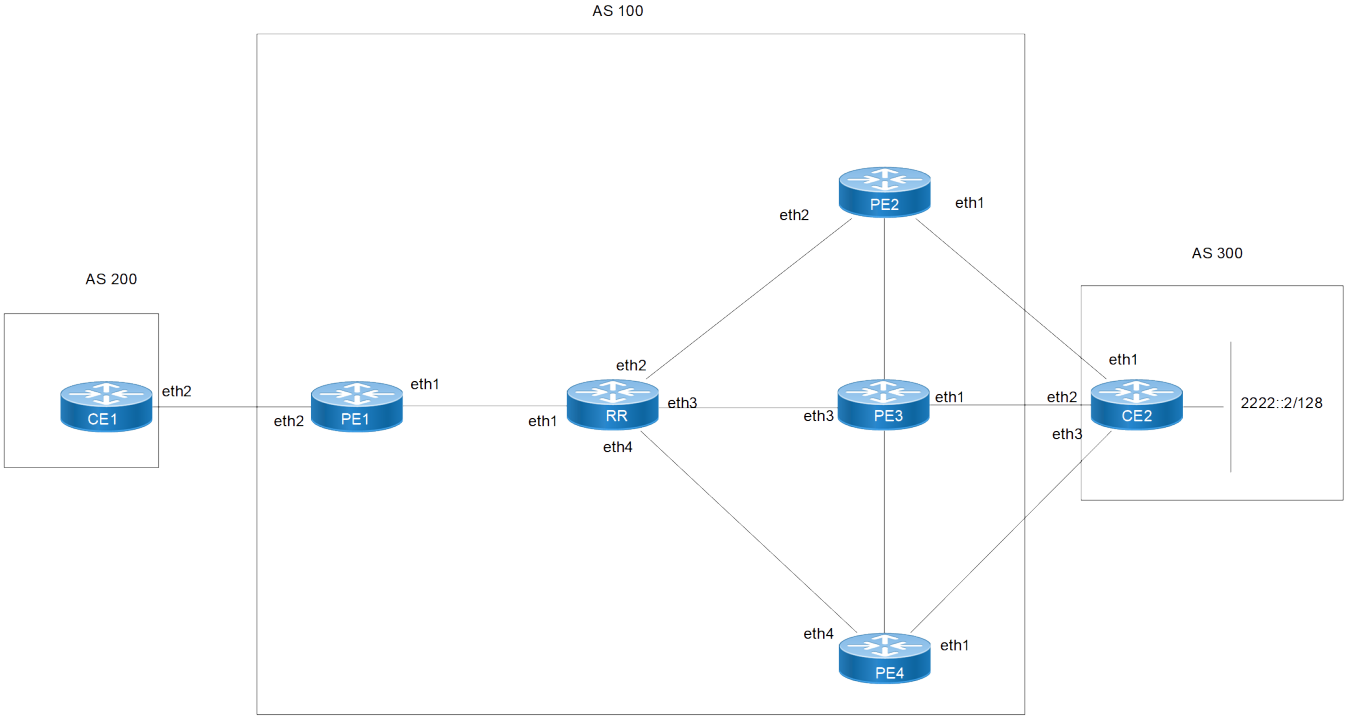
Additional Paths for 6PE

This section contains the configuration of additional paths group best for 6PE.

Topology

Figure 84. Additional paths group best for 6PE



Configuration

CE1: Interface

`CE1#configure terminal`	Enter configure mode.
`CE1(config)#hostname CE1`	Configure the hostname to CE1
`CE1(config)#interface eth2`	Enter the Interface mode for interface eth2.
`CE1(config-if)#ipv6 address 1001::1/64`	Configure IPV6 address for interface eth2
`(config)#commit`	Apply commit
`(config)#exit`	Exit Router BGP and Configure mode.

CE1: BGP

`CE1(config)#router bgp 200`	Enter BGP router mode
`CE1(config-router)#neighbor 1001::2 remote-as 100`	Configure BGP ipv6 neighbor on PE1
`CE1(config-router)#address-family ipv6 unicast`	Enter the address family ipv6
`CE1(config-router-af)#neighbor 1001::2 activate`	Activate neighbor under address family ipv6
`CE1(config-router-af)#exit-address-family`	Exit address family ipv6 unicast mode
`CE1(config-router)#exit`	Exit BGP router mode
`CE1(config)#commit`	Apply commit
`CE1#clear bgp 1001::2`	Clear BGP peer PE1

© 2026 IP Infusion Inc. Proprietary

PE1: Interface

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#hostname PE1`	Configure the hostname to PE1
`PE1(config)#interface eth2`	Enter the Interface mode for interface eth2
`PE1(config-if)#ipv6 address 1001::2/64`	Configure the IPv6 address for interface eth2
`PE1(config-if)#exit`	Exit interface mode
`PE1(config)#interface lo`	Enter the Interface mode for the loopback interface.
`PE1(config-if)#ip address 1.1.1.1/32`	Configure IPV4 address for loopback interface.
`PE1(config-if)#exit`	Exit interface mode
`PE1(config)#interface eth1`	Enter the Interface mode for interface eth1
`PE1(config-if)#ip address 10.1.1.1/24`	Configure the IP address for interface eth1
`(config-if)#exit`	Exit the interface level
`(config)#commit`	Apply commit
`(config)#exit`	Exit.

PE1: OSPF

`PE1(config)#router ospf 1`	Configure an OSPF instance 1
`PE1(config-router)#network 10.1.1.0/24 area 0`	Advertise the network towards P in Area 0
`PE1(config-router)#network 1.1.1.1/32 area 0`	Advertise the Loopback network in Area 0
`PE1(config-router)#exit`	Exit OSPF router mode
`PE1(config)#commit`	Apply commit
`PE1(config)#exit`	Exit the global mode

PE1: MPLS

`PE1(config)#router ldp`	Enable LDP Process
`PE1(config-router)#transport-address ipv4 1.1.1.1`	Configure Transport address for LDP
`PE1(config-router)#exit`	Exit router ldp mode
`PE1(config)#interface eth1`	Enter the interface mode for interface eth1
`PE1(config-if)#label-switching`	Enable label-switching on interface eth1
`PE1(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth1
`PE1(config-if)#exit`	Exit the interface mode
`PE1(config)#commit`	Apply commit
`PE1(config)#exit`	Exit the global mode

PE1: BGP

`PE1(config)#router bgp 100`	Configure router bgp mode

© 2026 IP Infusion Inc. Proprietary

`PE1(config)#bgp router-id 1.1.1.1`	Configure BGP router-id
`PE1(config-router)#neighbor 2.2.2.2 remote-as 100`	Configure BGP IPv4 neighbor on PE2
`PE1(config-router)#neighbor 2.2.2.2 update-source 1.1.1.1`	Configure the routing update source for RR as PE1's Loopback
`PE1(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled unicast mode
`PE1(config-router-af)#neighbor 2.2.2.2 activate`	Activate the neighbor RR for address-family ipv6 labeled-unicast unicast
`PE1(config-router-af)#exit-address-family`	Exit address-family ipv6 labeled-unicast mode
`PE1(config-router)#address-family ipv6 unicast`	Enter BGP address-family ipv6 unocast mode
`PE1(config-router)#neighbor 1001::1 remote-as 200`	Configure BGP IPv6 neighbor on CE1
`PE1(config-router-af)#exit-address-family`	Exit address-family ipv6 unicast mode
`PE1(config-router)#exit`	Exit router bgp mode
`PE1(config)#exit`	Exit configure mode
`PE1(config)#commit`	Apply commit

RR: Interface

`RR#configure terminal`	Enter configure mode.
`RR(config)#hostname RR`	Configure hostname as RR
`RR(config)#interface eth1`	Enter interface mode for interface eth1
`RR(config-if)#ip address 10.1.1.2/24`	Configure IPv4 address for interface eth1
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface eth2`	Enter interface mode for interface eth2
`RR(config-if)#ip address 20.1.1.2/24`	Configure IPv4 address for interface eth2
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface eth3`	Enter interface mode for interface eth3
`RR(config-if)#ip address 30.1.1.2/24`	Configure IPv4 address for interface eth3
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface eth4`	Enter interface mode for interface eth4
`RR(config-if)#ip address 40.1.1.2/24`	Configure IPv4 address for interface eth4
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface lo`	Enter Interface mode for the loopback interface.
`RR(config-if)#ip address 2.2.2.2/32`	Configure IPV4 address for loopback interface.
`RR(config-if)#exit`	Exit Interface mode.
`PE1(config)#commit`	Apply commit

© 2026 IP Infusion Inc. Proprietary

RR: OSPF

`RR(config)#router ospf 1`	Configure router OSPF instance 1
`RR(config-router)#network 10.1.1.0/24 area 0`	Advertise the network towards PE1 in area 0
`RR(config-router)#network 20.1.1.0/24 area 0`	Advertise the network towards PE2 in area 0
`RR(config-router)#network 30.1.1.0/24 area 0`	Advertise the network towards PE3 in area 0
`RR(config-router)#network 40.1.1.0/24 area 0`	Advertise the network towards PE4 in area 0
`RR(config-router)#network 2.2.2.2/32 area 0`	Advertise the Loopback network in area 0
`RR(config-router)#exit`	Exit the router ospf mode
`RR(config)#commit`	Apply commit

RR: MPLS

`RR(config)#router ldp`	Enable LDP Process
`RR(config-router)#transport-address ipv4 2.2.2.2`	Configure Transport address for LDP
`RR(config-router)#exit`	Exit router ldp mode
`RR(config)#interface eth1`	Enter the interface mode for interface eth1
`RR(config-if)#label-switching`	Enable label-switching on interface eth1
`RR(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth1
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface eth2`	Enter the interface mode for interface eth2
`RR(config-if)#label-switching`	Enable label-switching on interface eth2
`RR(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth2
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface eth3`	Enter the interface mode for interface eth3
`RR(config-if)#label-switching`	Enable label-switching on interface eth3
`RR(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth3
`RR(config-if)#exit`	Exit interface mode
`RR(config)#interface eth4`	Enter the interface mode for interface eth4
`RR(config-if)#label-switching`	Enable label-switching on interface eth4
`RR(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth4
`RR(config-if)#exit`	Exit interface mode
`RR(config)#commit`	Apply commit
`RR(config)#exit`	Exit the configure terminal mode

RR: BGP

`RR(config)#router bgp 100`	Configure router bgp mode
`RR(config)#bgp router-id 2.2.2.2`	Configure BGP router-id

`RR(config-router)#neighbor 1.1.1.1 remote-as 100`	Configure BGP neighbor on PE1
`RR(config-router)#neighbor 1.1.1.1 update-source 2.2.2.2`	Configure the routing update source for PE1 as RR's Loopback
`RR(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure BGP neighbor on PE2
`RR(config-router)#neighbor 3.3.3.3 update-source 2.2.2.2`	Configure the routing update source for PE2 as RR's Loopback
`RR(config-router)#neighbor 4.4.4.4 remote-as 100`	Configure BGP neighbor on PE3
`RR(config-router)#neighbor 4.4.4.4 update-source 2.2.2.2`	Configure the routing update source for PE3 as RR's Loopback
`RR(config-router)#neighbor 5.5.5.5 remote-as 100`	Configure BGP neighbor on PE4
`RR(config-router)#neighbor 5.5.5.5 update-source 2.2.2.2`	Configure the routing update source for PE4 as RR's Loopback
`RR(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled unicast mode
`RR(config-router-af)#neighbor 1.1.1.1 activate`	Activate the neighbor PE1 for address-family ipv6 lu unicast
`RR(config-router-af)#neighbor 1.1.1.1 route-reflector-client`	Configure PE1 as route-reflector-client
`RR(config-router-af)#neighbor 3.3.3.3 activate`	Activate the neighbor PE2 for address-family ipv6 lu unicast
`RR(config-router-af)#neighbor 3.3.3.3 route-reflector-client`	Configure PE2 as route-reflector-client
`RR(config-router-af)#neighbor 4.4.4.4 activate`	Activate the neighbor PE3 for address-family ipv6 lu unicast
`RR(config-router-af)#neighbor 4.4.4.4 route-reflector-client`	Configure PE3 as route-reflector-client
`RR(config-router-af)#neighbor 5.5.5.5 activate`	Activate the neighbor PE4 for address-family ipv6 lu unicast
`RR(config-router-af)#neighbor 5.5.5.5 route-reflector-client`	Configure PE4 as route-reflector-client
`RR(config-router-af)#exit-address-family`	Exit BGP address-family ipv6 lu unicast mode
`RR(config-router)#exit`	Exit router bgp mode
`RR(config)#commit`	Apply commit
`RR(config)#exit`	Exit configure mode

PE2: Interface

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#hostname PE2`	Configure the hostname to PE2
`PE2(config)#interface eth1`	Enter the Interface mode for interface eth1
`PE2(config-if)#ipv6 address 2001::1/64`	Configure the IPv6 address for interface eth1
`PE2(config-if)#exit`	Exit interface mode

© 2026 IP Infusion Inc. Proprietary

PE2(config)#interface lo	Enter the Interface mode for the loopback interface.
PE2(config-if)#ip address 3.3.3.3/32	Configure IPV4 address for loopback interface.
PE2(config-if)#exit	Exit interface mode
PE2(config)#interface eth2	Enter the Interface mode for interface eth2
PE2(config-if)#ip address 20.1.1.1/24	Configure the IP address for interface eth2
PE2(config-if)#exit	Exit configure mode
PE2(config)#commit	Apply commit

PE2: OSPF

PE2(config)#router ospf 1	Configure an OSPF instance 1
PE2(config-router)#network 20.1.1.0/24 area 0	Advertise the network towards RR in Area 0
PE2(config-router)#network 3.3.3.3/32 area 0	Advertise the Loopback network in Area 0
PE2(config-router)#exit	Exit OSPF router mode
PE2(config)#commit	Apply commit

PE2: MPLS

PE2(config)#router ldp	Enable LDP Process
PE2(config-router)#transport-address ipv4 3.3.3.3	Configure Transport address for LDP
PE2(config-router)#exit	Exit router ldp mode
PE2(config)#interface eth2	Enter the interface mode for interface eth2
PE2(config-if)#label-switching	Enable label-switching on interface eth2
PE2(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth2
PE2(config-if)#exit	Exit interface mode
PE2(config)#commit	Apply commit

PE2: BGP

PE2(config)#router bgp 100	Configure router bgp mode
PE2(config)#bgp router-id 3.3.3.3	Configure BGP router-id
PE2(config-router)#neighbor 2.2.2.2 remote-as 100	Configure BGP IPv4 neighbor on RR
PE2(config-router)#neighbor 2.2.2.2 update-source 3.3.3.3	Configure the routing update source for RR as PE2's Loopback
PE2(config-router)#address-family ipv6 labeled-unicast	Enter BGP address-family ipv6 labeled-unicast mode
PE2(config-router-af)#neighbor 2.2.2.2 activate	Activate the neighbor RR for address-family ipv6 labeled-unicast
PE2(config-router-af)#exit-address-family	Exit address-family ipv6 labeled-unicast mode
PE2(config-router)#address-family ipv6 unicast	Enter BGP address-family ipv6 unicast mode
PE2(config-router)#neighbor 2001::2 remote-as 300	Configure BGP IPv6 neighbor on CE2

© 2026 IP Infusion Inc. Proprietary

PE2(config-router-af)#exit-address-family	Exit address-family ipv6 unicast mode
PE2(config-router)#exit	Exit router bgp mode
PE2(config)#commit	Apply commit
PE2(config)#exit	Exit configure mode
PE2#clear bgp ipv6 unicast 2001::2 unicast	Clear BGP neighbor CE2

PE3: Interface

PE3#configure terminal	Enter configure mode.
PE3(config)#hostname PE3	Configure the hostname to PE3
PE3(config)#interface eth1	Enter the Interface mode for interface eth1
PE3(config-if)#ipv6 address 3001::1/64	Configure the IPv6 address for interface eth1
PE3(config-if)#exit	Exit interface mode
PE3(config)#interface lo	Enter the Interface mode for the loopback interface.
PE3(config-if)#ip address 4.4.4.4/32	Configure IPV4 address for loopback interface.
PE3(config-if)#exit	Exit interface mode
PE3(config)#interface eth3	Enter the Interface mode for interface eth3
PE3(config-if)#ip address 30.1.1.1/24	Configure the IP address for interface eth3
PE3(config-if)#exit	Exit interface mode
PE3(config)#commit	Apply commit

PE3: OSPF

PE3(config)#router ospf 1	Configure an OSPF instance 1
PE3(config-router)#network 30.1.1.0/24 area 0	Advertise the network towards RR in Area 0
PE3(config-router)#network 4.4.4.4/32 area 0	Advertise the Loopback network in Area 0
PE3(config-router)#exit	Exit OSPF router mode
PE3(config)#commit	Apply commit

PE3: MPLS

PE3(config)#router ldp	Enable LDP Process
PE3(config-router)#transport-address ipv4 4.4.4.4	Configure Transport address for LDP
PE3(config-router)#exit	Exit router ldp mode
PE3(config)#interface eth3	Enter the interface mode for interface eth3
PE3(config-if)#label-switching	Enable label-switching on interface eth3
PE3(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth3
PE3(config-if)#exit	Exit interface mode
PE3(config)#commit	Apply commit

© 2026 IP Infusion Inc. Proprietary

PE3: BGP

`PE3(config)#router bgp 100`	Configure router bgp mode
`PE3(config)#bgp router-id 4.4.4.4`	Configure BGP router-id
`PE3(config-router)#neighbor 2.2.2.2 remote-as 100`	Configure BGP IPv4 neighbor on RR
`PE3(config-router)#neighbor 2.2.2.2 update-source 4.4.4.4`	Configure the routing update source for RR as PE3's Loopback
`PE3(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled-unicast mode
`PE3(config-router-af)#neighbor 2.2.2.2 activate`	Activate the neighbor RR for address-family ipv6 labeled-unicast
`PE3(config-router-af)#exit-address-family`	Exit address-family ipv6 labeled-unicast mode
`PE3(config-router)#address-family ipv6 unicast`	Enter BGP address-family ipv6 unicast mode
`PE3(config-router)#neighbor 3001::2 remote-as 300`	Configure BGP IPv6 neighbor on CE2
`PE3(config-router-af)#exit-address-family`	Exit address-family ipv6 unicast mode
`PE3(config-router)#exit`	Exit router bgp mode
`PE3(config)#commit`	Apply commit
`PE3(config)#exit`	Exit configure mode

PE4: Interface

`PE4#configure terminal`	Enter configure mode.
`PE4(config)#hostname PE4`	Configure the hostname to PE4
`PE4(config)#interface eth1`	Enter the Interface mode for interface eth1
`PE4(config-if)#ipv6 address 4001::1/64`	Configure the IPv6 address for interface eth1
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#interface lo`	Enter the Interface mode for the loopback interface.
`PE4(config-if)#ip address 5.5.5.5/32`	Configure IPV4 address for loopback interface.
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#interface eth4`	Enter the Interface mode for interface eth4
`PE4(config-if)#ip address 40.1.1.1/24`	Configure the IP address for interface eth4
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#commit`	Apply commit

PE4: OSPF

`PE4(config)#router ospf 1`	Configure an OSPF instance 1
`PE4(config-router)#network 40.1.1.0/24 area 0`	Advertise the network towards RR in Area 0
`PE4(config-router)#network 5.5.5.5/32 area 0`	Advertise the Loopback network in Area 0
`PE4(config-router)#exit`	Exit OSPF router mode
`PE4(config)#commit`	Apply commit

© 2026 IP Infusion Inc. Proprietary

PE4: MPLS

`PE4(config)#router ldp`	Enable LDP Process
`PE4(config-router)#transport-address ipv4 5.5.5.5`	Configure Transport address for LDP
`PE4(config-router)#exit`	Exit router ldp mode
`PE4(config)#interface eth4`	Enter the interface mode for interface eth4
`PE4(config-if)#label-switching`	Enable label-switching on interface eth4
`PE4(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth4
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#commit`	Apply commit

PE4: BGP

`PE4(config)#router bgp 100`	Configure router bgp mode
`PE4(config)#bgp router-id 5.5.5.5`	Configure BGP router-id
`PE4(config-router)#neighbor 2.2.2.2 remote-as 100`	Configure BGP IPv4 neighbor on RR
`PE4(config-router)#neighbor 2.2.2.2 update-source 5.5.5.5`	Configure the routing update source for RR as PE4's Loopback
`PE4(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled-unicast mode
`PE4(config-router-af)#neighbor 2.2.2.2 activate`	Activate the neighbor RR for address-family ipv6 labeled-unicast
`PE4(config-router-af)#exit-address-family`	Exit address-family ipv6 labeled-unicast mode
`PE4(config-router)#address-family ipv6 unicast`	Enter BGP address-family ipv6 unicast mode
`PE4(config-router)#neighbor 4001::2 remote-as 300`	Configure BGP IPv6 neighbor on CE2
`PE4(config-router-af)#exit-address-family`	Exit address-family ipv6 unicast mode
`PE4(config-router)#exit`	Exit router bgp mode
`PE4(config)#commit`	Apply commit
`PE4(config)#exit`	Exit configure mode

CE2: Interface

`CE2#configure terminal`	Enter configure mode.
`CE2(config)#hostname CE2`	Configure the hostname to CE2
`CE2(config)#interface eth1`	Enter the Interface mode for interface eth1
`CE2(config-if)#ipv6 address 2001::2/64`	Configure IPV6 address for interface eth1
`CE2(config-if)#exit`	Exit Interface mode.
`CE2(config)#interface eth2`	Enter the Interface mode for interface eth2
`CE2(config-if)#ipv6 address 3001::2/64`	Configure IPV6 address for interface eth2
`CE2(config-if)#exit`	Exit Interface mode.

PE1

`PE1(config)#router bgp 100`	Configure router bgp mode
`PE1(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled-unicast mode
`PE1(config-router-af)#neighbor 2.2.2.2 additional-paths receive`	Configure BGP addpath receive capability for the 6pe-neighbor RR under address-family ipv6 labeled-unicast
`PE1(config-router-af)#neighbor 2.2.2.2 additional-paths receive`	Configure BGP addpath receive capability for the 6pe-neighbor RR under address-family ipv6 labeled-unicast
`PE1(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`PE1(config-router)#exit`	Exit Router BGP mode.
`PE1(config)#commit`	Apply commit
`PE1(config)#exit`	Exit Configure mode.

PE2

`PE2(config)#router bgp 100`	Configure router bgp mode
`PE2(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled-unicast mode
`PE2(config-router-af)#bgp additional-paths receive`	Configure BGP addpath receive capability under address-family ipv6 labeled-unicast
`(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`(config-router)#exit`	Exit Router BGP mode.
`(config)#commit`	Apply commit
`(config)#exit`	Exit Configure mode.

PE3

`PE3(config)#router bgp 100`	Configure router bgp mode
`PE3(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled-unicast mode
`PE3(config-router-af)#bgp additional-paths receive`	Configure BGP addpath receive capability under address-family ipv6 labeled-unicast
`PE3(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`PE3(config-router)#exit`	Exit Router BGP mode.
`PE3(config)#commit`	Apply commit
`PE3(config)#exit`	Exit Configure mode.

BGP Addpath Selection Configuration Best 2 Under Address-family ipv6 labeled-unicast

RR

`RR(config)#router bgp 100`	Configure router bgp mode
`RR(config-router)#address-family ipv6 labeled-unicast`	Enter BGP address-family ipv6 labeled-unicast mode
`RR(config-router-af)#no bgp additional-paths select all`	Unconfigure RR to select All addpaths
`RR(config-router-af)#bgp additional-paths select best 2`	Configure RR to select best 2 addpaths
`RR(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`RR(config-router)#exit`	Exit Router BGP mode.
`RR(config)#commit`	Apply commit
`RR(config)#exit`	Exit Configure mode.

RR#show bgp neighbors 4.4.4.4
BGP neighbor is 4.4.4.4, remote AS 100, local AS 100, internal link
  BGP version 4, remote router ID 4.4.4.4
  BGP state = Established, up for 00:04:02
  Last read 00:04:02, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Labeled Unicast: advertised and received
  Received 10 messages, 0 notifications, 0 in queue
  Sent 12 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  Update source is 3.3.3.3
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 3, Offset 0, Mask 0x8
  AIGP is enabled
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 For address family: IPv6 Labeled-Unicast
  BGP table version 1, neighbor version 1
  Index 3, Offset 0, Mask 0x8
  AF-dependant capabilities:
    Add-Path Send Capability : advertised
    Add-Path Receive Capability : received
  Route-Reflector Client
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  2 announced prefixes

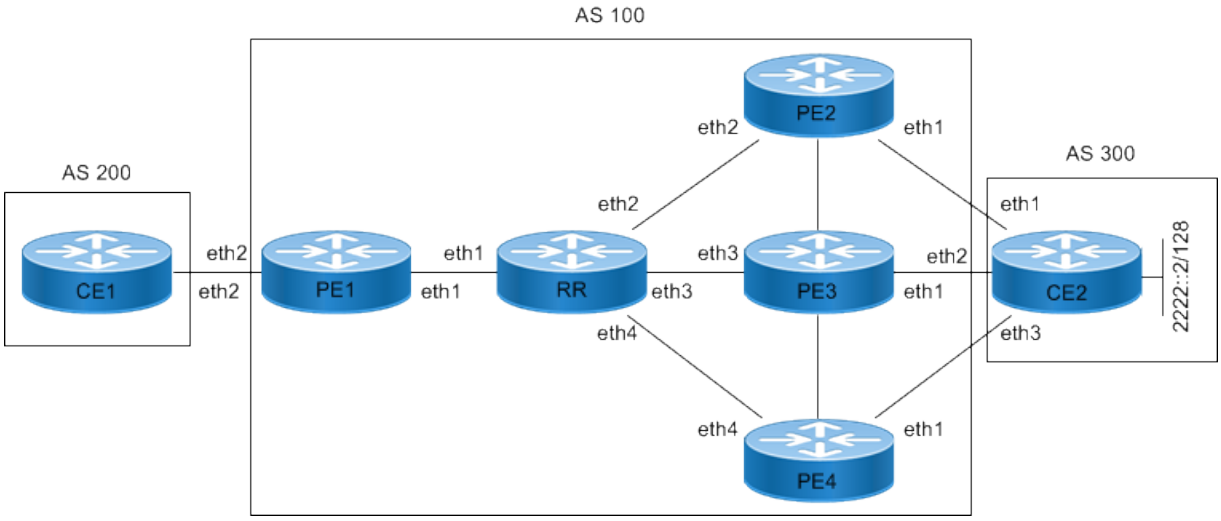
Additional Paths for 6VPE

This section explains how to configure the 6VPE additional path feature to enable advertising additional paths for a 6VPE prefix, over a 6VPE session.

Topology

The topology below illustrates CE1 and CE2 as customer edge routers connected to the Provider Edge routers PE1 and PE2 respectively over a non-default VRF. CE2 is advertising the IPv6 prefix 2222::2/128 over non-default VRF to PE2, PE3, and PE4 which further advertises the prefix to RR over 6VPE sessions. RR has the 6VPE prefix 2222::2/128 with 3 next-hops PE2, PE3, and PE4. In a normal scenario, RR advertises the 6VPE prefix 2222::2/128 to PE1 with only one path (the next-hop which is marked the “best”). But with 6VPE addpath configured on RR and PE1, RR can be made to advertise the 6VPE prefix with additional-paths to PE1

Figure 85. Additional Paths for 6VPE



Configuration

CE1: Interface

`CE1#configure terminal`	Enter configure mode.
`CE1(config)#hostname CE1`	Configure the hostname to CE1
`CE1(config)#interface eth2`	Enter the Interface mode for interface eth2.
`CE1(config-if)#ipv6 address 1001::1/64`	Configure IPV6 address for interface eth2
`(config)#commit`	Apply commit
`(config)#exit`	Exit Router BGP and Configure mode.

CE1: BGP

`CE1(config)#router bgp 200`	Enter BGP router mode
`CE1(config-router)#neighbor 1001::2 remote-as 100`	Configure BGP ipv6 neighbor on PE1
`CE1(config-router)#address-family ipv6 unicast`	Enter the address family ipv6
`CE1(config-router-af)#neighbor 1001::2 activate`	Activate neighbor under address family ipv6
`CE1(config-router-af)#exit-address-family`	Exit address family ipv6 unicast mode
`CE1(config-router)#exit`	Exit BGP router mode

© 2026 IP Infusion Inc. Proprietary

CE1(config)#commit	Apply commit
CE1#clear bgp 1001::2	Clear BGP peer PE1

PE1: Interface

PE1#configure terminal	Enter configure mode.
PE1(config)#hostname PE1	Configure the hostname to PE1
PE1(config)#ip vrf vrf1	Configure VRF name
PE1(config-vrf)#rd 1:100	Configure Route Distinguisher value
PE1(config-vrf)#route-target both 1:200	Configure Route Target Value
PE1(config-vrf)#exit	Exit vrf mode
PE1(config)#interface eth2	Enter the Interface mode for interface eth2
PE1(config-if)#ip vrf forwarding vrf1	Configure ip vrf-forwarding on interface eth2
PE1(config-if)#ipv6 address 1001::2/64	Configure the IPv6 address for interface eth2
PE1(config-if)#exit	Exit interface mode
PE1(config)#interface lo	Enter the Interface mode for the loopback interface.
PE1(config-if)#ip address 1.1.1.1/32	Configure IPV4 address for loopback interface.
PE1(config-if)#exit	Exit interface mode
PE1(config)#interface eth1	Enter the Interface mode for interface eth1
PE1(config-if)#ip address 10.1.1.1/24	Configure the IP address for interface eth1
(config-if)#exit	Exit the interface level
(config)#commit	Apply commit
(config)#exit	Exit.

PE1: OSPF

PE1(config)#router ospf 1	Configure an OSPF instance 1
PE1(config-router)#network 10.1.1.0/24 area 0	Advertise the network towards P in Area 0
PE1(config-router)#network 1.1.1.1/32 area 0	Advertise the Loopback network in Area 0
PE1(config-router)#exit	Exit OSPF router mode
PE1(config)#commit	Apply commit
PE1(config)#exit	Exit the global mode

PE1: MPLS

PE1(config)#router ldp	Enable LDP Process
PE1(config-router)#transport-address ipv4 1.1.1.1	Configure Transport address for LDP
PE1(config-router)#exit	Exit router ldp mode
PE1(config)#interface eth1	Enter the interface mode for interface eth1
PE1(config-if)#label-switching	Enable label-switching on interface eth1

© 2026 IP Infusion Inc. Proprietary

PE1(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth1
PE1(config-if)#exit	Exit the interface mode
PE1(config)#commit	Apply commit
PE1(config)#exit	Exit the global mode

PE1: BGP

PE1(config)#router bgp 100	Configure router bgp mode
PE1(config)#bgp router-id 1.1.1.1	Configure BGP router-id
PE1(config-router)#neighbor 2.2.2.2 remote-as 100	Configure BGP IPv4 neighbor on PE2
PE1(config-router)#neighbor 2.2.2.2 update-source 1.1.1.1	Configure the routing update source for RR as PE1's Loopback
PE1(config-router)#address-family vpnv6 unicast	Enter BGP address-family vpnv6 unicast mode
PE1(config-router-af)#neighbor 2.2.2.2 activate	Activate the neighbor RR for address-family vpnv6 unicast
PE1(config-router-af)#exit-address-family	Exit address-family ipv6 labeled-unicast mode
PE1(config-router)#address-family ipv6 vrf vrf1	Enter BGP address-family ipv6 vrf vrf1 mode
PE1(config-router)#neighbor 1001::1 remote-as 200	Configure BGP IPv6 neighbor on CE1
PE1(config-router-af)#exit-address-family	Exit address-family ipv6 vrf vrf1 mode
PE1(config-router)#exit	Exit router bgp mode
PE1(config)#exit	Exit configure mode
PE1(config)#commit	Apply commit
PE1#clear bgp ipv6 unicast 1001::1 vrf vrf1	Clear BGP neighbor CE1

RR: Interface

RR#configure terminal	Enter configure mode.
RR(config)#hostname RR	Configure hostname as RR
RR(config)#interface eth1	Enter interface mode for interface eth1
RR(config-if)#ip address 10.1.1.2/24	Configure IPv4 address for interface eth1
RR(config-if)#exit	Exit interface mode
RR(config)#interface eth2	Enter interface mode for interface eth2
RR(config-if)#ip address 20.1.1.2/24	Configure IPv4 address for interface eth2
RR(config-if)#exit	Exit interface mode
RR(config)#interface eth3	Enter interface mode for interface eth3
RR(config-if)#ip address 30.1.1.2/24	Configure IPv4 address for interface eth3
RR(config-if)#exit	Exit interface mode
RR(config)#interface eth4	Enter interface mode for interface eth4
RR(config-if)#ip address 40.1.1.2/24	Configure IPv4 address for interface eth4

© 2026 IP Infusion Inc. Proprietary

RR(config-if)#exit	Exit interface mode
RR(config)#interface lo	Enter Interface mode for the loopback interface.
RR(config-if)#ip address 2.2.2.2/32	Configure IPV4 address for loopback interface.
RR(config-if)#exit	Exit Interface mode.
PE1(config)#commit	Apply commit

RR: OSPF

RR(config)#router ospf 1	Configure router OSPF instance 1
RR(config-router)#network 10.1.1.0/24 area 0	Advertise the network towards PE1 in area 0
RR(config-router)#network 20.1.1.0/24 area 0	Advertise the network towards PE2 in area 0
RR(config-router)#network 30.1.1.0/24 area 0	Advertise the network towards PE3 in area 0
RR(config-router)#network 40.1.1.0/24 area 0	Advertise the network towards PE4 in area 0
RR(config-router)#network 2.2.2.2/32 area 0	Advertise the Loopback network in area 0
RR(config-router)#exit	Exit the router ospf mode
RR(config)#commit	Apply commit

RR: MPLS

RR(config)#router ldp	Enable LDP Process
RR(config-router)#transport-address ipv4 2.2.2.2	Configure Transport address for LDP
RR(config-router)#exit	Exit router ldp mode
RR(config)#interface eth1	Enter the interface mode for interface eth1
RR(config-if)#label-switching	Enable label-switching on interface eth1
RR(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth1
RR(config-if)#exit	Exit interface mode
RR(config)#interface eth2	Enter the interface mode for interface eth2
RR(config-if)#label-switching	Enable label-switching on interface eth2
RR(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth2
RR(config-if)#exit	Exit interface mode
RR(config)#interface eth3	Enter the interface mode for interface eth3
RR(config-if)#label-switching	Enable label-switching on interface eth3
RR(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth3
RR(config-if)#exit	Exit interface mode
RR(config)#interface eth4	Enter the interface mode for interface eth4
RR(config-if)#label-switching	Enable label-switching on interface eth4
RR(config-if)#enable-ldp ipv4	Enable LDP for IPv4 on interface eth4
RR(config-if)#exit	Exit interface mode

PE4: Interface

`PE4#configure terminal`	Enter configure mode.
`PE4(config)#hostname PE4`	Configure the hostname to PE4
`PE4(config)#ip vrf vrf1`	Configure VRF name
`PE4(config-vrf)#rd 1:100`	Configure Route Distinguisher value
`PE4(config-vrf)#route-target both 1:200`	Configure Route Target Vlaue
`PE4(config-vrf)#exit`	Exit vrf mode
`PE4(config)#interface eth1`	Enter the Interface mode for interface eth1
`PE4(config-if)#ip vrf forwarding vrf1`	Configure ip vrf-forwarding on interface eth1
`PE4(config-if)#ipv6 address 4001::1/64`	Configure the IPv6 address for interface eth1
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#interface lo`	Enter the Interface mode for the loopback interface.
`PE4(config-if)#ip address 5.5.5.5/32`	Configure IPV4 address for loopback interface.
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#interface eth4`	Enter the Interface mode for interface eth4
`PE4(config-if)#ip address 40.1.1.1/24`	Configure the IP address for interface eth4
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#commit`	Apply commit

PE4: OSPF

`PE4(config)#router ospf 1`	Configure an OSPF instance 1
`PE4(config-router)#network 40.1.1.0/24 area 0`	Advertise the network towards RR in Area 0
`PE4(config-router)#network 5.5.5.5/32 area 0`	Advertise the Loopback network in Area 0
`PE4(config-router)#exit`	Exit OSPF router mode
`PE4(config)#commit`	Apply commit

PE4: MPLS

`PE4(config)#router ldp`	Enable LDP Process
`PE4(config-router)#transport-address ipv4 5.5.5.5`	Configure Transport address for LDP
`PE4(config-router)#exit`	Exit router ldp mode
`PE4(config)#interface eth4`	Enter the interface mode for interface eth4
`PE4(config-if)#label-switching`	Enable label-switching on interface eth4
`PE4(config-if)#enable-ldp ipv4`	Enable LDP for IPv4 on interface eth4
`PE4(config-if)#exit`	Exit interface mode
`PE4(config)#commit`	Apply commit

© 2026 IP Infusion Inc. Proprietary

PE4: BGP

PE4(config)#router bgp 100	Configure router bgp mode
PE4(config)#bgp router-id 5.5.5.5	Configure BGP router-id
PE4(config-router)#neighbor 2.2.2.2 remote-as 100	Configure BGP IPv4 neighbor on RR
PE4(config-router)#neighbor 2.2.2.2 update-source 5.5.5.5	Configure the routing update source for RR as PE4's Loopback
PE4(config-router)#address-family vpnv6 unicast	Enter BGP address-family vpnv6 unicast mode
PE4(config-router-af)#neighbor 2.2.2.2 activate	Activate the neighbor RR for address-family vpnv6 unicast
PE4(config-router-af)#exit-address-family	Exit address-family ipv6 labeled-unicast mode
PE4(config-router)#address-family ipv6 vrf vrf1	Enter BGP address-family ipv6 vrf vrf1 mode
PE4(config-router)#neighbor 4001::2 remote-as 300	Configure BGP IPv6 neighbor on CE2
PE4(config-router-af)#exit-address-family	Exit address-family ipv6 vrf vrf1 mode
PE4(config-router)#exit	Exit router bgp mode
PE4(config)#commit	Apply commit
PE4(config)#exit	Exit configure mode
PE4#clear bgp ipv6 unicast * vrf vrf1	Reset IPv6 BGP connection for all VRF addresses.

CE2: Interface

CE2#configure terminal	Enter configure mode.
CE2(config)#hostname CE2	Configure the hostname to CE2
CE2(config)#interface eth1	Enter the Interface mode for interface eth1
CE2(config-if)#ipv6 address 2001::2/64	Configure IPV6 address for interface eth1
CE2(config-if)#exit	Exit Interface mode.
CE2(config)#interface eth2	Enter the Interface mode for interface eth2
CE2(config-if)#ipv6 address 3001::2/64	Configure IPV6 address for interface eth2
CE2(config-if)#exit	Exit Interface mode.
CE2(config)#interface eth3	Enter the Interface mode for interface eth3
CE2(config-if)#ipv6 address 4001::2/64	Configure IPV6 address for interface eth3
CE2(config-if)#exit	Exit Interface mode.
CE2(config)#interface lo	Enter the Interface mode for interface Loopback
CE2(config-if)#ipv6 address 2222::2/128	Configure IPV6 address for interface Loopback
CE2(config-if)#exit	Exit Interface mode.
CE2(config)#commit	Apply commit

© 2026 IP Infusion Inc. Proprietary

CE2: BGP

CE2(config)#router bgp 300	Enter BGP router mode
CE2(config-router)#neighbor 2001::1 remote-as 100	Configure BGP ipv6 neighbor on PE2
CE2(config-router)#neighbor 3001::1 remote-as 100	Configure BGP ipv6 neighbor on PE3
CE2(config-router)#neighbor 4001::1 remote-as 100	Configure BGP ipv6 neighbor on PE4
CE2(config-router)#address-family ipv6 unicast	Enter the address family ipv6
CE2(config-router-af)#neighbor 2001::1 activate	Activate neighbor under address family ipv6
CE2(config-router-af)#neighbor 3001::1 activate	Activate neighbor under address family ipv6
CE2(config-router-af)#neighbor 4001::1 activate	Activate neighbor under address family ipv6
CE2(config-router-af)#network 2222::2/128	Advertise the IPv6 prefix of Loopback into BGP
CE2(config-router-af)#exit-address-family	Exit address family ipv6 unicast mode
CE2(config-router)#exit	Exit BGP router mode
CE2(config)#commit	Apply commit
CE2(config)#exit	Exit configure mode

BGP Addpath Capability for VPNV6 Unicast Address-family

RR

RR(config)#router bgp 100	Configure router bgp mode
RR(config-router)#address-family vpnv6 unicast	Enter BGP address-family vpnv6 unicast mode
RR(config-router-af)#bgp additional-paths select all	Configure RR to select all addpaths
RR(config-router-af)#bgp additional-paths send	Configure BGP addpath send capability under address-family vpnv6 unicast
(config-router-af)#exit-address-family	Exit bgp address-family mode.
(config-router)#exit	Exit Router BGP mode.
(config)#commit	Apply commit
(config)#exit	Exit Configure mode.

PE1

PE1(config)#router bgp 100	Configure router bgp mode
PE1(config-router)#address-family vpnv6 unicast	Enter BGP address-family vpnv6 unicast mode
PE1(config-router-af)#neighbor 2.2.2.2 additional-paths receive	Configure BGP addpath receive capability for the 6VPE-neighbor RR under address-family vpnv6 unicast
(config-router-af)#exit-address-family	Exit bgp address-family mode.
(config-router)#exit	Exit Router BGP mode.
(config)#commit	Apply commit
(config)#exit	Exit Configure mode.

© 2026 IP Infusion Inc. Proprietary

PE2

`PE2(config)#router bgp 100`	Configure router bgp mode
`PE2(config-router)#address-family vpnv6 unicast`	Enter BGP address-family vpnv6 unicast mode
`PE2(config-router-af)#bgp additional-paths receive`	Configure BGP addpath receive capability under address-family vpnv6 unicast
`(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`(config-router)#exit`	Exit Router BGP mode.
`(config)#commit`	Apply commit
`(config)#exit`	Exit Configure mode.

PE3

`PE3(config)#router bgp 100`	Configure router bgp mode
`PE3(config-router)#address-family vpnv6 unicast`	Enter BGP address-family vpnv6 unicast mode
`PE3(config-router-af)#bgp additional-paths receive`	Configure BGP addpath receive capability under address-family vpnv6 unicast
`PE3(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`PE3(config-router)#exit`	Exit Router BGP mode.
`PE3(config)#commit`	Apply commit
`PE3(config)#exit`	Exit Configure mode.

PE4

`PE4(config)#router bgp 100`	Configure router bgp mode
`PE4(config-router)#address-family vpnv6 unicast`	Enter BGP address-family vpnv6 unicast mode
`PE4(config-router-af)#bgp additional-paths receive`	Configure BGP addpath receive capability under address-family vpnv6 unicast
`PE4(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`PE4(config-router)#exit`	Exit Router BGP mode.
`PE4(config)#commit`	Apply commit
`PE4(config)#exit`	Exit Configure mode.

Validation at RR

Add-Path Send Capability Advertised to and Received From 6VPE Peers

BGP Addpath Selection Configuration Best 3 Under Address-family VPNV6 Unicast

RR

`RR(config)#router bgp 100`	Configure router bgp mode
`RR(config-router)#address-family vpnv6 unicast`	Enter BGP address-family vpnv6 unicast mode
`RR(config-router-af)#no bgp additional-paths select best`	Unconfigure RR to select Best 2 addpaths
`RR(config-router-af)#bgp additional-paths select best 3`	Configure RR to select best 3 addpaths
`RR(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`RR(config-router)#exit`	Exit Router BGP mode.
`RR(config)#commit`	Apply commit
`RR(config)#exit`	Exit Configure mode.

BGP Labeled Unicast IPv4 with Add Path

This section contains basic BGP labeled unicast with Add-Path configuration examples with OSPF as the IGP.

Overview

As MPLS deployments expand beyond the service provider core and edge to the access and metropolitan networks, the number of edge-to-edge label-switched paths (LSPs) in many networks is increasing substantially. This continued growth can present scaling challenges-with some networks already reaching their limit-and can also slow end-to end restoration. Dividing the network into multiple regions can alleviate these issues by limiting the total number of end-to-end LSPs, and enabling failures to be contained and restored in a single region. These regions operate separate instances of interior gateway protocol (IGP), and uses BGP Labeled Unicast (BGP-LU) to advertise route information between inter region routers. By providing connectivity and communication between regions, BPG-LU enables service providers to massively scale the number of MPLS-enabled devices on their networks.

By default, all BGP routers and Route-Reflectors propagate only their best paths over their sessions. In case they advertise any route with the same NLRI as a previously advertised route, the latest one implicitly replaces the previous advertisement, which is known as an Implicit Withdraw. The Implicit Withdraw can achieve better scaling, but at the cost of path diversity.

The use of route-reflectors thus has significant effect on redundancy by hiding alternate paths. Using full-mesh is not an option, so a mechanism is needed to allow the propagation of multiple alternate paths in an RR environment.

Topology

Configurations

AGN3 Configurations

`AGN3(config)#interface lo`	Enter interface lo mode
`AGN3(config-if)#ip address 14.14.14.14/32`	Configure ip address for loopback interface
`AGN3(config-if)#exit`	Exit interface loopback mode
`AGN3(config)#router ldp`	Configure router ldp
`AGN3(config-router)#transport-address ipv4 14.14.14.14`	Configure transport address as loopback
`AGN3(config-router)#exit`	Exit the router ldp mode
`AGN3(config-if)#interface eth5`	Enter interface mode
`AGN3(config-if)#ip address 41.1.1.171/24`	Configure ip address on the interface
`AGN3(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`AGN3(config-if)#label-switching`	Enable label-switching on the interface
`AGN3(config-if)#exit`	Exit the interface mode
`AGN3(config)#router ospf 1`	Configure router ospf instance 1
`AGN3(config-router)#network 14.14.14.14/32 area 0`	Add the loopback network into ospf instance 1
`AGN3(config-router)#network 41.1.1.171/24 area 0`	Add the ip address into ospf instance 1
`AGN3(config-router)#exit`	Exit router ospf mode
`AGN3(config)#router bgp 100`	Enter router bgp mode
`AGN3(config-router)#network 14.14.14.14/32`	Advertise loopback through network command inside bgp
`AGN3(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure iBGP neighbor
`AGN3(config-router)#neighbor 8.8.8.8 remote-as 100`	Configure iBGP neighbor
`AGN3(config-router)#neighbor 9.9.9.9 remote-as 100`	Configure iBGP neighbor
`AGN3(config-router)#neighbor 3.3.3.3 update-source 14.14.14.14`	Update the source for the neighbor as loopback ip
`AGN3(config-router)#neighbor 8.8.8.8 update-source 14.14.14.14`	Update the source for the neighbor as loopback ip
`AGN3(config-router)#neighbor 9.9.9.9 update-source 14.14.14.14`	Update the source for the neighbor as loopback ip
`AGN3(config-router)#neighbor 3.3.3.3 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN3(config-router)#neighbor 8.8.8.8 fall-over`	Configure bfd for all the neighbors

© 2026 IP Infusion Inc. Proprietary

`bfd multihop`	
`AGN3(config-router)#neighbor 9.9.9.9 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN3(config-router)#allocate-label all`	Enable allocate label all command
`AGN3(config-router)#address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast address family
`AGN3(config-router-af)#neighbor 3.3.3.3 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN3(config-router-af)#neighbor 8.8.8.8 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN3(config-router-af)#neighbor 9.9.9.9 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN3(config-router-af)#neighbor 3.3.3.3 next-hop-self`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN3(config-router-af)#neighbor 8.8.8.8 next-hop-self`	Activate next hop self for the neighbor
`AGN3(config-router-af)#neighbor 9.9.9.9 next-hop-self`	Activate next hop self for the neighbor
`AGN3(config-router-af)#bgp additional-paths receive`	Enable bgp additional paths receive at global level under ipv4 labeled-unicast address-family
`AGN3(config-router-af)#neighbor 9.9.9.9 additional-paths disable`	Disable additional paths for neighbor 9.9.9.9
`AGN3(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`AGN3(config-router)#exit`	Exit Router BGP mode.
`AGN3(config)#commit`	Apply commit
`AGN3(config)#exit`	Exit Configure mode.

AGN1 Configurations

`AGN1(config)#interface lo`	Enter interface lo mode
`AGN1(config-if)#ip address 1.1.1.1/32`	Configure ip address for loopback interface
`AGN1(config-if)#exit`	Exit interface loopback mode
`AGN1(config)#router ldp`	Configure router ldp
`AGN1(config-router)#transport-address ipv4 1.1.1.1`	Configure transport address as loopback
`AGN1(config-router)#exit`	Exit the router ldp mode
`AGN1(config-if)#interface eth1`	Enter interface mode
`AGN1(config-if)#ip address 10.1.1.156/24`	Configure ip address on the interface
`AGN1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`AGN1(config-if)#label-switching`	Enable label-switching on the interface
`AGN1(config-if)#exit`	Exit the interface mode

© 2026 IP Infusion Inc. Proprietary

`AGN1(config)#router ospf 1`	Configure router ospf instance 1
`AGN1(config-router)#network 1.1.1.1/32 area 0`	Add the loopback network into ospf instance 1
`AGN1(config-router)#network 10.1.1.0/24 area 0`	Add the ip address into ospf instance 1
`AGN1(config-router)#exit`	Exit router ospf mode
`AGN1(config)#router bgp 100`	Enter router bgp mode
`AGN1(config-router)#network 1.1.1.1/32`	Advertise loopback through network command inside bgp
`AGN1(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure iBGP neighbor
`AGN1(config-router)#neighbor 8.8.8.8 remote-as 100`	Configure iBGP neighbor
`AGN1(config-router)#neighbor 9.9.9.9 remote-as 100`	Configure iBGP neighbor
`AGN1(config-router)#neighbor 3.3.3.3 update-source 1.1.1.1`	Update the source for the neighbor as loopback ip
`AGN1(config-router)#neighbor 8.8.8.8 update-source 1.1.1.1`	Update the source for the neighbor as loopback ip
`AGN1(config-router)#neighbor 9.9.9.9 update-source 1.1.1.1`	Update the source for the neighbor as loopback ip
`AGN1(config-router)#neighbor 3.3.3.3 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN1(config-router)#neighbor 8.8.8.8 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN1(config-router)#neighbor 9.9.9.9 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN1(config-router)#allocate-label all`	Enable allocate label all command
`AGN1(config-router)#address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast address family
`AGN1(config-router-af)#neighbor 3.3.3.3 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN1(config-router-af)#neighbor 8.8.8.8 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN1(config-router-af)#neighbor 9.9.9.9 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN1(config-router-af)#neighbor 3.3.3.3 next-hop-self`	Activate next hop self for the neighbor
`AGN1(config-router-af)#neighbor 8.8.8.8 next-hop-self`	Activate next hop self for the neighbor
`AGN1(config-router-af)#neighbor 9.9.9.9 next-hop-self`	Activate next hop self for the neighbor
`AGN1(config-router-af)#neighbor 3.3.3.3 additional-paths receive`	Enable bgp additional paths receive at neighbor level under ipv4 labeled-unicast address-family
`AGN1(config-router-af)#neighbor 8.8.8.8 additional-paths receive`	Enable bgp additional paths receive at neighbor level under ipv4 labeled-unicast address-family

© 2026 IP Infusion Inc. Proprietary

`AGN1(config-router-af)#neighbor 9.9.9.9 additional-paths receive`	Enable bgp additional paths receive at neighbor level under ipv4 labeled-unicast address-family
`AGN1(config-router-af)#exit-address-family`	Exit bgp address-family mode.
`AGN1(config-router)#exit`	Exit Router BGP mode.
`AGN1(config)#commit`	Apply commit
`AGN1(config)#exit`	Exit Configure mode.

P1 Configurations

`P1(config)#interface lo`	Enter interface lo mode
`P1(config-if)#ip address 2.2.2.2/32`	Configure ip address for loopback interface
`P1(config-if)#exit`	Exit interface loopback mode
`P1(config)#router ldp`	Configure ldp on the router
`P1(config-router)#transport-address ipv4 2.2.2.2`	Enable loopback ip as transport address
`P1(config-router)#exit`	Exit the router ldp mode
`P1(config)#interface eth1`	Enter interface mode
`P1(config-if)#ip address 10.1.1.157/24`	Configure ip address on the interface
`P1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P1(config-if)#label-switching`	Enable label switching on the interface
`P1(config-if)#exit`	Exit the interface mode
`P1(config)#interface eth2`	Enter interface mode
`P1(config-if)#ip address 20.1.1.157/24`	Configure ip address on the interface
`P1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P1(config-if)#label-switching`	Enable label switching on the interface
`P1(config-if)#exit`	Exit the interface mode
`P1(config)#interface eth3`	Enter interface mode
`P1(config-if)#ip address 23.1.1.157/24`	Configure ip address on the interface
`P1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P1(config-if)#label-switching`	Enable label switching on the interface
`P1(config-if)#exit`	Exit the interface mode
`P1(config)#interface eth4`	Enter interface mode
`P1(config-if)#ip address 21.1.1.157/24`	Configure ip address on the interface
`P1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P1(config-if)#label-switching`	Enable label switching on the interface
`P1(config-if)#exit`	Exit the interface mode
`P1(config)#interface eth5`	Enter interface mode
`P1(config-if)#ip address 41.1.1.157/24`	Configure ip address on the interface

© 2026 IP Infusion Inc. Proprietary

P1(config-if)#enable-ldp ipv4	Enable ldp on the interface
P1(config-if)#label-switching	Enable label switching on the interface
P1(config-if)#exit	Exit the interface mode
P1(config)#router ospf 1	Enter router ospf mode with instance as 1
P1(config-router)#network 10.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 1 with area 0 using network command
P1(config-router)#network 20.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 1 with area 0 using network command
P1(config-router)#network 21.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 1 with area 0 using network command
P1(config-router)#network 41.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 1 with area 0 using network command
P1(config-router)#network 23.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 1 with area 0 using network command
P1(config-router)#network 2.2.2.2/32 area 0.0.0.0	Add interface loopback into ospf instance 1 with area 0 using network command
P1(config-router)#exit	Exit Router ospf mode.
P1(config)#commit	Apply commit
P1(config)#exit	Exit Configure mode.

BR3 Configurations

BR3(config)#enable ext-ospf-multi-inst	Enable ospf multi instance
BR3(config)#interface lo	Enter interface lo mode
BR3(config-if)#ip address 8.8.8.8/32	Configure ip address for loopback interface
BR3(config-if)#exit	Exit the interface mode
BR3(config)#router ldp	Configure ldp on the router
BR3(config-router)#transport-address ipv4 8.8.8.80	Enable loopback ip as transport address
BR3(config-router)#exit	Exit the router ldp mode
BR3(config)#interface eth3	Enter interface mode
BR3(config-if)#ip address 22.1.1.165/24	Configure ip address on the interface
BR3(config-if)#enable-ldp ipv4	Enable ldp on the interface
BR3(config-if)#label-switching	Enable label switching on the interface
BR3(config-if)#exit	Exit the interface mode
BR3(config)#interface eth4	Enter interface mode
BR3(config-if)#ip address 21.1.1.165/24	Configure ip address on the interface
BR3(config-if)#enable-ldp ipv4	Enable ldp on the interface
BR3(config-if)#label-switching	Enable label switching on the interface

© 2026 IP Infusion Inc. Proprietary

BR3(config-if)#exit	Exit the interface mode
BR3(config)#router ospf 1	Configure router ospf on BR3 with instance id 1
BR3(config-router)#network 8.8.8.8/32 area 0	Add the loopback network into instance 1
BR3(config-router)#network 21.1.1.165/24 area 0	Add the network as part of ospf instance id 1
BR3(config-router)#exit	Exit the router ospf mode
BR3(config)#router ospf 2	Configure router ospf which will be part of core area with instance id as 2
BR3(config-router)#network 8.8.8.8/32 area 0.0.0.0 instance-id 2	Add interface loopback into ospf instance 2 with area 0 using network command
BR3(config-router)#network 22.1.1.165/24 area 0	Add the network as part of ospf instance id 2
BR3(config-router)#exit	Exit the router ospf mode
BR3(config)#router bgp 100	Configure router bgp
BR3(config-router)#neighbor 1.1.1.1 remote-as 100	Configure ibgp neighbor
BR3(config-router)#neighbor 14.14.14.14 remote-as 100	Configure ibgp neighbor
BR3(config-router)#neighbor 5.5.5.5 remote-as 100	Configure ibgp neighbor
BR3(config-router)#neighbor 10.10.10.10 remote-as 100	Configure ibgp neighbor
BR3(config-router)#neighbor 11.11.11.11 remote-as 100	Configure ibgp neighbor
BR3(config-router)#neighbor 12.12.12.12 remote-as 100	Configure ibgp neighbor
BR3(config-router)#neighbor 1.1.1.1 update-source 8.8.8.8	Configure update source for the neighbor with loopback address
BR3(config-router)#neighbor 14.14.14.14 update-source 8.8.8.8	Configure update source for the neighbor with loopback address
BR3(config-router)#neighbor 5.5.5.5 update-source 8.8.8.8	Configure update source for the neighbor with loopback address
BR3(config-router)#neighbor 10.10.10.10 update-source 8.8.8.8	Configure update source for the neighbor with loopback address
BR3(config-router)#neighbor 11.11.11.11 update-source 8.8.8.8	Configure update source for the neighbor with loopback address
BR3(config-router)#neighbor 12.12.12.12 update-source 8.8.8.8	Configure update source for the neighbor with loopback address
BR3(config-router)#neighbor 1.1.1.1 fall-over bfd multihop	Configure bfd for the neighbor
BR3(config-router)#neighbor 14.14.14.14 fall-over bfd multihop	Configure bfd for the neighbor
BR3(config-router)#neighbor 5.5.5.5 fall-over bfd multihop	Configure bfd for the neighbor
BR3(config-router)#neighbor 10.10.10.10 fall-over bfd multihop	Configure bfd for the neighbor

© 2026 IP Infusion Inc. Proprietary

BR3(config-router)#neighbor 11.11.11.11 fall-over bfd multihop	Configure bfd for the neighbor
BR3(config-router)#neighbor 12.12.12.12 fall-over bfd multihop	Configure bfd for the neighbor
BR3(config-router)#allocate-label all	Configure allocate label all command
R3(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR3(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor under address family labeled unicast
BR3(config-router-af)#neighbor 5.5.5.5 activate	Activate the neighbor under address family labeled unicast
BR3(config-router-af)#neighbor 10.10.10.10 activate	Activate the neighbor under address family labeled unicast
BR3(config-router-af)#neighbor 11.11.11.11 activate	Activate the neighbor under address family labeled unicast
BR3(config-router-af)#neighbor 12.12.12.12 activate	Activate the neighbor under address family labeled unicast
BR3(config-router-af)#neighbor 14.14.14.14 activate	Activate the neighbor under address family labeled unicast
BR3(config-router-af)#neighbor 1.1.1.1 route-reflector-client	Configure neighbor as route reflector client
BR3(config-router-af)#neighbor 14.14.14.14 route-reflector-client	Configure neighbor as route reflector client
BR3(config-router-af)#neighbor 5.5.5.5 next-hop-self	Configure next-hop self for the neighbor
BR3(config-router-af)#neighbor 10.10.10.10 next-hop-self	Configure next-hop self for the neighbor
BR3(config-router-af)#neighbor 11.11.11.11 next-hop-self	Configure next-hop self for the neighbor
BR3(config-router-af)#neighbor 12.12.12.12 next-hop-self	Configure next-hop self for the neighbor
BR3(config-router-af)#neighbor 1.1.1.1 additional-paths send	Enable neighbor level additional paths send for per neighbor
BR3(config-router-af)#neighbor 1.1.1.1 advertise additional-paths best 2	Enable selection of best 2 paths to be advertised to neighbor using neighbor level commands
BR3(config-router-af)#exit-address-family	Exit BGP address-family ipv4-labeled unicast mode
BR3(config-router)#end	Return to configure terminal mode

BR1 Configurations

BR1(config)#enable ext-ospf-multi-inst	Enable ospf multi instance
BR1(config)#interface lo	Enter interface lo mode

`BR1(config-if)#ip address 3.3.3.3/32`	Configure ip address for loopback interface
`BR1(config-if)#exit`	Exit the interface mode
`BR1(config)#router ldp`	Configure ldp on the router
`BR1(config-router)#transport-address ipv4 3.3.3.3 0`	Enable loopback ip as transport address
`BR1(config-router)#exit`	Exit the router ldp mode
`BR1(config)#interface eth1`	Enter interface mode
`BR1(config-if)#ip address 30.1.1.158/24`	Configure ip address on the interface
`BR1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR1(config-if)#label-switching`	Enable label switching on the interface
`BR1(config-if)#exit`	Exit the interface mode
`BR1(config)#interface eth2`	Enter interface mode
`BR1(config-if)#ip address 20.1.1.158/24`	Configure ip address on the interface
`BR1(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR1(config-if)#label-switching`	Enable label switching on the interface
`BR1(config-if)#exit`	Exit the interface mode
`BR1(config)#router ospf 1`	Configure router ospf with instance id 1
`BR1(config-router)#network 3.3.3.3/32 area 0`	Add the loopback network into instance 1
`BR1(config-router)#network 20.1.1.0/24 area 0`	Add the network as part of ospf instance id 1
`BR1(config-router)#exit`	Exit the router ospf mode
`BR1(config)#router ospf 2`	Configure router ospf which will be part of core area with instance id as 2
`BR1(config-router)#network 3.3.3.3/32 area 0.0.0.0 instance-id 2`	Add interface loopback into ospf instance 2 with area 0 using network command
`BR1(config-router)#network 30.1.1.0/24 area 0`	Add the network as part of ospf instance id 2
`BR1(config-router)#exit`	Exit the router ospf mode
`BR1(config)#route-map BEST2`	Create a route-map to select best 2 paths
`BR1(config-route-map)#match additional-paths advertise-set select best 2`	Select best 2 paths to advertise to the neighbor
`BR1(config-route-map)#exit`	Exit the route-map mode
`BR1(config)#router bgp 100`	Configure router bgp
`BR1(config-router)#neighbor 1.1.1.1 remote-as 100`	Configure ibgp neighbor
`BR1(config-router)#neighbor 14.14.14.14 remote-as 100`	Configure ibgp neighbor
`BR1(config-router)#neighbor 5.5.5.5 remote-as 100`	Configure ibgp neighbor
`BR1(config-router)#neighbor 10.10.10.10 remote-as 100`	Configure ibgp neighbor
`BR1(config-router)#neighbor 11.11.11.11 remote-as 100`	Configure ibgp neighbor

© 2026 IP Infusion Inc. Proprietary

BR1(config-router)#neighbor 12.12.12.12 remote-as 100	Configure ibgp neighbor
BR1(config-router)#neighbor 1.1.1.1 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR1(config-router)#neighbor 14.14.14.14 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR1(config-router)#neighbor 5.5.5.5 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR1(config-router)#neighbor 10.10.10.10 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR1(config-router)#neighbor 11.11.11.11 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR1(config-router)#neighbor 12.12.12.12 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR1(config-router)#neighbor 1.1.1.1 fall-over bfd multihop	Configure bfd for the neighbor
BR1(config-router)#neighbor 14.14.14.14 fall-over bfd multihop	Configure bfd for the neighbor
BR1(config-router)#neighbor 5.5.5.5 fall-over bfd multihop	Configure bfd for the neighbor
BR1(config-router)#neighbor 10.10.10.10 fall-over bfd multihop	Configure bfd for the neighbor
BR1(config-router)#neighbor 11.11.11.11 fall-over bfd multihop	Configure bfd for the neighbor
BR1(config-router)#neighbor 12.12.12.12 fall-over bfd multihop	Configure bfd for the neighbor
BR1(config-router)#allocate-label all	Configure allocate label all command
BR1(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR1(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor under address family labeled unicast
BR1(config-router-af)#neighbor 5.5.5.5 activate	Activate the neighbor under address family labeled unicast
BR1(config-router-af)#neighbor 10.10.10.10 activate	Activate the neighbor under address family labeled unicast
BR1(config-router-af)#neighbor 11.11.11.11 activate	Activate the neighbor under address family labeled unicast
BR1(config-router-af)#neighbor 12.12.12.12 activate	Activate the neighbor under address family labeled unicast
BR1(config-router-af)#neighbor 14.14.14.14 activate	Activate the neighbor under address family labeled unicast
BR1(config-router-af)#neighbor 1.1.1.1 route-reflector-client	Configure neighbor as route reflector client
BR1(config-router-af)#neighbor 14.14.14.14 route-	Configure neighbor as route reflector client

reflector-client	
BR1(config-router-af)#neighbor 5.5.5.5 next-hop-self	Configure next-hop self for the neighbor
BR1(config-router-af)#neighbor 10.10.10.10 next-hop-self	Configure next-hop self for the neighbor
BR1(config-router-af)#neighbor 11.11.11.11 next-hop-self	Configure next-hop self for the neighbor
BR1(config-router-af)#neighbor 12.12.12.12 next-hop-self	Configure next-hop self for the neighbor
BR1(config-router-af)#neighbor 1.1.1.1 additional-paths send	Enable additional paths send capability on neighbor level under ipv4 labeled unicast address family
BR1(config-router-af)#neighbor 14.14.14.14 additional-paths send	Enable additional paths send capability on neighbor level under ipv4 labeled unicast address family
BR1(config-router-af)#neighbor 1.1.1.1 advertise additional-paths all	Enable selection of all paths to be advertised to neighbor using neighbor level commands
BR1(config-router-af)#neighbor 14.14.14.14 route-map BEST2 out	Enable selection of all paths to be advertised to neighbor using neighbor level commands
BR1(config-router-af)#exit-address-family	Exit BGP address-family ipv4-labeled unicast mode
BR1(config-router)#end	Return to configure terminal mode

BR4 Configurations

BR4(config)#enable ext-ospf-multi-inst	Enable ospf multi instance
BR4(config)#interface lo	Enter interface lo mode
BR4(config-if)#ip address 9.9.9.9/32	Configure ip address for loopback interface
BR4(config-if)#exit	Exit the interface mode
BR4(config)#access-list 1 permit 10.10.10.10 0.0.0.0	Configure the access list to allow the BR5 loopback ip
BR4(config)#access-list 2 permit 11.11.11.11 0.0.0.0	Configure the access list to allow the BR6 loopback ip
BR4(config)#access-list 3 permit 5.5.5.5 0.0.0.0	Configure the access list to allow the BR2 loopback ip
BR4(config)#access-list 4 permit 12.12.12.12 0.0.0.0	Configure the access list to allow the BR7 loopback ip
BR4(config)#route-map A permit 10	Configure route-map A and permit
BR4(config-route-map)#match ip address 1	Match ip address 1
BR4(config-route-map)#exit	Exit the route-map
BR4(config)#route-map A permit 20	Configure route-map A and permit

© 2026 IP Infusion Inc. Proprietary

`BR4(config-route-map)#match ip address 2`	Match ip address 2
`BR4(config-route-map)#exit`	Exit the route-map
`BR4(config)#route-map A permit 30`	Configure route-map A and permit
`BR4(config-route-map)#match ip address 3`	Match ip address 3
`BR4(config-route-map)#exit`	Exit the route-map
`BR4(config)#route-map A permit 40`	Configure route-map A and permit
`BR4(config-route-map)#match ip address 4`	Match ip address 4
`BR4(config-route-map)#exit`	Exit the route-map
`BR4(config)#router ldp`	Configure ldp on the router
`BR4(config-router)#transport-address ipv4 9.9.9.9 0`	Enable loopback ip as transport address
`BR4(config-router)#exit`	Exit the router ldp mode
`BR4(config)#interface eth3`	Enter interface mode
`BR4(config-if)#ip address 23.1.1.166/24`	Configure ip address on the interface
`BR4(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR4(config-if)#label-switching`	Enable label switching on the interface
`BR4(config-if)#exit`	Exit the interface mode
`BR4(config)#interface eth4`	Enter interface mode
`BR4(config-if)#ip address 24.1.1.166/24`	Configure ip address on the interface
`BR4(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR4(config-if)#label-switching`	Enable label switching on the interface
`BR4(config-if)#exit`	Exit the interface mode
`BR4(config)#router ospf 1`	Configure router ospf with instance id 1
`BR4(config-router)#network 9.9.9.9/32 area 0`	Add the loopback network into instance 1
`BR4(config-router)#network 23.1.1.0/24 area 0`	Add the network as part of ospf instance id 1
`BR4(config-router)#redistribute ospf 2 route-map A`	Redistribute the selected routes from ospf instance 2 into instance 1
`BR4(config-router)#exit`	Exit the router ospf mode
`BR4(config)#router ospf 2`	Configure router ospf which will be part of core area with instance id as 2
`BR4(config-router)#network 9.9.9.9/32 area 0.0.0.0 instance-id 2`	Add interface loopback into ospf instance 2 with area 0 using network command
`BR4(config-router)#network 24.1.1.0/24 area 0`	Add the network as part of ospf instance id 2
`BR4(config-router)#exit`	Exit the router ospf mode
`BR4(config)#router bgp 100`	Configure router bgp
`BR4(config-router)#neighbor 1.1.1.1 remote-as 100`	Configure ibgp neighbor
`BR4(config-router)#neighbor 14.14.14.14 remote-as 100`	Configure ibgp neighbor

© 2026 IP Infusion Inc. Proprietary

BR4(config-router)#neighbor 5.5.5.5 remote-as 100	Configure ibgp neighbor
BR4(config-router)#neighbor 10.10.10.10 remote-as 100	Configure ibgp neighbor
BR4(config-router)#neighbor 11.11.11.11 remote-as 100	Configure ibgp neighbor
BR4(config-router)#neighbor 12.12.12.12 remote-as 100	Configure ibgp neighbor
BR4(config-router)#neighbor 1.1.1.1 update-source 9.9.9.9	Configure update source for the neighbor with loopback address
BR4(config-router)#neighbor 14.14.14.14 update-source 9.9.9.9	Configure update source for the neighbor with loopback address
BR4(config-router)#neighbor 5.5.5.5 update-source 9.9.9.9	Configure update source for the neighbor with loopback address
BR4(config-router)#neighbor 10.10.10.10 update-source 3.3.3.3	Configure update source for the neighbor with loopback address
BR4(config-router)#neighbor 11.11.11.11 update-source 9.9.9.9	Configure update source for the neighbor with loopback address
BR4(config-router)#neighbor 12.12.12.12 update-source 9.9.9.9	Configure update source for the neighbor with loopback address
BR4(config-router)#neighbor 1.1.1.1 fall-over bfd multihop	Configure bfd for the neighbor
BR4(config-router)#neighbor 14.14.14.14 fall-over bfd multihop	Configure bfd for the neighbor
BR4(config-router)#neighbor 5.5.5.5 fall-over bfd multihop	Configure bfd for the neighbor
BR4(config-router)#neighbor 10.10.10.10 fall-over bfd multihop	Configure bfd for the neighbor
BR4(config-router)#neighbor 11.11.11.11 fall-over bfd multihop	Configure bfd for the neighbor
BR4(config-router)#neighbor 12.12.12.12 fall-over bfd multihop	Configure bfd for the neighbor
BR4(config-router)#allocate-label all	Configure allocate label all command
BR4(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR4(config-router-af)#neighbor 1.1.1.1 activate	Activate the neighbor under address family labeled unicast
BR4(config-router-af)#neighbor 5.5.5.5 activate	Activate the neighbor under address family labeled unicast
BR4(config-router-af)#neighbor 10.10.10.10 activate	Activate the neighbor under address family labeled unicast
BR4(config-router-af)#neighbor 11.11.11.11 activate	Activate the neighbor under address family labeled unicast
BR4(config-router-af)#neighbor 12.12.12.12 activate	Activate the neighbor under address family labeled unicast

© 2026 IP Infusion Inc. Proprietary

BR4(config-router-af)#neighbor 14.14.14.14 activate	Activate the neighbor under address family labeled unicast
BR4(config-router-af)#neighbor 1.1.1.1 route-reflector-client	Configure neighbor as route reflector client
BR4(config-router-af)#neighbor 14.14.14.14 route-reflector-client	Configure neighbor as route reflector client
BR4(config-router-af)#neighbor 5.5.5.5 next-hop-self	Configure next-hop self for the neighbor
BR4(config-router-af)#neighbor 10.10.10.10 next-hop-self	Configure next-hop self for the neighbor
BR4(config-router-af)#neighbor 11.11.11.11 next-hop-self	Configure next-hop self for the neighbor
BR4(config-router-af)#neighbor 12.12.12.12 next-hop-self	Configure next-hop self for the neighbor
BR4(config-router-af)#bgp additional-paths send	Enable additional paths send capability at global level under address-family labeled-unicast
BR4(config-router-af)#neighbor 1.1.1.1 advertise additional-paths best 3	Enable selection of best 3 paths per neighbor using neighbor level commands
BR4(config-router-af)#neighbor 14.14.14.14 advertise additional-paths all	Enable selection of all paths to be advertised to neighbor using neighbor level commands
BR4(config-router-af)#exit-address-family	Exit BGP address-family ipv4-labeled unicast mode
BR4(config-router)#end	Return to configure terminal mode

P2 Configurations

P2(config)#interface lo	Enter interface lo mode
P2(config-if)#ip address 4.4.4.4/32	Configure ip address for loopback interface
P2(config-if)#exit	Exit interface loopback mode
P2(config)#router ldp	Configure ldp on the router
P2(config-router)#transport-address ipv4 4.4.4.40	Enable loopback ip as transport address
P2(config-router)#exit	Exit the router ldp mode
P2(config)#interface eth1	Enter interface mode
P2(config-if)#ip address 30.1.1.159/24	Configure ip address on the interface
P2(config-if)#enable-ldp ipv4	Enable ldp on the interface
P2(config-if)#label-switching	Enable label switching on the interface
P2(config-if)#exit	Exit the interface mode
P2(config)#interface eth2	Enter interface mode
P2(config-if)#ip address 40.1.1.159/24	Configure ip address on the interface
P2(config-if)#enable-ldp ipv4	Enable ldp on the interface

© 2026 IP Infusion Inc. Proprietary

`P2(config-if)#label-switching`	Enable label switching on the interface
`P2(config-if)#exit`	Exit the interface mode
`P2(config)#interface eth3`	Enter interface mode
`P2(config-if)#ip address 22.1.1.159/24`	Configure ip address on the interface
`P2(config-if)#enable-ldp ipv4`	Enable rsvp on the interface
`P2(config-if)#label-switching`	Enable label switching on the interface
`P2(config-if)#exit`	Exit the interface mode
`P2(config)#interface eth4`	Enter interface mode
`P2(config-if)#ip address 24.1.1.159/24`	Configure ip address on the interface
`P2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P2(config-if)#label-switching`	Enable label switching on the interface
`P2(config-if)#exit`	Exit the interface mode
`P2(config)#interface eth5`	Enter interface mode
`P2(config-if)#ip address 25.1.1.159/24`	Configure ip address on the interface
`P2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P2(config-if)#label-switching`	Enable label switching on the interface
`P2(config-if)#exit`	Exit the interface mode
`P2(config)#interface eth6`	Enter interface mode
`P2(config-if)#ip address 27.1.1.159/24`	Configure ip address on the interface
`P2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P2(config-if)#label-switching`	Enable label switching on the interface
`P2(config-if)#exit`	Exit the interface mode
`P2(config)#interface eth7`	Enter interface mode
`P2(config-if)#ip address 29.1.1.159/24`	Configure ip address on the interface
`P2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P2(config-if)#label-switching`	Enable label switching on the interface
`P2(config-if)#exit`	Exit the interface mode
`P2(config)#router ospf 2`	Configure Router ospf with instance id 2
`P2(config-router)#network 30.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 2 with area 0 using network command
`P2(config-router)#network 40.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 2 with area 0 using network command
`P2(config-router)#network 22.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 2 with area 0 using network command
`P2(config-router)#network 24.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 2 with area 0 using network command
`P2(config-router)#network 25.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 2 with area 0

	using network command
P2(config-router)#network 27.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 2 with area 0 using network command
P2(config-router)#network 29.1.1.0/24 area 0.0.0.0	Add interface into ospf instance 2 with area 0 using network command
P2(config-router)#network 4.4.4.4/32 area 0.0.0.0	Add interface loopback into ospf instance 2 with area 0 using network command
P2(config-router)#exit	Exit router ospf mode

BR5 Configurations

BR5(config)#enable ext-ospf-multi-inst	Enable ospf multi instance
BR5(config)#interface lo	Enter interface lo mode
BR5(config-if)#ip address 10.10.10.10/32	Configure ip address for loopback interface
BR5(config-if)#exit	Exit the interface mode
BR5(config)#router ldp	Configure ldp on the router
BR5(config-router)#transport-address ipv4 10.10.10.10 0	Enable loopback ip as transport address
BR5(config-router)#exit	Exit router ldp mode
BR5(config)#interface eth3	Enter interface mode
BR5(config-if)#ip address 26.1.1.167/24	Configure ip address on the interface
BR5(config-if)#enable-ldp ipv4	Enable ldp on the interface
BR5(config-if)#label-switching	Enable label switching on the interface
BR5(config-if)#exit	Exit the interface mode
BR5(config)#interface eth5	Enter interface mode
BR5(config-if)#ip address 25.1.1.167/24	Configure ip address on the interface
BR5(config-if)#enable-ldp ipv4	Enable ldp on the interface
BR5(config-if)#label-switching	Enable label switching on the interface
BR5(config-if)#exit	Exit the interface mode
BR5(config)#router ospf 2	Configure router ospf with instance id 2
BR5(config-router)#network 10.10.10.10/32 area 0	Add the loopback network into instance 2
BR5(config-router)#network 25.1.1.0/24 area 0	Add the network as part of ospf instance id 2
BR5(config-router)#exit	Exit the router ospf mode
BR5(config)#router ospf 3	Configure router ospf which will be part of aggregation area 2 with instance id as 3
BR5(config-router)#network 10.10.10.10/32 area 0.0.0.0 instance-id 3	Add interface loopback into ospf instance 3 with area 0 using network command
BR5(config-router)#network 26.1.1.0/24 area 0	Add the network as part of ospf instance id 3

© 2026 IP Infusion Inc. Proprietary

BR5(config-router)#exit	Exit the router ospf mode
BR5(config)#router bgp 100	Configure router bgp
BR5(config-router)#neighbor 3.3.3.3 remote-as 100	Configure ibgp neighbor
BR5(config-router)#neighbor 7.7.7.7 remote-as 100	Configure ibgp neighbor
BR5(config-router)#neighbor 8.8.8.8 remote-as 100	Configure ibgp neighbor
BR5(config-router)#neighbor 9.9.9.9 remote-as 100	Configure ibgp neighbor
BR5(config-router)#neighbor 13.13.13.13 remote-as 100	Configure ibgp neighbor
BR5(config-router)#neighbor 15.15.15.15 remote-as 100	Configure ibgp neighbor
BR5(config-router)#neighbor 3.3.3.3 update-source 10.10.10.10	Configure update source for the neighbor with loopback address
BR5(config-router)#neighbor 7.7.7.7 update-source 10.10.10.10	Configure update source for the neighbor with loopback address
BR5(config-router)#neighbor 8.8.8.8 update-source 10.10.10.10	Configure update source for the neighbor with loopback address
BR5(config-router)#neighbor 9.9.9.9 update-source 10.10.10.10	Configure update source for the neighbor with loopback address
BR5(config-router)#neighbor 13.13.13.13 update-source 10.10.10.10	Configure update source for the neighbor with loopback address
BR5(config-router)#neighbor 15.15.15.15 update-source 10.10.10.10	Configure update source for the neighbor with loopback address
BR5(config-router)#neighbor 3.3.3.3 fall-over bfd multihop	Configure bfd for the neighbor
BR5(config-router)#neighbor 7.7.7.7 fall-over bfd multihop	Configure bfd for the neighbor
BR5(config-router)#neighbor 8.8.8.8 fall-over bfd multihop	Configure bfd for the neighbor
BR5(config-router)#neighbor 9.9.9.9 fall-over bfd multihop	Configure bfd for the neighbor
BR5(config-router)#neighbor 13.13.13.13 fall-over bfd multihop	Configure bfd for the neighbor
BR5(config-router)#neighbor 15.15.15.15 fall-over bfd multihop	Configure bfd for the neighbor
BR5(config-router)#allocate-label all	Configure allocate label all command
BR5(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR5(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor under address family labeled unicast
BR5(config-router-af)#neighbor 7.7.7.7 activate	Activate the neighbor under address family labeled unicast
BR5(config-router-af)#neighbor 8.8.8.8 activate	Activate the neighbor under address family labeled unicast

© 2026 IP Infusion Inc. Proprietary

BR5(config-router-af)#neighbor 9.9.9.9 activate	Activate the neighbor under address family labeled unicast
BR5(config-router-af)#neighbor 13.13.13.13 activate	Activate the neighbor under address family labeled unicast
BR5(config-router-af)#neighbor 15.15.15.15 activate	Activate the neighbor under address family labeled unicast
BR5(config-router-af)#neighbor 13.13.13.13 route-reflector-client	Configure neighbor as route reflector client
BR5(config-router-af)#neighbor 7.7.7.7 route-reflector-client	Configure neighbor as route reflector client
BR5(config-router-af)#neighbor 15.15.15.15 next-hop-self	Configure next-hop self for the neighbor
BR5(config-router-af)#neighbor 3.3.3.3 next-hop-self	Configure next-hop self for the neighbor
BR5(config-router-af)#neighbor 8.8.8.8 next-hop-self	Configure next-hop self for the neighbor
BR5(config-router-af)#neighbor 9.9.9.9 next-hop-self	Configure next-hop self for the neighbor
BR5(config-router-af)#bgp additional-paths send	Enable additional paths send capability on neighbor level under ipv4 labeled unicast address family
BR5(config-router-af)#bgp additional-paths select all	Select all the available paths to advertise to the next router
BR5(config-router)#exit	Exit BGP router mode

BR6 Configurations

BR6(config)#enable ext-ospf-multi-inst	Enable ospf multi instance
BR6(config)#interface lo	Enter interface lo mode
BR6(config-if)#ip address 11.11.11.11/32	Configure ip address for loopback interface
BR6(config-if)#exit	Exit the interface mode
BR6(config)#router ldp	Configure ldp on the router
BR6(config-router)#transport-address ipv4 11.11.11.11	Enable loopback ip as transport address
BR5(config-router)#exit	Exit router ldp mode
BR6(config)#interface eth4	Enter interface mode
BR6(config-if)#ip address 28.1.1.168/24	Configure ip address on the interface
BR6(config-if)#enable-ldp ipv4	Enable ldp on the interface
BR6(config-if)#label-switching	Enable label switching on the interface
BR6(config-if)#exit	Exit the interface mode
BR6(config)#interface eth6	Enter interface mode
BR6(config-if)#ip address 27.1.1.168/24	Configure ip address on the interface

© 2026 IP Infusion Inc. Proprietary

`BR6(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR6(config-if)#label-switching`	Enable label switching on the interface
`BR6(config-if)#exit`	Exit the interface mode
`BR6(config)#router ospf 2`	Configure router ospf with instance id 2
`BR6(config-router)#network 11.11.11.11/32 area 0`	Add the loopback network into instance 2
`BR6(config-router)#network 27.1.1.0/24 area 0`	Add the network as part of ospf instance id 2
`BR6(config-router)#exit`	Exit the router ospf mode
`BR6(config)#router ospf 3`	Configure router ospf which will be part of aggregation 2 with instance id as 3
`BR6(config-router)#network 11.11.11.11/32 area 0.0.0.0 instance-id 3`	Add interface loopback into ospf instance 3 with area 0 using network command
`BR6(config-router)#network 28.1.1.0/24 area 0`	Add the network as part of ospf instance id 3
`BR6(config-router)#exit`	Exit the router ospf mode
`BR6(config)#router bgp 100`	Configure router bgp
`BR6(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure ibgp neighbor
`BR6(config-router)#neighbor 7.7.7.7 remote-as 100`	Configure ibgp neighbor
`BR6(config-router)#neighbor 8.8.8.8 remote-as 100`	Configure ibgp neighbor
`BR6(config-router)#neighbor 9.9.9.9 remote-as 100`	Configure ibgp neighbor
`BR6(config-router)#neighbor 13.13.13.13 remote-as 100`	Configure ibgp neighbor
`BR6(config-router)#neighbor 15.15.15.15 remote-as 100`	Configure ibgp neighbor
`BR6(config-router)#neighbor 3.3.3.3 update-source 11.11.11.11`	Configure update source for the neighbor with loopback address
`BR6(config-router)#neighbor 7.7.7.7 update-source 11.11.11.11`	Configure update source for the neighbor with loopback address
`BR6(config-router)#neighbor 8.8.8.8 update-source 11.11.11.11`	Configure update source for the neighbor with loopback address
`BR6(config-router)#neighbor 9.9.9.9 update-source 11.11.11.11`	Configure update source for the neighbor with loopback address
`BR6(config-router)#neighbor 13.13.13.13 update-source 11.11.11.11`	Configure update source for the neighbor with loopback address
`BR6(config-router)#neighbor 15.15.15.15 update-source 11.11.11.11`	Configure update source for the neighbor with loopback address
`BR6(config-router)#neighbor 3.3.3.3 fall-over bfd multihop`	Configure bfd for the neighbor
`BR6(config-router)#neighbor 7.7.7.7 fall-over bfd multihop`	Configure bfd for the neighbor
`BR6(config-router)#neighbor 8.8.8.8 fall-over bfd multihop`	Configure bfd for the neighbor
`BR6(config-router)#neighbor 9.9.9.9 fall-over bfd`	Configure bfd for the neighbor

© 2026 IP Infusion Inc. Proprietary

multihop	
BR6(config-router)#neighbor 13.13.13.13 fall-over bfd multihop	Configure bfd for the neighbor
BR6(config-router)#neighbor 15.15.15.15 fall-over bfd multihop	Configure bfd for the neighbor
BR6(config-router)#allocate-label all	Configure allocate label all command
BR6(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR6(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor under address family labeled unicast
BR6(config-router-af)#neighbor 7.7.7.7 activate	Activate the neighbor under address family labeled unicast
BR6(config-router-af)#neighbor 8.8.8.8 activate	Activate the neighbor under address family labeled unicast
BR6(config-router-af)#neighbor 9.9.9.9 activate	Activate the neighbor under address family labeled unicast
BR6(config-router-af)#neighbor 13.13.13.13 activate	Activate the neighbor under address family labeled unicast
BR6(config-router-af)#neighbor 15.15.15.15 activate	Activate the neighbor under address family labeled unicast
BR6(config-router-af)#neighbor 13.13.13.13 route-reflector-client	Configure neighbor as route reflector client
BR6(config-router-af)#neighbor 7.7.7.7 route-reflector-client	Configure neighbor as route reflector client
BR6(config-router-af)#neighbor 15.15.15.15 route-reflector-client	Configure neighbor as route reflector client
BR6(config-router-af)#neighbor 15.15.15.15 next-hop-self	Configure next-hop self for the neighbor
BR6(config-router-af)#neighbor 3.3.3.3 next-hop-self	Configure next-hop self for the neighbor
BR6(config-router-af)#neighbor 8.8.8.8 next-hop-self	Configure next-hop self for the neighbor
BR6(config-router-af)#neighbor 9.9.9.9 next-hop-self	Configure next-hop self for the neighbor
BR6(config-router-af)#bgp additional-paths send	Enable additional paths send capability on neighbor level under ipv4 labeled unicast address family
BR6(config-router-af)#bgp additional-paths select best 2	Select best 2 paths from the available additional paths to advertise to the next router
BR6(config-router)#exit	Exit BGP router mode

BR2 Configurations

BR2(config)#enable ext-ospf-multi-inst	Enable ospf multi instance

`BR2(config)#interface lo`	Enter interface lo mode
`BR2(config-if)#ip address 5.5.5.5/32`	Configure ip address for loopback interface
`BR2(config-if)#exit`	Exit the interface mode
`BR2(config)#router ldp`	Configure ldp on the router
`BR2(config-router)#transport-address ipv4 5.5.5.5`	Enable loopback ip as transport address
`BR2(config-router)#exit`	Exit router ldp mode
`BR2(config)#interface eth1`	Enter interface mode
`BR2(config-if)#ip address 50.1.1.160/24`	Configure ip address on the interface
`BR2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR2(config-if)#label-switching`	Enable label switching on the interface
`BR2(config-if)#exit`	Exit the interface mode
`BR2(config)#interface eth2`	Enter interface mode
`BR2(config-if)#ip address 40.1.1.160/24`	Configure ip address on the interface
`BR2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR2(config-if)#label-switching`	Enable label switching on the interface
`BR2(config-if)#exit`	Exit the interface mode
`BR2(config)#router ospf 2`	Configure router ospf with instance id 2
`BR2(config-router)#network 5.5.5.5/32 area 0`	Add the loopback network into instance 2
`BR2(config-router)#network 40.1.1.0/24 area 0`	Add the network as part of ospf instance id 2
`BR2(config-router)#exit`	Exit the router ospf mode
`BR2(config)#router ospf 3`	Configure router ospf which will be part of aggregation 2 with instance id as 3
`BR2(config-router)#network 5.5.5.5/32 area 0.0.0.0 instance-id 3`	Add interface loopback into ospf instance 3 with area 0 using network command
`BR2(config-router)#network 50.1.1.0/24 area 0`	Add the network as part of ospf instance id 3
`BR2(config-router)#exit`	Exit the router ospf mode
`BR2(config)#router bgp 100`	Configure router bgp
`BR2(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure ibgp neighbor
`BR2(config-router)#neighbor 7.7.7.7 remote-as 100`	Configure ibgp neighbor
`BR2(config-router)#neighbor 8.8.8.8 remote-as 100`	Configure ibgp neighbor
`BR2(config-router)#neighbor 9.9.9.9 remote-as 100`	Configure ibgp neighbor
`BR2(config-router)#neighbor 13.13.13.13 remote-as 100`	Configure ibgp neighbor
`BR2(config-router)#neighbor 15.15.15.15 remote-as 100`	Configure ibgp neighbor
`BR2(config-router)#neighbor 3.3.3.3 update-source 5.5.5.5`	Configure update source for the neighbor with loopback address
`BR2(config-router)#neighbor 7.7.7.7 update-source`	Configure update source for the neighbor with

5.5.5.5	loopback address
BR2(config-router)#neighbor 8.8.8.8 update-source 5.5.5.5	Configure update source for the neighbor with loopback address
BR2(config-router)#neighbor 9.9.9.9 update-source 5.5.5.5	Configure update source for the neighbor with loopback address
BR2(config-router)#neighbor 13.13.13.13 update-source 5.5.5.5	Configure update source for the neighbor with loopback address
BR2(config-router)#neighbor 15.15.15.15 update-source 5.5.5.5	Configure update source for the neighbor with loopback address
BR2(config-router)#neighbor 3.3.3.3 fall-over bfd multihop	Configure bfd for the neighbor
BR2(config-router)#neighbor 7.7.7.7 fall-over bfd multihop	Configure bfd for the neighbor
BR2(config-router)#neighbor 8.8.8.8 fall-over bfd multihop	Configure bfd for the neighbor
BR2(config-router)#neighbor 9.9.9.9 fall-over bfd multihop	Configure bfd for the neighbor
BR2(config-router)#neighbor 13.13.13.13 fall-over bfd multihop	Configure bfd for the neighbor
BR2(config-router)#neighbor 15.15.15.15 fall-over bfd multihop	Configure bfd for the neighbor
BR2(config-router)#allocate-label all	Configure allocate label all command
BR2(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR2(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor under address family labeled unicast
BR2(config-router-af)#neighbor 7.7.7.7 activate	Activate the neighbor under address family labeled unicast
BR2(config-router-af)#neighbor 8.8.8.8 activate	Activate the neighbor under address family labeled unicast
BR2(config-router-af)#neighbor 9.9.9.9 activate	Activate the neighbor under address family labeled unicast
BR2(config-router-af)#neighbor 13.13.13.13 activate	Activate the neighbor under address family labeled unicast
BR2(config-router-af)#neighbor 15.15.15.15 activate	Activate the neighbor under address family labeled unicast
BR2(config-router-af)#neighbor 13.13.13.13 route-reflector-client	Configure neighbor as route reflector client
BR2(config-router-af)#neighbor 7.7.7.7 route-reflector-client	Configure neighbor as route reflector client
BR2(config-router-af)#neighbor 15.15.15.15 route-reflector-client	Configure neighbor as route reflector client
BR2(config-router-af)#neighbor 15.15.15.15 next-hop-self	Configure next-hop self for the neighbor

BR2(config-router-af)#neighbor 3.3.3.3 next-hop-self	Configure next-hop self for the neighbor
BR2(config-router-af)#neighbor 8.8.8.8 next-hop-self	Configure next-hop self for the neighbor
BR2(config-router-af)#neighbor 9.9.9.9 next-hop-self	Configure next-hop self for the neighbor
BR2(config-router-af)#bgp additional-paths send	Enable additional paths send capability on neighbor level under ipv4 labeled unicast address family
BR2(config-router-af)#bgp additional-paths select best 3	Select best 3 paths from the available additional paths to advertise to the next router
BR2(config-router)#exit	Exit BGP router mode

BR7 Configurations

BR7(config)#enable ext-ospf-multi-inst	Enable ospf multi instance
BR7(config)#interface lo	Enter interface lo mode
BR7(config-if)#ip address 12.12.12.12/32	Configure ip address for loopback interface
BR7(config-if)#exit	Exit the interface mode
BR7(config)#access-list 1 permit 3.3.3.3 0.0.0.0	Configure the access list to allow the BR5 loopback ip
BR7(config)#access-list 2 permit 8.8.8.8 0.0.0.0	Configure the access list to allow the BR6 loopback ip
BR7(config)#access-list 3 permit 9.9.9.9 0.0.0.0	Configure the access list to allow the BR7 loopback ip
BR7(config)#route-map A permit 10	Configure route-map A and permit
BR7(config-route-map)#match ip address 1	Match ip address 1
BR7(config-route-map)#exit	Exit the route-map
BR7(config)#route-map A permit 20	Configure route-map A and permit
BR7(config-route-map)#match ip address 2	Match ip address 2
BR7(config-route-map)#exit	Exit the route-map
BR7(config)#route-map A permit 30	Configure route-map A and permit
BR7(config-route-map)#match ip address 3	Match ip address 3
BR7(config-route-map)#exit	Exit the route-map
BR7(config)#router ldp	Configure ldp on the router
BR7(config-router)#transport-address ipv4 12.12.12.12 0	Enable loopback ip as transport address
BR7(config-router)#exit	Exit router ldp mode
BR7(config)#interface eth5	Enter interface mode
BR7(config-if)#ip address 33.1.1.169/24	Configure ip address on the interface

© 2026 IP Infusion Inc. Proprietary

`BR7(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR7(config-if)#label-switching`	Enable label switching on the interface
`BR7(config-if)#exit`	Exit the interface mode
`BR7(config)#interface eth7`	Enter interface mode
`BR7(config-if)#ip address 29.1.1.169/24`	Configure ip address on the interface
`BR7(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`BR7(config-if)#label-switching`	Enable label switching on the interface
`BR7(config-if)#exit`	Exit the interface mode
`BR7(config)#router ospf 2`	Configure router ospf with instance id 2
`BR7(config-router)#network 12.12.12.12/32 area 0`	Add the loopback network into instance 2
`BR7(config-router)#network 29.1.1.0/24 area 0`	Add the network as part of ospf instance id 2
`BR7(config-router)#exit`	Exit the router ospf mode
`BR7(config)#router ospf 3`	Configure router ospf which will be part of aggregation 2 with instance id as 3
`BR7(config-router)#redistribute ospf 2 route-map A`	Redistribute selected loopbacks into ospf instance 3
`BR7(config-router)#network 12.12.12.12/32 area 0.0.0.0 instance-id 3`	Add interface loopback into ospf instance 3 with area 0 using network command
`BR7(config-router)#network 33.1.1.0/24 area 0`	Add the network as part of ospf instance id 3
`BR7(config-router)#exit`	Exit the router ospf mode
`BR7(config)#router bgp 100`	Configure router bgp
`BR7(config-router)#neighbor 3.3.3.3 remote-as 100`	Configure ibgp neighbor
`BR7(config-router)#neighbor 7.7.7.7 remote-as 100`	Configure ibgp neighbor
`BR7(config-router)#neighbor 8.8.8.8 remote-as 100`	Configure ibgp neighbor
`BR7(config-router)#neighbor 9.9.9.9 remote-as 100`	Configure ibgp neighbor
`BR7(config-router)#neighbor 13.13.13.13 remote-as 100`	Configure ibgp neighbor
`BR7(config-router)#neighbor 15.15.15.15 remote-as 100`	Configure ibgp neighbor
`BR7(config-router)#neighbor 3.3.3.3 update-source 12.12.12.12`	Configure update source for the neighbor with loopback address
`BR7(config-router)#neighbor 7.7.7.7 update-source 12.12.12.12`	Configure update source for the neighbor with loopback address
`BR7(config-router)#neighbor 8.8.8.8 update-source 12.12.12.12`	Configure update source for the neighbor with loopback address
`BR7(config-router)#neighbor 9.9.9.9 update-source 12.12.12.12`	Configure update source for the neighbor with loopback address
`BR7(config-router)#neighbor 13.13.13.13 update-source 12.12.12.12`	Configure update source for the neighbor with loopback address

© 2026 IP Infusion Inc. Proprietary

BR7(config-router)#neighbor 15.15.15.15 update-source 12.12.12.12	Configure update source for the neighbor with loopback address
BR7(config-router)#neighbor 3.3.3.3 fall-over bfd multihop	Configure bfd for the neighbor
BR7(config-router)#neighbor 7.7.7.7 fall-over bfd multihop	Configure bfd for the neighbor
BR7(config-router)#neighbor 8.8.8.8 fall-over bfd multihop	Configure bfd for the neighbor
BR7(config-router)#neighbor 9.9.9.9 fall-over bfd multihop	Configure bfd for the neighbor
BR7(config-router)#neighbor 13.13.13.13 fall-over bfd multihop	Configure bfd for the neighbor
BR7(config-router)#neighbor 15.15.15.15 fall-over bfd multihop	Configure bfd for the neighbor
BR7(config-router)#allocate-label all	Configure allocate label all command
BR7(config-router)#address-family ipv4 labeled-unicast	Configure address-family ipv4 labeled unicast
BR7(config-router-af)#neighbor 3.3.3.3 activate	Activate the neighbor under address family labeled unicast
BR7(config-router-af)#neighbor 7.7.7.7 activate	Activate the neighbor under address family labeled unicast
BR7(config-router-af)#neighbor 8.8.8.8 activate	Activate the neighbor under address family labeled unicast
BR7(config-router-af)#neighbor 9.9.9.9 activate	Activate the neighbor under address family labeled unicast
BR7(config-router-af)#neighbor 13.13.13.13 activate	Activate the neighbor under address family labeled unicast
BR7(config-router-af)#neighbor 15.15.15.15 activate	Activate the neighbor under address family labeled unicast
BR7(config-router-af)#neighbor 13.13.13.13 route-reflector-client	Configure neighbor as route reflector client
BR7(config-router-af)#neighbor 7.7.7.7 route-reflector-client	Configure neighbor as route reflector client
BR7(config-router-af)#neighbor 15.15.15.15 route-reflector-client	Configure neighbor as route reflector client
BR7(config-router-af)#neighbor 15.15.15.15 next-hop-self	Configure next-hop self for the neighbor
BR7(config-router-af)#neighbor 3.3.3.3 next-hop-self	Configure next-hop self for the neighbor
BR7(config-router-af)#neighbor 8.8.8.8 next-hop-self	Configure next-hop self for the neighbor
BR7(config-router-af)#neighbor 9.9.9.9 next-hop-self	Configure next-hop self for the neighbor
BR7(config-router-af)#bgp additional-paths send-receive	Enable additional paths send-receive capability on neighbor level under ipv4 labeled unicast address

© 2026 IP Infusion Inc. Proprietary

	family
BR7(config-router-af)#bgp additional-paths select all	Select all additional paths to advertise to the next router
BR7(config-router-af)#exit-address-family	Exit bgp address-family ipv6 labeled-unicast mode
BR7(config-router)#exit	Exit BGP router mode

P3 Configurations

P3(config)#interface lo	Enter interface lo mode
P3(config-if)#ip address 6.6.6.6/32	Configure ip address for loopback interface
P3(config-if)#exit	Exit interface loopback mode
P3(config)#router ldp	Configure ldp on the router
P3(config-router)#transport-address ipv4 6.6.6.60	Enable loopback ip as transport address
P3(config-router)#exit	Exit the router ldp mode
P3(config)#interface eth1	Enter interface mode
P3(config-if)#ip address 50.1.1.161/24	Configure ip address on the interface
P3(config-if)#enable-ldp ipv4	Enable ldp on the interface
P3(config-if)#label-switching	Enable label switching on the interface
P3(config-if)#exit	Exit the interface mode
P3(config)#interface eth2	Enter interface mode
P3(config-if)#ip address 60.1.1.161/24	Configure ip address on the interface
P3(config-if)#enable-ldp ipv4	Enable ldp on the interface
P3(config-if)#label-switching	Enable label switching on the interface
P3(config-if)#exit	Exit the interface mode
P3(config)#interface eth3	Enter interface mode
P3(config-if)#ip address 26.1.1.161/24	Configure ip address on the interface
P3(config-if)#enable-ldp ipv4	Enable rsvp on the interface
	Enable label switching on the interface
P3(config-if)#exit	Exit the interface mode
P3(config)#interface eth4	Enter interface mode
P3(config-if)#ip address 28.1.1.161/24	Configure ip address on the interface
P3(config-if)#enable-ldp ipv4	Enable ldp on the interface
P3(config-if)#label-switching	Enable label switching on the interface
P3(config-if)#exit	Exit the interface mode
P3(config)#interface eth5	Enter interface mode
P3(config-if)#ip address 33.1.1.161/24	Configure ip address on the interface

© 2026 IP Infusion Inc. Proprietary

`P3(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P3(config-if)#label-switching`	Enable label switching on the interface
`P3(config-if)#exit`	Exit the interface mode
`P3(config)#interface eth6`	Enter interface mode
`P3(config-if)#ip address 32.1.1.161/24`	Configure ip address on the interface
`P3(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P3(config-if)#label-switching`	Enable label switching on the interface
`P3(config-if)#exit`	Exit the interface mode
`P3(config)#interface eth7`	Enter interface mode
`P3(config-if)#ip address 42.1.1.161/24`	Configure ip address on the interface
`P3(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`P3(config-if)#label-switching`	Enable label switching on the interface
`P3(config-if)#exit`	Exit the interface mode
`P3(config)#router ospf 3`	Configure Router ospf with instance id 3
`P3(config-router)#network 26.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 28.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 32.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 33.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 42.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 50.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 60.1.1.0/24 area 0.0.0.0`	Add interface into ospf instance 3 with area 0 using network command
`P3(config-router)#network 6.6.6.6/32 area 0.0.0.0`	Add interface loopback into ospf instance 2 with area 0 using network command
`P3(config-router)#exit`	Exit router ospf mode

AGN4 Configurations

`AGN4(config)#interface lo`	Enter interface lo mode
`AGN4(config-if)#ip address 13.13.13.13/32`	Configure ip address for loopback interface
`AGN4(config-if)#exit`	Exit interface loopback mode
`AGN4(config)#router ldp`	Configure router ldp
`AGN4(config-router)#transport-address ipv4`	Configure transport address as loopback

© 2026 IP Infusion Inc. Proprietary

13.13.13.13	
AGN4(config)#exit	Exit the router ldp mode
AGN4(config)#interface eth6	Enter interface mode
AGN4(config-if)#ip address 32.1.1.170/24	Configure ip address on the interface
AGN4(config-if)#enable-ldp ipv4	Enable ldp on the interface
AGN4(config-if)#label-switching	Enable label-switching on the interface
AGN4(config-if)#exit	Exit the interface mode
AGN4(config)#router ospf 3	Configure router ospf instance 3
AGN4(config-router)#network 13.13.13.13/32 area 0	Add the loopback network into ospf instance 3
AGN4(config-router)#network 32.1.1.0/24 area 0	Add the ip address into ospf instance 3
AGN4(config-router)#exit	Exit router ospf mode
AGN4(config)#router bgp 100	Enter router bgp mode
AGN4(config-router)#network 13.13.13.13/32	Advertise loopback through network command inside bgp
AGN4(config-router)#neighbor 5.5.5.5 remote-as 100	Configure iBGP neighbor
AGN4(config-router)#neighbor 10.10.10.10 remote-as 100	Configure iBGP neighbor
AGN4(config-router)#neighbor 11.11.11.11 remote-as 100	Configure iBGP neighbor
AGN4(config-router)#neighbor 12.12.12.12 remote-as 100	Configure iBGP neighbor
AGN4(config-router)#neighbor 5.5.5.5 update-source 13.13.13.13	Update the source for the neighbor as loopback ip
AGN4(config-router)#neighbor 10.10.10.10 update-source 13.13.13.13	Update the source for the neighbor as loopback ip
AGN4(config-router)#neighbor 11.11.11.11 update-source 13.13.13.13	Update the source for the neighbor as loopback ip
AGN4(config-router)#neighbor 12.12.12.12 update-source 13.13.13.13	Update the source for the neighbor as loopback ip
AGN4(config-router)#neighbor 5.5.5.5 fall-over bfd multihop	Configure bfd for all the neighbors
AGN4(config-router)#neighbor 10.10.10.10 fall-over bfd multihop	Configure bfd for all the neighbors
AGN4(config-router)#neighbor 11.11.11.11 fall-over bfd multihop	Configure bfd for all the neighbors
AGN4(config-router)#neighbor 12.12.12.12 fall-over bfd multihop	Configure bfd for all the neighbors
AGN4(config-router)#allocate-label all	Enable allocate label all command
AGN4(config-router)#address-family ipv4 labeled-unicast	Enter ipv4 labeled-unicast address family
AGN4(config-router-af)#neighbor 5.5.5.5 activate	Activate the neighbor under ipv4 labeled-unicast address family

© 2026 IP Infusion Inc. Proprietary

`AGN4(config-router-af)#neighbor 10.10.10.10 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN4(config-router-af)#neighbor 11.11.11.11 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN4(config-router-af)#neighbor 12.12.12.12 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN4(config-router-af)#bgp additional-paths receive`	Enable bgp additional paths receive at global level under ipv4 labeled unicast address family
`AGN4(config-router-af)#exit`	End from router bgp mode

AGN2 Configurations

`AGN2(config)#interface lo`	Enter interface lo mode
`AGN2(config-if)#ip address 7.7.7.7/32`	Configure ip address for loopback interface
`AGN2(config-if)#exit`	Exit interface loopback mode
`AGN2(config)#router ldp`	Configure router ldp
`AGN2(config-router)#transport-address ipv4 7.7.7.7`	Configure transport address as loopback
`AGN2(config-router)#exit`	Exit router ldp mode
`AGN2(config)#interface eth2`	Enter interface mode
`AGN2(config-if)#ip address 60.1.1.162/24`	Configure ip address on the interface
`AGN2(config-if)#enable-ldp ipv4`	Enable ldp on the interface
`AGN2(config-if)#label-switching`	Enable label-switching on the interface
`AGN2(config-if)#exit`	Exit the interface mode
`AGN2(config)#router ospf 3`	Configure router ospf instance 3
`AGN2(config-router)#network 7.7.7.7/32 area 0`	Add the loopback network into ospf instance 3
`AGN2(config-router)#network 60.1.1.0/24 area 0`	Add the ip address into ospf instance 3
`AGN2(config-router)#exit`	Exit router ospf mode
`AGN2(config)#router bgp 100`	Enter router bgp mode
`AGN2(config-router)#network 7.7.7.7/32`	Advertise loopback through network command inside bgp
`AGN2(config-router)#neighbor 5.5.5.5 remote-as 100`	Configure iBGP neighbor
`AGN2(config-router)#neighbor 10.10.10.10 remote-as 100`	Configure iBGP neighbor
`AGN2(config-router)#neighbor 11.11.11.11 remote-as 100`	Configure iBGP neighbor
`AGN2(config-router)#neighbor 12.12.12.12 remote-as 100`	Configure iBGP neighbor
`AGN2(config-router)#neighbor 5.5.5.5 update-source 7.7.7.7`	Update the source for the neighbor as loopback ip

© 2026 IP Infusion Inc. Proprietary

`AGN2(config-router)#neighbor 10.10.10.10 update-source 7.7.7.7`	Update the source for the neighbor as loopback ip
`AGN2(config-router)#neighbor 11.11.11.11 update-source 7.7.7.7`	Update the source for the neighbor as loopback ip
`AGN2(config-router)#neighbor 12.12.12.12 update-source 7.7.7.7`	Update the source for the neighbor as loopback ip
`AGN2(config-router)#neighbor 5.5.5.5 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN2(config-router)#neighbor 10.10.10.10 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN2(config-router)#neighbor 11.11.11.11 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN2(config-router)#neighbor 12.12.12.12 fall-over bfd multihop`	Configure bfd for all the neighbors
`AGN2(config-router)#allocate-label all`	Enable allocate label all command
`AGN2(config-router)#address-family ipv4 labeled-unicast`	Enter ipv4 labeled-unicast address family
`AGN2(config-router-af)#neighbor 5.5.5.5 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN2(config-router-af)#neighbor 10.10.10.10 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN2(config-router-af)#neighbor 11.11.11.11 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN2(config-router-af)#neighbor 12.12.12.12 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN2(config-router-af)#neighbor 5.5.5.5 additional-paths receive`	Enable bgp additional paths receive at neighbor level under ipv4 labeled unicast address family
`AGN2(config-router-af)#neighbor 10.10.10.10 additional-paths receive`	Enable bgp additional paths receive at neighbor level under ipv4 labeled unicast address family
`AGN2(config-router-af)#neighbor 11.11.11.11 additional-paths receive`	Enable bgp additional paths receive at neighbor level under ipv4 labeled unicast address family
`AGN2(config-router-af)#exit-address-family`	Exit BGP address-family ipv4-labeled unicast mode
`AGN2(config-router)#end`	Return to configure terminal mode

AGN5 Configurations

`AGN5(config)#interface lo`	Enter interface lo mode
`AGN5(config-if)#ip address 15.15.15.15/32`	Configure ip address for loopback interface
`AGN5(config-if)#exit`	Exit interface loopback mode
`AGN5(config)#router ldp`	Configure router ldp
`AGN5(config-router)#transport-address ipv4 15.15.15.15`	Configure transport address as loopback

© 2026 IP Infusion Inc. Proprietary

AGN5(config-router)#exit	Exit router ldp mode
AGN5(config)#interface eth7	Enter interface mode
AGN5(config-if)#ip address 42.1.1.172/24	Configure ip address on the interface
AGN5(config-if)#enable-ldp ipv4	Enable ldp on the interface
AGN5(config-if)#label-switching	Enable label-switching on the interface
AGN5(config-if)#exit	Exit the interface mode
AGN5(config)#router ospf 3	Configure router ospf instance 3
AGN5(config-router)#network 15.15.15.15/32 area 0	Add the loopback network into ospf instance 3
AGN5(config-router)#network 42.1.1.0/24 area 0	Add the ip address into ospf instance 3
AGN5(config-router)#exit	Exit router ospf mode
AGN5(config)#router bgp 100	Enter router bgp mode
AGN5(config-router)#network 15.15.15.15/32	Advertise loopback through network command inside bgp
AGN5(config-router)#neighbor 5.5.5.5 remote-as 100	Configure iBGP neighbor
AGN5(config-router)#neighbor 10.10.10.10 remote-as 100	Configure iBGP neighbor
AGN5(config-router)#neighbor 11.11.11.11 remote-as 100	Configure iBGP neighbor
AGN5(config-router)#neighbor 12.12.12.12 remote-as 100	Configure iBGP neighbor
AGN5(config-router)#neighbor 5.5.5.5 update-source 15.15.15.15	Update the source for the neighbor as loopback ip
AGN5(config-router)#neighbor 10.10.10.10 update-source 15.15.15.15	Update the source for the neighbor as loopback ip
AGN5(config-router)#neighbor 11.11.11.11 update-source 15.15.15.15	Update the source for the neighbor as loopback ip
AGN5(config-router)#neighbor 12.12.12.12 update-source 15.15.15.15	Update the source for the neighbor as loopback ip
AGN5(config-router)#neighbor 5.5.5.5 fall-over bfd multihop	Configure bfd for all the neighbors
AGN5(config-router)#neighbor 10.10.10.10 fall-over bfd multihop	Configure bfd for all the neighbors
AGN5(config-router)#neighbor 11.11.11.11 fall-over bfd multihop	Configure bfd for all the neighbors
AGN5(config-router)#neighbor 12.12.12.12 fall-over bfd multihop	Configure bfd for all the neighbors
AGN5(config-router)#allocate-label all	Enable allocate label all command
AGN5(config-router)#address-family ipv4 labeled-unicast	Enter ipv4 labeled-unicast address family
AGN5(config-router-af)#neighbor 5.5.5.5 activate	Activate the neighbor under ipv4 labeled-unicast address family
AGN5(config-router-af)#neighbor 10.10.10.10 activate	Activate the neighbor under ipv4 labeled-unicast

© 2026 IP Infusion Inc. Proprietary

	address family
`AGN5(config-router-af)#neighbor 11.11.11.11 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN5(config-router-af)#neighbor 12.12.12.12 activate`	Activate the neighbor under ipv4 labeled-unicast address family
`AGN5(config-router-af)#exit-address-family`	Exit BGP address-family ipv4-labeled unicast mode
`AGN5(config-router)#end`	Return to configure terminal mode
`AGN5(config-router-af)#exit`	End from router bgp mode

Validation for BGP Labeled Unicast with Additional Paths

Verify OSPF neighborship is up with `show ip ospf neighbor`.

Verify LDP sessions are up with `show ldp session`.

Check BGPLU with Additional Paths

```
AGN1#

BR3#show ip bgp labeled-unicast all

BGP4+ Additional Paths Configuration

Overview

The Border Gateway Protocol (BGP) ADDPATH feature allows the advertisement of multiple paths through the same peering session for a given prefix without the new paths implicitly replacing any previous paths. This behavior promotes path diversity and reduces the severity of a network failure, thereby improving the control plane convergence in case of network failures.

Normal BGP Behavior

By default, all BGP routers and Route-Reflectors propagate only their best paths over their sessions. In case they advertise any route with the same NLRI as a previously advertised route, the latest one implicitly replaces the previous advertisement, which is known as an Implicit Withdraw. The Implicit Withdraw can achieve better scaling, but at the cost of path diversity.

The use of route-reflectors (or confederations), thus has significant effect on redundancy by hiding alternate paths. Using full-mesh is not an option, so a mechanism is needed to allow the propagation of multiple alternate paths in an RR/Confederation environment. Such mechanism is already available in BGP/MPLS VPN scenarios, where multiple point of attachments for CE sites could utilize different RD values to differentiate the same routes advertised from different connection points. However, a generic solution is required, allowing for advertising multiple alternate paths with IPv4 or any other address-family.

The “Advertisement of Multiple Paths in BGP” or “BGP Add-Path” as the feature is usually called is a BGP extension that allows the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previously advertised ones.

BGP Behavior with Additional Paths

The advertisement of multiple paths in BGP is made possible by aending a BGP OPEN message to the neighbor with a BGP capability code of 69, which identifies the BGP ADD-PATH Capability.

Address Family Identifier(AFI)	2 octets
Subsequent Address Family Identifier(SAFI)	1 octet
Send/Receive	1 octet

The send/receive field in the BGP Capability TLV indicates whether for a given <AFI, SAFI>, the sender is able to:

- Receive multiple paths from its peer (value 1)
- Send multiple paths to its peer (value 2), or
- both (value 3)
- Each alternate path is identified by a Path Identifier in addition to the address prefix

Path Identifier	4 octets
Length	1 octet
Prefix	variable

In the event of a next-hop failure, the BGP Add-Path feature hence improves the BGP control plane convergence

© 2026 IP Infusion Inc. Proprietary

Note: BGP does not advertise additional paths (non-best paths) to a neighbor when the neighbor is an eBGP peer with implicit next-hop-self or when next-hop-self is explicitly configured using the neighbor A.B.C.D next-hop-self command.

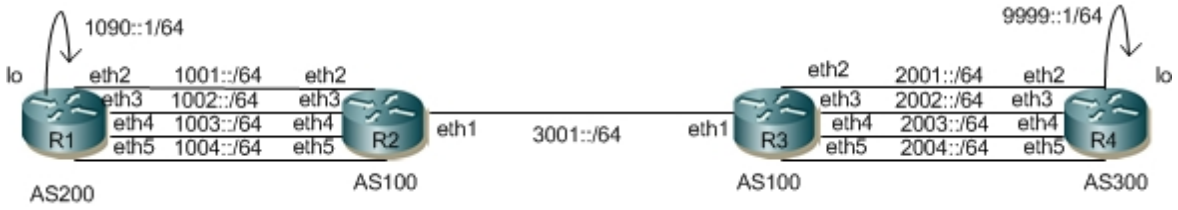
Topology

Figure 87. BGP4+ additional paths



R1

`#configure terminal`	Enter the configure mode.
`(config)#interface eth2`	Enter interface mode for interface eth2
`(config-if)#ipv6 address 1001::1/64`	Configure IPv6 address for the interface eth2
`(config-if)#exit`	Exit the interface mode
`(config)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ipv6 address 1002::1/64`	Configure IPv6 address for the interface eth3
`(config-if)#exit`	Exit the interface mode
`(config)#interface eth4`	Enter interface mode for interface eth4
`(config-if)#ipv6 address 1003::1/64`	Configure IPv6 address for the interface eth4
`(config-if)#exit`	Exit the interface mode
`(config)#interface eth5`	Enter interface mode for interface eth5
`(config-if)#ipv6 address 1004::1/64`	Configure IPv6 address for the interface eth5
`(config-if)#exit`	Exit the interface mode
`(config)#interface lo`	Enter interface mode for loopback lo
`(config-if)#ipv6 address 1090::1/64`	Configure IPv6 address for Loopback interface lo
`(config-if)#exit`	Exit the interface mode
`(config)#router bgp 200`	Enter the router bgp mode
`(config-router)#neighbor 1001::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#neighbor 1002::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#neighbor 1004::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#neighbor 1003::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#address-family ipv6 unicast`	Enter address-family mode for neighbor router session to activate.

(config-if)#exit	Exit the interface mode
(config)#interface eth4	Enter interface mode for interface eth4
(config-if)#ipv6 address 2003::2/64	Configure IPv6 address for the interface eth4
(config-if)#exit	Exit the interface mode
(config)#interface eth5	Enter interface mode for interface eth5

© 2026 IP Infusion Inc. Proprietary

(config-if)#ipv6 address 2004::2/64	Configure IPv6 address for the interface eth5
(config-if)#exit	Exit the interface mode
(config)#router bgp 100	Enter the router bgp mode
(config-router)#neighbor 3001::1 remote-as 100	Specify a neighbor router with peer address and remote-as for BGP peering.
(config-router)#neighbor 2001::1 remote-as 300	Specify a neighbor router with peer address and remote-as for BGP peering.
(config-router)#neighbor 2002::1 remote-as 300	Specify a neighbor router with peer address and remote-as for BGP peering.
(config-router)#neighbor 2003::1 remote-as 300	Specify a neighbor router with peer address and remote-as for BGP peering.
(config-router)#neighbor 2004::1 remote-as 300	Specify a neighbor router with peer address and remote-as for BGP peering.
(config-router)#address-family ipv6 unicast	Enter address-family mode for neighbor router session to activate.
(config-router-af)#neighbor 2001::1 activate	Activate the neighbor router with peer address.
(config-router-af)#neighbor 2002::1 activate	Activate the neighbor router with peer address.
(config-router-af)#neighbor 2003::1 activate	Activate the neighbor router with peer address.
(config-router-af)#neighbor 2004::1 activate	Activate the neighbor router with peer address.
(config-router-af)#neighbor 3001::1 activate	Activate the neighbor router with peer address.
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit Router BGP mode
(config)#router ipv6 ospf	Enter Router OSPFv3 mode.
(config-router)#redistribute connected	Configure Redistribution of Connected networks into OSPF
(config-router)#exit	Exit the router ospf mode and enter the configure mode
(config)#commit	Apply commit
(config)#exit	Exit the configure mode

R4

#configure terminal	Enter the configure mode.
(config)#interface eth2	Enter interface mode for interface eth2
(config-if)#ipv6 address 2001::1/64	Configure IPv6 address for the interface eth2
(config-if)#exit	Exit the interface mode
(config)#interface eth3	Enter interface mode for interface eth3
(config-if)#ipv6 address 2002::1/64	Configure IPv6 address for the interface eth3
(config-if)#exit	Exit the interface mode

© 2026 IP Infusion Inc. Proprietary

`(config)#interface eth4`	Enter interface mode for interface eth4
`(config-if)#ipv6 address 2003::1/64`	Configure IPv6 address for the interface eth4
`(config-if)#exit`	Exit the interface mode
`(config)#interface eth5`	Enter interface mode for interface eth5
`(config-if)#ipv6 address 2004::1/64`	Configure IPv6 address for the interface eth5
`(config-if)#exit`	Exit the interface mode
`(config)#interface lo`	Enter interface mode for loopback lo
`(config-if)#ipv6 address 9999::1/64`	Configure IPv6 address for Loopback interface lo
`(config-if)#exit`	Exit the interface mode
`(config)#router bgp 300`	Enter the router bgp mode
`(config-router)#neighbor 2001::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#neighbor 2002::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#neighbor 2003::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#neighbor 2004::2 remote-as 100`	Specify a neighbor router with peer address and remote-as for BGP peering.
`(config-router)#address-family ipv6 unicast`	Enter address-family mode for neighbor router session to activate.
`(config-router-af)#neighbor 2001::2 activate`	Activate the neighbor router with peer address.
`(config-router-af)#neighbor 2002::2 activate`	Activate the neighbor router with peer address.
`(config-router-af)#neighbor 2003::2 activate`	Activate the neighbor router with peer address.
`(config-router-af)#neighbor 2004::2 activate`	Activate the neighbor router with peer address.
`(config-router-af)#network 9999::/64`	Activate the neighbor router with peer address.
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config-router)#exit`	Exit the router BGP mode and enter the configure mode
`(config)#commit`	Apply commit
`(config)#exit`	Exit the configure mode

Additional Paths at the Global Level

R2

`#configure terminal`	Enter the configure mode.
`(config)#router bgp 100`	Enter BGP router mode
`(config-router)#address-family ipv6 unicast`	Enter address-family mode for neighbor router session to activate.
`(config-router-af)#bgp additional-paths send`	Configure R2 to send additional paths to all iBGP neighbors
`(config-router-af)#bgp additional-paths select all`	Configure R2 to select all available paths to send to all iBGP neighbors
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config-router)#exit`	Exit the router BGP mode and enter the configure mode
`(config)#commit`	Apply commit
`(config)#exit`	Exit the configure mode

R3

`#configure terminal`	Enter the configure mode.
`(config)#router bgp 100`	Enter BGP router mode
`(config-router)#address-family ipv6 unicast`	Enter address-family mode for neighbor router session to activate.
`(config-router-af)#bgp additional-paths receive`	Configure R3 to receive additional paths from all iBGP neighbors.
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config-router)#exit`	Exit the router BGP mode and enter the configure mode
`(config)#commit`	Apply commit
`(config)#exit`	Exit the configure mode

Additional Paths at the Neighbor Level

R2

`#configure terminal`	Enter the configure mode.
`(config)#router bgp 100`	Enter BGP router mode
`(config-router)#address-family ipv6 unicast`	Enter address-family mode for neighbor router session to activate.
`(config-router-af)#neighbor 3001::2 additional-paths send-receive`	Configure R2 to send-receive additional paths to the iBGP neighbor R3
`(config-router-af)#neighbor 3001::2 advertise additional-paths all`	Configure R2 to advertise all available paths to the iBGP neighbor R3
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config-router)#exit`	Exit the router BGP mode and enter the configure mode
`(config)#commit`	Apply commit
`(config)#exit`	Exit the configure mode

R3

`#configure terminal`	Enter the configure mode.
`(config)#router bgp 100`	Enter BGP router mode
`(config-router)#address-family ipv6 unicast`	Enter address-family mode for neighbor router session to activate.
`(config-router-af)#neighbor 3001::1 additional-paths send-receive`	Configure R3 to receive additional paths from the iBGP neighbor R2
`(config-router-af)#neighbor 3001::1 advertise additional-paths all`	Configure R2 to advertise all available paths to the iBGP neighbor R3
`(config-router-af)#exit-address-family`	Exit Address Family mode and return to Router mode.
`(config-router)#exit`	Exit the router BGP mode and enter the configure mode
`(config)#commit`	Apply commit
`(config)#exit`	Exit the configure mode

BGP Flowspec Support for IPv4

This section contains configurations of BGP Flowspec support for IPv4.

The BGP flow specification (flowspec) feature allows users to rapidly deploy and propagate filtering and policing functionality among a large number of BGP peer routers to mitigate the effects of a distributed denial-of-service (DDoS) attack over your network.

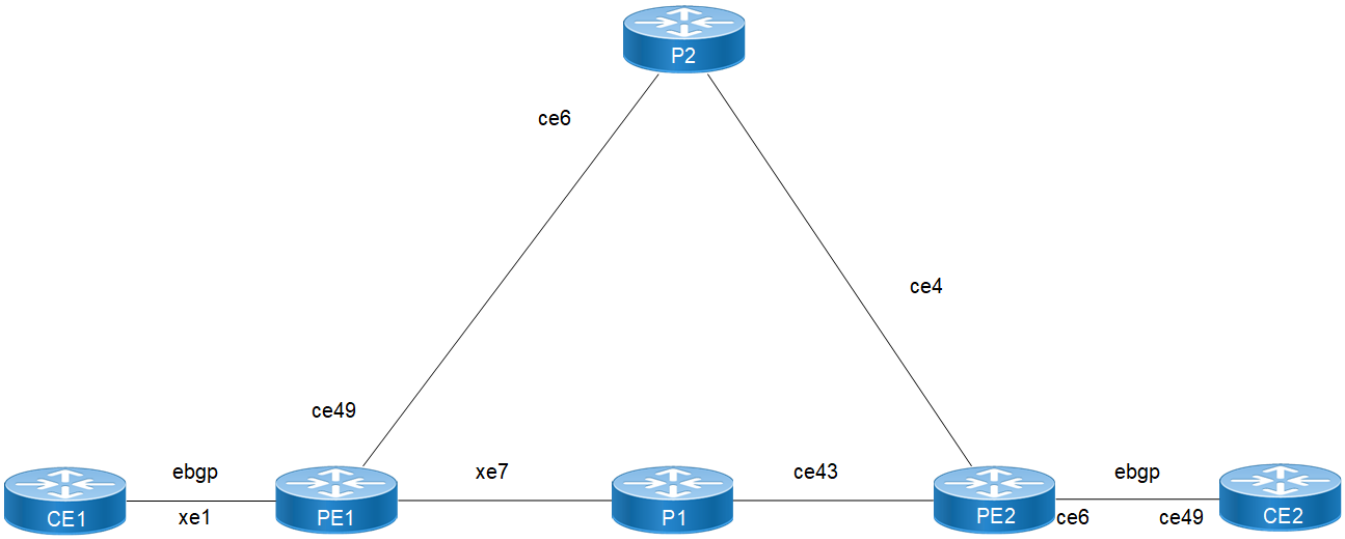
The BGP flowspec, specifically stated in here, allows users effectively to construct instructions to match a particular flow with source, destination, L4 parameters and packet specifics such as length, fragment and so on. Flowspec allows for a dynamic installation of an action at the border routers to either:

- Drop the traffic
- Inject it in a different VRF for analysis or
- Allow it, but police it at a specific defined rate

BGP Flowspec IPv4 Configuration

Topology

Figure 88. BGP Flowspec support for IPv4



CE1 Configuration

`CE1#configure terminal`	Enter configure mode.
`CE1(config)# class-map type traffic match-all ocnos`	Configure class map with class name
`CE1(config-cmap-tr)#match destination-address ipv4 3.3.3.3/32`	Configure match with destination ip address
`CE1(config-cmap-tr)#match source-address ipv4 3.3.3.3/32`	Enable match with source ip address
`CE1(config-cmap-tr)# match destination-port 44-144`	Enable match with destination port

`CE1(config-cmap-tr)#exit`	Exit from class map traffic
`CE1(config)#commit`	Commits the configuration
`CE1(config)#class-map type traffic match-all ocnos2`	Configure class map with class name
`CE1(config-cmap-tr)# match destination-address ipv4 10.1.1.0/24`	Configure match with destination ip address
`CE1(config-cmap-tr)# match source-address ipv4 10.1.1.0/24`	Enable match with source ip address
`CE1(config-cmap-tr)# match source-port 22-122`	Enter match with source port
`CE1(config-cmap-tr)#exit`	Exit from class map traffic
`CE1(config)#commit`	Commits the configuration
`CE1(config)#policy-map type pbr CE1`	Configure policy map type pbr with policy name
`CE1(config-pmap-pbr)# class type traffic ocnos2`	Enter class map traffic class name
`CE1(config-pmap-pbr-c)# police rate 21000 bps`	Enable policy rate
`CE1(config-pmap-pbr-c)#exit`	Exit from polocy map traffic
`CE1(config-pmap-pbr)#exit`	Exit from policy map
`CE1(config)#policy-map type pbr PE1`	Configure policy map type pbr with policy name
`CE1(config-pmap-pbr)# class type traffic ocnos`	Enter class map traffic class name
`CE1(config-pmap-pbr-c)# police rate 4444444 bps`	Enable policy rate
`CE1(config-cmap-tr)#exit`	Exit from class map
`CE1(config)#commit`	Commits the configuration
`CE1(config)#flowspec`	Configure flowspec
`CE1(config-flowspec)#address-family ipv4`	Enter address-family mode with ipv4
`CE1(config-flowspec-af)#service-policy type pbr PE1`	Enable service plocy type pbr with policy name
`CE1(config-flowspec-af)#service-policy type pbr CE1`	Enable service plocy type pbr with policy name
`CE1(config-flowspec-af)#exit`	Exit from address family mode
`CE1(config-flowspec)#commit`	Commits the configuration
`CE1(config)#interface xe1`	Enter interface mode
`CE1(config-if)#ip address 10.1.1.1/24`	Configure ip address
`CE1(config-if)#exit`	Exit from interface mode
`CE1(config)#interface xe1.10`	Enter the sub interface mode
`CE1(config-if)# encapsulation dot1q 10`	Enable encapsulate dot 1q
`CE1(config-if)# ip address 66.1.1.1/24`	Configure ip address
`CE1(config-if)#exit`	Exit from interface mode
`CE1(config)#commit`	Commits the configuration
`CE1(config)#router bgp 100`	Configure bgp intstance
`CE1(config-router)#neighbor 10.1.1.2 remote-as 65000`	Enable neighbour ip address with remote-as 65000
`CE1(config-router)# neighbor 66.1.1.2 remote-as 65000`	Enable neighbour ip address with remote-as 65000

© 2026 IP Infusion Inc. Proprietary

`CE1(config-router)#address-family ipv4 unicast`	Enter address family ipv4 unicast mode
`CE1(config-router-af)#redistribute connected`	Enable redistribute connected
`CE1(config-router-af)#neighbor 10.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)#neighbor 66.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)#exit-address-family`	Exit from address family mode
`CE1(config-router)#address-family ipv4 flowspec`	Enter address family ipv4 flowspec mode
`CE1(config-router-af)#neighbor 10.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)#neighbor 66.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)#exit-address-family`	Exit from address family mode
`CE1(config-router)#exit`	Exit from router mode
`CE1(config)#commit`	Commits the configuration

PE1 Configuration

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#ip vrf vrf100`	Enter vrf vrf name
`PE1(config-vrf)# rd 100:1`	Enter rd value
`PE1(config-vrf)# route-target both 100:1`	Enter router targeted as both
`PE1(config-vrf)#exit`	Exit from vrf mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#ip vrf vrf101`	Enter vrf vrf name
`PE1(config-vrf)# rd 101:1`	Enter rd value
`PE1(config-vrf)# route-target both 101:1`	Enter router targeted as both
`PE1(config-vrf)#exit`	Exit from vrf mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#qos enable`	Enable qos
`PE1(config)#qos statistics`	Enable qos statistics
`PE1(config)#class-map type traffic match-all clas1`	Configure class map with class name
`PE1(config-cmap-tr)# match destination-address ipv4 4.4.4.4/32`	Configure match with destination ip address
`PE1(config-cmap-tr)# match destination-port 400-499`	Enable match with destination-port
`PE1(config-cmap-tr)#exit`	Exit from class map traffic mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#policy-map type pbr pol1`	Configure policy map type pbr with policy name
`PE1(config-pmap-pbr)# class type traffic clas1`	Enable class type traffic with class map name
`PE1(config-pmap-pbr-c)# redirect ipv4 extcommunity rt 100:10`	Enable redirect ipv4 extcommunity with rt
`PE1(config-pmap-pbr-c)#exit`	Exit from policy map traffic

© 2026 IP Infusion Inc. Proprietary

`PE1(config-pmap-pbr)#exit`	Exit from policy map
`PE1(config)#commit`	Commits the configuration
`PE1(config)#flowspec`	Configure flowspec
`PE1(config-flowspec)# address-family ipv4`	Enter address-family mode with ipv4
`PE1(config-flowspec-af)# service-policy type pbr pol1`	Enable service policy type pbr with policy name
`PE1(config-flowspec-af)#exit`	Exit from address family mode
`PE1(config-flowspec)#exit`	Exit from flowspec mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#router ldp`	Configure router ldp
`PE1(config-router)# targeted-peer ipv4 3.3.3.3`	Configure targeted peer ipv4 address
`PE1(config-router-targeted-peer)# exit-targeted-peer-mode`	Exit from targeted peer mode
`PE1(config-router)#exit`	Exit from router mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface lo`	Enter interface mode
`PE1(config-if)# ip address 1.1.1.1/32 secondary`	Assign ip address as secondary
`PE1(config-if)# ip router isis 1`	Enable router isis instance
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface ce51`	Enter interface mode
`PE1(config-if)# ip address 40.1.1.1/24`	Assign ip address
`PE1(config-if)# label-switching`	Enable label switching
`PE1(config-if)# ip router isis 1`	Enable router isis instance
`PE1(config-if)# enable-ldp ipv4`	Enable ldp ipv4
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface xe1`	Enter interface mode
`PE1(config-if)# ip vrf forwarding vrf100`	Enable vrf forwarding with vrf name
`PE1(config-if)# ip address 10.1.1.2/24`	Assigh the ip address
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1-7026(config)#interface xe1.10`	Enter the sub interface mode
`PE1-7026(config-if)# encapsulation dot1q 10`	Enable encapsulate dot 1q
`PE1-7026(config-if)# ip vrf forwarding vrf100`	Enable vrf forwarding under interface
`PE1-7026(config-if)# ip address 66.1.1.2/24`	Assigh the ip address
`PE1-7026(config-if)#exit`	Exit from interface mode

`CE2(config-router)# address-family ipv4 unicast`	Enter address family ipv4 unicast mode
`CE2(config-router-af)# redistribute connected`	Enter redistribute connected
`CE2(config-router-af)# neighbor 30.1.1.2 activate`	Activate the neighbour
`CE2(config-router-af)# neighbor 55.1.1.1 activate`	Activate the neighbour
`CE2(config-router-af)# exit-address-family`	Exit from address family mode
`CE2(config-router)# address-family ipv4 flowspec`	Enter address family ipv4 flowspec mode
`CE2(config-router-af)# neighbor 30.1.1.2 activate`	Activate the neighbour
`CE2(config-router-af)# neighbor 55.1.1.1 activate`	Activate the neighbour
`CE2(config-router-af)# exit-address-family`	Exit from address family

© 2026 IP Infusion Inc. Proprietary

`CE2(config-router)#exit`	Exit from router bgp mode
`CE2(config)#commit`	Commits the configuration

BGP Flowspec IPv4 Validation

CE1

The CE1 node configurations are verified using the show commands listed below.

```
CE1#sh ip bgp
BGP table version is 5, local router ID is 4.4.4.4

BGP neighbor is 1.1.1.1, remote AS 65000, local AS 65000, internal link
  BGP version 4, local router ID 3.3.3.3, remote router ID 1.1.1.1
  BGP state = Established, up for 02:34:56
  Last read 00:00:05, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family VPNv4 Unicast: advertised and received
    Address family IPv4 Flow Specification: advertised and received
    Address family VPNv4 Flow Specification: advertised and received
  Received 392 messages, 1 notifications, 0 in queue
  Sent 408 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  Update source is lo

For address family: IPv4 Unicast  BGP table version 7, neighbor version 7
  Index 1, Offset 0, Mask 0x2
  AIGP is enabled
  Community attribute sent to this neighbor (both)
  Large Community attribute sent to this neighbor
  4 accepted prefixes
  4 announced prefixes

For address family: VPNv4 Unicast  BGP table version 3, neighbor version 3
  Index 1, Offset 0, Mask 0x2
  AIGP is enabled
  Community attribute sent to this neighbor (both)
  Large Community attribute sent to this neighbor
  4 accepted prefixes
  4 announced prefixes

For address family: IPv4 Flow Specification  BGP table version 18, neighbor version 18
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  Large Community attribute sent to this neighbor
  2 accepted prefixes
  3 announced prefixes

For address family: VPNv4 Flow Specification  BGP table version 5, neighbor version 5
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  Large Community attribute sent to this neighbor
  1 accepted prefixes
  2 announced prefixes

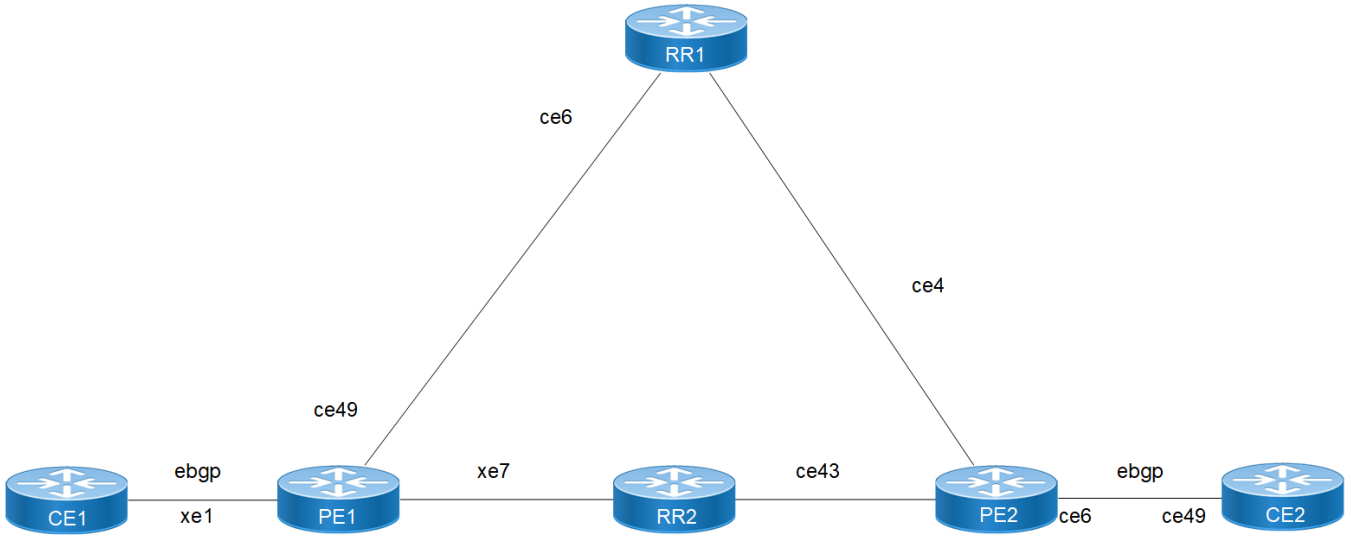
BGP Flowspec Configuration With RR

Topology

Figure 89. BGP Flowpec support for IPv4 with RR



CE1 Configuration

`CE1#configure terminal`	Enter configure mode.
`CE1(config)# class-map type traffic match-all ocnos`	Configure class map with class name
`CE1(config-cmap-tr)#match destination-address ipv4 5.5.5.5/32`	Configure match with destination ip address
`CE1(config-cmap-tr)#match source-address ipv4 4.4.4.4/32`	Enable match with source ip address
`CE1(config-cmap-tr)#match protocol 12`	Enable match with protocol
`CE1(config-cmap-tr)#match port 333-444`	Enable match with port
`CE1(config-cmap-tr)#exit`	Exit from class map traffic
`CE1(config)#commit`	Commits the configuration
`CE1(config)#class-map type traffic match-all ocnos2`	Configure class map with class name
`CE1(config-cmap-tr)# match destination-address ipv4`	Configure match with destination ip address

`10.1.1.0/24`	
`CE1(config-cmap-tr)# match source-address ipv4 10.1.1.0/24`	Enable match with source ip address
`CE1(config-cmap-tr)# match protocol 44`	Enable match with protocol
`CE1(config-cmap-tr)# match destination-port 44-144`	Enable match with destination port
`CE1(config-cmap-tr)# match source-port 22-122`	Enter match with source port
`CE1(config-cmap-tr)#exit`	Exit from class map traffic
`CE1(config)#commit`	Commits the configuration
`CE1(config)#policy-map type pbr CE1`	Enable policy map type pbr policy name
`CE1(config-pmap-pbr)# class type traffic ocnos2`	Enable class type traffic class name
`CE1(config-pmap-pbr-c)# police rate 21000 bps`	Set the policy rate
`CE1(config-pmap-pbr-c)#exit`	Exit from class
`CE1(config-pmap-pbr)#exit`	Exit from policy map
`CE1(config)#policy-map type pbr PE1`	Enable policy map type pbr policy name
`CE1(config-pmap-pbr)# class type traffic ocnos`	Enable class type traffic class name
`CE1(config-pmap-pbr-c)# police rate 4444444 bps`	Set the policy rate
`CE1(config-cmap-tr)#exit`	Exit from class map traffic
`CE1(config)#commit`	Commits the configuration
`CE1(config)#flowspec`	Configure flowspec
`CE1(config-flowspec)#address-family ipv4`	Enter address family ipv4 mode
`CE1(config-flowspec-af)#service-policy type pbr PE1`	Enable service policy type pbr with policy name
`CE1(config-flowspec-af)#service-policy type pbr CE1`	Enable service policy type pbr with policy name
`CE1(config-flowspec-af)#exit`	Exit from address family
`CE1(config-flowspec)#exit`	Exit from flowspec mode
`CE1(config)#commit`	Commits the configuration
`CE1(config)#interface lo`	Enter the loopback onterface mode
`CE1(config-if)# ip address 4.4.4.4/32 secondary`	Assign the ip add as secondary
`CE1(config-if)# ip router isis 1`	Enable the router isis instance
`CE1(config-if)#exit`	Exit from interface mode
`CE1(config)#commit`	Commits the configuration
`CE1(config)#interface xe1`	Enter the interface mode
`CE1(config-if)#ip address 10.1.1.1/24`	Configure ip address
`CE1(config)#interface xe1.10`	Configure subinterface
`CE1(config-if)# encapsulation dot1q 10`	Enable encapsulate dot1q vlan id
`CE1(config-if)# ip address 66.1.1.1/24`	Configure ip address
`CE1(config-if)#exit`	Exit from interface mode

© 2026 IP Infusion Inc. Proprietary

`CE1(config)#commit`	Commits the configuration
`CE1(config)#router bgp 100`	Configure bgp intstance
`CE1(config-router)# neighbor 10.1.1.2 remote-as 65000`	Enable neighbour ip address with remote-as 65000
`CE1(config-router)# neighbor 66.1.1.2 remote-as 65000`	Enable neighbour ip address with remote-as 65000
`CE1(config-router)# address-family ipv4 unicast`	Enter the address family ipv4 unicast
`CE1(config-router-af)# redistribute connected`	Enter redistribute connected
`CE1(config-router-af)# neighbor 10.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)# neighbor 66.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)# exit-address-family`	Exit from address family mode
`CE1(config-router)# address-family ipv4 flowspec`	Enter the address family ipv4 flowspec
`CE1(config-router-af)# neighbor 10.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)#neighbor 66.1.1.2 activate`	Activate the neighbour
`CE1(config-router-af)# exit-address-family`	Exit from address family mode
`CE1(config-router)#exit`	Exit from router mode
`CE1(config)#commit`	Commits the configuration

PE1 Configuration

`PE1#configure terminal`	Enter configure mode.
`PE1(config)#ip vrf vrf100`	Enter vrf vrf name
`PE1(config-vrf)# rd 100:1`	Enter rd value
`PE1(config-vrf)# route-target both 100:1`	Enter router targeted as both
`PE1(config-vrf)#exit`	Exit from vrf mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#ip vrf vrf101`	Enter vrf vrf name
`PE1(config-vrf)# rd 101:1`	Enter rd value
`PE1(config-vrf)# route-target both 101:1`	Enter router targeted as both
`PE1(config-vrf)#exit`	Exit from vrf mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#qos enable`	Enable qos
`PE1(config)#qos statistics`	Enable qos statistics
`PE1-7026(config)#class-map type traffic match-all class1`	Configure class map with class name
`PE1-7026(config-cmap-tr)# match destination-address ipv4 3.3.3.3/32`	Configure match with destination ip address
`PE1-7026(config-cmap-tr)# match source-address ipv4 1.1.1.1/32`	Enable match with source ip address
`PE1-7026(config-cmap-tr)# match protocol 78`	Enable match with protocol

© 2026 IP Infusion Inc. Proprietary

`PE1-7026(config-cmap-tr)# match port 101-201`	Enable match with port range
`PE1-7026(config-cmap-tr)# match destination-port 400-499`	Enable match with destination-port range
`PE1-7026(config-cmap-tr)# match source-port 330-399`	Enable match with source-port range
`PE1-7026(config-cmap-tr)# match ipv4 icmp-code 10`	Enable match with icmp code
`PE1-7026(config-cmap-tr)# match packet-length 22-222`	Enable match with packet length range
`PE1-7026(config-cmap-tr)# match dscp 10`	Enable match with dscp
`PE1-7026(config-cmap-tr)#exit`	Exit from class map traffic
`PE1-7026(config)#commit`	Commits the configuration
`PE1-7026(config)#policy-map type pbr pol11`	Configure policy map type pbr with policy name
`PE1-7026(config-pmap-pbr)# class type traffic class1`	Enable class type traffic with class map name
`PE1-7026(config-pmap-pbr-c)# police rate 1000011 bps`	Enable policy rate
`PE1-7026(config-pmap-pbr-c)# set dscp 0e`	Set the dscp value
`PE1-7026(config-pmap-pbr-c)#exit`	Exit from polocy map traffic
`PE1-7026(config-pmap-pbr)#exit`	Exit from policy map
`PE1-7026(config)#commit`	Commits the configuration
`PE1(config)#flowspec`	Configure flowspec
`PE1(config-flowspec)# address-family ipv4`	Enter address-family mode with ipv4
`PE1(config-flowspec-af)# service-policy type pbr pol11`	Enable service plocy type pbr with policy name
`PE1(config-flowspec-af)#exit`	Exit from address family mode
`PE1(config-flowspec)#exit`	Exit from flowspec mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#router ldp`	Enter router ldp mode
`PE1(config-router)# targeted-peer ipv4 3.3.3.3`	Enable targeted peer ipv4 address
`PE1(config-router-targeted-peer)# exit-targeted-peer-mode`	Exit from targeted peer mode
`PE1(config-router)#exit`	Exit from router ldp
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface lo`	Enter interface mode
`PE1(config-if)# ip address 1.1.1.1/32 secondary`	Assign the ip address secondary
`PE1(config-if)# ip router isis 1`	Enable router isis instance
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface ce49`	Enter interface mode
`PE1(config-if)# ip address 40.1.1.1/24`	Assign the ip add

© 2026 IP Infusion Inc. Proprietary

`PE1(config-if)# label-switching`	Enable label switching
`PE1(config-if)# ip router isis 1`	Enter router isis instance
`PE1(config-if)# enable-ldp ipv4`	Enable ldp ipv4
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface xe1`	Enter the interface mode
`PE1(config-if)# ip address 10.1.1.2/24`	Assign the ip add
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface xe1.10`	Enter the sub-interface mode
`PE1(config-if)# encapsulation dot1q 10`	Enable encapsulate dot1q with vlan id
`PE1(config-if)# ip vrf forwarding vrf100`	Enable ip vrf forwarding vrf name
`PE1(config-if)# ip address 66.1.1.2/24`	Assign the ip add
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#interface xe7`	Enter interface mode
`PE1(config-if)# ip address 20.1.1.1/24`	Assign the ip add
`PE1(config-if)# label-switching`	Enable label switching
`PE1(config-if)# ip router isis 1`	Enter router isis instance
`PE1(config-if)# enable-ldp ipv4`	Enable ldp ipv4
`PE1(config-if)#exit`	Exit from interface mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#router isis 1`	Configure isis instance
`PE1(config-router)# is-type level-1-2`	Configure is-type-level-1-2
`PE1(config-router)# metric-style wide`	Configure metric style wide
`PE1(config-router)# mpls traffic-eng router-id 1.1.1.1`	Configure router id
`PE1(config-router)# mpls traffic-eng level-1`	Configure traffic engg level-1
`PE1(config-router)# mpls traffic-eng level-2`	Configure traffic engg level-2
`PE1(config-router)# dynamic-hostname`	Configure hostname
`PE1(config-router)# bfd all-interfaces`	Enable bfd all interfaces
`PE1(config-router)# net 49.0000.0000.0001.00`	Configure network id
`PE1 (config-router)# passive-interface lo`	Configure passive interface as loopback
`PE1(config-router)#exit`	Exit from isis instance mode
`PE1(config)#commit`	Commits the configuration
`PE1(config)#router bgp 65000`	Configure bgp instance
`PE1(config-router)# neighbor 6.6.6.6 remote-as`	Enable neighbour address with remote-as 65000

© 2026 IP Infusion Inc. Proprietary

65000	
PE1(config-router)# neighbor 10.1.1.1 remote-as 100	Enable neighbour address with remote-as 100
PE1(config-router)# neighbor 20.1.1.2 remote-as 65000	Enable neighbour address with remote-as 65000
PE1(config-router)# neighbor 6.6.6.6 update-source lo	Enable neighbour address with update loopback
PE1(config-router)# address-family ipv4 unicast	Enter address family ipv4 mode
PE1(config-router-af)# neighbor 6.6.6.6 activate	Activate the neighbour
PE1(config-router-af)# neighbor 6.6.6.6 next-hop-self	Enter neighbor ip add with next hop self

`RR1(config-router-af)# neighbor 3.3.3.3 activate`	Activate the neighbour
`RR1(config-router-af)# neighbor 3.3.3.3 route-reflector-client`	Enable the neighbor ip add as route reflector client
`RR1(config-router-af)# exit-address-family`	Exit from address family mode
`RR1(config-router)#exit`	Exit from router bgp instance mode
`RR1(config)#commit`	

PE2 Configuration

`PE2#configure terminal`	Enter configure mode.
`PE2(config)#router ldp`	Enter vrf vrf name
`PE2(config-router)# targeted-peer ipv4 1.1.1.1`	Enter rd value
`PE2(config-router-targeted-peer)#exit-targeted-peer-mode`	Enter router targeted as both
`PE2(config-router)#exit`	Exit from vrf mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#ip vrf vrf100`	Enter vrf vrf name
`PE2(config-vrf)# rd 100:1`	Enter rd value
`PE2(config-vrf)# route-target both 100:1`	Enter router targeted as both
`PE2(config-vrf)#exit`	Exit from vrf mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#ip vrf vrf101`	Enter vrf vrf name
`PE2(config-vrf)# rd 101:1`	Enter rd value
`PE2(config-vrf)# route-target both 101:1`	Enter router targeted as both
`PE2(config-vrf)#exit`	Exit from vrf mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#class-map type traffic match-all cl1`	Configure class map with class name
`PE2(config-cmap-tr)# match destination-address ipv4 1.1.1.1/32`	Configure match with destination ip address
`PE2(config-cmap-tr)# match source-address ipv4 3.3.3.3/32`	Enable match with source ip address
`PE2(config-cmap-tr)# match port 111-222`	Enable match with port range
`PE2(config-cmap-tr)# match destination-port 300-399`	Enable match with destination-port range
`PE2(config-cmap-tr)# match source-port 230-299`	Enable match with source-port range
`PE2(config-cmap-tr)#exit`	Exit from class map traffic
`PE2(config)#commit`	Commits the configuration
`PE2(config)#policy-map type pbr pol1`	Configure policy map type pbr with policy name
`PE2(config-pmap-pbr)# class type traffic cl1`	Enable class type traffic with class map name
`PE2(config-pmap-pbr-c)# police rate 1111111 bps`	Enable policy rate

© 2026 IP Infusion Inc. Proprietary

`PE2(config-pmap-pbr-c)#exit`	Exit from polocy map traffic
`PE2(config-pmap-pbr)#exit`	Exit from policy map
`PE2(config)#commit`	Commits the configuration
`PE2(config)#flowspec`	Configure flowspec
`PE2(config-flowspec)# address-family ipv4`	Enter address-family mode with ipv4
`PE2(config-flowspec-af)# service-policy type pbr pol1`	Enable service plocy type pbr with policy name
`PE2(config-flowspec-af)#exit`	Exit from address family mode
`PE2(config-flowspec)#exit`	Exit from flowspec mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#interface lo`	Enter the loopback interface
`PE2(config-if)# ip address 3.3.3.3/32 secondary`	Assign the ip add secondary
`PE2(config-if)# ip router isis 1`	Enable router isis instance
`PE2(config-if)#exit`	Exit from interface mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#interface ce4`	Enter the interface mode
`PE2(config-if)# ip address 50.1.1.1/24`	Assign the ip add
`PE2(config-if)# label-switching`	Enable label switching
`PE2(config-if)# ip router isis 1`	Enter router isis instance
`PE2(config-if)# enable-ldp ipv4`	Enable ldp ipv4
`PE2(config-if)#exit`	Exit from interface mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#interface ce43`	Enter the interface mode
`PE2(config-if)# speed 40g`	Set the interface speed
`PE2(config-if)# ip address 11.1.1.1/24`	Assign the ip add
`PE2(config-if)# label-switching`	Enable label switching
`PE2(config-if)# ip router isis 1`	Enter router isis instance
`PE2(config-if)#enable-ldp ipv4`	Enable ldp ipv4
`PE2(config-if)#exit`	Exit from interface mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#interface ce6`	Enter the interface mode
`PE2(config-if)# ip address 30.1.1.2/24`	Assign the ip add
`PE2(config-if)#exit`	Exit from interface mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#interface ce6.10`	Enter the sub-interface mode
`PE2(config-if)# encapsulation dot1q 10`	Enable encapsulate dot1q vlan id

© 2026 IP Infusion Inc. Proprietary

`PE2(config-if)# ip vrf forwarding vrf100`	Enable brf forwarding vrf name
`PE2(config-if)# ip address 55.1.1.1/24`	Assign the ip add
`PE2(config-if)#exit`	Exit from interface mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#router isis 1`	Configure isis instance
`PE2(config-router)# is-type level-1-2`	Configure is-type-level-1-2
`PE2(config-router)# metric-style wide`	Configure metric style wide
`PE2(config-router)# mpls traffic-eng router-id 3.3.3.3`	Configure router id
`PE2(config-router)# mpls traffic-eng level-1`	Configure traffic engg level-1
`PE2(config-router)# mpls traffic-eng level-2`	Configure traffic engg level-2
`PE2(config-router)# dynamic-hostname`	Configure hostname
`PE2(config-router)# bfd all-interfaces`	Enable bfd all interfaces
`PE2(config-router)# net 49.0000.0000.0003.00`	Configure network id
`PE2(config-router)# passive-interface lo`	Configure passive interface as loopback
`PE2(config-router)#exit`	Exit from isis instance mode
`PE2(config)#commit`	Commits the configuration
`PE2(config)#router bgp 65000`	Configure bgp instance
